Kaka`ako Community Development District

TOD Overlay Plan
Final Environmental Impact Statement

Prepared for:
Hawaii Community Development Authority

Prepared by:
Lee Sichter LLC

This Final Environmental Impact Statement and all ancillary documents were prepared under the signatory's direction or supervision, and the information submitted, to the best of the signatory's knowledge, fully addresses document content requirements as set forth in Chapter 343, Hawaii Revised Statutes, as amended, and Sections 11-200-17 and 11-200-18 of the Hawaii Administrative Rules.

Anthony J.H. Ching
Executive Director
Hawaii Community Development Authority

JUNE 10, 2015
Date

Accepting Authority: Governor, State of Hawai`i

Note to Reader

This final environmental impact statement includes the complete text of the draft EIS and all comment letters received by HCDA together with the agency's written responses, plus any changes/revisions to the text resulting from those letters.

Pursuant to the requirements of Section 11-200-18(D), Hawaii Administrative Rules, "The text of the final EIS which [sic] ***shall be written in a format which allows the reader to easily distinguish changes made to the text of the draft EIS."***

To comply with this requirement, all SUBSTANTIVE changes and/or revisions to the draft EIS are presented in bold-face, italicized and underlined text. Non-substantive revisions, e.g. correction of spelling errors, typos, renumbering of the Table of Contents etc., are NOT identified in this manner.

0.0 Executive Summary

0.1 Introduction

In 1976, the State Legislature designated Kaka`ako as a Community Development District (KCDD) under the jurisdiction of the Hawaii Community Development Authority (HCDA) - a body corporate and public instrument of the State of Hawai`i responsible for planning and revitalizing redevelopment areas. By direction of the State Legislature, Kaka`ako has been identified as a significantly underdeveloped and underutilized relative to its central location in urban Honolulu and HCDA has been tasked with planning for its redevelopment.

The 601.6-acre Kaka`ako Community Development District (KCDD) is situated within the Kona district of the Honolulu ahupua`a and is part of the Primary Urban Center. It is prominently located less than a mile east of Honolulu's central business district, and between the densely populated Punchbowl district to the north, Ala Moana Shopping Center and Waikiki to the east, and the Downtown area and Honolulu Harbor to the west. For planning purposes, it is divided into two parts, the Mauka Area and the Makai Area.

South King Street, Punchbowl Street, Ala Moana Boulevard and Piikoi Street bound the Mauka Area of the KCDD. It is envisioned as the residential, commercial and retail mixed-use neighborhood of the KCDD. Located makai of Ala Moana Boulevard, the Makai Area consists primarily of state and agency controlled land along the waterfront. It is bounded by Ala Moana Boulevard on the north, Ala Moana Regional Park on the east, Forest Avenue and the property line between Honolulu Harbor's Pier 2 and Pier 4 on the west, and the Pacific Ocean on the south. The Makai Area also includes a non-contiguous property called the Aloha Tower Special District (ATSD), a 3.4-acre parcel in Downtown owned by the Hawaiian Electric Company's (HECO) and occupied by HECO's downtown power plant. The ATSD is situated on the makai side of Ala Moana Boulevard and is bounded by Richard Street, Bishop Street, and Aloha Tower Drive. It is adjacent to Irwin Park, the Downtown Financial District and the Aloha Tower redevelopment area.

In 2012, the Honolulu City Council approved an alignment for the Honolulu Authority for Rapid Transportation (HART) elevated light-~~rail~~ ~~transit~~ ***metro*** system. The alignment identified three transit stations in within the Kaka`ako Community Development District: two in Kaka`ako Mauka (the Civic Center and Kaka`ako stations) and one at the Aloha Tower Special District (the Downtown station).

In response to this action, the HCDA retained consultants to prepare a plan to address the future opportunities presented by the introduction of an elevated light rail system or the expansion of other forms of public transit in Kaka`ako. The Draft

Transit Oriented Development Overlay Plan (hereinafter, "Draft TOD Overlay Plan") was published in May 2013 and distributed for public review (see Appendix A).

Subsequent to publication of the Draft TOD Overlay Plan, concerns were raised about excessive density in the KCDD and the effects of increased building heights upon existing residents. In response to these and other concerns, the 2014 State Legislature approved House Bill 1866 (House Draft 2, Senate Draft 1) that, among other things, limited building heights in the Mauka Area to 418 feet (400 feet plus appurtenant facilities such as elevator equipment), thereby reducing allowable building densities. On April 30, 2014, the Governor signed the bill into law as Act 61.

This Environmental Impact Statement (EIS) has been prepared to analyze the impacts of transit-oriented development in Kaka`ako. Development in the KCDD is governed by rules established separately for the Mauka Area and the Makai Area. For the purposes of this EIS, the "Future Baseline" condition is what would happen in the District if it were built-out in accordance with established rules and plans. The Proposed Action is a regulatory "overlay" on the Future Baseline Condition. Rather than change the fundamental character already established for the KCDD, it amends it or overlays it by offering a vision of how the district could respond to the opportunities presented by the introduction of an elevated light rail system in the Mauka Area[1]. The HART light ~~rail~~ ***metro*** system presents certain additional urban infill development opportunities with the KCDD and it is the impact of that additional development opportunity that is being disclosed in this EIS.

0.2 Summary of the Proposed Action and Alternatives

The Proposed Action is the implementation of transit-oriented development in the KCDD. It is intended to be an incentive based program that would provide development incentives for landowners: in exchange for density bonuses, landowners would be required to provide exemplary public benefits as part of their property redevelopment program.

For the purposes of this EIS, the Draft TOD Overlay Plan is identified as TOD Alternative A. The urban design scenario resulting from the adoption of Act 61 is identified in this EIS as TOD Alternative B. For the purposes of this EIS, no specific course of action is recommended. The Proposed Action is defined as the implementation of either TOD Alternative A or TOD Alternative B.

This EIS discloses the environmental, social, and economic impacts that will result from the implementation of either TOD Alternative A or TOD Alternative B. Once

[1] The entire rail system was the subject of a separate EIS that was approved by the Federal Transit Administration on January 18, 2011. Thus, it is important to understand that the present EIS is not intended to evaluate the impacts of the ~~HART~~ light ~~rail~~ ***metro*** system alignment through the KCDD. That has already been done.

this EIS has been completed, the Draft TOD Overlay Plan may require revisions to accommodate the findings of the EIS. Ultimately, the HCDA will determine what course of action to take regarding transit-oriented development, that is to say: select TOD Alternative A and amend the Mauka Area rules to implement it[2], select TOD Alternative B and amend the Mauka Area rules to implement it, or elect to take no action to amend the Mauka Area rules.

For the purposes of this EIS, full build-out of the KCDD is targeted for 2035. Whether this actually happens will depend upon decisions made by private landowners and public agencies. However, it is necessary to identify a target year for analytical purposes of comparison.

Both TOD Alternative A and TOD Alternative B increase the overall quantity of housing in the KCDD as compared to the Future Baseline Condition and introduce new opportunities for area land uses such as a limited number of hotels (no more than three) and office/industrial buildings. Under the Proposed Action's policies, increases in land use capacity are only allowed if tethered to new community amenities and public realm enhancements, the substructure that supports urban lifestyles.

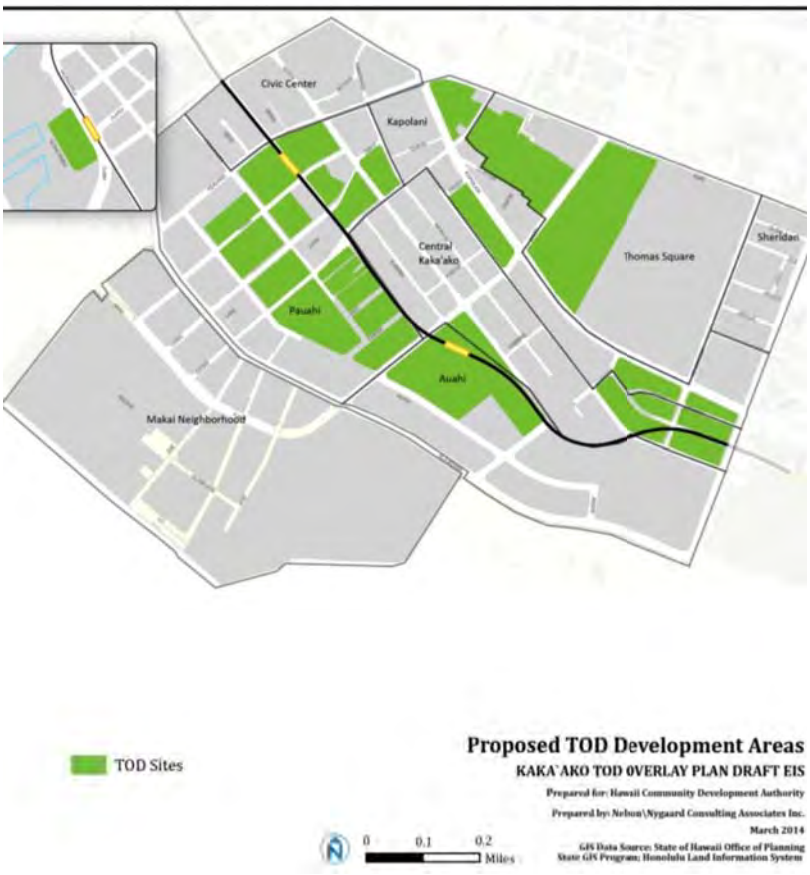
The Proposed Action asserts that strong land use and transit-planning partnerships can lay the groundwork to develop livable neighborhoods, improve public health, lower vehicle miles traveled (VMT), and reduce greenhouse gas (GHG) emissions, all while increasing sociability. By providing the opportunity for more growth, the private sector must respond by investing in the neighborhood amenity.

TOD Alternative A introduces significant height and tall residential towers to accommodate capacity increases. In this Alternative, building forms could include a cluster of 420-550' tall high-rise residential towers, as well as no more than three residential towers rising to 700' (one each in the Pauahi and Auahi neighborhood of the Mauka Area and one as part of the potential redevelopment of Blaisdell Center). The "as of right" development capacity in TOD Alternative A is 5.0 FAR (floor area ratio) including all floor area associated with parking. The maximum proposed FARs in TOD sites range from 7 FAR to a maximum of 10 FAR. With a potential for increased development capacity, this Alternative anticipates a redevelopment pattern that, depending on the size of the parcel, can accommodate multiple, inter-related buildings on a single development block.

TOD Alternative B explores how redevelopment might occur with a similar, but slightly reduced increase in capacity while maintaining the existing envelope of 418' height limitations, pursuant to Act 61. Alternative B was developed to maximize density within the District, taking into account the height limitation imposed by Act

[2] However, so long as Act 61 remains in force, building heights in the Mauka Area cannot exceed 418 feet. If the HCDA Board elects to implement TOD Alternative A, it must still comply with the provisions of Act 61.

61 and without compromising desirable urban design and aesthetic character. The "as of right" capacity for TOD Alternative B is 5.0 FAR including all floor area associated with parking. The maximum proposed FARs in TOD sites range from 7 FAR to a maximum of 9 FAR.



In both Alternatives, an incentive zoning method is proposed as a future implementation tool to achieve bonuses beyond the "as of right" development allowances. In an incentive zoning method, developers provide amenities (or payments allocated towards those amenities) in exchange for development rights. With more intensive use of property there are greater profits. As a trade-off for a greater intensity of use, the land developer is asked to contribute to enhanced public realm, cultural amenity and/or street connectivity. Adequate profitability is also required of private developers and their investors to ensure that rezoning efforts do not simply elevate land values. Incentive zoning programs must be carefully managed to ensure that the value of the community amenity is proportional and outweighs any adverse effects caused by additional building bulk. The specific parameters of the incentive zoning method will be addressed during TOD Overlay rule making by the HCDA.

Under the Proposed Action, the Mauka Area will continue its planned transformation towards a truly urban, high-rise, 24-hour, mixed-use neighborhood. Either TOD Alternative will increase overall development capacity only in selected neighborhoods within the Mauka Area (see Figure 2-1). No capacity or rule changes are proposed in the Makai Area, or for mature, and built-out existing neighborhoods (Sheridan, Civic Center and portions of Central Kaka`ako) outside of the TOD Overlay development area.

In most areas, it is assumed that increased capacity in TOD Alternatives A and B come with public infrastructure improvements that will support healthy neighborhoods including:

- Safe bicycle lanes and greatly enhanced bicycle accessibility;
- Improvements to both pedestrian and vehicular connections in the district;
- Additional funding for parks and public realm at the ground level;
- Midblock crossing at alleys and ways to enhance connections between the TOD Overlay plan area and other parts of the district;
- The screening and structuring of parking;
- The application of a broad range of transportation demand management to reduce the amount of valuable land consumed by parking. (TDM programs are typically financial incentives to encourage commuters to travel by modes other than driving, including subsidized transit passes; these tools provide alternatives to single occupancy driving.);
- Wide sidewalks and sidewalk amenities;
- Street trees and urban greening;

Figure ES-1: Proposed TOD Development Areas

Note: The HCDA identifies "neighborhoods" in the KCDD for planning purposes. The Thomas Square neighborhood identified above <u>does not</u> include Thomas Square Park, which lies just outside the KCDD on the mauka side of King Street.

- An incentive program will correlate the allocation of multi-purpose open spaces for additional height and capacity. Open spaces may be allocated on site, for example on green roofs as well as contribute to a dedicated in-lieu program to further develop planned parks and open spaces. This encourages private investment in open space and recreational facilities.
- Both the Alternatives explore the ability to allocate a large park space located on a redeveloped Blaisdell Center Site, and a redeveloped HECO site, both in the Thomas Square District.
- The Proposed Action guides HCDA in the integration of a new transit plaza associated with the Civic Center Station.
- Green connections and mid-block paths are associated with redevelopment of consolidated parcels under both Alternatives.
- The Proposed Action directs HCDA to tie a minimum of fee ($ per SF) or per FAR to public active space. A tiered program may be proposed for each neighborhood prioritizing needed amenity.

0.3 Use of Public Funds or Lands for the Proposed Action

The Proposed Action is a planning tool intended to encourage transit-oriented development in the KCDD. To that end, public funds will be used to implement the plan. These funds take the form of a portion of the operational costs of the HCDA; the governmental authority charged with implementing and enforcing development regulations in the KCDD.

As the KCDD contains publicly owned streets, sidewalks and park space, public funds will be used for on-going maintenance of these facilities. Improvements to these facilities envisioned in the Proposed Action may be implemented at the discretion of the overseeing agency. For example, the roadways within the KCDD fall under the jurisdiction of the City and County of Honolulu. Implementation of a Complete Streets program in the KCDD will require funding by the City.

Certain properties within the KCDD are owned by government agencies. Public funds may be used to develop or to facilitate development of these properties.

0.4 Summary of Beneficial and Adverse Impacts

Implementation of the Proposed Action will cause potential short-term and long-term impacts to the natural and built environment. The potential impacts are summarized below:

Population: The following table summarizes full-build out in 2035 under the existing rules (Future Baseline Condition) and the two TOD alternatives.

	Residential Units	Full-Time Residential Population	Average De Facto Population(1)	Total Operational Jobs at Build-Out(2)	Office Jobs Only	Cumulative Construction Jobs from Full Build-Out(3)
Future Baseline	21,146	33,466	33,844	51,207	37,186	55,612
TOD Alt. B	26,588	42,477	44,465	43,651	29,474	68,994
Impact (difference)	*5,443*	*9,011*	*10,621*	*-7,555*	*-7,712*	*13,382*
TOD Alt. A	28,968	46,181	48,223	45,157	30,397	75,970
Impact (difference)	*7,822*	*12,715*	*14,359*	*-6,050*	*-6,789*	*20,359*

(1) "De Facto" Population = Full-Time residents minus those temporarily away + Part-Time residents and (for TOD Alternatives A and B) Hotel Guests.
(2) Total Full- and Part-Time jobs, all shifts and days of the week.
(3) In Job-Years (both Full- and Part-Time); includes some "soft-cost" (architect/engineer) jobs; includes construction of additional public infrastructure and government facilities attributable to each scenario.
Source: EIS Appendix G (Socio-Economic Analysis)

TOD Alternative A would add approximately 12,715 people to the full-time residential population over the Future Baseline Condition, 3,704 more than TOD Alternative B. However, this growth actually represents a population shift. It is anticipated that people moving to Kaka`ako will be doing so from elsewhere on the

island. Both TOD Alternatives are consistent with State and City policies to concentrate much of the island's future growth in Kaka`ako or similar high-density locations.

Employment: As evidenced in the above table, both TOD Alternatives result in a reduction of office buildings in the KCDD when compared to the Future Baseline Condition. The alternatives focus on increasing the availability of new residential opportunities. TOD Alternative A would provide 45,157 operational jobs at build-out, approximately 6,000 less than the Future Baseline Condition. The greater reduction in density attributable to TOD Alternative B would result in a greater reduction in office space, with 7,555 fewer jobs than forecasted for the Future Baseline Condition at full build-out.

Construction: Full build-out of TOD Alternative A would create 75,970 construction jobs, 20,359 more than those forecasted for the Future Baseline Condition. Implementation of TOD Alternative B would generate less construction employment, but still more than 13,000 jobs over the Future Baseline Condition. Short-term construction impacts will include noise from the operation of construction equipment, slow moving vehicles on the roads to project sites, temporary coning or closure of traffic lanes to divert traffic from construction in roadways, and the degradation of air quality.

Infrastructure: Redevelopment of a mature urban area in the heart of greater Honolulu will impact infrastructure systems that serve the entire region.

- Water – At full build-out, TOD Alternative A will increase demand by approximately 1.11 million gallons per day (MGD) over the Future Baseline Condition. TOD Alternative B would increase demand by approximately 800,000 gallons per day. Several upgrades to the existing water service system have already been identified as part of the Future Baseline Condition, but have not yet been implemented. Given on-going and planned Board of Water Supply and Ward redevelopment projects in the area, the existing system is generally capable of meeting peak hour domestic consumption demand. However, approximately 37,600 linear feet of existing 6- and 8- inch diameter water mains need to be upgraded to 12-inch diameter mains to accommodate fire flow requirements. No additional regional improvements are required.
- Wastewater – At full build-out, TOD Alternative A would increase daily wastewater flow rates by 1.2 million gallons over the Future Baseline Condition. TOD Alternative B would increase wastewater flow by 900,000 gallons per day. Several capital improvement projects have been budgeted by the City to improve trunk lines, rehabilitate sewer lines, and add a new pump station in the area. In addition, the City is presently studying preliminary alignments for new Relief Sewer Corridors that would address sewer flow outside of the KCDD, and in so doing, help reduce demand on existing

collection lines in the KCDD. In addition to these projects, the Proposed Action would require the replacement of portions of sewer lines within KCDD:

- 480 LF of 10" sewer on Halekauwila Street between South and Keawe Streets with a 12" sewer;
- 310 LF of 8" sewer on Keawe Street makai of Halekauwila Street with a 12" sewer;
- 250 LF of 6" sewer on Ilaniwai between Kamani Street and Ward Avenue with an 8" sewer; and
- Upsize 305 LF of planned sewer in Pohukaina Street between Ahui Street and Ward Avenue from 12" to 18" diameter to 24" sewer in Ward Avenue.

Even with these projects and improvements in place, a number of existing branching sewer mains in the District would remain surcharged ***(excessively burdened)***. However, the existing system, as modified by the identified improvements, will be capable of meeting peak flow requirements. Despite the surcharged conditions, no spills are anticipated.

- Solid Waste – No modifications to the solid waste disposal program within the Mauka Area are proposed. Expansion of private contractor provided collection services might be required to meet future increased demands.
- Drainage – The existing drainage system is inadequate to accommodate and dispose of design storm rainfall runoff quantities in both the existing and future conditions. Several system improvements have been identified to address existing deficiencies, including pavement resurfacing and new drain inlets and/or catch basins, but HCDA presently has no current schedule for their design or construction. However, it is noted that since most of the future improvements are anticipated to be vertical development, additional rainfall runoff, due to development, is anticipated to be negligible; and as such, surface water ponding concerns and existing drainage system inadequacies would not be exacerbated. In other words, while the existing drainage system has deficiencies, the Proposed Action will not exacerbate them.
- Electrical – At full build-out, TOD Alternative A would increase demand for electricity an estimated 1.2 million volt-amperes over the Future Baseline Condition. TOD Alternative B would increase demand an estimated 400,000 volt-amperes. It appears that, in general, the existing underground duct systems within the Mauka Area have sufficient space to accommodate the proposed load growth with the caveat that, in some areas, new infrastructure would need to be constructed to extend the 25 kV distribution system. Additionally, development in areas served by existing overhead lines may be limited until an underground duct system is installed in these areas. In the worst case (TOD Alternative A), it appears that within 9 years, HECO would apparently either need to serve the additional loads from the Iwilei and Kewalo Substations, by adding another substation transformer in both substations, or need to construct and energize its proposed Cooke Street

Substation site, or both. Beyond 9 years of development, HECO would likely need to secure an additional substation site. The need for this site would be evaluated by HECO based on actual load growth experienced during the 23-year build-out.

Traffic: The increase of residents, visitors, and workers in the Mauka Area will exacerbate traffic conditions. Slower vehicular travel times are anticipated. However, there are no intersections within the KCDD that deteriorate from Level of Service (LOS) E or better under the Future Baseline Condition to LOS F under the Proposed Action. That said, three intersections along Ala Moana Boulevard (at South Street, Cooke Street, and Ward Avenue) and two on Ward Avenue (at Queen Street and at Kapiolani Boulevard), which are forecasted to operate at LOS F under the Future Baseline Condition, would also operate at LOS F under the Proposed Action.

Traffic delay under the Proposed Action is not anticipated to result in a level of delay to buses that would require additional buses or operating costs compared to the Future Baseline condition. Therefore, there is no significant transit operations impact resulting from the Proposed Action.

The ~~fixed guideway~~ ***metro*** transit system ~~– HART –~~ is presently under construction. ~~HART~~ ***The system*** will provide faster, more reliable transit along the corridor where many transit vehicles must operate in mixed-flow traffic, and serve as an attractive alternative to the private automobile. The project would strengthen the connection between Kapolei, Downtown Honolulu and Kaka`ako, UH Manoa, and Waikiki.

A major goal of the Proposed Action is to encourage transit oriented development. The Proposed Action is intended to facilitate and encourage transit use by placing relatively high-density development adjacent to or within easy walking access of major transit facilities such as stations on the fixed guideway system or transfer points between bus lines. TOD projects also typically encourage the use of non-motorized modes of travel, including pedestrian and bicycle travel, and discourage the use of private automobiles.

The Proposed Action will generate the following net increases in trips in comparison to the Future Baseline Condition:

- Walk/bike trips: up to 29 percent increase over the Future Baseline Condition
- Transit trips: up to 19 percent increase over the Future Baseline Condition
- Motor vehicle trips: up to 16 percent increase over the Future Baseline Condition based on daily trips, while the increase in peak-hour motor vehicle trips would be smaller:
    - up to 7 percent increase over the Future Baseline Condition during the AM Peak Hour

- up to 9 percent increase over the Future Baseline Condition during the PM Peak Hour

The Proposed Action will result in up to a three-fold increase in daily bicycle volumes with no commensurate or appropriate increase in bicycle capacity. A similar increase will occur in daily pedestrian crossings at major pedestrian corridors.

Social Impacts: The following outlines some of the fundamental impacts/benefits resulting from the implementation of the Proposed Action.

- Improved public health – Transit rich environments, such as Kaka`ako, will benefit not only from important statistical reductions in traffic injuries or fatalities, but also reduced air pollution ***during peak travel hours*** and increased levels of daily physical exercise, which has broad implications for public health, and reduced medical costs. Studies show that obesity rates tend to fall sharply with increased walking, cycling and transit use.
- Alternative Travel Options – The Proposed Action not only provides better future access to the ~~HART rapid~~ ***light metro*** transit project to improve regional mobility to non-drivers via the two major stations within the District, but it also further builds upon the current Ward Centers and Kamehameha Schools Master Plans. Both of these Plans are dedicated to introducing more street level activity and have been engaged by HCDA to allocate space for new local circulation options for vehicles and pedestrians. There is also a clear household and community wide cost-savings attributed to transit use. Families that are able to own less vehicles per household can spend those dollars elsewhere. Furthermore, walking and cycling are the most sustainable transport modes, and are affordable by virtually everyone.
- Improved Access to Housing – The primary goal of the Proposed Action is to encourage more housing in an accessible location proximate to existing job centers. The historical trend of high demand for residential housing on O`ahu coupled with strong economic conditions could conceivably result in housing development meeting expectations in the 2035 timeframe, especially if infrastructure investments identified in the Proposed Action are prioritized to support these intensive levels of development. Within the District, proposals for more intensive land uses with taller buildings will provide a greater number of total units than what is allowable under the Future Baseline Condition. Under the current HCDA Reserved Housing Policy, 20% of all new units will be built as workforce housing. In order for landowners and/or developers to achieve density incentives, workforce housing may even take on greater percentages in some areas. The Proposed Action also continues HCDA's strategy to preserve characteristics of neighborhoods with existing resident populations or historic and institutional uses, particularly in the Sheridan and Civic Center neighborhoods (neither of these

neighborhoods are eligible for participation in the TOD Overlay Plan's supplementary height and density programs).

- Improved Parking Options - As areas urbanize, with more people and uses competing for access to the same destinations, parking becomes highly contested. The availability and supply of parking is one of the strongest indicators of a population's likely transit mode share, with free and readily available parking strongly correlated with reduced transit ridership. Applying measures to manage parking efficiently achieves the broader planning objectives of supporting more compact development, encouraging transit use, and increasing development affordability. The Proposed Action studies where and how to manage parking as a public resource, with a particular emphasis on both long-term "park once" systems (residential or employee parking) and short-term (visitors and shopping) parking needs. When implemented, the Proposed Action will offer a menu of different types of on-street parking treatments, provide a basis for market-based pricing of parking, explore context-sensitive parking requirements for new land uses, and provide progressive measures to introduce options for shared parking resources between uses. The Proposed Action also incorporates policies to encourage long term parking management strategies at the District scale to provide more efficient utilization.
- Reserved Housing – High-rise development provides a better opportunity for the provision of reserved housing than single-family unit residential development because the land and infrastructure costs for high-rise development are distributed among a greater number of units. In addition, the sale of high-priced units in a building can help offset (subsidize) the cost of the units reserved for lower income families. The cost of developing single-family units makes it difficult to achieve affordability without government subsidy. While there are successful government programs, it is clear that they have not met the demand. The Proposed Action is intended to increase the number of reserved housing units in three fundamental ways. First, by adhering to the HCDA 20% Rule (20% percent of all new units constructed must be reserved for families/individuals who qualify under federal affordability guidelines), the increase in density envisioned in the Proposed Action will result in a greater number of units coming to market, and a proportionate increase in the number of those that reserved. Second, the Proposed Action includes height and density bonuses that are intended to encourage developers to participate in the provision of reserved units. Simply put, a developer would be allowed to increase the density of a structure in exchange for what are described as "exemplary public benefits". The result is a negotiated process whereby the HCDA can bargain for the increased provision of reserved housing. Third, by relaxing the parking standards per dwelling unit, by untethering parking from residential units in deference to the District's proximity to rail and employment centers, and by increasing building heights (in the case of TOD Alternative A), the HCDA is attempting to bring down the development cost of units, which would result

in their increased affordability. If it is possible to include more units in a building because fewer floors must be dedicated to onsite parking and more floors are allowed, then arguably the cost of constructing the building can be distributed among a greater number of units, thereby lowering the cost of each.

- Parks and Open Space – Neither the HCDA (the primary provider of parks and recreational facilities in Kakaʻako) nor the City's Department of Parks and Recreation currently plans to construct additional parks in or near Kakaʻako, suggesting that impacts will be confined to existing parks in the region.

Cultural Resources: Several Hawaiian cultural resources, in the form of historic structures are located in the District. While, these buildings are not directly threatened by redevelopment, there is a high probability that cultural recourses in the form of human remains (*iwi*) will be inadvertently found during excavation activities associated with new development. Implementation of the Proposed Action could potentially impact these cultural resources. It could also impact the several contemporary cultural resources identified in the District including cultural learning facilities; public parks and grounds, memorials and commemorations; religious and spiritual gathering places; and public art installation and entertainment centers.

Visual Resources: It is anticipated that the build-out of the Mauka Area under the Future Baseline Condition or either TOD Alternative will impair the existing mauka-makai views. As projects in the Mauka Area develop according to existing zoning, views of, and within the KCDD are expected to change significantly. The greatest impacts will be seen with the higher intensity growth in number and frequency of high-rise buildings under the TOD Alternative A. TOD Alternative B would result in impacts greater than the Future Baseline Condition, but less than the TOD Alternative A. Under either Alternative, panoramic views from identified viewpoints, and existing high-rise or low-rise buildings will be curtailed, but existing view corridors along major mauka-makai streets will be preserved. Buildings fronting Ala Moana Boulevard and situated in the Makai Area will have reduced views of the Koʻolau Range, while buildings along Kapiolani and in the Thomas Square Neighborhood will have reduced views of the ocean. This is typical of an urban environment where external views of landscapes are slowly exchanged for framed views and new architectural features.

Government Revenue: State revenues are projected to be $14.8 million more than costs annually for TOD Alternative A and $14.1 million annually for TOD Alternative B. If municipal revenues are limited to General Excise Tax and property taxes, the difference between revenues and costs is a positive $0.08 million annually for TOD Alternative A and a negative $0.41 million annually for TOD Alternative B. However, if legislature-imposed caps on the Transit Accommodations Tax are eliminated, TOD Alternative A would generate approximately $1.2 million annually and TOD Alternative B would generate approximately $0.7 million annually. Therefore,

Proposed Action is unlikely to have any real perceptible impact on annual County operating budgets.

Secondary and Cumulative Impacts: Introducing transit-oriented development as an overlay to the redevelopment of Kaka`ako already anticipated under the current Mauka Area rules (the Future Baseline Condition), is likely to affect the residents and visitors to nearby areas such as downtown Honolulu, the Ala Moana/Sheridan district, Waikiki, and other areas of the City and County of Honolulu. Implementation of TOD, when added to other adopted and proposed projects of a similar nature (such as other TOD projects envisioned by the City along the transit line corridor) may have a significant affect on a regional scale, and at an islandwide scale.

Kaka`ako is situated in the Primary Urban Center, which is intended to accommodate a substantial portion of O`ahu's population growth over the next 25 to 30 years. The Proposed Action will have long-term effects on the decisions by O`ahu residents about where to live, work, and play, which will, in turn lead to a redistribution of population.

Implementation of the Proposed Action will also provide new employment, residential, commercial, and light-industrial opportunities that together sustain the redevelopment activity that was initiated by the implementation of the Mauka Area Plan in 2011.

0.5 Summary of Recommended Mitigation Measures

Following is a summary of the major measures recommended to mitigate the impacts associated with implementing the Proposed Action:

Population: The effects of increased population in the District will be mitigated through the implementation of a palette of objectives and policies to improve quality of life. These are best summarized by the "6-D Objectives" of the Proposed Action:

- Objective D1: Destinations – Coordinate Land Use and Transportation;
- Objective D2: Distance – Create a well-connected street network using Complete Streets principles;
- Objective D3: Design – Create places for people;
- Objective D4: Density – Concentrate and intensify activities near frequent transit;
- Objective D5: Diversity – Encourage a mix of uses; and
- Objective D6: Demand Management – Encourage the "auto trip not taken" through a systems management approach.

Construction: Implementation of Best Management Practices for each new construction projects in the District will mitigate the short-term impacts of construction activities, including impacts on traffic, noise quality, and air quality.

Infrastructure: Several water main, wastewater collection line, and drainage projects have been identified to improve the distribution of water in the district, the collection of wastewater, and storm water catchment. These include:

- Upgrading existing -6 and -8 inch diameter water mains to accommodate peak hour domestic water consumption demand requirements and 4,000-gallon per minute fire flow requirements;
- Replace 480 LF of 10" sewer on Pohukaina Street between South and Keawe Streets with a 12" sewer;
- Upsize 305 LF of HHG's planned sewer in Pohukaina Street between Ahui Street and Ward Avenue from 12" to 18" diameter;
- Replace 480 LF of 10" sewer on Halekauwila Street between South and Keawe Streets with a 12" sewer;
- Replace 310 LF of 8" sewer on Keawe Street makai of Halekauwila Street with a 12" sewer;
- Replace 250 LF of 6" sewer on Ilaniwai between Kamani Street and Ward Avenue with an 8" sewer;
- Upsize 305 LF of HHG's planned sewer in Pohukaina Street between Ahui Street and Ward Avenue from 12" to 18" diameter to 24" sewer in Ward Avenue; and
- Require new developments to retain storm water runoff on-site through the use of infiltration or rain-harvesting methods, or allow discharge to run off through an appropriate bio filter such as a rain garden, green roof, or tree box filters.

Traffic: Implementation of the Proposed Action, while generating significant traffic impacts, it also intended to mitigate them by encouraging and facilitating improved bicycle, pedestrian, and transit access within the KCDD. Specific traffic mitigations include:

- Increase the allocation of green signal time per cycle at the Ala Moana Blvd/South Street and Ala Moana Blvd/Cooke Street intersections;
- Restripe north/south approaches at Ala Moana Blvd/Ward Ave to eliminate split signal phases.
- Reduce the length of the east-leg pedestrian crossing at Ala Moana Blvd/Ward Ave;
- Provide restriped and bollard-protected bicycle lanes on Punchbowl Street, South Street, and Cooke Street;
- Install bicycle lanes on Ward Avenue;
- Provide restriped bicycle lands on Pensacola Street/Piikoi Street and study potential two-way conversion with 3 lanes and bicycle lanes;

- Construct a cycle track or strip bicycle lanes on Halekauwila Street, contingent with the final design and location of the ~~HART~~ ***light metro*** guideway columns;
- Construct curb extensions at all intersections with on-street parking and that have 24' curb-to-curb walk distances of minor streets or 26' curb-to-curb walk distances of major streets; Reduce intersection skew; Tighten intersection geometry; Construct pedestrian refuge islands (Each mitigation measure requires further study);
- Require redevelopment setbacks that ensure a minimum 15' pedestrian realm (sidewalk plus buffer including furniture zone and landscaping) regardless of existing pedestrian realm width. (If the existing pedestrian realm is greater than 15', then there is no significant impact.);
- Reconstruct streets in Central Kaka`ako as shared industrial streets while maintaining delivery and parking storage functions;
- Reduce Ala Moana Boulevard signal cycle lengths to 120 seconds and couple with other signal optimization features; this will create more lane capacity (from 800vph to 1200vph); and
- Construct makai side shared use path on Ala Moana Boulevard.

Social: While much of the Proposed Action will improve quality of life in the KCDD as discussed in the Impacts section above, additional actions can be taken by HCDA to mitigate impacts:

- Revise current Reserve Housing program to increase the amount of affordable housing provided in the District;
- Develop a Parks Master Plan that would thoroughly study needs and best ways to meet them.

Cultural: To mitigate impacts on cultural resources in the event they are uncovered during property excavation or ground disturbance, HCDA will continue to require full compliance with procedures established by the Oahu Island Burial Council and the State Historic Preservation Division of the Department of Land and Natural Resources. HCDA will also ensure that parking and accessibility to historic structures is not reduced as the result of new developments in surrounding areas. With regard to contemporary cultural facilities that exist in the District, HCDA will encourage landowners/lessors to offer adjusted rent spaces to help preserve those uses and activities in the District.

Visual Resources: The preservation of visual resources can be best accomplished during implementation of the Proposed Action by ensuring that the development rules to be enacted include provisions such as:

- Present prototypical development lots, with preferred site design for staggered of offset towers;

- Encourage staggered building heights (tower configurations should provide skyline diversity);
- Provide examples of appropriate building tops;
- Revise standard (ch 15-217-55 (4) for view corridor streets in the TOD Overlay Area to regularize the setback allowed in the Master Plan areas, at 75' above the Street Element;
- Revise rule 15-217-54 (c) that requires an increased setback by three feet for every ten feet of building height. These rules are in conflict with building types as proposed and would negate the ability for large parcels to place multiple buildings on a development parcel by reducing flexibility and pushing development to one side of the development parcel.
- Revise Mauka Area Rule designating 25% of tower "void" space to be located at the street frontage.
- Revise Mauka Area Rule designating 65% of tower to be located on street frontage;
- Encourage developments to provide aesthetic treatments on rooftops;
- Create a green-roof policy; and
- For *Iconic Towers* in TOD Alternative A (if implemented), include a provision for the public to access the view by providing public lobby, restaurant, or other public space on top floors.

0.6 Unresolved Issues

Regional Infrastructure: The construction of a region-serving Relief Sewer Corridor to relieve wastewater demands in Waikiki and elsewhere in Honolulu is presently being evaluated by the City's Environmental Services Department. The decision to construct the line, and if so, where will impact wastewater collection line capacities in Kaka`ako. Some existing sewer lines in Kaka`ako are surcharged by wastewater generated elsewhere. Construction of the relief sewer line would resolve capacity issues and might preclude the need for additional smaller-scale sewer improvements in the District. The relief sewer line project has been under consideration for several years and the outcome of decision-making is beyond the control of HCDA. The matter will remain unresolved until the City completes its planning efforts, and the timing of that effort remains unknown.

City's 2040 Population Projections: The City and County of Honolulu's Department of Planning and Permitting periodically forecasts population on the island of O`ahu for purposes of long-range planning. For the past several years, DPP has utilized population projections with a planning horizon of 2035. The Proposed Action assumes the same planning horizon as its hypothetical build-out date. In 2013, the City advised HCDA that it would soon begin updating its current population forecast to 2040. As recently as October 2014, in a follow-up inquiry to the City as to the status of its efforts, we were advised that the City has developed

interim projections to 2040, which have been used by the City for some planning purposes. However, we were also advised that *official* projections are still on hold due to technical issues that must be resolved. The City is targeting June 2015 as a possible release date for the *official* projections. The matter will remain unresolved until such time that the DPP officially releases the 2040 forecast.

The Ultimate Timing and Extent of Community Amenities: As the majority of property in the KCDD is privately owned, individual properties will undergo redevelopment based on the preferences and needs of the respective property owners. The existing Mauka Area rules define the maximum allowable scope of redevelopment of any particular property. While the TOD Overlay Plan, when implemented, will change that scope, it is an incentive based program and it will remain up to the property owner to determine how much density to pursue should they determine that redevelopment is in their interest. Thus, the scope of potential community amenities are tethered to the land use capacity of a particular property, as defined by the property owner in a redevelopment proposal. For example, Kamehameha Schools has elected to focus the redevelopment of some of its properties at a density (including building height) that is less than what is allowed under existing rules. The ultimate timing of redevelopment of any given property is therefore unknown to the HCDA until the property owner presents specific plans to the agency for approval. Additionally, the extent of community amenities that may arise from the redevelopment of any particular property will ultimately be negotiated between the property owner and the agency and will be directly proportional to the density of the redevelopment proposed: the pursuit of maximum allowable density by a property owner will likely result in greater public amenities than a more modest development proposal. Thus, the ultimate provision of community amenities is unknown until such time that a property's redevelopment plan is formulated, presented to HCDA for review and approval, and the nature and extent of community amenities are successfully negotiated.

Office of Hawaiian Affairs (OHA) Master Plan: In 2014, OHA announced that it would prepare a master plan to determine the future uses and development timing for its property holdings in the Makai Area. The outcome of its master planning efforts will have broad implications on matters concerning general urban density, infrastructure capacity, and views. The scope and timing of the OHA master plan will remain unresolved until such time that the agency selects a consultant, establishes a deadline for the planning effort and its decision-making.

Completion of HCDA Parks Master Plan: HCDA has determined the need to prepare a master plan for the provision of public and private parklands and recreational and/or passive open space in the KCDD. The timing for the preparation, review, and approval of the plan is presently unresolved. The outcome of this process cannot be known until the effort is funded by HCDA, a consultant is selected, and a deadline for completion is established.

Implementation of the Proposed Action: The Proposed Action is described throughout this document as being "incentive based", meaning that to achieve the HCDA's desired outcome of more affordable housing, pedestrian-friendlier streets, and less emphasis on the automobile, developers will be offered an incentive of greater density and/or relaxed parking standards, etc. How this incentive based program will be implemented is unresolved at this point in time. The process for implementing TOD requires the publication of a Draft TOD Overlay Plan, which was done in May 2013, followed by the preparation of an EIS to evaluate its impacts (which is now underway). Once the EIS effort is concluded, the Draft TOD Overlay Plan must be finalized and then approved by the HCDA. After that occurs, final rules for implementing TOD must be prepared by the HCDA and presented to the public for comment, before being reviewed by the HCDA for final approval. The rules are the mechanism by which the incentive based program will be implemented. The exact form and content of those rules cannot be finalized at this point in time, which leaves the matter unresolved. The matter will be resolved once the rules are finalized, presented to the public for comment, and ultimately reviewed by the HCDA for approval. However, Appendix B of the Draft TOD Overlay Plan (presented in Volume Two of the EIS as Appendix A) presents a preliminary idea of the scope and content of the proposed rules for TOD.

0.7 Compatibility with Land Use Plans and Policies

The Proposed Action is consistent with prevailing City and State land use plans and policies.

0.8 Required Permits and Approvals

The following permits and/or approvals will be required for individual development projects:

Subdivision Approval (if applicable)	Department of Planning and Permitting
Building/Grading Permits	Department of Planning and Permitting
Installation of Power Lines & Substations	State Public Utilities Commission
National Pollutant Discharge Elimination System (NPDES) Permit	State Department of Health
Noise Permit	State Department of Health
Modification of Highway Access Points	State Department of Transportation
Work Within the State Highway ROW	State Department of Transportation
Dewatering/Stockpiling	Department of Planning and Permitting
Trenching	Department of Planning and Permitting
Street Usage Permit	***Department of Transportation Services***

Development Permit	Hawaii Community Development Authority
FAA Form 7460-1	***Federal Aviation Administration***

GLOSSARY OF TERMS, ABBREVIATIONS, AND ACRONYMS

AADCCH	African American Diversity Cultural Center of Hawai`i.
AAQS	Ambient Air Quality Standards.
ACE	United States Army Corps of Engineers (also referred to as 'the Corps' or 'COE').
ACHP	Advisory Council on Historic Preservation.
AIS	Archaeological Inventory Survey.
AMI	Average median income.
AMSD	Ala Moana Special District: a corridor along the Mauka side of Ala Moana Boulevard within the Kaka`ako Community Development District with restricted height limits.
ATSD	Aloha Tower Special District.
BCH	Belt Collins Hawaii.
Blvd.	Boulevard.
BMP	Best Management Practices.
BPBM	Bernice Pauahi Bishop Museum.
BTP	Burial Treatment Plan.
BWS	Board of Water Supply, City and County of Honolulu.
CCH	City and County of Honolulu.
CDP	Census Designated Place.
CCTV	Closed circuit television.
Cfs	Cubic feet per second.
Ch	Chapter.
Chapter 343	Chapter of the Hawai`i Revised Statutes that addresses environmental assessment.
CIA	Cultural Impact Assessment.
Cm	Centimeter.
CT	Census Tract.
dBA	A-weighted decibel, a unit of sound measurement.
DBEDT	Hawai'i State Department of Business, Economic Development and Tourism.
DLNR	Hawai`i State Department of Land and Natural Resources.
DNL	Day-night average sound level, also referred to as Ldn.
DOD	United States Department of Defense.
DOE	Hawai`i State Department of Education.
DOH	Hawai`i State Department of Health.
DOT	Hawai`i State Department of Transportation.
DPP	City and County of Honolulu Department of Planning and Permitting.
DPP-CEB	City and County of Honolulu Department of Planning and Permitting – Civil Engineering Branch.
DTS	City and County of Honolulu Department of Transit Services.

EIS	Environmental Impact Statement.
EISPN	Environmental Impact Statement Preparation Notice.
ENV	City and County of Honolulu Department of Environmental Services.
ENV-RD	City and County of Honolulu Department of Environmental Services – Refuse Division.
ESA	Endangered Species Act.
ESDU	Equivalent single-family dwelling unit.
˚F	Degrees Fahrenheit.
FAA	Federal Aviation Administration.
FAR	Floor Area Ratio.
FHA	Federal Housing Administration.
FEMA	Federal Emergency Management Agency.
FIRM	Flood Insurance Rate Map.
Floorplate	The physical area occupied by a floor in a high-rise tower.
GET	General Excise Tax.
GHG	Green House Gases.
GIS	Global Information System.
GPD	Gallons per day.
GPM	Gallons per minute.
GPS	Global Positioning System.
GST	Gravity sewer tunnel.
HAR	Hawai`i Administrative Rules.
HART	Honolulu Authority for Rapid Transit.
HCDA	Hawaii Community Development Authority.
HECO	Hawaiian Electric Company.
HEPA	Hawai`i Environmental Policy Act
HFD	Honolulu Fire Department.
HHFDC	Hawai`i Housing and Finance Development Corporation.
HHG	Howard Hughes Group.
HPD	Honolulu Police Department.
HPU	Hawai`i Pacific University.
HRS	Hawai`i Revised Statutes, as amended.
HTCo.	Hawaiian Telcom.
HUD	Federal Department of Housing and Urban Development.
Iconic Tower	A residential tower that exceeds current height limits (by up to several hundred feet).
ID	Improvement District.
Shared Industrial Street	***A street in Central Kaka`ako whose usage includes frequent vehicular activity related to abutting light industrial uses along it.***
JABSOM	John A Burns School of Medicine.
JMK	John M. Knox & Associates
KCDD	Kaka`ako Community Development District.
KMCMP	Kaka`ako Makai Conceptual Master Plan.

KS	Kamehameha Schools.
KV or kV	Kilo-volt.
LCA	Land Commission Award, a land title originally granted by the Kingdom of Hawai`i.
LEED	Leadership in Energy and Environmental Design.
LID	Low impact development.
LF	Linear feet.
LOS	Level of Service.
M	Meter.
MAIP	Mauka Area Infrastructure Plan, May 2009.
Makai Area	The Makai portion of the Kaka`ako Community Development District, bounded by Ala Moana Boulevard, Ala Moana Regional Park, the ocean, and the property line between Pier 2 and Pier 4 at the Honolulu Harbor shoreline.
Mauka Area	The Mauka portion of the Kaka`ako Community Development District, bounded by Ala Moana Boulevard, Piikoi Street, South King Street, and Punchbowl Street.
MGD	Million gallons per day.
Mm	Millimeter.
MPH	Miles per hour.
MSL	Mean sea level.
MVA	Mega Volt-Amperes.
MW or Mw	Mega-watt.
M/yr	Meters per year.
Negotiated Open Spaces	***Areas of open space that have been identified and required during the HCDA's review of a Development Permit application.***
NRCS	Natural Resource Conservation Service.
NBC	Neil S. Blaisdell Center.
NN	Nelson/Nygaard; the transportation consulting firm contributing to the EIS.
NPDES	National Pollutant Discharge Elimination System.
NRHP	National Register of Historic Places.
NWS	National Weather Service.
OEQC	State of Hawai`i Office of Environmental Quality Control.
OHA	State of Hawai`i Office of Hawaiian Affairs.
OIBC	O`ahu Island Burial Council.
OP	State Office of Planning.
OTWC	Oceanic Time Warner Cable.
PPM	Parts per million.
PM	Particulate matter.
Proposed Action	The implementation of transit oriented development in Kaka`ako.
Psi	Pounds per square inch.
PUC	Primary Urban Center.

ROW	Right-of-way.
SCIA	Supplemental Cultural Impact Assessment.
SCP	Sustainable Communities Plan. The City and County of Honolulu recognizes seven regional planning areas: two Development Plan areas and five SCP areas.
SCS	U. S. Soil Conservation Service.
SF	Square foot or square feet.
SIA	Socio-economic impact assessment.
SEIS	Supplemental environmental impact statement.
SF	Square feet.
SFHA	Special Flood Hazard Area.
SHPD	State Historic Preservation Division of the State of Hawai`I Department of Land and Natural Resources.
SIHP	State Inventory of Historic Places.
SLUC	Hawai`i State Land Use Commission (also referred to as LUC).
SMA	Special Management Area.
SOEST	Hawai`i School of Ocean and Earth Sciences and Technology.
SPS	Sewage pump station.
TAT	Transit accommodations tax.
TAZ	Transportation analysis zone.
TCP	Traditional Cultural Property.
TDM	Transportation Demand Management; a collection of strategies to manage the demand for scarce parking and roadway capacity.
TheBus	Municipal bus service operated by the City and County of Honolulu.
TMK	Tax Map Key, the method of land mapping employed by the State of Hawai`i and the City and County of Honolulu for the purposes or real property assessment.
TOD	Transit-Oriented Development.
TOD-A	Transit-Oriented Development Alternative A.
TOD-B	Transit-Oriented Development Alternative B.
TOD Overlay Plan	A comprehensive analysis of the issues and opportunities associated with TOD in Kaka`ako.
TMA	Transportation Management Association.
TMK	Tax Map Key.
UIC	Underground injection control.
Ug/l	Micrograms per liter: equal to one millionth of a gram.
U.S.	United States.
USFWS	United States Fish & Wildlife Service.
USGS	United States Geological Survey.
VA	Federal Veterans Administration.
v/c	Volume-to-capacity ratio.
VIA	The consulting architectural firm contributing to the EIS.
VMT	Vehicle miles traveled.
VPH	Vehicles per hour.

WWTP	Wastewater treatment plant.
WWPS	Wastewater pump station.

FEIS Compliance			**11-200-17 Content requirements for Draft EIS (applicable to SEIS per 11-200-28)**
	A		The Draft EIS shall contain at a minimum the information contained in this section (11-200-17)
	B		Summary Sheet with the following
ES Section 0.1		1	Brief description of the Proposed Action
ES Section 0.3		2	Significant beneficial/adverse/cumulative/secondary impacts
ES Section 0.4		3	Proposed mitigation measures
ES Section 0.1		4	Alternatives considered
ES Section 0.5		5	Unresolved issues
ES Section 0.6		6	Compatibility with land use plans/policies; listing of permits/approvals
Beginning of each Chapter	C		Table of Contents
Chap 1 Section 1.1	D		Statement of Purpose/Need for the Proposed Action
Chap 2	E		Project Description with enough detail to evaluate environmental impacts
Chap 1 Figure 1-1		1	Detailed map (USGS topo, FIRM, or floodway boundary)
Chap 2 Section 2.2		2	Statement of objectives
Chap 2 Section 2.3		3	General description of action's characteristics:
Chap 2 Section 2.3.4		a	technical
Chap 4 Section 4.10		b	social
Chap 4 Sections 4.1 to 4.4		c	environmetal
ES Section 0.3		4	Use of public funds or lands for the action
Chap 2 Section 2.4		5	Phasing and timing of the action
various figures throughout		6	Summary technical data, diagrams etc. for evaluation of potential impacts
Chap 1 Section 1.8		7	Historic perspective
Chap 3	F		Rigorous exploration and objective evaluation of alternatives
Chap 3 Section 3.2		1	No action
Chap 3 Sections 3.3 & 3.4		2	Different nature with similar benefits and different environmental impacts
Chap 3 Section 3.4.3		3	Alternate designs or details
Chap 3 Section 3.2		4	Postponing the action
Chap 3 Section 3.4.2		5	Alternative locations
Chap 3 Section 3.3		6	Comparative evaluation of benefits, costs, risks of reasonable alternatives
Chap 4	G		Existing environmental setting
Chap 2 Section 2.3.1		1	Local
ES Section 0.1		2	Regional
Chap 4 Section 4.3.1		3	Rare or unique environmental resources
Chap 1 Section 1.2.3		4	Related projects in area contributing to possible cumulative effect
Chap 4 Section 4.10.2		5	Area's population/growth characteristics & assumptions used to justify the action
Chap 6 Section 6.5		6	Secondary population/growth characteristics
Chap 5	H		Relationship of Proposed Action to land use plans, policies and controls
Chap 5		1	For conflicts, extent to which conflict has been reconciled and reasons for proceeding
Chap 2 Section 2.5		2	List of necessary approvals and status of each
Chap 4	I		Statement of probable impacts
Chap 4		1	Consideration of all phases
Chap 4		2	Direct/indirect
Chap 1 Section 1.2.3		3	Interrelationships and cumulative impacts of Action and other related projects
Chap 6 Section 6.5		4	Secondary impacts
Chap 4 Section 4.10.2.2		5	Estimated population impacts
Chap 4 Section 4.10		6	Effects of population change
Chap 4 Sections 4.8 & 4.9		7	Direct or indirect sources of pollution
Chap 6	J		Relationship between local short-term uses of environment and maintenance/enhancement of long-term productivity
Chap 6 Section 6.2.1		1	Trade-offs/short-term & long-term gains/losses
Chap 6 Section 6.2.2		2	Extent to which Proposed Action forecloses future options
Chap 6 Section 6.2.3		3	Narrows range of beneficial uses
Chap 6 Section 6.2.4		4	Poses long-term risks to health and safety
Chap 6 Section 6.2.6		5	Environmentally signficant consequences
Chap 6 Section 6.3	K		Irreversible/irretrievable commitments of resources
Chap 6 Section 6.3.1		1	Unavoidable impacts
Chap 6 Section 6.3.2		2	Use of non-renewable resources
Chap 6 Section 6.2.3		3	Curtails range of benefical uses
Chap 6 Section 6.3.3		4	Possibility of environmental accidents resulting from any phase of Proposed Action
Chap 6 Section 6.3.4		5	Loss/destruction of natural/cultural resources
Chap 4	L		All probable adverse environmental effects that cannot be avoided
Chap 6 Section 6.3.2		1	Rationale for proceeding with Action, notwithstanding, adverse effects
Chap 6 Section 6.4		2	Other governmental policies that offset adverse environmental effects
Chap 6 Section 6.4		3	Ability of reasonable alternatives to achieve countervailing benefits to avoid adverse effects
Chap 4	M		Mitigation measures
Chap 4		1	Basis for determining mitigations to reduce impacts to insignificant levels
Chap 4		2	Timing of mitigations/commitments to assuring mitigation
Chap 6 Section 6.6	N	1	Summarize unresolved issues
Chap 6 Section 6.6		2	How they will be resolved prior to implementing action or overridding reasons for proceeding without resolution
Chap 8 Section 8.2	O	1	Consulted parties
Chap 7 Section 7.1		2	Disclosure of preparers
Chap 8 Section 8.3	P	1	Reproduction of all substantive comments and responses
Chap 8 Section 8.3		2	List of parties consulted who had no comments

1.0 Statement of Purpose and Need

1.1 Purpose and Need for the Environmental Impact Statement

Purpose: The environmental assessment discussed in this document is presented in accordance with the requirements of Hawai`i's Environmental Protection Act ("HEPA"), Chapter 343 of Hawaii Revised Statutes as amended ("HRS"), and Chapter 11-200, Hawaii Administrative Rules ("HAR"), the rules governing the Office of Environmental Quality Control ("OEQC"). Section 11-200-5B, HAR, requires that "…when an agency proposes to implement an action to use state or county lands or funds, it shall be subject to the provisions of chapter 343, HRS, and this chapter." This EIS is intended to fulfill this requirement.

This EIS also fulfills the requirement established by the Environmental Quality Commission, pursuant to its Declaratory Ruling No. 80-01, issued on May 22, 1980, and by the Environmental Council, pursuant to its Declaratory Ruling No. 84-01, issued on March 28, 1984. As stated in its ruling in 1980:

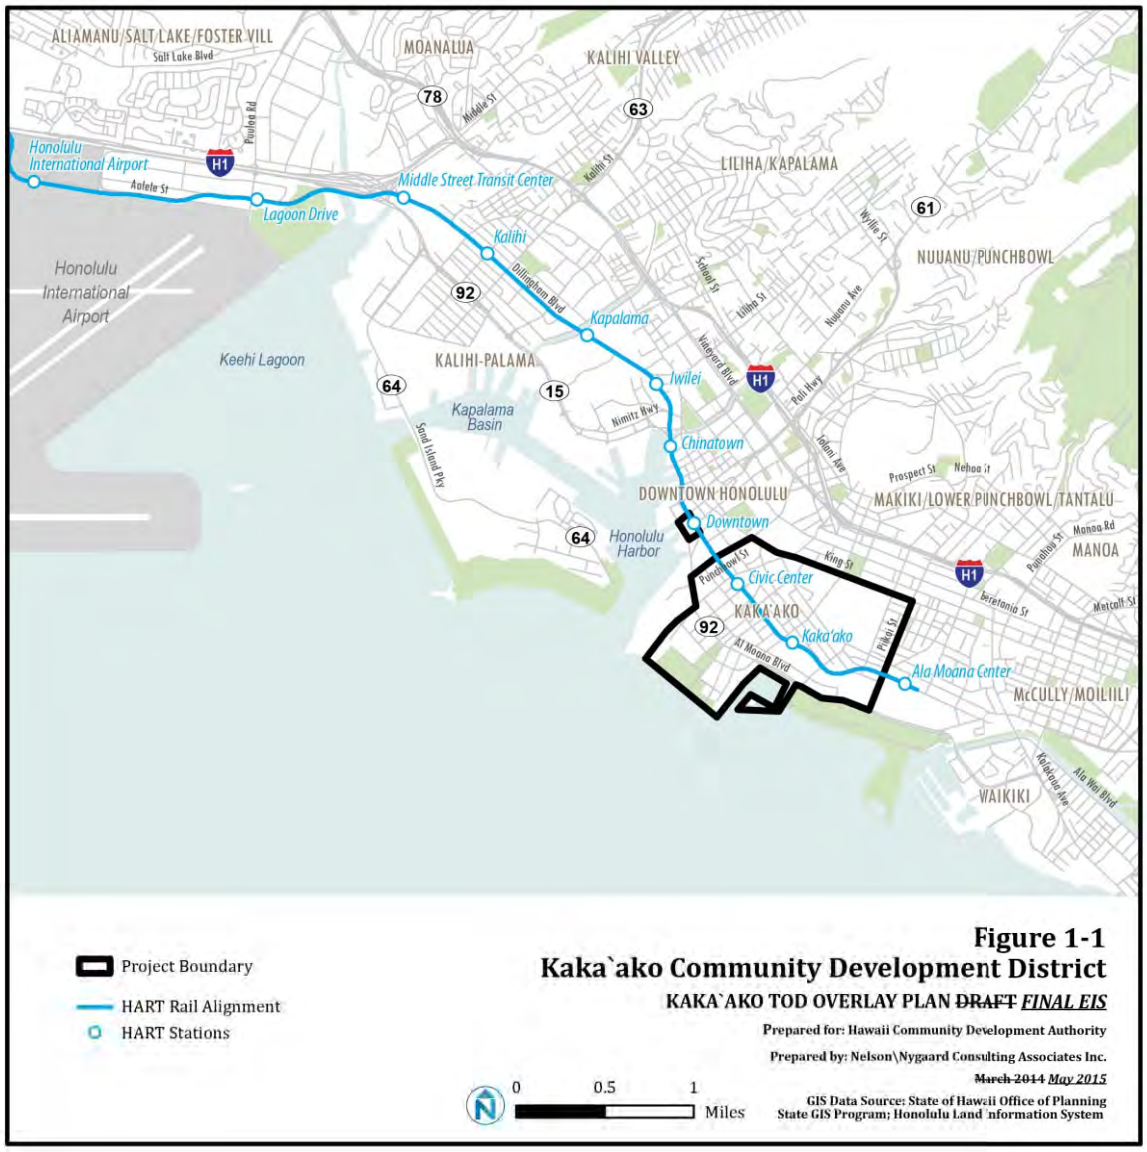
> *"…an environmental impact statement should be prepared for the entire Kaka`ako Development District Plan as a "…group of proposed or possible actions" taken as a comprehensive whole. Such an approach would dictate that the initial statement would be general and broad, dealing with the impacts of development policies, goals, concepts and strategies, all commensurate with the level of initial-phase considerations involved in the planning process."* (Dec. Ruling 80-01)

In Chapter 206E, Hawaii Revised Statutes (HRS) as amended, Kaka`ako is designated as a Community Development District (KCDD) under the jurisdiction of the Hawaii Community Development Authority (HCDA) - a body corporate and public instrument of the State of Hawai`i responsible for planning and revitalizing redevelopment areas. In 1976, the State Legislature set forth its purpose for creating the HCDA:

> *The legislature further finds that there exists within the State vast, unmet community development needs. These include, but are not limited to, a lack of suitable affordable housing; insufficient commercial and industrial facilities for rent; residential areas which do not have facilities necessary for basic liveability, such as parks and open space; and areas which are planned for extensive land allocation to one, rather than mixed uses.*
>
> *It is further determined that the lack of planning and coordination in such areas has given rise to these community development needs and*

that existing laws and public and private mechanisms have either proven incapable or inadequate to facilitate timely redevelopment and renewal.

The legislature finds that a new and comprehensive authority for community development must be created to join the strengths of private enterprise, public development and regulation into a new form capable of long-range planning and implementation of improved community development. The purpose of this chapter is to establish such a mechanism in the Hawaii community development authority, a public entity which shall determine community development programs and cooperate with private enterprise and the various components of federal, state, and county governments in bringing plans to fruition. For such areas designated as community development districts, the legislature believes that the planning and implementation program of the Hawaii community development authority will result in communities which serve the highest needs and aspirations of Hawaii's people.



The legislature finds that the creation of the Hawaii community development authority, the establishment of community development districts, and the issuance of bonds pursuant to this chapter to finance public facilities serve the public interest and are matters of statewide concern. (Section 1, Chapter 206E, HRS)

By direction of the State Legislature, Kaka`ako has been identified as a significantly underdeveloped and underutilized relative to its central location in urban Honolulu and HCDA has been tasked with planning for the redevelopment of the KCDD. The original Community Development District encompassed the Mauka Area. In 1983, the HCDA adopted a separate plan for the Makai Area. Today, the KCDD includes both the Mauka and Makai Areas, as well as the Aloha Tower Special District. (see Figure 1-1)

In 2005 the HCDA embarked on a comprehensive review of the Mauka Area Plan and Rules to address livability, urban design and upgrading infrastructure needs. This Plan was developed around smart growth concepts, and was adopted in 2011. A supplemental environmental impact statement (SEIS) was prepared to assess the impacts of the proposed rules. In 2011, the Governor accepted the Final Supplemental EIS for the Draft Mauka Area Plan as fulfilling the requirements of Chapter 343, HRS. The HCDA Board subsequently approved the rules implementing the Mauka Area Plan.

As set forth in the 2011 Conceptual Master Plan for the Makai District, the area of the KCDD makai of Ala Moana Boulevard (and including the Aloha Tower Special District) is envisioned as the community's gathering place that welcomes all people with enriching cultural, recreational, and educational public uses.

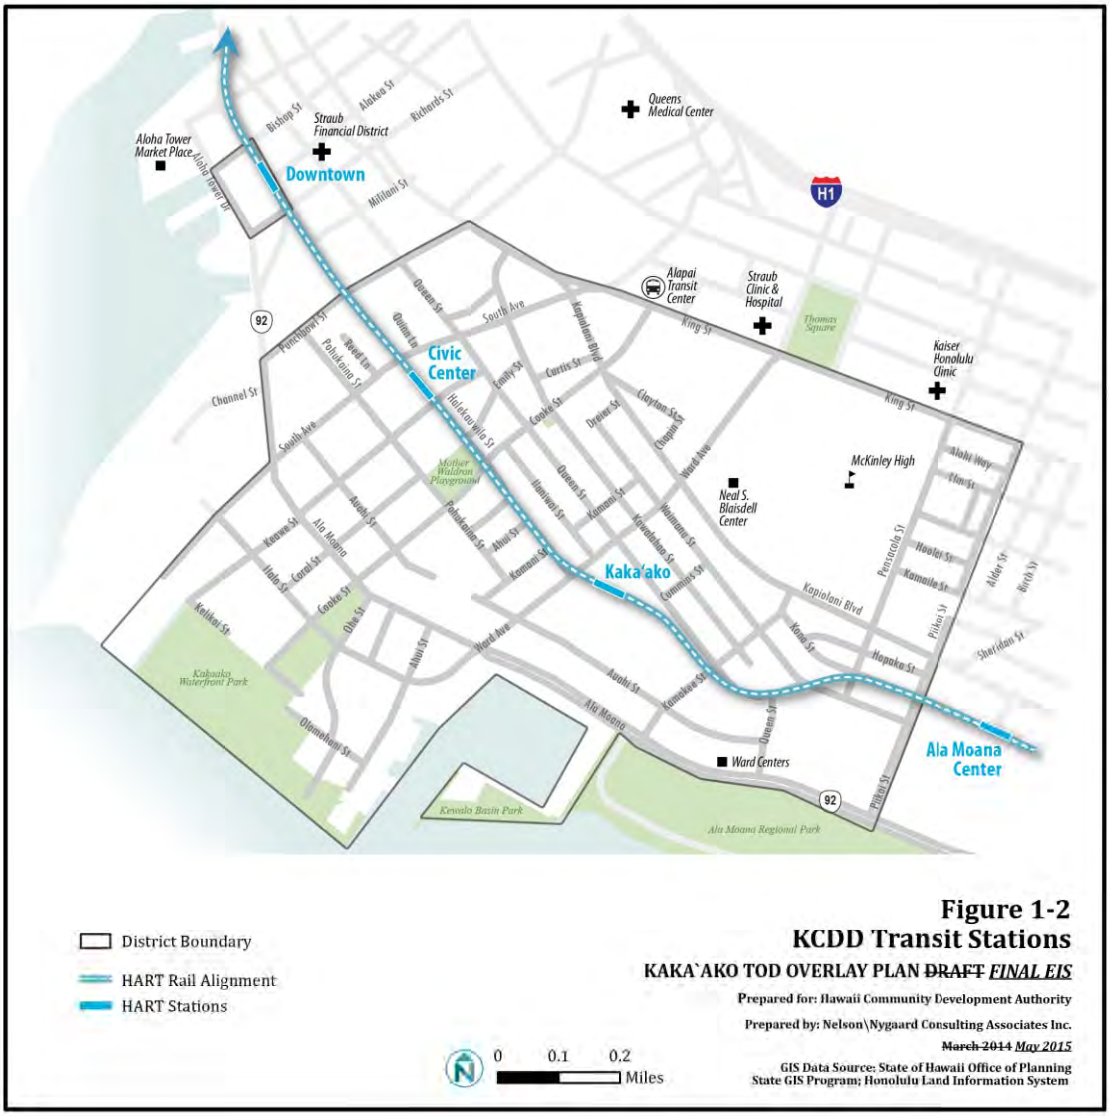


Figure 1-1: Kaka`ako Community Development District

In 2012, the Honolulu City Council approved an alignment for the Honolulu Authority for Rapid Transportation (HART) elevated light ~~rail~~ ***metro*** ~~transit~~ system. The alignment identified three transit stations in within the Kaka`ako Community Development District: two in Kaka`ako Mauka (the Civic Center and Kaka`ako stations) and one at the Aloha Tower Special District (the Downtown station). (see Figure 1-2)

In response to this action, HCDA retained consultants to prepare a plan to address the future opportunities presented by the introduction of an elevated light rail

Figure 1-2: KCDD Transit Stations

system or the expansion of other forms of public transit in Kaka`ako. The Draft Transit Oriented Development Overlay Plan (hereinafter, "Draft TOD Overlay Plan") was published in May 2013 and distributed for public review (see Appendix A).

Subsequent to publication of the Draft TOD Overlay Plan, concerns were raised about excessive density in the KCDD and the effects of increased building heights upon existing residents. In response to these and other concerns, the 2014 State Legislature approved House Bill 1866 (House Draft 2, Senate Draft 1) that, among other things, limited building heights in the Mauka Area to 418 feet (400 feet plus appurtenant facilities such as elevator equipment), thereby reducing allowable building densities. On April 30, 2014, the Governor signed the bill into law as Act 61.

For the purposes of this EIS, the Draft TOD Overlay Plan is identified as TOD Alternative A. The urban design scenario resulting from the adoption of Act 61 is identified in this EIS as TOD Alternative B. This EIS discloses the environmental, social, and economic impacts that will result from the implementation of either TOD Alternative A or TOD Alternative B. Once this EIS has been completed, the Draft TOD Overlay Plan may require revisions to accommodate the findings of the EIS. Ultimately, the HCDA will determine what course of action to take regarding transit-oriented development, that is to say: select TOD Alternative A and amend the Mauka Area rules to implement it[1], select TOD Alternative B and amend the Mauka Area rules to implement it, or elect to take no action to amend the Mauka Area rules.

For the purposes of this EIS, while no specific course of action is recommended, the Proposed Action is defined as the implementation of either Alternative TOD-A or Alternative TOD-B. The impacts of both alternatives (TOD-A and TOD-B) as they relate to the implementation of the land uses, urban design standards, mobility and access policies, Complete Streets initiative, and parking and transportation demand management strategies among other things are disclosed in this EIS.

Need: TOD Alternative A and TOD Alternative B both respond to the recent approval of the HART elevated rail system and the designation of three transit station locations within the KCDD. The coming introduction of rail transit - in parallel with community driven interest in creating a city that is highly walkable, friendly and safe for pedestrian and cyclists and not entirely dependent on vehicular modes of transportation – was an impetus for the analysis. It should be noted that a changing transportation paradigm is only a representation of a much broader movement to bring vitality to urban Honolulu, reflecting the values of the native Hawaiian culture, particularly stewardship of the land and environment, preservation of the native culture, openness to the visiting world, and responsibility to local people and their prosperity.

[1] However, so long as Act 61 remains in force, building heights in the Mauka Area cannot exceed 418 feet. If the HCDA Board elects to implement TOD Alternative A, it must still comply with the provisions of Act 61.

Honolulu and urban O`ahu are regarded as places of great natural beauty with a unique quality of life. However, O`ahu faces a number of challenges including high housing costs, high energy prices, high levels of traffic congestion and automotive vehicle dependence, increasing obesity rates, urban design that restricts or limits walking and healthy activities, and a high level of dependence on imported oil for energy and mobility.

Transit-oriented development can help to address each of these challenges, particularly in urban areas where good bus service and pedestrian infrastructure is already in place, amenities and services are abundant, and major job centers are in close proximity. The implementation of either TOD Alternative A or TOD Alternative B in the KCCD represents the region's best opportunity to create a thriving urban neighborhood that reduces per capita demands on energy, land, and other valuable resources; creates affordable housing opportunities; and reduces the overall cost and impact of living, while simultaneously building a culturally rich and vital urban neighborhood in the heart of urban Honolulu.

1.2 Location of the Proposed Action

The 601.6-acre KCDD is situated within the Kona district of the Honolulu ahupua`a and is part of the Primary Urban Center. It is prominently located less than a mile east of Honolulu's central business district, and between the densely populated Punchbowl district to the north, Ala Moana Shopping Center and Waikiki to the east, and the Downtown area and Honolulu Harbor to the west.

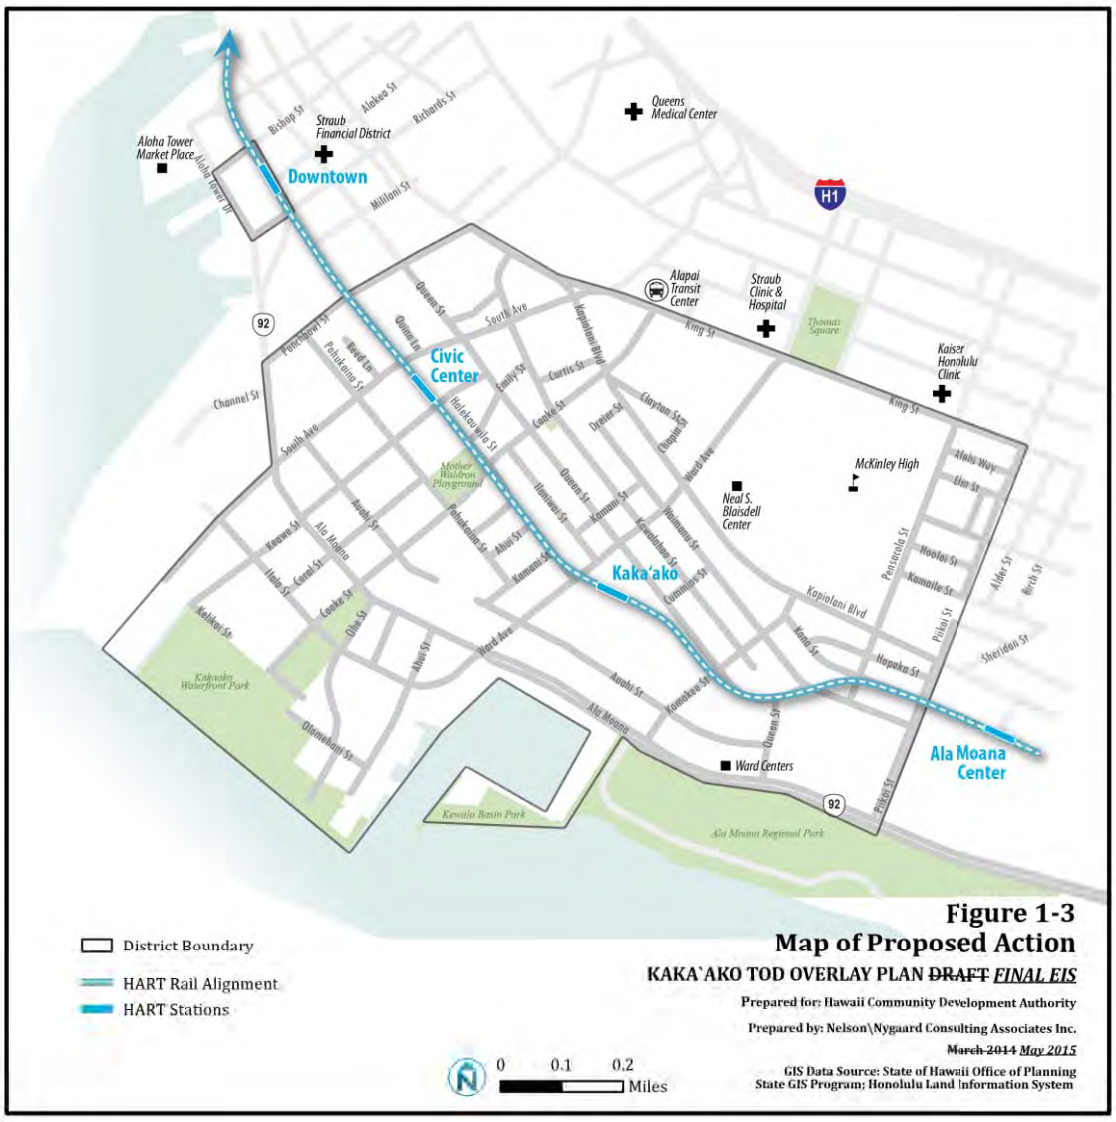
The KCDD consists of 603 separate properties. The tax map numbers for these properties are presented in Table 1-1.

1.2.1 Mauka and Makai Areas

Within the KCDD there are two planning areas, each with its own unique set of land use policies. The Mauka Area is bounded by South King Street, Punchbowl Street, Ala Moana Boulevard and Piikoi Street. It is envisioned as the residential, commercial and retail mixed-use neighborhood of the KCDD.

Located makai of Ala Moana Boulevard, the Makai Area consists primarily of state and agency controlled land along the waterfront. It is bounded by Ala Moana Boulevard on the north, Ala Moana Regional Park on the east, Forest Avenue and the property line between Honolulu Harbor's Pier 2 and Pier 4 on the west, and the Pacific Ocean on the south. (See Figure 1-3) The Makai Area is envisioned as the community's gathering place for cultural, recreational, and educational public uses. On April 11, 2012, the Governor of Hawai`i, Neil Abercrombie, signed into law a bill that transferred 10 parcels of land totaling approximately 25 acres to the Office of Hawaiian Affairs (OHA) for settlement of its ceded lands claims. OHA is presently

engaged in the preparation of a master plan to determine the best use of those lands.



The Makai Area also includes a 3.4-acre parcel in Downtown Honolulu identified as the Aloha Tower Special District (ATSD). The parcel is owned by the Hawaiian Electric Company's (HECO) and includes its downtown power plant. It is situated on the makai side of Ala Moana Boulevard and is bounded by Richard Street, Bishop Street, and Aloha Tower Drive. It is adjacent to Irwin Park, the Downtown Financial District and the Aloha Tower redevelopment area.

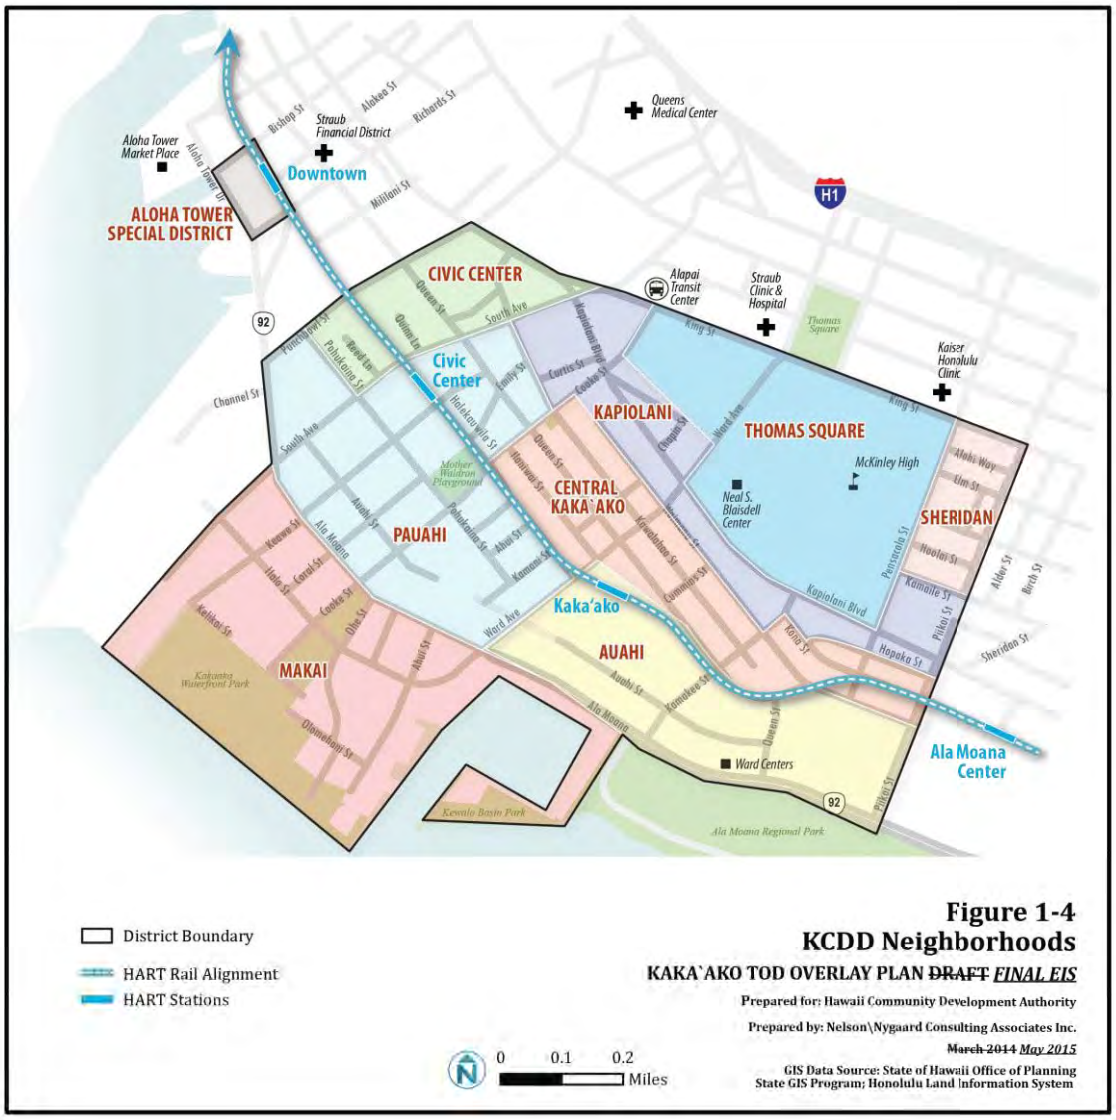

Figure 1-3: Map of Proposed Action

1.2.2 Neighborhoods

For planning purposes, the HCDA has defined 7 neighborhoods in the Mauka Area, the Makai Area, and one special district within the KCDD. (See Figure 1-4)

Figure 1-4: KCDD Neighborhoods

Pauahi Neighborhood is presented in the Mauka Area Plan as a mixed-use "urban village." The name of the neighborhood honors the legacy of Princess Bernice Pauahi Bishop, who is the benefactor of Kamehameha Schools - the major landowner in this area. HART's proposed Civic Center station is located within this neighborhood. The Mauka Area Plan envisions the Pauahi neighborhood as a high-rise area with pedestrian scaled podiums and active frontages. Several properties on the mauka

side of Ala Moana Boulevard are owned by Kamehameha Schools. The implementation of the Kamehameha School's Master Plan will help to activate the Pauahi neighborhood and potentially areas along busy Ala Moana Boulevard.

Auahi Neighborhood is emerging as Kaka`ako's retail and entertainment center. Recent development has generated a marked increase in pedestrian activity, particularly in the vicinity of Auahi and Kamakee Streets. This activity is expected to multiply as the Howard Hughes Corporation, the majority landholder in this neighborhood, builds out its master plan. The Auahi neighborhood is envisioned to expand upon its retail and entertainment base providing active frontages and lively pedestrian environment with high-rise residential towers above. HART's proposed Kaka`ako Station is slated to be built on the master planned property making this district a gateway to Kaka`ako's Kewalo Basin Harbor and waterfront promenade for rail transit patrons.

**Kapi`olani Neighborhood** is a place where land uses are strongly influenced by the busy Kapi`olani Boulevard corridor. As a link between Downtown Honolulu and Waikiki, the Kapi`olani corridor is an attractive location for high-rise mixed-use development, including retail stores, services and showrooms at grade level, and office and residential uses on higher floors. The continuous canopy of monkeypod trees and wide planting strip at the curb line lends a distinctive character to the corridor that enhances its value for future development and as a shaded, comfortable street for pedestrian traffic. The entire neighborhood is within a five-minute walk from either a proposed HART station or one of TheBus transfer stations.

Thomas Square District is a neighborhood makai of the historic Thomas Square Park. (Thomas Square Park is not contained within the Thomas Square District because the park lies outside of the KCDD.) The park is surrounded by properties that are home to some of Honolulu's major cultural and educational venues – the Honolulu Museum of Art, the Neal S. Blaisdell Center, and McKinley High School. The majority of the Thomas Square District land west of the park is owned by the City and County of Honolulu, Hawai`i State Department of Education, and the Hawaiian Electric Company. While there are no immediate redevelopment plans for the lands west of the park, these properties are in many ways ideal candidates for transit-oriented redevelopment. The properties are large, relatively under-utilized, and well connected to the urban grid and a wealth of services and amenities. Blaisdell Center and McKinley High School are situated within the Thomas Square District.

Central Kaka`ako is composed primarily of small lots with individual ownership. Predominate land uses in this area are service businesses, many with an industrial character, such as repair shops and production facilities. As a distinct reminder of the district's legacy as a light-industrial and residential community, Central Kaka`ako is valued as a convenient location for service businesses and envisioned to maintain its existing character because of the important role these businesses will play in providing services to the many new residents expected to move into the

area. Significant redevelopment is not expected in this area because of the small lot size. However, some improvements are needed and there are opportunities to create more pedestrian tolerant linkages between other important redevelopment areas and HART stations.

Civic Center is characterized by government and other important civic buildings spread out in a campus-like setting. Only a small portion of this neighborhood falls within the KCDD and therefore TOD has a relatively minor influence on the overall character of the neighborhood. HART's proposed Civic Center station will be located within a five-minute walk from most government buildings providing employees convenient access to rail transit. Given the existing campus character and the scale and ambiance of the significant and historic buildings in this area, existing zoning parameters will remain in place.

Sheridan Neighborhood is predominately a residential neighborhood composed of small, fee-simple lots. This established community also includes active commercial uses fronting King Street and the historic Makiki Christian Church located along Pensacola Street. The KCDD's Sheridan neighborhood area represents approximately half of the larger Sheridan Tract, which is bisected by Piikoi Street. The land use, small lot size, block size and land tenure patterns within the Sheridan Neighborhood are very similar to the other half of Sheridan Tract, which is located on the Diamond Head side of Piikoi Street, just outside the KCDD. While some building renovations and redevelopment occurs in this area, the scale and pace of change is slight compared other areas of Kaka`ako. Residents in this neighborhood will be within walking distance of HART's proposed Ala Moana Station.

Aloha Tower Special District is a single property that is a part of a much larger neighborhood near downtown Honolulu. The property is owned by the Hawaiian Electric Company and is situated mauka of the Aloha Tower Marketplace and entertainment complex. It is immediately adjacent to HART's proposed downtown station. In early 2013, Hawai`i Pacific University secured the lease of the Aloha Tower Marketplace property and announced its intention to locate student dormitories on a portion of the property. This proposed use is consistent with and supportive of transit-oriented development.

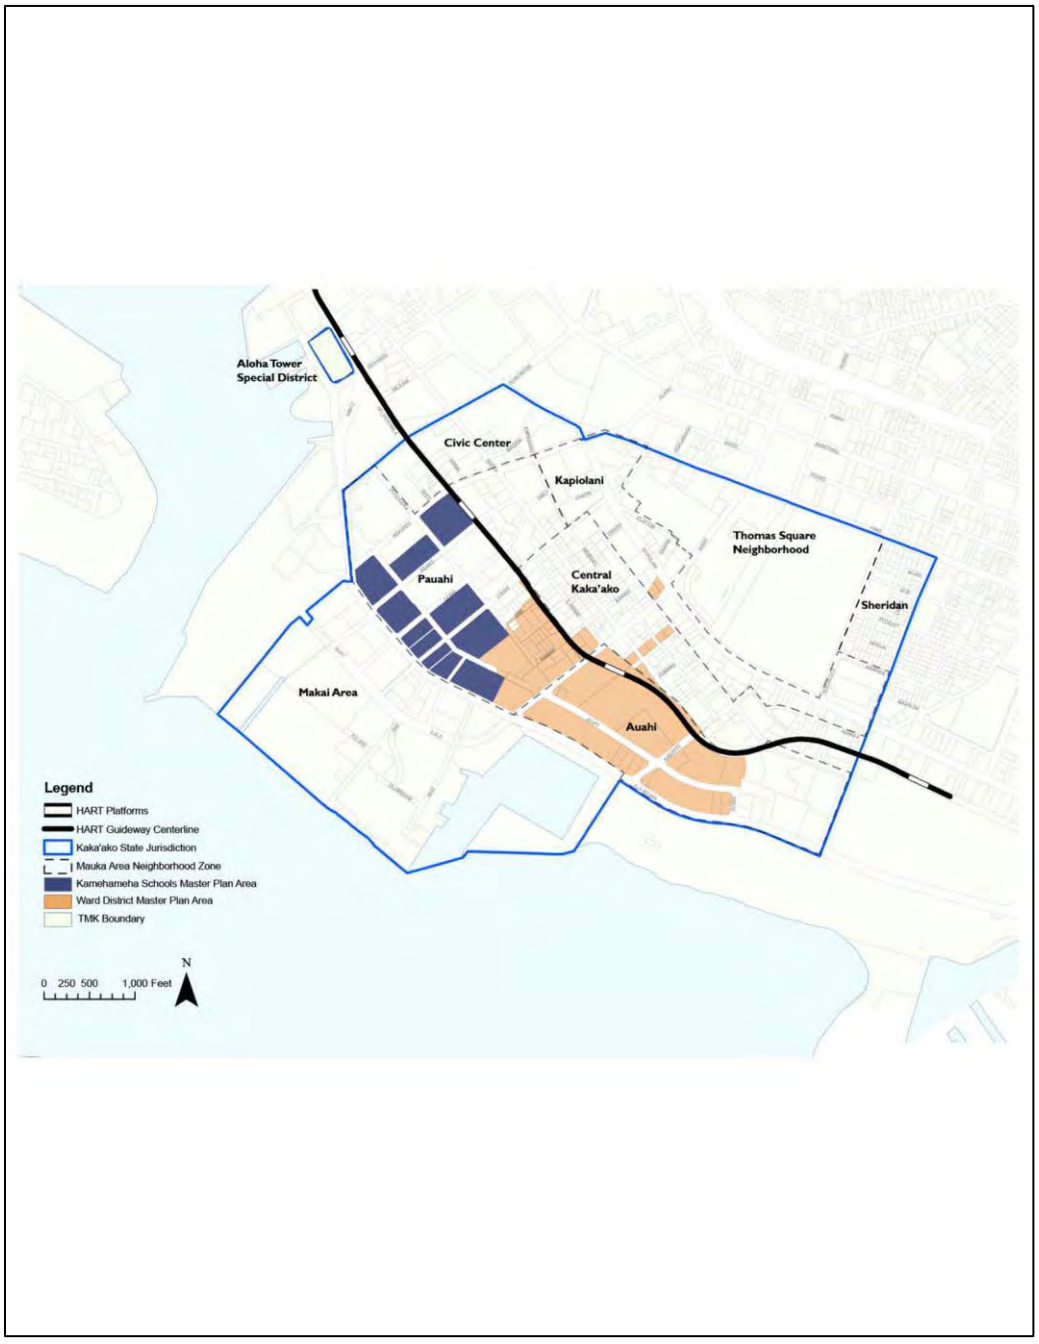
**Kaka`ako Makai Area** contains a mix of commercial and public land uses. It includes Kewalo Basin, the Kaka`ako Waterfront Park, the Gateway Park, and the John A. Burns School of Medicine, as well as the former Gold Bond Building, the Children's Discovery Center, several private businesses, and cargo operations at Fort Armstrong. As discussed above, the jurisdiction over approximately 25 acres of the Makai Area was transferred to OHA in 2012.

1.2.3 Non-Governmental Master Plans

Two areas within the KCDD are governed by master plans that were adopted prior to the enactment of the development rules for the Mauka Area in 2011 (see Figure 1-5).

Kamehameha Schools adopted the Kaioulu`o Kaka`ako Master Plan in 2010 for 29-acres (nine blocks) within the Pauahi neighborhood. The Master Plan is in keeping with the vision and requirements set forth by the HCDA in its Mauka Area Plan (2005). The KS Master Plan envisions a mixed-use urban neighborhood with a variety of housing options, retail and office spaces and an emphasis on pedestrian comfort, community and public realm improvements and street level open spaces. Its series of design strategies are generally consistent with the Mauka Area Plan (2005). The Master Plan has a focus on mixed-income uses with an estimated 550 Reserved Housing units (it is noted that the actual total of units will depend on the building costs, exactions and the strength of the economy). Kamehameha Schools also proposes approximately 2,750 residential units including lofts, townhouses and townhomes in up to seven residential towers. HART Civic Center Station is proposed adjacent to KS Block A at the corner of South and Halekauwila Streets.

The approximately 60-acre Ward Neighborhood Master Plan is also in conformance with the Mauka Area Plan (2005). The Master Plan focuses on the development of a high-density retail, residential and entertainment center within the Auahi neighborhood of the Mauka Area. The Ward Neighborhood Master Plan provisions also include street improvements to break down the existing large blocks, the provision of public active spaces at the street level, and major pedestrian enhancements. Improvements to Auahi Street as a retail corridor are coordinated with the Kamehameha School Master Plan. The Ward Neighborhood Master Plan is flexible enough to accommodate a variety of housing markets from luxury, to market rate to reserved housing as well as retail and commercial uses. The actual program for each block may vary depending on market demand and opportunities. Kaka`ako Station will be located at the corner of Ward Avenue adjacent to Halekauwila Street on the Ward Neighborhood Master Plan properties.



Implementation of the TOD Overlay Plan will present Kamehameha Schools and Howard Hughes Corporation with an opportunity to embrace new opportunities related to transit-oriented development. However, in order to do so, the existing master plan must be formally amended and that amendment must be approved by HCDA.

1.3 Overview of TOD Alternatives A and B

Implementation of either TOD Alternative A or TOD Alternative B would constitute a supplementary action that overlays the Comprehensive Plan for the Makai Area

(2011), and the Mauka Area Plan (2011) and implements Smart Growth objectives. Development under either alternative further focuses growth with an emphasis on transit-oriented development (TOD), and transit-friendly transportation planning strategies. The Alternatives' purpose is not to redefine the vision from this earlier effort, but rather, to utilize TOD to enhance Kaka`ako as a whole and the Mauka Area in particular (all three proposed KCDD transit stations are situated in the Mauka Area). The effort follows upon a statewide interest in TOD strategies as a positive

Figure 1-5: Master Plan Areas

tool for land use planning. TOD opportunities are defined by the State Office of Planning in the document *Leveraging State Agency Involvement in Transit Oriented Development to Strengthen Hawaii's Economy*:

> "TOD is an implementation tool for achieving "smart growth," defined as compact, mixed-use, transit-linked, and walkable communities. Its primary goal is to reduce consumption of undeveloped land by concentrating development, rather than allowing low-density suburban sprawl to consume a larger land area."[2]

Related efforts have included station area planning by the City & County of Honolulu along the HART proposed alignment.

Implementing either Alternative will increase overall development capacity within selected areas of the Mauka District. The primary purpose of either Alternative is to coordinate future urban redevelopment with the provision of HART rapid transit so that residents, employees and visitors can take advantage of improved mobility choices. The land use policies of either Alternative focus intensive mixed-use redevelopment into identified areas near to proposed HART transit stations. Either Alternative would include a set of comprehensive policies that aim to create a network of safe and comfortable streets with convenient access to HART stations. As associated with capacity increases, the Alternatives focus on tools to introduce an integrated transportation management with requirements for improved street connectivity, trip reduction (transportation demand management), transit enhancements (feeder service, connectors and local bus enhancements), pedestrian and bike improvements, shared parking and parking pricing. Neither Alternative proposes new development in the Makai District related to the proposed transit stations; however both Alternatives envision the integration of the Complete Streets concept throughout the Mauka and Makai Districts.

TOD Alternative A includes the following actions:

Land Use:

- Increase overall development capacity while reducing building volumes dedicated to storing automobiles;
- Identify specific properties for public/private joint development partnerships to function as TOD catalysts;
- Allow and promote a mix of building types;
- Provide a limited number of hotels for travelers and business professionals who wish to stay outside of Waikiki;
- Increase opportunities for Reserved (affordable) Housing;

[2] State Office of Planning, *Leveraging State Agency Involvement in Transit Oriented Development To Strengthen Hawaii's Economy, 2012*

- Promote transit-friendly and community-supportive land uses that encourage "round the clock" activity in and near transit stations;
- Encourage preservation and adaptive re-use of *character* buildings that highlight the "old Hawaii" of the early 20th century;
- Identify specific properties within the Mauka Area for consolidation to promote redevelopment;
- Establish an incentive program to correlate allocation of active (open) spaces for additional height and capacity;
- Provide green connections and mid-block paths with redevelopment of consolidated parcels;

Urban Design:

- Increase maximum allowable building heights on a limited number of properties to encourage exemplary buildings that contribute to the District's identity;
- Provide a maximum of three *iconic towers* (heights between 550 and 700 feet), subject to the provision of exceptional public benefits;
- Preserve mauka-makai view corridors;
- Establish floor-plate controls ***(see page 4-15, Appendix A)*** for high rise towers;
- Ensure significant separations between *iconic towers*;
- Add flexibility to street frontage setbacks;
- Establish a design review process to ensure quality of building design;
- Encourage climate responsive design;

Mobility and Access:

- Require large developments to provide internal streets/pedestrian connections;
- Prioritize streets according to bicycle and pedestrian use, vehicle use, transit, and goods movement;
- Designate parking access and loading streets;
- Minimize curb-cuts needed for driveway access to reduce vehicle/pedestrian conflicts;
- Make walking and cycling access to transit stations as direct as possible;
- Implement a coordinated multimodal way finding program;
- Create a safe, comfortable, and well-connected pedestrian network;
- Promote district-wide accessibility to people of all ages and abilities;
- Develop a district-wide traffic calming plan;
- Encourage active sidewalks and transparent building facades;
- Provide street trees, weather protection, and other amenities;
- Provide high quality access to transit stations;

- Ensure seamless transitions between transit modes and pedestrian-oriented places;
- Implement a Downtown/Kaka`ako/Ala Moana circulator system that enhances access to HART stations and key KCDD destinations and those in adjacent districts;
- Create a complete network of high quality bicycle facilities;
- Promote KCDD as a cycling district;
- Work with local partners to develop a bike-share system in Kaka`ako;
- Improve access to bicycle parking and require new developments to include bicycle storage;
- Implement a Complete Streets program in KCDD;
- Remove minimum parking requirements;
- Balance parking supply and demand by including parking in *floor-area ratio* (FAR) calculations;
- Phase parking requirements and/or accommodate parking in satellite locations;
- "Unbundle" parking stalls from residential units to allow consumers to consider the optional purchase or rental of a stall;
- "Unbundle" parking costs from commercial leases;
- Accommodate tandem and stacked parking; and
- Promote car sharing in Kaka`ako.

TOD Alternative B would generally include the same actions identified above, with the exception that new building heights would not exceed 418 feet in height as specified in Act 61

1.4 Guiding Principles of Transit-Oriented Development

The overall goals of Transit-Oriented Development are to achieve the quality of life improvements as associated with well-planned, in-town densification tied to transit accessibility, non-vehicular infrastructure improvements and access to a broad mix of uses, public amenity and services. To implement these goals, TOD's guiding principles rely on six "D's" of transit oriented, pedestrian-focused community planning:

- D1: Destinations: Coordinate land use and transportation by concentrating development along reasonable direct corridors, so that most destinations are on the way to other destinations.
- D2: Distance: Create a well-connected street network using Complete Street Principles and maximize the area's capabilities to move people by developing environment where people walk, bike and take transit.
- D3: Design: Provide tools to ensure that the public realm is safe, comfortable and inviting for people of all ages and abilities.

- D4: Density: Concentrate and intensify activities near frequent transit and continue to encourage compact development in the Mauka area.
- D5: Diversity: Encourage a mix of uses, including opportunities for employment and residential, daily services, entertainment, public open spaces and entertainment.
- D6: Demand Management: Encourage the "auto trip not taken" through a systems management approach.

In summary the Transit-Oriented Development Overlay Plan aims to:

Reinforce local land use context - Focus improvements on those areas that have a higher potential for redevelopment including surface parking lots, and buildings that have exceeded their useful life, while maintaining those areas that are already functioning as an integral part of the KCCD community.

Provide a variety of land uses – Reinforce the mixed-use policies of the Mauka Area Plan, but further encourages land uses still missing from the area including a full service grocery store, a limited number of hotels, and cultural and community amenities.

Plan for Active Public Spaces - As Kaka`ako evolves, the provision of legible, accessible, and multi-functional public spaces are essential to neighborhood livability. Transit-Oriented Development provides guidelines for the provision of these spaces.

Apply Best Practices for balanced mobility – Envision the implementation of a comprehensive array of complete streets policies to develop a holistic transportation system in KCDD that is coordinated with the implementation of the HART rapid transit system, and maximize the capacity to move people by developing environments that encourage people to walk, bike and take transit, rather than driving for all trips.

1.5 Applicant and Accepting Authority

The ~~Applicant~~ ***Proposing and Determination Agency*** is the Hawaii Community Development Authority (HCDA).

The Accepting Authority for the EIS is the Governor of the State of Hawai`i. Pursuant to Chapter 343, HRS, the Accepting Authority must determine whether the Final EIS complies with the requirements of the law. That determination is not a judgment on the merits of the Alternatives presented in the EIS. Rather, it is a judgment as to whether the EIS fulfills the content and process requirements specified in Section 11-200 HAR, and whether or not all substantive comments received have been adequately addressed by the applicant, in this case, the HCDA.

1.6 Schedule for Transit-Oriented Development

For the purposes of this EIS, implementation of Transit-Oriented Development has a planning horizon of 2035, meaning that full build out of the development envisioned in the Alternatives is forecast to conclude by the end of that year. The analysis conducted for this EIS assumes 2013 as the baseline year, but includes data assembled from prior years by the State of Hawai`i, the City and County of Honolulu, and the large landowners in the district.

The planning horizon is specifically established to facilitate a comprehensive review of impacts for the purposes of environmental assessment. In actuality, full-build out of the KCDD will respond to market cycles that are not easily predictable. The year 2035 was selected as the planning horizon because at the time this document was being prepared, it is the horizon year utilized by the State and the City and County of Honolulu in its population projections.

1.7 Funding

Implementation of Transit-Oriented Development will be funded by a variety of sources including the HCDA, other agencies of the State of Hawai`i, the City and County of Honolulu, private property owners, and developers acting as agents of property owners.

1.8 Contemporary Historical Perspective

The State of Hawaii has a well-established planning context for encouraging growth in the Kaka`ako Mauka Area as part of the City and County of Honolulu's Primary Urban Center (PUC), an area extending from Kahala to Pearl City across the island's southern coastline. The City's PUC Development Plan, originally adopted in the mid-1980s, presents specific guidance for local government to "provide for high-density housing options in mixed-use developments around transit stations."[3] The PUC Development Plan also encourages "transit-oriented development" to facilitate transit use and allow for increased densities without generating increased vehicular congestion.

As described above, in 2012, Honolulu City Council adopted the Honolulu Area Rapid Transportation (HART) elevated transit alignment. Much of the Mauka Area is within a 5 to 10 minute walking distance from planned HART rapid transit stations (approximately .25 to .5 miles) at Kaka`ako Station and Civic Center Station. See Figure 1-6.

---

[3] Primary Urban Center Plan, 2004 ES-4

Additionally, the KCDD has significant access to The Bus and local transit service; with the King and Kapolani as major service corridors; and stops on Punchbowl, King Street, and Ala Moana Boulevard among the busiest transit boarding locations in Honolulu.

The following describes the transit stations located within and influencing the planning context for the Proposed Action.

Figure 1-6: Walking Distance to HART Rapid Transit Stations

Civic Center Station: Located on Halekauwila Street between South and Keawe Streets, this station site is adjacent to land that is part of Kamehameha School's Kaioulu O Kaka`ako Master Plan area. A block away from the station is the historic Mother Waldron Neighborhood Park, which will be the beginning of Kamehameha

Schools' planned park-to-park connection down to the Kaka`ako Waterfront Park and the Pacific Ocean. In April 2014 the HCDA approved a development permit application for a residential, commercial mixed-use project on the land block bounded by Halekauwila, South, Pohukaina, and Keawe Streets. The Civic center Station is closely integrated as part of this development project.

Kaka`ako Station: This station is planned by the City to be located on property that is part of the Ward Master Plan. The station site is positioned on the corner of Ward Avenue and Queen Street and will operate as the closest stop to Kewalo Basin harbor, the Ewa side of Ala Moana Beach Park, the Diamond Head side of Kaka`ako Waterfront Park and the Blaisdell Arena, Exhibition and Concert Halls.

Downtown Station (at the Aloha Tower Special District): This station is located adjacent to the Aloha Tower Special District. This station will function as a connection between Aloha Tower and Honolulu's Central Business District. A pedestrian overpass is part of the design for the station, which will play a significant role in safely moving people over the Nimitz Highway/Ala Moana Boulevard corridor.

From a transportation perspective, despite reliable existing bus transit service and significant plans for improved high capacity transit access, pedestrian activity within the KCDD is low when compared to downtown or Waikiki. The streets are often wide and do not intersect at right angles, which can be difficult to cross with fast moving traffic. It has been well documented in preceding planning efforts, particularly in the Mauka Area Plan, (2011) that the KCDD street network is oriented towards vehicles and prioritizes automobile mobility to the detriment of other users. This emphasis however, is changing. The State of Hawaii's Complete Street Policy Act 054 provides a framework to address this imbalance. The State encourages local governments to enact "complete streets policy to reasonably accommodate convenient access and mobility for all users of the public highways – including pedestrians, bicyclists, transit users, motorists and persons of all ages and abilities."

Chapter Two:
Description of Proposed Action

Table of Contents

2.1 Introduction 1
2.2 Objectives of Transit-Oriented Development 2
2.3 Elements of the Proposed Action 5
2.3.1 Neighborhood Character 7
2.3.2 Land Uses 13
2.3.2.1 Hotels and Tourism 16
2.3.2.2 Office 17
2.3.2.3 Retail/Commercial/Professional Services 17
2.3.2.4 Industrial 18

2.0 Description of the Proposed Action

2.1 Introduction

The Proposed Action is the implementation of a Transit-Oriented Development (TOD) Plan for the Kaka`ako Community Development District (KCDD) and the Aloha Tower Special District (ATSD). This environmental impact statement (EIS) discloses the impacts that are anticipated as the result of implementing the Proposed Action.

It is important to note here that this EIS addresses two alternative visions for implementing transit-oriented development: TOD Alternative A and TOD Alternative B. This EIS contains no recommendation concerning which Alternative is preferable.

For the purposes of this EIS, the Proposed Action is the implementation of transit-oriented development in general, be it TOD Alternative A or Alternative B. As was briefly discussed in Chapter One, TOD Alternative A represents the Draft TOD Overlay Plan presented in Appendix A. TOD Alternative B represents a hybrid of Alternative A: it contains modifications to the urban density of the KCDD resulting from the enactment of Act 61 in April 2014, which restricted building heights in the Mauka Area to 418 feet. Rather than eliminate TOD Alternative A from further consideration because it recommends that some new buildings in the KCDD exceed a height of 418 feet, HCDA has elected to retain it for the purposes of full disclosure, as well as a "rigorous exploration" of alternatives as required by Section 11-200-17(F), Hawaii Administrative Rules. HCDA recognizes that TOD Alternative A cannot be implemented unless Act 61's height restrictions are repealed. However, for the purposes of this EIS analysis, HCDA believes that it is prudent to address a full range of alternatives.

Development within the KCDD is regulated by the HCDA pursuant to rules adopted for the Mauka Area in 2011 and the Makai Area (2005), which includes the non-contiguous ATSD, as well as the Mauka Area height limit imposed by Act 61(2014). Together, these initiatives established the desired development pattern for the KCDD. For the purposes of this EIS, the "Future Baseline" condition is what would happen in the district if it were built-out in accordance with established rules and plans. The Future Baseline Condition for the Mauka Area was fully addressed in the 2009 Final Supplemental EIS for the Kaka`ako Community Development District.

The Proposed Action is a regulatory "overlay" on the baseline. Rather than change the fundamental character already established for the KCDD, it amends it or overlays it by offering a vision of how the district could respond to the opportunities presented by the introduction of an elevated light rail system in the Mauka Area that was approved by the Honolulu City Council in 2012. The entire rail system was the

subject of a separate EIS that was approved by the Federal Transit Administration on January 18, 2011. Thus, it is important to understand that the present EIS is not intended to evaluate the impacts of the ~~HART~~ light ~~rail~~ ***metro*** system alignment through the KCDD. That has already been done. The ~~HART~~ light ~~rail~~ ***metro*** system presents certain additional urban infill development opportunities within the KCDD and it is the impact of that additional development opportunity that is being disclosed in the EIS.

To accomplish this, both TOD Alternatives create a vision for what additional development is possible, and, for the purposes of evaluation, present a target year for the full build-out of that vision: 2035. Will build-out actually occur by 2035? Probably not. Actual build-out of the Mauka Area will result from the decisions made by individual property owners and government agencies investing in infrastructure. It will also be affected by the cyclical nature of the economy, both in Hawai`i and on the mainland United States. However, to fulfill the requirement of Chapter 343, HRS that the impacts of a proposed development be disclosed as early as is practicable, the HCDA has selected the year 2035 to evaluate the impacts of full build-out for transit-oriented development. 2035 is the year that both the State of Hawai`i and the City and County of Honolulu have established as the horizon year for their long-range population forecasts. It is, therefore, a convenient year to compare the future of the KCDD with and without the changes that would be incurred with the Overlay Plan adoption. Please refer to Chapter 3 for a comparison of the KCDD in 2035 upon full build-out of the Future Baseline Condition vs. full build-out of the two Alternatives.

2.2 Objectives of Transit-Oriented Development

The goal of implementing transit-oriented development is to develop the Kaka'ako community in ways that promote the shared values of livability, environmental, social and economic sustainability and resiliency in the face of change. The result must enhance the distinct character and history of the Kaka'ako community, and contribute to the environmental, social and economic health of the region. The Proposed Action is intended to express the agency's dedication to place making through enhanced urban form and concentrating development near to infrastructure investments.

The objectives and policies outlined below are based on the "6 D's" of pedestrian focused, transit-oriented, community development:

Objective D1: Destinations – Coordinate land use and transportation

Coordinate transportation and land use by concentrating development along reasonably direct corridors, so that most destinations are '*on the way*' to other destinations. When transportation and land use are well coordinated, transit,

walking and biking can provide fast, direct and cost-effective access to more destinations.

Policy D1.1 Locate highest density of uses near high capacity, high-frequency transit, including high frequency bus and ~~HART~~ ***light metro*** stations

Policy D1.2 Sustain the district's mixed use character and encourage a mix of land uses around transit stations, near transit corridors and transfer centers to spread demand throughout the day and create an interesting and dynamic pedestrian environment.

Policy D1.3 Create quality connections between the Kaka'ako district and neighboring districts to extend the viability of active transportation choices.

Objective D2: Distance – Create a well-connected street network using Complete Streets principles

Implement complete streets policies and develop a holistic transportation system in KCDD, finding ways to maximize the capacity to move people by developing environments that encourage people to walk, bike and take transit, rather than driving for all trips. A well-connected street network shortens travel distances, making it possible for people to walk or cycle to transit service quickly and conveniently from the places they live, work, shop, and play, and to support walking and cycling as everyday transportation options. Implementation of the complete streets network will require coordination between work at street level and the need to consider upgrades to utilities to support new development.

Policy D2.1 Provide a fine-grained street network, minimizing the distances between intersections and avoiding streets that do not connect into the greater grid.

Policy D2.2 Create a multimodal mobility network, providing a continuous high quality environment that encourages active transportation and quality public spaces throughout the district.

Policy D2.3 Balance system uses by creating multimodal streets with priority for moving people rather than cars through design treatments that encourage walking, biking and taking transit.

Policy D2.4 Make walking and cycling access to frequent transit as direct as possible.

Policy D2.5 Complete streets implementation will be coordinated with the implementation of new utility infrastructure necessary to catalyze and support development.

Objective D3: Design – Create places for people

Create streets and public spaces that are carefully designed with the needs of people in mind. The public realm should be safe, comfortable, and inviting for people of all ages and abilities. To achieve these objectives, transit-oriented neighborhoods have complete streets designed to meet the needs of a range of users, and they provide inviting public spaces that welcome lingering, gathering and celebration.

Development in transit-oriented neighborhoods also reinforces the distinct history, culture, and character of Kaka`ako's neighborhoods using context-sensitive design and enhancing the pedestrian environment.

Policy D3.1 Design streets to relate to buildings in a way that creates porosity, interest, and public space opportunities

Policy D3.2 Design streets that are accessible and easily navigated by users of all abilities

Policy D 3.3 Design parking and parking access to support a pedestrian-oriented realm

Policy D3.4 Design the spaces adjacent to ~~HART~~ ***light metro*** stations and alignment through Kaka'ako in ways that maximize access and benefit to the community.

Policy D3.5 Design spaces that integrate the history, culture, and character of Kaka`ako.

Objective D4: Density – Concentrate and intensify activities near frequent transit

Encourage more intensive development near frequent transit (transit service that arrives every 15 minutes or better) to enable livable, walkable, and resilient neighborhoods. To function well, higher density development should be combined with the other principles of good transit-oriented development, creating a compact community with a connected street network, well-designed buildings and public spaces, a mix of land uses, and managed demand for private vehicle travel. In Kaka'ako, more intense land use will relieve development pressures on suburban and rural areas by attracting development to urban areas in the District that can be well served by a variety of modes.

Policy D4.1 Encourage mixed use and redevelopment along transit corridors.

Policy D4.2: Offset increased development heights with increased active public space amenities that directly benefit the building's residents and tenants.

Policy D4.3 Plan for density that supports community character and promotes quality of life

OBJECTIVE D5: Diversity – Encourage a mix of uses

Create an internally diverse and vibrant mixed-use community through the provision of a range of housing choices, services and facilities, which improve the quality of life for residents and businesses.

Policy D5.1: Provide a mix of housing types at varying densities and costs.

Policy D5.2: Preserve and enhance active public space.

PolicyD5. 3: Include a broad mix of commercial and light industrial uses that are compatible with an urban village.

Objective D6: Demand Management – Encourage the "Auto Trip Not Taken" through a systems management approach

Develop a comprehensive systems approach to parking and travel demand management. This will include developing the Kaka'ako district in a way that allows a resident of the district to meet many of their needs within the district, avoiding the need to travel longer distances for basic life needs. Combined with the emphasis on high quality, convenient, reliable and competitive transportation choices, these policies can have a wide range of positive benefits, including reducing traffic congestion and air pollution, making better use of existing capacity and infrastructure, increasing traffic safety, and improving public health.

Policy D6.1: Manage parking supply and demand consistent with the goals of reducing driving trips.

Policy D6.2 Create an environment within Kaka'ako that will enable residents to meet many of their needs within the district, reducing the need to drive outside of the district for all trips.

Policy D6.3: Ensure that all non-auto mobility choices are designed to be convenient and competitive with the auto to maximize non-auto travel.

2.3 Elements of the Proposed Action

A common misconception exists that dense, busy cities generate traffic congestion. However, many studies have shown that typical suburban housing developments are often more congested than mixed urban areas, because a higher percentage of

trips rely on automobiles, and there are comparably less route choices. In well-designed, higher density, mixed-use neighborhoods with good pedestrian, cycling, and transit access, households tend to own fewer cars and ultimately drive 20-40 percent less annual miles than the same households would in auto-dependent locations.[1] The transit-friendly land use objectives and goals as presented in Section 2.2 compel us to build differently. Mobility, access, and higher density, mixed-use urban environments can work together to support the creation of positive feedback loops. Co-locating people with their everyday needs provides incentive to walk, bike, or take transit, and drive less, eventually resulting in a compact, walkable community.[2]

Many cities throughout the U.S. are now also working on tools to better integrate mixed-incomes households into redeveloping urban areas, from experiments with mixed-income buildings in New York City, to inclusive zoning ordinances in Honolulu, and affordability requirements in San Francisco.[3] The Proposed Action also supports this effort by bolstering the residential component already defined in the Mauka Area Plan under the Future Baseline Condition and increasing overall capacity. A supply-side solution in the form of providing additional incentive for developing affordable housing needs to be reinforced with regulatory policies that ensure the long-term tenure of those affordable units. It is with this question in mind that the HCDA developed a vision to add additional capacity to the Kaka`ako district.

Both TOD Alternative A and TOD Alternative B increase the overall quantity of housing as compared to the Future Baseline Condition and introduce new opportunities for area land uses such as a limited number of hotels and office/industrial buildings. Under the Proposed Action's policies increases in land use capacity are only allowed if tethered to new community amenities and public realm enhancements, which are elements that support urban lifestyles. The Proposed Action does not articulate a precise standard for density bonuses in exchange for community amenities, but assumes that it is an issue that will be taken on during plan implementation.

The Proposed Action asserts that strong land use and transit-planning partnerships can lay the groundwork to develop livable neighborhoods, improve public health, lower vehicle miles traveled (VMT), and reduce greenhouse gas (GHG) emissions, all

---

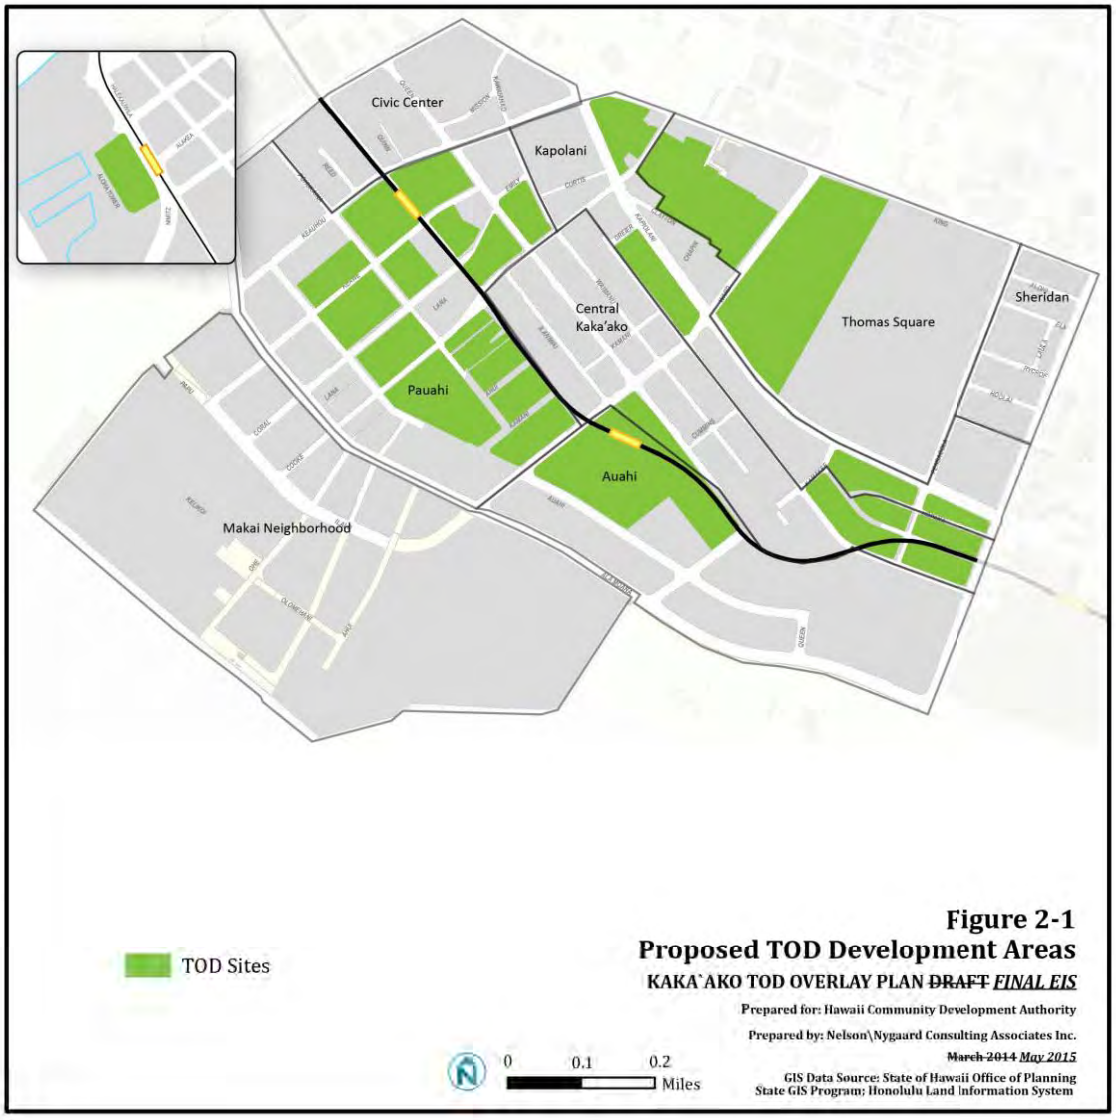
while increasing social capital. When the public sector provides opportunity for more growth, the private sector responds by investing in the neighborhood amenity.

The Proposed Action treats questions of parking and mobility as critical to resolving questions about the future development of Kaka`ako. We know that building parking is expensive; it takes up space which otherwise could be used for housing or other active uses and impacts the quality of the public realm. The Proposed Action explores a future of Kaka`ako that moves away from each single use parking space, each person requiring free storage for their vehicle at the beginning and end of each trip, and instead, envisions a district-wide parking management scenario. This will enable a move towards a more balanced mix of mobility options, relying first of the completion of the ~~HART train~~ ***light metro rail***, but also by tapping into private sector investments to complete the street grid, create a bicycle network, provide shared parking districts, and improve the condition of public sidewalks and parks.

The following section describes two scenarios envisioned for the Proposed Action – whose primary distinction is in the height of allowable structures, and resulting capacity.

1) TOD Alternative A introduces significant height and tall residential towers to accommodate capacity increases. In this Alternative, building forms could rise to 700' in a total of three instances, with options for a cluster of 420-550' tall high-rise towers.



2) TOD Alternative B explores how redevelopment might occur with a similar, but slightly reduced increase in capacity while maintaining the existing envelope of 418' height limitations, pursuant to Act 61. Alternative B was developed to maximize density within the District, taking into account the height limitation imposed by Act 61 and without compromising desirable urban design and aesthetic character.

2.3.1 Neighborhood Character

Under the Proposed Action, the Mauka Area will continue its planned transformation towards a truly urban, high-rise, 24-hour, mixed-use neighborhood. Either of the TOD Alternatives will increase overall development capacity in selected neighborhoods within the Mauka Area (see Figure 2-1). No capacity or rule changes are proposed in the Makai Area, or for mature, and built-out existing neighborhoods (Sheridan, Civic Center and portions of Central Kaka`ako) outside of the TOD Overlay area.

In most areas, it is assumed that increased capacity in TOD Alternatives A and B come with public infrastructure improvements that will support healthy neighborhoods. These improvements will focus on the implementation of a Complete Streets program and enhancing the public realm with provisions for public parks, multi-modal transportation opportunities, and shared parking.

Figure 2-1: Proposed TOD Development Areas

Following is a description of redevelopment associated for each of the neighborhoods included in the KCDD.

Civic Center – This area is generally not eligible to participate in the Proposed Action, and consequently there are no increases in development capacity beyond the Future Baseline Condition, with limited changes occurring in this neighborhood. Many properties will likely remain in their current condition.

Thomas Square District – Redevelopment in this district is focused on two sites for civic, residential and commercial uses, Blaisdell Center and the HECO property (with

the remainder of the area generally built-out). The McKinley High School property is assumed to continue in its existing condition, as well as conditions along King Street.

The Proposed Action explores the possibility of residential and mixed uses on these two potential development sites to support civic improvements. In contrast to the Future Baseline Condition, both Alternatives directly boost pedestrian and vehicular street connections, and create new open spaces and parks.

Under both Alternatives, the Blaisdell and HECO properties are assumed to redevelop at a total FAR of 6.5.[4] However in TOD Alternative A, a much increased height limit allows for a smaller building footprints creating an opportunity for more public realm enhancements at ground level.

TOD Alternative A: To take full advantage of the Blaisdell site and tall height allowances, including one dramatic and iconic 700' tower, this Alternative could potentially support:

- The extension of Thomas Square Park across King Street and replace the area now generally occupied by the Concert Hall and parking structure;
- A re-designed state-of-the-art performance center;
- An enlarged sports arena;
- A mixed-use entertainment center;
- Options for a tall, iconic mixed use residential tower;
- Opportunities for additional Affordable Housing;
- A business-oriented hotel to meet the demand for visitors coming to Honolulu's downtown for business purposes;
- A site design based on pedestrian access;
- A completed street grid with improved vehicular connections in both `Ewa-Diamond Head and Mauka-Makai directions across the property;
- A coordinated mobility and access strategy with shared parking arrangements;
- Provisions to encourage people to arrive at the site using all modes of transportation, including transit, walking and cycling; and
- Sustainable building design and green building techniques.

TOD Alternative A also envisions a wholesale redevelopment of the HECO site with a cluster of high rise residential and mixed-use buildings, providing opportunities for a centralized pedestrian movements, park space, and an improved circulation network completing the street grid. This would change the character from a mixed employment area by increasing housing opportunities to augment the King Street

[4] Floor Area Ratio (FAR) is a mechanism used by municipal governments to control or regulate the amount of development on a particular property. For example, a 50,000 square foot property with an FAR of 2.0 would be allowed to have a total of 100,000 square feet of development, distributed among as many floors as the height limit would allow.

corridor, the Queens Medical Center complex, the Arts District, and Downtown Honolulu.

TOD Alternative B: This Alternative reduces site capacity on redevelopment parcels as compared to TOD Alternative A. At the Blaisdell Center, TOD Alternative B envisions a redeveloped performing arts center, including a sports arena, and explores the addition of high-rise residential uses, and a hotel to the site. In comparison to TOD Alternative A, this alternative reduces overall development capacity while creating additional open space on the makai side of King Street that can enhance the existing open space by Thomas Square park. The HECO parcel is a similar intensity as the TOD A, but retains 400' height limits, necessitating some larger building floor plates.

Sheridan Neighborhood – No increases in development capacity or change to neighborhood character.

Auahi Neighborhood - All of the block areas in Auahi are within the 5- to 10-minute walking radius of the proposed Kaka`ako ~~HART~~ ***light metro*** station. The Ward Neighborhood Master Plan comprises a large portion of the Auahi Neighborhood, and select portions of the Master Plan were studied in the TOD Overlay Plan as eligible sites for additional residential high-rise capacity. ~~– specifically Land Block 1 and Land Block 5~~. (No capacity changes are proposed to the form of development between Auahi St. and Ala Moana Boulevard in order to accommodate the Ala Moana Special Review District – Ward Neighborhood Master Plan's Land Blocks 2, 3, and 4.)

The Master Plan as currently entitled constitutes the Future Baseline Condition and is presently in phase one of its development program. The Ward Neighborhood Master Plan envisions a visually rich, stimulating, and activated retail environment, with a large central park area offset with high-rise residential buildings throughout the site and structured parking that is screened from the street. The Proposed Action looks to encourage additional crossings of Ala Moana Boulevard as well as integration of the public realm associated with the Kaka`ako ~~HART~~ ***light metro*** station.

TOD Alternative A: This Alternative supplements the vision for the existing Ward Neighborhood Master Plan to accommodate significant increased capacity associated with the potential for tall towers (above 400'), as well as increased frequency of towers. In this scenario, a dramatic skyline would include one 700' Iconic Tower as well as four towers reaching up to 550'. These towers would provide the opportunity for a new visionary transportation and employment hub in Honolulu (ultimately resulting in a revised vision for the area). To achieve this program, the area would likely rely upon progressive parking strategies such as a district–wide, shared parking and implementation of Transportation Demand Management strategies ***(see page 8-14 of Appendix A for extensive discussion of TDM strategies)***. The area would be busy, pedestrian filled, with new retail space,

homes, and employment opportunities. TOD Alternative A also envisions hotel use as an allowable use in this neighborhood within the TOD designated land parcels.

It is beyond the scope of the Proposed Action to redesign in detail this area to accommodate additional growth, but it can be assumed that additional public activated open space would be included beyond that which is currently planned at the ground level.

TOD Alternative B: This Alternative supplements the Future Baseline Condition with increased frequency of towers, and some taller heights on already planned buildings (subject to the height limitations imposed by Act 61) – however the main characteristics of the Ward Neighborhood Master Plan program would remain in place. The Alternative explores opportunities in later phases of development, particularly in land block 5b (to the Ewa of Ward Avenue). No additional open space is envisioned at the ground level on the site. TOD Alternative B maintains the retail, mixed character as envisioned in the Ward Area Master Plan with a boost in intensity. Wide sidewalks and a central open space create a busy, pedestrian-oriented area with retail and residential buildings as well as some employment. TOD Alternative B also envisions hotel use as an allowable use in this neighborhood within the TOD designated land parcels.

Similar to TOD Alternative A, under TOD Alternative B the expectation for progressive parking approaches would still be in place, e.g. shared parking, district wide parking, charging separately for parking spaces from a residential unit, and other Transportation Demand Management measures.

Pauahi Neighborhood - The Pauahi area has been determined as a prime candidate for transit-oriented development. This neighborhood contains a portion of the Kamehameha Schools Master Plan area (Blocks A, B C, and D). No changes are proposed to the capacity or form of development between Auahi St. and Ala Moana Boulevard.

In both Alternatives, the Pauahi Neighborhood transforms to a high-rise residential neighborhood, with structured parking within block size redevelopment projects. Buildings at the ground level seek to be better anchored to the street not only with retail uses, such as along Auahi Street, but also with residential uses such as townhome projects and ground-oriented units that may accommodate larger families. While projects explored in both Alternatives consolidate development sites to show the most potential for capacity, it is likely that some older buildings would remain.

TOD Alternative A: Increased capacity is due to increased building height and frequency of towers associated with Kamehameha Schools Master Plan area on all blocks within the Master Plan area, as well as individual TOD redevelopment sites. Individual development sites have been estimated at a range between 8.5 up to 10 FAR. Additionally, the State-owned 690 Pohukaina site is located in this district, and

envisioned for the purpose of this analysis to include either a dramatic, high-rise tower of 650' at 8.5 FAR, or two smaller towers at approximately 400' each.

Under this scenario, up to five towers over 400' (430-550') could be developed within the Pauahi Neighborhood on individual parcels (outside of Kamehameha Schools properties). Improvements to the street network are planned as part of TOD infrastructure improvements, with additional vehicular and pedestrian connections on most consolidated development sites. Additionally, improvements to the public realm would include small scale, neighborhood level public parks and plazas associated with individual redevelopment sites.

TOD Alternative B: This Alternative shows reduced capacity compared with TOD Alternative A with a maximum FAR of 9 and 418' height limitations. In this scenario, Kamehameha Schools' blocks A and D are envisioned with increased capacity in the form of added residential height (but not to exceed 418').

Privately owned parcels near the Civic Center ~~HART~~ ***light metro*** station were assumed to be consolidated, as their proximity and current use as parking lots represent a good opportunity for TOD. Instead of single tall tower development form envisioned in TOD Alternative A at 690 Pohukaina Street, the site accommodates a two-tower form at a reduced height. The opportunity for improved circulation with new pedestrian and vehicular connections is also present. Plans for parks and other public realm improvements would be included with TOD Overlay redevelopment sites.

**Kapi`olani Neighborhood** - The Kapi`olani corridor has an existing pattern of high rise residential mixed with office uses and much is already constructed at a high capacity. A moderate amount of changes are assumed in this neighborhood with the completion of several more office or residential buildings. The TOD Alternatives explore redevelopment at 8.5 FAR, including both office and high-rise residential development. There is a minor reduction estimated for retail and civic uses as compared to the Future Baseline Condition.

Kapi'olani will continue to be an attractive alternative for office uses outside of downtown, due to its nearby access to light rail.

The Proposed Action may provide new tools and strategies to reduce the amount of parking expected by employers, thereby reducing the overall bulk and mass of structured parking areas.

Central Kaka`ako** - Only the portions of Central Kaka`ako impacted by the ~~HART~~ ***light metro* alignment are eligible to participate in the Proposed Action (on the Diamond Head side of the District). Under both Alternatives, these selected parcels are assumed to consolidate and redevelop at FARs ranging from 7.1 - 8.5 FAR. These areas are assumed to redevelop as high-rise residential building types resulting in a net increase of residential uses associated with an increased tower frequency and

requisite height limitations. Additional activated park spaces are envisioned as associated with the ~~HART rail~~ ***light metro*** alignment, including improvements to circulation, temporary uses, and street level activation.

Within the Central Kaka`ako Neighborhood, land parcels not eligible for transit-oriented development under the Future Baseline Condition may redevelop to 3.5 FAR only when infrastructure is sufficient, including improvements to utilities and sidewalks. The overall redevelopment of the Mauka Area will likely increase development pressure here, and the share of small businesses relying on access to low-cost space will likely decrease.

Makai Area - This area presently allows only commercial uses. No density increases associated with Proposed Action have been proposed. The TOD Alternatives estimate a very general potential build-out under the existing planning parameters for the purposes of a broader analysis. Changes associated with the Makai Area may include the potential for shared parking arrangements and improved crossings into the Makai District across Ala Moana Boulevard. Opportunities occur to include makai-based improvements as part of private sector development mitigations in Kaka`ako's Mauka Area under the Proposed Action.

Aloha Tower Special District - The HECO substation parcel adjacent to the ~~HART~~ ***light metro*** Downtown Station is particularly well positioned for TOD redevelopment for a range of uses, as it enjoys waterfront views and proximity to Downtown. Under both Alternatives, this site would be able to develop using an increase in capacity (9.7 FAR) with more flexibility in off-street parking requirements. This vision is coordinated with the City and County of Honolulu Neighborhood Transit-Oriented Development Plan[5] that envisions the area as a mixed-use, high intensity district appropriate and recognizes the opportunity for revitalizing the HECO substation complex into a citywide destination and community-gathering place. Both Alternatives envision hotel use as an allowable land use on this parcel.

2.3.2 Land Uses

As an urban region, the Mauka Area will have a mix of uses with opportunities for diverse residential and mixed-use commercial buildings in proximity to transit stations. The Proposed Action emphasizes residential use, which would account for nearly 75 percent of developable land uses in the Mauka Area (exclusive of parking). Both Alternatives will increase overall development capacity within selected neighborhoods of the Mauka Area to permit more people to locate in close proximity to the ~~HART rapid transit~~ ***light metro*** system, which will in turn:

- Reduce household costs associated with storing automobiles and driving;

[5] Downtown Neighborhood Transit-Oriented Development Plan Public Review Draft, City County of Honolulu, p 4-3

- Increase the potential for Reserved Housing
- Concentrate activities where there is the greatest level of accessibility;
- Minimize island-wide development pressure on rural areas, which will in turn help preserve O`ahu's natural resources; and
- Anticipate a variety of building types to meet the needs of a variety of income levels at different life stages.

Land uses presented in the TOD Alternatives include allocations for Residential, Office, Retail and Industrial. Hotels are included on three sites within the Mauka Area.

Although most of the properties within the KCDD Mauka Area are within a quarter to half mile walking distance from a future ~~HART rail~~ ***light metro*** station, not all areas of the District will experience significant land use changes. In fact, within the Mauka Area, only 25 of the 73 Mauka block areas show increased land use capacity. These increased-density blocks consist of 219 acres or about half of the total Mauka Area.

The Proposed Action consolidates growth into the core area, while maintaining existing neighborhoods (e.g., a building currently limited to a low-rise will not become eligible for a high-rise structure), public parks, and major public assets to ensure continuity and longevity for users. As such, either TOD Alternative will have limited impact on the following Mauka Area locations:

- The existing low-scale residential character of Sheridan Neighborhood;
- The majority of Central Kaka`ako identified as low-rise industrial and service business areas;
- The Civic Center which contains major historic sites and civic structures; and
- The Ala Moana Special District Review Area, the one block- wide strip along Ala Moana Boulevard that maintains Mauka Area Rule limitation on building heights and density.

One possible scenario for the distribution of development capacity is depicted in Table 2-1 and Table 2-2, based on each of the neighborhoods that comprise the area.

Table 2-1: Development Capacity in TOD Alternative A

TOD Alternative A	Total	Total
	Non Residential SF	Residential SF
Percent of Total	27%	73%
Kaka'ako Total	14,890,939	41,093,384
Mauka Area	11,839,961	40,756,616

2.3.2.1 Hotels and Tourism

Consistent with the City & County of Honolulu's Primary Urban Center Development Plan, it is HCDA's opinion that there is demand for hotels within the Kaka`ako area,

particularly to meet business traveler needs. Both Alternatives include provisions to allow hotels at three locations in proximity to the district transit stations (Auahi, Blaisdell Center, and Aloha Tower Special District). This use is estimated to total approximately 1,044 potential rooms.

For the purposes of this analysis, hotels under consideration include full service, business, and condo-hotels for travelers seeking to stay outside of the tourist districts. A Kaka`ako hotel will be a transit ride from the airport and will be highly accessible for meetings and work engagements at Civic Center, the commercial core, or the convention center. Regulatory limitations on the size and total amount of hotels are included in TOD Plan Policies.

2.3.2.2 Office

In Honolulu's urban core, limited remaining land parcels for office development, combined with the higher net return to developers from high-rise residential uses may curtail the level of commercial development in Kaka`ako.[6] Changes proposed in the Proposed Action include an option for larger floor plate office buildings (maximum 28,000 SF per floor with height limitations of 160'). This is considered desirable for corporate tenants.

In both Alternatives, high-rise commercial is generally assumed to be located along Kapi`olani Boulevard, and in close proximity to Civic Center Station. Office uses do not increase between the Baseline Condition and the TOD Alternatives. The TOD Alternatives actually anticipate a modest decrease in office uses in the KCDD due to a lack of available sites and existing economic conditions that support residential development.

2.3.2.3 Retail/Commercial/Professional Services

Kaka`ako is transitioning to become a mixed-use, 24-hour neighborhood that can better compete in terms of desirability with residential locations outside the City's core, and with existing retail environments such as Ala Moana Center. In order to retain and attract new residents and businesses, the Proposed Action's policies encourage neighborhoods focused on creating places for people – from small shops to a full-service grocery store, and from cultural amenities to medical services and day care. In particular, the TOD Alternatives promote land uses that encourage transit use throughout the day (peak period, mid-day, nighttime, and weekends) to encourage "round the clock" activity in and around transit stations.

The total amount of Commercial/Retail uses is assumed to remain relatively stable between Alternatives and the Future Baseline Condition; however this represents a significant increase over existing conditions. Retail uses are assumed to be located

---

6 Colliers Monroe Friedlander Consulting, City and County of Honolulu General Plan Update Commercial Real Estate Market Trends Report, 2010, p 10.

at street level with Auahi Street as a major retail street. Other commercial uses such as professional services may locate in upper stories or will be vertically mixed within projects throughout the district. There are no restrictions currently proposed on the type, and size of retail uses within the district under the Proposed Action.

2.3.2.4 Industrial

Industrial uses in the Proposed Action are assumed to continue existing trends in the Kaka`ako area that include continued gentrification of existing urban industrial properties, near-term and mid-term ground lease expiration, rising industrial land cost and rental rates, and movement towards West O`ahu industrial park developments.[7] In the KCDD, HCDA has provided an incentive towards industrial uses in both the Ward and Kamehameha Schools Master Plans. As such, the Alternatives assume a minimal increase of 87,000 SF over the Future Baseline Condition associated with the general capacity increases in these two areas.

The types of industrial use acknowledge a trend towards diversification, including buildings that may mix office uses with light industrial, creative research, and development intensive services. These uses may occur in vertical, multi-tenanted structures with a higher number of workers per square foot. These structures are assumed to be compatible with residential and other commercial and entertainment uses and take advantage of proximity to transit.

2.3.2.5 Civic

The Proposed Action explores the potential expansion of Thomas Square Historic Park as associated with the redevelopment of the Blaisdell Center performing arts center and arena. Both Alternatives include the provision of a new public plaza, pedestrian connections and public uses – such as a performing arts center and sports arena on the Blaisdell Center property.

However, the allocation of an expanded park on the Blaisdell site would be possible only with participation of the City and County of Honolulu (the landowner) and other state and county agencies, and with the inclusion of enough revenue generating uses to cover the associated costs. At this stage in other neighborhood areas within the Mauka Area, civic uses have generally not been differentiated from other types of commercial or entertainment uses.

2.3.2.6 Residential

The TOD Alternatives both include significant increases in residential development. Overlaying transit-oriented development on the KCDD Mauka Area provides an opportunity to revisit the existing Reserved Housing Policy defined in the Hawaii

---

7 Ibid. p 10

Revise Statues (Chapter 217). The following summarizes HCDA's plans to provide affordable housing as part of the TOD Overlay Plan:

- Residential Projects that include residential units of 10 or more must provide at least 20% of the residential units as reserved housing units.
- Hotels and other commercial development shall have the requirement to provide reserved housing. The HCDA will develop a formula for the number of units to be provided.
- The reserved housing price shall be based on area median income of 80-140%. The HCDA shall develop a formula for what percentages of the reserved housing units are provided at what AMI level.
- As much as feasible, the HCDA will couple the reserved housing requirement with incentive-based zoning. The number of reserved housing units required for a particular project should in in line with the incentive provided for the project.
- The developer must sell the units, priced between 80-140 percent of AMI, to qualified buyers with deeded covenants in favor of HCDA that include a buy-back provision for every successive future sale of the unit, and in the event that the HCDA waves its right to buy-back, a perpetual equity sharing provision.
- The buy-back price shall be based on the original purchase price, inflated by an appropriate index plus owner-paid unit improvements; or indexed to the AMI at the time of resale, whichever is lower.
- A reserved housing buyer shall set an equity-sharing percentage at the time of the original purchase. HCDA's share of the equity upon resale will be transferred to the HCDA's Reserved Housing Sub-Account in the event that HCDA waves its right to buy back the unit.

The developer may also choose to develop rental units, in which case the reserved housing units shall be rented to tenants qualified between 80 to 100 percent of AMI. Such rental units shall remain as reserved housing for a period of 30 years. The developer will be responsible for managing such units. After the regulated period the reserved housing units may be sold with HCDA or a successor agency having the first option to purchase.

Jointly this program, along with the ongoing efforts by the State of Hawaii Housing and Finance Development Corporation (HHFDC) that enable affordable housing in the KCDD, aims towards income diversity and workforce housing availability. HCDA has broad discretion and control to influence the type of units available as reserved housing to accommodate identified neighborhood needs, including larger family units.

TOD Alternative A envisions an approximate 37% increase in total residential SF over the Future Baseline Condition. This increase can be attributed to greater allowable capacity on TOD eligible sites (up to 10 FAR in Pauahi and Auahi), and

taller allowable heights. This Alternative assumes a possible increase of up to 7,822 housing units.

TOD Alternative B would result in an approximate 25.7% increase in overall residential units from the Future Baseline Condition, equaling approximately 5,443 units.

2.3.2.7 Parks and Open Space

Both Alternatives maintain all existing parks and existing and already negotiated open spaces a part of already improved developments, and in addition, will create opportunities for activated public realm associated with new street level connections, plazas and potential civic uses. An estimated 7% net area is proposed for building amenity spaces to be used by building tenants. This requirement does not penalize developers for choosing smaller unit sizes and is comparable to 55 SF per unit required under the existing Mauka Area Rules.

The following strategies are proposed towards meeting the goal of an active livable community within Kaka`ako, including a variety of multi-purpose active open spaces.

- An incentive program will provide for correlating the allocation of activated spaces for additional height and capacity. Spaces may be allocated on site, for example on green roofs as well as contribute to a dedicated in-lieu program to further develop planned parks and open spaces. This encourages private investment in open space and recreational facilities.
- Both the Alternatives explore the ability to allocate a large park space located on a redeveloped Blaisdell Center Site, and a redeveloped HECO site, both in the Thomas Square Neighborhood.
- The Proposed Action guides HCDA in the integration of a new transit plaza associated with the Civic Center Station.
- Green connections and mid-block paths are associated with redevelopment of consolidated parcels under both Alternatives.
- The Proposed Action directs HCDA to tie a minimum of fee ($ per SF) or per FAR to public active space. A tiered program may be proposed for each neighborhood prioritizing needed amenity.

Under both Alternatives, the majority of new public useable open spaces will be built as part of redevelopment projects. These spaces will be found not only in civic-scaled public parks, but also in small pocket parks on streets (promenades), semi-public courtyards, publically accessible interior spaces, public viewing plazas, and community gardens. Public spaces that are developed concurrently with individual sites may have full or partial public access (such as a grade-level or elevated courtyard, residential stoops, or gardens), and may be either publically or privately owned. In all instances, public spaces must be usable, neighborly, and provide for multiple functions where feasible.

2.3.3 Mauka Development Parameters

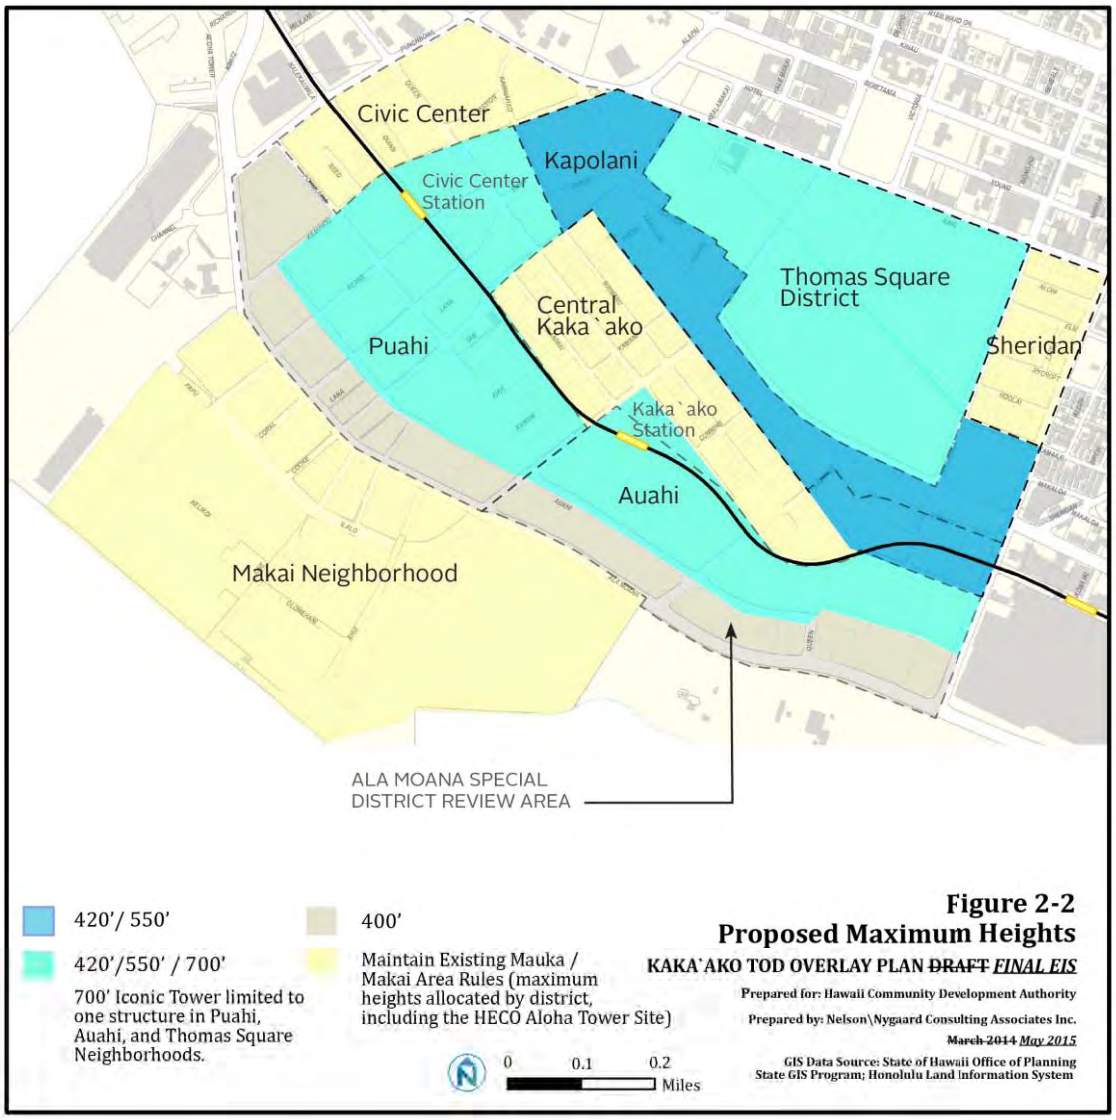
The TOD Alternatives test the results of new FAR and height limitations, and the application of very general design standards, focusing on those blocks that are most likely to redevelop. (Not all sites, particularly those with existing major projects, unconsolidated land ownership, or currently entitled buildings are assumed to redevelop under the Proposed Action.) The Future Baseline Condition allows properties in the Mauka Area to develop to a maximum floor area ratio (FAR) of 3.5, exclusive of parking, (an additional 1.5 to 2 FAR can be assumed for parking).

Under the Proposed Action, the intention for including parking into capacity controls (FAR) is to encourage efficient use of space allocated to parking. The TOD Alternatives establish a new maximum target FAR, inclusive of parking by neighborhood zone, in the range of 6.5 up to 10.0 FAR. Planning-level assumptions for gross SF of land use and parking capacity developed in various 3D modeling programs provided a basis for analysis. However, redevelopment may take place at a variety of different scales.

It should be noted that a slightly different process was used to create capacity estimates in Ward Neighborhood Master Plan and Kamehameha Schools Master Plan Areas. TOD Alternatives explored height increases to mid- and high-rise residential buildings in coordination with the entitled master plan allowances. This estimate is used to understand the impacts for a moderate (TOD Alternative B) to a significant amount (TOD Alternative A) of additional growth beyond the existing Master Plan. Neighborhood height increases for TOD Alternative A are summarized on the following map in Figure 2-2. Under TOD Alternative B, height increases would be limited to 418 feet. (See Section 2.3.5 below for a more detailed discussion of building heights.)

The **TOD Alternative A** "as of right" capacity is 5.0 FAR including all floor area associated with parking. The maximum proposed FARs in tested sites range from 7 FAR to a maximum of 10 FAR. With a potential for increased development capacity, this Alternative anticipates a redevelopment pattern that, depending on the size of the parcel, can accommodate multiple, inter-related buildings on a single development block. (See Figure 2-3)

Figure 2-2: Distribution of Building Heights – TOD Alternative A



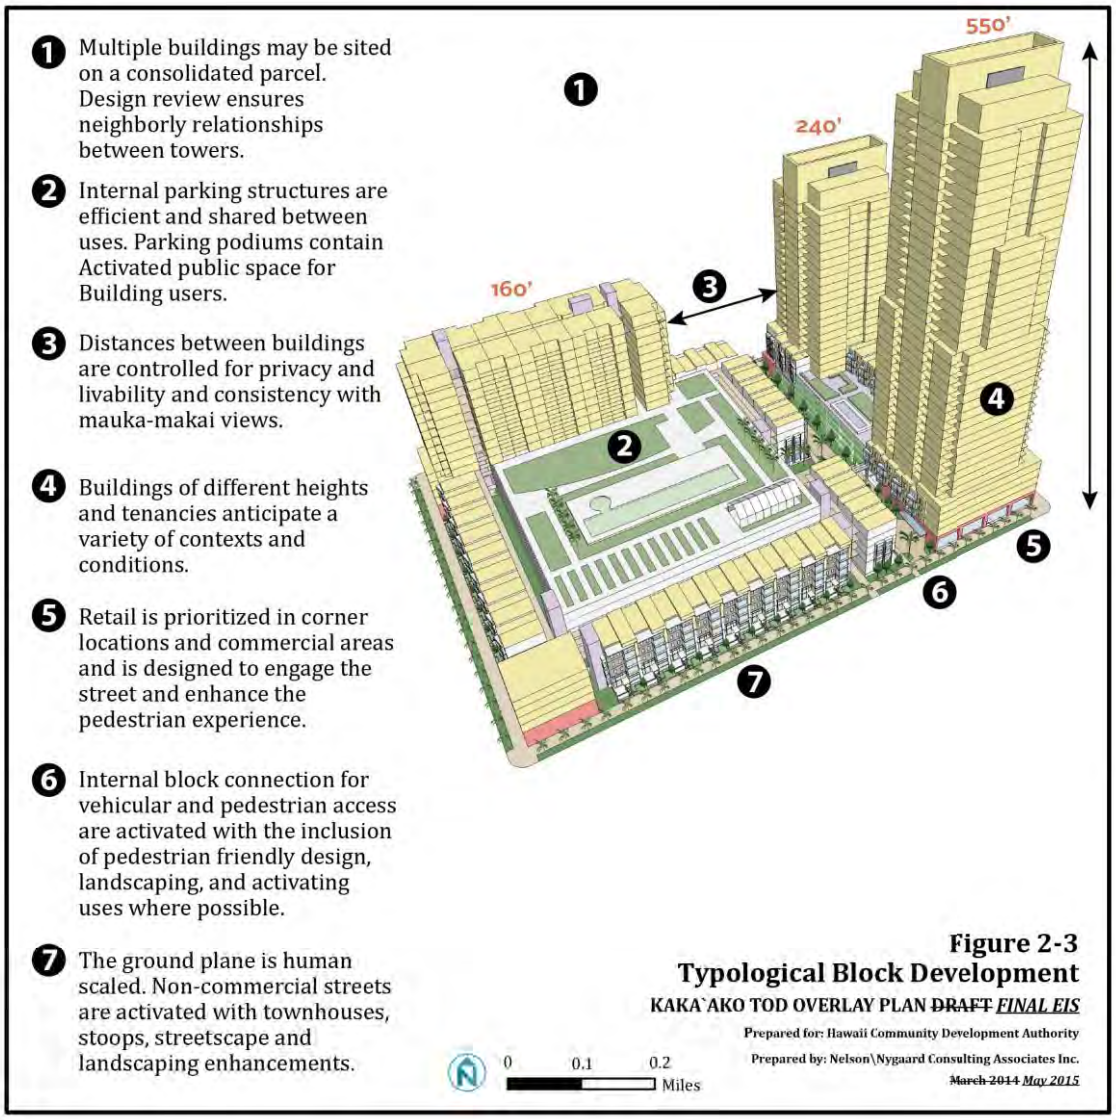


Figure 2-3: Typological Block Development

The **TOD Alternative B** "as of right" capacity is 5.0 FAR including all floor area associated with parking. The maximum proposed FARs in tested sites range from 7 FAR to a maximum of 9 FAR. The capacity is slightly reduced to a maximum of FAR 9 in Auahi and Pauahi with all else holding equal.

In both Alternatives, an incentive zoning method is proposed as a future implementation tool to achieve bonuses beyond the "as of right" development allowances. In an incentive zoning method, developers provide amenities (or payments allocated towards those amenities) in exchange for development rights.

With more intensive use of property there are greater profits. As a trade-off for a greater intensity of use, the land developer is asked to contribute to enhanced public realm, cultural amenity and/or street connectivity. Adequate profitability is also required of private developers and their investors to ensure that rezoning efforts do not simply elevate land values. Incentive zoning programs must be carefully managed to ensure that the value of the community amenity is proportional and outweighs any adverse effects caused by additional building bulk. The specific parameters of the incentive zoning method are, however, beyond the scope of this EIS and will be addressed during rule making by the HCDA.

2.3.4 Urban Design

Using basic design parameters, both TOD Alternatives include an Urban Design Framework that adjusts the urban form provisions as identified in the Mauka Area Plan to accommodate increased density and heights. The Urban Design Framework is also supported by considerations regarding mobility and access, including attributes of street design, parking requirements, public realm and activation, as well as attention to integrating ~~HART~~ ***light metro*** stations into the neighborhoods.

Urban Design strategies as outlined in the Proposed Action are intended to:

- ensure appropriate building siting and view preservation in the district;
- activate the streets and ground plane including a set of "typed streets" and secondary access lanes for improved connections that build on the Mauka Area Plan and Rules;
- create an alternative to most residential areas of O`ahu, that being a high rise neighborhood with a variety of development types;
- ensure adequate sunlight, views and public active space for a livable neighborhood; and
- create a flexible, form-based framework for redevelopment.

To understand how a general height increase would impact the area, the Alternatives test a diversity of high-rise types and a hierarchy of building form as described in Section 2.3.5 below.

2.3.5 Building Height

The Proposed Action's policies seek to encourage exemplary buildings and advance the development of well-sited, tall, slender towers. When planned well, high-rise residential neighborhoods create a skyline of framed views through and between towers, as well as green spaces on podiums that will enhance views down from neighboring buildings and residential areas on the slopes of Punchbowl, Pauoa, and to a lesser extent, Makiki. A sensitive application of height paired with quality streetscape design can produce the characteristics of a comfortable pedestrian-oriented environment on the ground plane, while adding to the overall capacity in Honolulu's Primary Urban Center.

Building height also has economic impacts. For example, it can offset costs associated with more slender buildings, and allocation of space at the ground level.

Due to parking structures typically required above grade, the scale and mass of building bases will be similar in both Alternatives and the amount of parking required for the development can act as a de-facto limitation on total site capacity. However, with the assumed implementation of the Proposed Action's mobility, circulation and access strategies, a drop in the ratio of parking spaces desired per unit may be palatable to developers and people choosing to live in Kaka'ako.

The Future Baseline Condition allows three levels of building height in the Mauka Area:

- A maximum of 65 feet for Street-Front buildings;
- A range of 80 to 215 feet for Mid-Height buildings impacting view planes; and,
- A maximum of 400 feet for any Towers taller than Mid-Height buildings.

In the Makai Area, the Future Baseline Condition allows building heights generally to 200 feet. Under the Future Baseline Condition, tower floor plates are restricted by lot size. Setbacks and siting are controlled according to a Regulating Plan.

TOD Alternative A changes these parameters to allow for a maximum height for buildings as determined by a specified Building Type and Neighborhood Zone. All proposed TOD Overlay high-rise building types are limited to lot sizes of 40,000 or greater. Towers reaching 550' or greater are limited only to lot sizes of 90,000 SF or greater, with one tower allowed per development site (see Figure 2-2). Alternative A limits the allocation of up to 700' to three Iconic Tower buildings one allowed in each of the Auahi, Pauahi and Thomas Square Neighborhoods. The Alternative includes a total of nineteen mixed-use towers at heights ranging between 400 and 700 feet as follows:

- Ten towers are estimated at 400-420 feet.
- Six towers are estimated at 420-550 feet.
- Three towers (including one tower in Pauahi, one tower at Blaisdell Center and one tower in Auahi) estimated at 650-700 feet.

High-rise building types are summarized below:

a) Efficiency Residential
Maximum Height 240'
Floorplate maximum: 20,000SF

b) High-Rise Commercial/Office
Maximum Height: 160'
Floorplate maximum: 28,000SF

c) Iconic Tower
Maximum Height: 700'
Tapering floor plate, ranging from
20,000 SF to 11,000 SF

d) Center Core/ Point Tower
Maximum Height 550' (Limited to parcels greater than 90,000SF)
(One tower per development block)

Center Core Maximum Footprint: 12,000SF
Maximum Dimension: 120'

Point Tower Maximum Footprint: 900SF
Maximum Dimension: 120'

TOD Alternative B: Under this Alternative, the maximum building heights remains at 418' within eligible areas. Building types tested under this Alternative are summarized following:

a) Efficiency Residential
Maximum Height 240'
Maximum Footprint: 20,000SF

b) High Rise Commercial/Office
Maximum Height: 160'
Floorplate maximum: 28,000SF

c) Center Core/ Point Tower
Maximum Height 418'

Center Core
Maximum Footprint: 12,000SF
Maximum Dimension: 120'

Point Tower
Maximum Footprint: 9,000SF
Maximum Dimension: 120'

Given the prevailing height limitation, this Alternative will likely result in less diversity of building form and more buildings that provide broader floor plates. Architectural form and massing may still take advantage of changes in plane and volume to accommodate variety. While the standards presented above are virtually the same, except for building height, it is likely that developers will seek to maximize density under TOD Alternative B. The end product will likely tend to be

somewhat shorter, squatter buildings when compared to those in TOD Alternative A.

2.3.6 Transportation

Both Alternatives assume that mobility and access are not ends in themselves, but rather, means for supporting community outcomes. This portends future investments in Complete Streets prioritized to move people efficiently, safely, and comfortably.

While there are many types of walkable, transit-oriented communities around the world, they share a common characteristic: people can walk, bike, or take transit from their homes to accomplish many of their daily activities. Transitioning Kaka`ako to a walkable community will require well-coordinated public investment centered on transit stations and nodes.

To provide sufficient space for civic life, shopping, comfortable sidewalks, and vital commerce, spatially efficient modes of transportation must be prioritized. Locating jobs, housing, and services within walkable communities reduces the need for short inefficient auto trips. The six "D" principles outlined in Section 2.2 above describe how land uses and transportation integrate to create a walkable, transit-oriented community in Kaka`ako.

When the ~~HART rapid transit~~ ***light metro*** system becomes active, many more people will travel in and out of Kaka`ako each day without a car. Since almost every transit trip is preceded or followed by a walking or bicycle trip, emphasis should be placed on improving conditions for non-motorized mobility and access. The quality of pedestrian and bicycle access to transit is largely dependent on factors controlled in the public street right-of-way.

Both TOD Alternatives recommend a policy hierarchy to guide transportation and prioritize transit access investments as the KCDD is redeveloped. Figure 2-4 illustrates the modal priority contained that guides implementation.

2.3.6.1 Transit

Both Alternatives encourage transit integrated redevelopment and enhance access to ~~HART~~ ***light metro*** stations from all parts of Kaka`ako. While is responsible for the design of the stations themselves, the TOD Alternatives contemplate a set of strategies and actions for the areas around the station. Streets, paths, signage, connections to feeder transit, and buildings in the station area are the elements that tie the station together with the surrounding community.

Figure 2-4: Modal Hierarchy

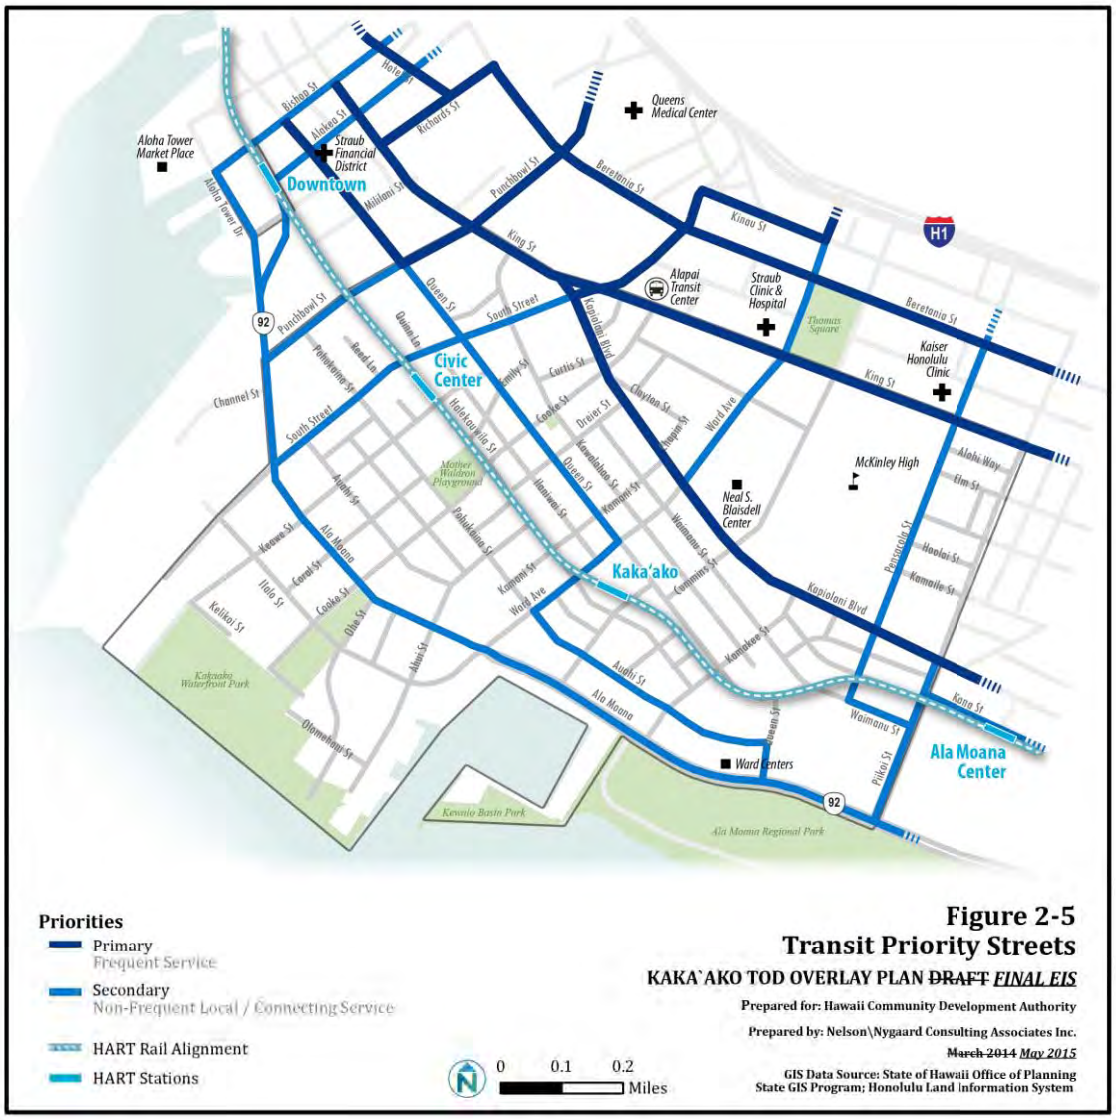
Specific integration opportunities are explored for the three ~~HART~~ ***light metro*** stations: Kaka`ako Station, Civic Center Station, and Downtown Station. These strategies and actions are intended to improve connections and enhance the overall accessibility of the ~~HART~~ ***light metro*** stations as well as mitigate the impact of the elevated alignment along Halekauwila Street. Actions address setbacks, propose the location of potential new connecting streets, establish primary pedestrian access, and provide opportunities for bicycles and feeder service facilities.

As the City and County of Honolulu continues to enhance public transit, it will be important to coordinate these investments with improvements in street design, establishing clear priority for transit on important routes. Some transit routes are more important than others and different types of service require different strategies for integration with other modes of transportation. Designing streets to be sensitive to the needs of transit will require HCDA to develop clear, site-specific guidance for the different routes through the KCDD.

Figure 2-5 illustrates streets where it is critical to consider transit operations in the design and allocation of right-of-way. The dark blue, or primary corridors, are those that carry high-frequency bus service and where dedicated rights-of-way or higher levels of investment in intersection priority treatments may be needed. The introduction of rapid transit to the KCDD will significantly change the dynamic for

access to the district and mobility between the district and adjacent areas on the transit line.

Figure 2-5: Transit Priority Streets



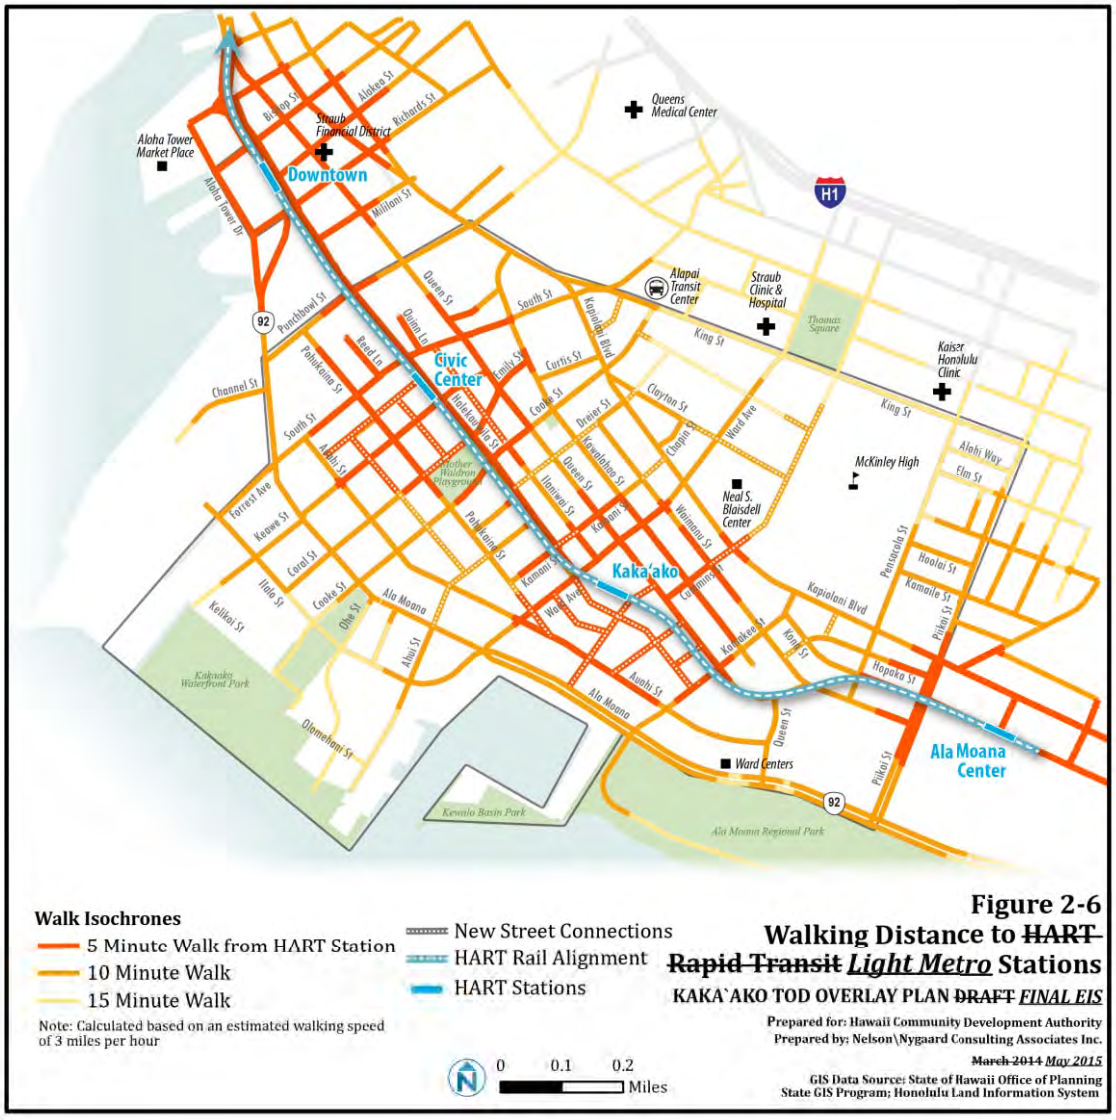


Figure 2-6 in Chapter One illustrates the approximate walk time to a ~~HART~~ ***light metro*** station from different parts of the district. If also shows how new street and pedestrian connections provided in the TOD Alternatives extend the amount of people and places with a 15-minute walk of a future ~~HART~~ ***light metro*** station.

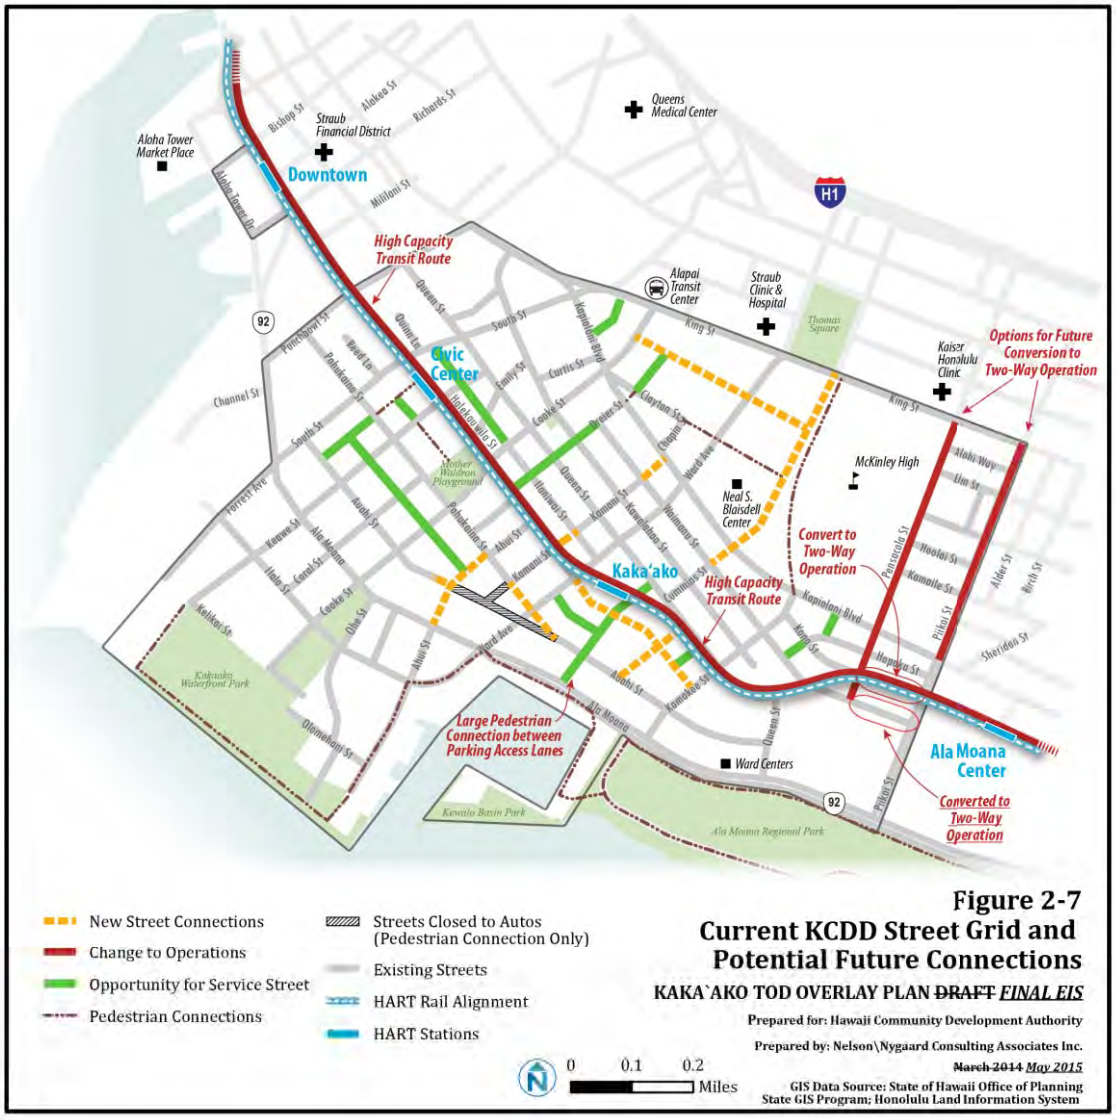
Both TOD Alternatives initiate a modal hierarchy based on a Pedestrian First approach followed by transit, bicycles, and autos. Strategies are organized into two components—improving street connectivity and improving the modal hierarchy,



and are supported by implementation-focused actions and regulatory changes. Figure 2-7 shows the existing KCDD street grid and potential future connections as associated with urban-scaled redevelopment.

Figure 2-6: Walking Distances to ~~HART Rapid Transit~~ *Light Metro* Stations

Both TOD Alternatives include a series of strategies directing HCDA to plan and implement a "Complete Street Network" to substantially increase district access for non-motorized and transit users while preserving current levels of person mobility.

Figure 2-7: Current KCDD Street Grid and Potential Future Connections

Many of the strategies presented in the Proposed Action related to mobility and access are not the direct responsibility of HCDA and may require inter-agency coordination or partnerships to ensure implementation. In these cases, strategies are considered to be guidelines, rather than firm requirements.

Figure 2-8 illustrates the route for a potential streetcar circulator that would connect key KCDD destinations and neighborhoods with Downtown, the Civic Center, Ala Moana, and potentially with Waikiki.

Figure 2-8: Local Circulator Options

Introduction of rapid transit in Kaka`ako and adjoining districts is likely to increase overall demand for bus and at-grade transit.

2.3.6.2 Pedestrian Accessibility

Figure 2-9 illustrates where pedestrian design and investment are prioritized as the district develops and TOD in Kaka`ako is realized.

Primary pedestrian priority streets are those that connect key destinations in or adjacent to the district, including ~~HART~~ ~~rail~~ ***light metro*** stations, and that will ultimately support active street front uses such as retail stores, public plazas, and

entertainment venues. These streets require spacious sidewalks and a high level of pedestrian amenity.

Figure 2-9: Pedestrian Priority Streets in the KCDD

Secondary pedestrian priority streets are those that do not provide direct connections to major destinations or have very high traffic volumes. While these streets may never be ideal for walking along for long distances, they must still be safe enough to accommodate walking, and they should be easy and safe enough to cross that they do not serve as a barrier to pedestrians.

Low speed streets are generally service streets that may have narrow widths and where pedestrians and traffic are expected to mix in a shared right-of-way. Note

that the term "low speed streets" should not be interpreted to suggest that high-speeds are promoted elsewhere in the KCDD.

Greenway connections are streets where there is opportunity to connect parks, green-space, and public plazas with well-landscaped, shaded, and interesting walking routes.

2.3.6.3 Bicycle Accessibility

Figure 2-10 illustrates where cycling facilities should be prioritized. Primary streets are those where fully separated facilities (i.e., cycle tracks or buffered bike lanes), or on-street bike lanes should be considered. Secondary streets are those that should be signed and marked for bicyclists (with shared lane markings), but where cyclists would share the lane with traffic. Low speed streets are those that have design features that calm traffic and require motorists to drive at speeds that allow cyclists to easily integrate with traffic. The TOD Alternatives anticipate a Bike Share program.

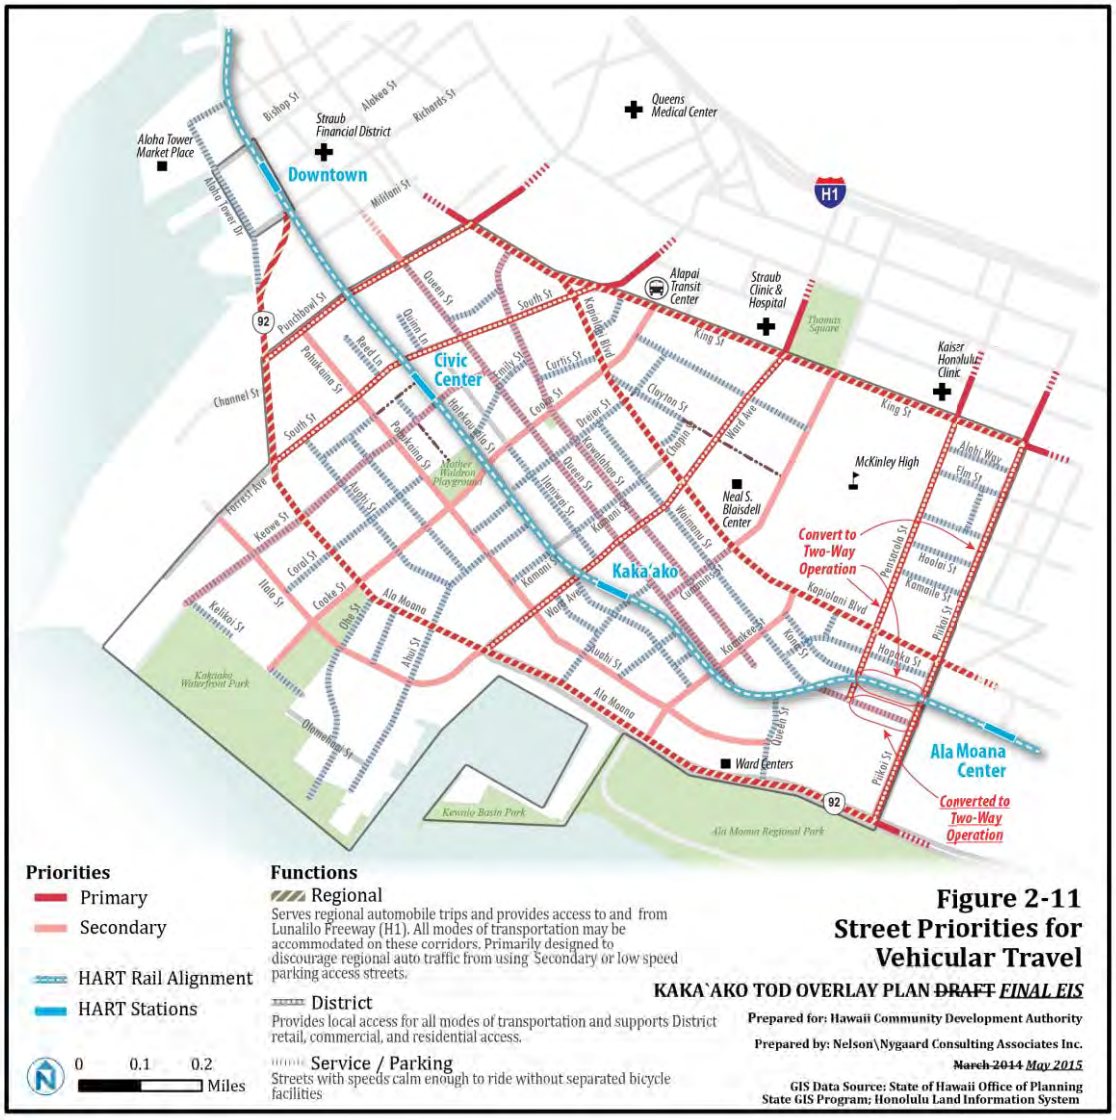
2.3.6.4 Automobile Accessibility

Figure 2-11 illustrates Primary and Secondary Vehicular Streets that function to move auto traffic through the KCDD. All streets in the KCDD, unless a pedestrian-only connection, accommodate motor vehicle travel.

Earlier in this Chapter, Figure 2-7 illustrated the potential for a more Complete Street-oriented grid. The TOD Overlay Plan and both Alternatives would require large developments to provide through-block pedestrian connections when a substantial portion of a block is developed with commercial projects or when the ground floor uses are largely commercial. In cases where adequate lot size exists to develop two commercial projects on a block, a through block pedestrian connection is required. The Proposed Action's policies also differentiate between new full street connections, new pedestrian-only connections, and former street connection turned pedestrian-only connections.

2.3.6.5 Parking

The treatment of off-street parking within a neighborhood has an impact on the quality of the public realm. Parking facility location and configuration influence not only the building form and land use options, but also the ways in which future users will travel or interact with the neighborhood. With the introduction of high-capacity transit and Complete Streets, Kaka`ako will transition to a "park once" location. This strategy encourages people who drive to the neighborhood to park only once and walk to a variety of destinations. ***Following is a summary of proposed parking policies and incentives envisioned under the Proposed Action:***



- ***Manage On-Street Parking***

    - ***Price on-street parking to ensure availability***
        - ***Designate zones and monitor parking occupancies***
        - ***Implement a pilot test of metering pricing***
        - ***Consider creating parking benefit districts***
- ***Remove Minimum Parking Requirements***
- ***Include Building Area Devoted to Parking as Part of Calculated Floor Area***
- ***Establish a Park-Once District in Kaka`ako***
    - ***Work with property owners and businesses to ensure that existing private parking is made available to the public when not needed for its primary commercial use***
    - ***Maximize use of the existing parking supply by improving wayfinding and parking information***
- ***Unbundle Parking Costs from Housing Costs***
- ***Unbundle Parking Costs from Commercial Leases***
- ***Tandem and Stacked Parking Permitted by Right***

Figure 2-10: Cycling Priority Streets

Figure 2-11: Street Priorities for Vehicle Travel

To ensure that parking demand and supply are in balance, the TOD Alternatives include the area/space needed for parking in overall density controls. Under the Mauka and Makai Area Rules, building volumes associated with above-ground parking are not included in the maximum FAR calculation, e.g. an FAR of 3.5 does not include how many floors of parking garage or area of at-grade parking that may be needed for the development. It is understood that for each new building to accommodate parking structures, an additional one to two FAR (3.5+1.0 or 3.5+2.0) are generally required (depending on the building's use). The TOD Alternatives shifts this strategy to recognize parking and its impacts as a land use.

2.3.7 Infrastructure

A KCDD Mauka Area Infrastructure Plan Update has been prepared to identify infrastructure system improvements to support future development, redevelopment, growth, diversification and densification of land use and population. The proposed infrastructure system would support a development projection to year 2035 and possibly beyond, depending on the rate of development. A summary of the infrastructure assessment and recommendations for improvement are provided below.

Since its establishment in 1976, HCDA has implemented eleven construction projects as part of its Improvement District (ID) Program to improve the network of streets and infrastructure within the KCDD in order to facilitate and encourage redevelopment and growth and maintain a safe, active community where visitors and residents may comfortably and conveniently live, work and play. The ID Program, which received funding from the Hawaii State Legislature and contributions from property owners and public utility companies, installed improvements within the road right-of-way such as: reconstructing and/or widening streets; installing streetlights, curbs, gutters and sidewalks; improving storm drain, sanitary sewer and water systems; and, upgrading and/or undergrounding of electrical power and communication systems.

A twelfth project, for improvements within Queen Street between Ward Avenue and Kamakee Street, received public opposition and construction bids exceeded available funding; as such, this project was cancelled. HCDA has no plans for future projects as part of the ID Program.

2.3.7.1 Drainage

The existing drainage system within the KCDD is inadequate to accommodate the design flows for both the existing and future conditions when including flow from outside the KCDD. [8] However, improved streets (those with curbs, gutters, sidewalks and storm drain facilities), can generally handle rainfall under moderate to severe storms. Therefore, improvements of unimproved streets are suggested so they would not be as prone to flooding during moderate rainfall events.

Since most of the Proposed Action improvements are anticipated to be vertical developments and the City requires that proposed improvements not discharge runoff to the municipal system in excess of the current condition; the anticipated affect to the municipal system will be negligible. As such, roadway flooding concerns and existing drainage system inadequacies would not be exacerbated.

---

[8] Reference: Final Supplemental Environmental Impact Statement for the Kakaako Community Development District, Mauka Area Plan dated May 2009, Volume III, Appendix E - Mauka Area Infrastructure Plan

The majority of the KCDD is at elevations between the 5- and 10-foot above mean sea level and, is potentially susceptible to future sea level rise.

A large portion of the KCDD is within the Federal Emergency Management Agency (FEMA) designated Special Flood Hazard Area. FEMA regulates developments within flood hazard areas and the City DPP administers the floodplain management program.

Please refer to a detailed discussion of the KCDD's drainage system in Chapter Four, Section 4.11.4.2.

2.3.7.2 Potable Water

The existing water distribution system in the KCDD is adequate to meet the peak hour domestic demands of the Proposed Action (either alternative). However, approximately 37,600 linear feet of existing 6- and 8-inch water mains will need to be replaced with new 12-inch diameter mains to meet ~~both peak hour domestic consumption demand requirements and~~ 4000-gpm fire flow requirements.

2.3.7.3 Wastewater Collection and Treatment

The existing KCDD Mauka Area sewer system as modified by planned Howard Hughes Group (HHG) system improvements and Future Baseline and TOD Alternative proposed improvements will be capable of meeting peak hour wastewater flow requirements. Surcharged conditions will, however, continue to be experienced in branch sewers, but given the sewer line depths, spills will not occur.

Currently planned improvements include the City's Mauka Relief Sewer Corridor project, which significantly impacts the Mauka Area's wastewater master plan. Per discussion with City Department of Environmental Services (ENV), the City does not have a schedule for completing the Mauka Relief Sewer Corridor. ENV acknowledged that the project is behind schedule within Kaka`ako and that they will need to complete the improvements by year 2020, implement an alternative project, or request to extend the completion date.

2.3.7.4 Solid Waste Disposal

No modifications to the solid waste disposal program within the Mauka Area are proposed. Expansion of private contractor provided collection services might be required to meet future increased demands.

2.3.7.5 Electrical

To provide for future electrical requirements, Hawaiian Electric Co. (HECO) may serve the additional loads from its Iwilei and Kewalo Substations by adding another substation transformer, or construct and energize its proposed Cooke Street

Substation site, or a combination of the these alternatives. Beyond 9 years, HECO will likely need to secure an additional substation site; however, the need for this site would be evaluated by HECO based on actual load growth experienced before year 2035.

Where overhead facilities exist, consideration will be given to constructing underground duct systems and relocating the existing overhead conductors.

2.3.7.6 Telecommunications

Hawaiian Telcom's (HTCo.) existing Alakea and Kaka'ako Central Office facilities appear adequate to accommodate the projected residential, commercial and industrial developments. However, HTCo. may request easements within the Mauka Area or from building developers to allow multi-plexing "pair-gain" units, which would concentrate 100 customer lines onto 1 HTCo. trunk line and lessen the quantity of cables HTCo. would need in their underground duct system or onto the joint pole system.

Similar to the electrical system, where overhead facilities exist, consideration will be given to constructing underground duct systems and relocating the existing overhead conductors.

Oceanic Time Warner Cable (OTWC) presently serves the Island of O'ahu from its Mililani Technology Park facility. In the Mauka Area, where the HCDA's ID program constructed underground duct facilities, no provisions were made for OTWC facilities. Therefore, to initially serve these areas, OTWC negotiated with HTCo. to use space within the HTCo. duct facilities.

After the construction of the OTWC duct line along Ala Moana Boulevard, OTWC may be able to reconfigure its system to lessen the impact on the HTCo. duct facilities. Construction of OTWC infrastructure within the road rights-of-way, however, may be required of developers to service connection points within their development.

Similar to the electrical and telephone systems, where overhead facilities exist, consideration will be given to constructing underground duct systems and relocating the existing overhead conductors.

2.3.7.7 Synthetic Natural Gas

Currently, Hawai'i Gas has no major upgrades or line installations planned in the Mauka Area. Hawai'i Gas has indicated that they can meet additional gas service needs through installation of new or larger lines, service laterals and meters, or by providing on-site containerized gas.

2.3.7.8 Traffic Signal System

A regional study of the existing and projected traffic flows is needed to determine feasible traffic signal timing and coordination changes. Any changes should be implemented as a single construction package rather than installed piece-meal. Consultation with the City Department of Transportation Services (DTS), which would review the proposed changes, will help to minimize conflicts with DTS's deployment of their intelligent transportation systems. Traffic signal controllers that do not currently have a modem and telephone connector will need upgrading to permit the signals to be controlled by the City through its Traffic Management Center. Finally, as the traffic signal duct system is developed, fiber optic cables and closed circuit television cameras could be installed to facilitate the intelligent transportation system.

2.3.7.9 Roadway Street Light System

With the increase of residential units and commercial properties within the Mauka Area, the illumination criteria on which the present street lighting system is based may need to be evaluated and the street lighting system may need to be upgraded to account for the higher pedestrian and automobile interaction. Also, consideration will be given to upgrading the streetlights to newer technology.

As existing overhead utility lines are placed underground, the joint pole mounted streetlights could be converted to conventional streetlights on concrete foundations. Additional electrical metering locations may need to be sited in order to provide power to the street light systems.

2.4 Implementation

Once the EIS process is completed, the Proposed Action will be adjusted to accommodate public input as appropriate. The HCDA will then draft rules for implementing transit-oriented development in the KCDD. The HCDA Board must formally adopt those rules in order for TOD to be implemented. The actual timing of new TOD development will proceed incrementally, depending upon the initiatives of private landowners and public agencies with specific interests in the District, economic cycles, and the availability of public funding.

2.5 Required Permits and Approvals

The following permits and/or approvals will be required for individual development projects:

Subdivision Approval (if applicable)	Department of Planning and Permitting
Building/Grading Permits	Department of Planning and Permitting
Installation of Power Lines & Substations	State Public Utilities Commission
National Pollutant Discharge Elimination System (NPDES) Permit	State Department of Health
Noise Permit	State Department of Health
Modification of Highway Access Points	State Department of Transportation
Work Within the State Highway ROW	State Department of Transportation
Dewatering/Stockpiling	Department of Planning and Permitting
Trenching	Department of Planning and Permitting
Street Usage Permit	***Department of Transportation Services***
Development Permit	Hawaii Community Development Authority
FAA Form 7460-1	***Federal Aviation Administration***

3.0 Alternatives to the Proposed Action

3.1 Introduction

The EIS analysis employs the following logic: if the KCCD is hypothetically built out in 2035 pursuant to the existing Mauka and Makai Area Plans and Rules that have previously been adopted by the HCDA, certain urban design characteristics will prevail which for the purposes of the following discussion are collectively referred to as the Future Baseline Condition. The Proposed Action is an "overlay" upon the existing Mauka and Makai Area Plans, meaning that it would augment the Future Baseline Condition, regardless of which TOD Alternative is selected. Thus, this analysis focuses on a comparison of how the district would appear in 2035 if built out under the current Mauka and Makai Area Plans and Rules (Future Baseline Condition) and how the district would appear in 2035 if built out under either TOD Alternative.

It is important to understand that either TOD Alternative is essentially optional. If the HCDA eventually adopts specific rules to implement transit-oriented development in the District, pursuant to either TOD Alternative A or TOD Alternative B, the decision to develop specific properties pursuant to those new rules rests with the landowner, who can opt to develop in accordance with the existing Mauka and Makai Area Rules, or can take advantage of the density bonuses, height exemptions (limited to TOD Alternative A), and parking-standard reductions provided under transit-oriented development. This "opt-in" approach ensures that the HCDA (as well as individual landowners) have flexibility in their decision-making and can respond to changes in factors such as the timing of the light rail system's construction as well as trends in the overall economy.

It is important to note here that even if the HCDA adopts rules for transit-oriented development, it still remains an opt-in program. The Ward Neighborhood and KS Master Plans present an example of this: not all parcels within both Master Plan areas are planned for maximum density and maximum allowable height.

3.2 Defining The No Action Alternative

For the purpose of evaluating alternatives in an EIS, it is required that a No Action Alternative be considered. But, what does No Action mean for an urban area that has been targeted for redevelopment since the 1980s? Unlike a vacant rural property that might remain undeveloped for decades, Kaka`ako is already a mature urban area that has seen cycles of redevelopment for well over a hundred years. As existing structures reach the end of their usable life cycle, they will be renovated or demolished and replaced by their owners. It is highly unlikely that individual landowners would take no action over the long-term, abandon their property, and allow existing buildings to slowly deteriorate into disuse, and in so doing, forfeit any further economic return on their investment. It is

equally unlikely that no further change will occur in the district, and the land uses present today will continue in perpetuity. For these reasons, the classic interpretation of No Action is neither reasonable nor relevant to Kaka`ako.

Because the existing development rules are already in place in the KCDD, and landowners in the KCDD are responding to them with development proposals, it is not reasonable to assume that new development in the district will suddenly stop and that the district would remain the same over the next two decades as it is today. While development responds to economic cycles, and periods of strong growth are typically followed by periods of weaker growth, over the course of time the ebb and flow of development in response to market conditions and economic cycles will result in continuing physical changes within the KCDD, pursuant to the Future Baseline Condition. Thus, it is unreasonable to conclude that no further development in Kaka`ako is a likely, or even remotely possible.

Because this EIS focuses on the intentions of a governmental development authority, for the purposes of considering a No Action Alternative, the question is this: what happens if HCDA takes no further action to revise the Mauka and Makai Area Plans and Rules? In Kaka`ako, if no further action is taken by HCDA, the regulating authority, to revise the Mauka and Makai Area Plans and Rules, the future development of the district would be governed by the existing rules. Thus, the No Action Alternative is the same as the Future Baseline Condition: by the 2035 planning horizon, development in the district would be implemented in accordance with the rules that are already in place. The extent of that development is subject to market conditions and economic cycles, but the character of that development will ultimately be consistent with the development plan rules that are in place today; the Mauka and Makai Area Plans and Rules.

3.3 Implementing the Existing Mauka District Rules (Future Baseline Condition)

3.3.1 Explanation of 2035 Planning Horizon

The target year 2035 was determined by the availability of population forecasts developed by other agencies, including the State's Department of Business, Economic Development & Tourism ("DBEDT") and the City and County of Honolulu's Department of Planning and Permitting. The target year is not based upon market assumptions. No market analysis for development scenarios has been conducted for the Proposed Action. Rather, HCDA is responsible for adopting plans and rules to guide the redevelopment of the KCCD, irrespective of market conditions. Thus, for the purposes of this EIS, 2035 is identified as the target year for full build out according to the existing rules, as well as under the Proposed Action.

In all likelihood, full build out will not be completed by 2035. The target year has been selected based on the availability of population forecast data in order provide a

reasonable basis for comparing the future without the Proposed Action and with the Proposed Action. In reality, market conditions in Hawai`i roughly follow a 10-year economic cycle. Development tends to slow once the market reaches its peak and starts to decline, and then development accelerates as the market strengthens following the bottom of the economic cycle. Hawai`i is presently in the accelerating phase of the current economic cycle. It is anticipated that at least two, or possibly three market cycles will occur between now and 2035. Given this phenomenon, the Future Baseline Condition assumes full build out in the target year for the purposes of this EIS analysis irrespective of market cycles.

3.3.2 Summary Description of Baseline Condition

Table 3-1 summarizes the build out of the KCDD in 2035 under the Future Baseline Condition. The following principles are presented in the Urban Design element of the Mauka Area Plan. They describe the vision for the KCCD in 2035 under the prevailing rules:

- Create an outstanding pedestrian environment;
- Create a network of green streets;
- Provide a maximum of road connections;
- Connect pedestrian paths across major thoroughfare;
- Strong Mauka-Makai linkage;
- Support the small-lot, mixed-use pattern of Central Kaka`ako; and
- Support TOD.

Under the Mauka Area Plan and Rules, properties are allowed to be developed to a maximum floor-area-ratio (FAR) of 3.5 with the following exceptions:

- In Sheridan, all lots other than those that front King Street will have a maximum FAR of 2.0 to reflect the residential use pattern and building scale of the neighborhood, and
- In areas where infrastructure has not been upgraded pursuant to an improvement district and/or where streets do not meet the proposed standards in the Mauka Area Plan, the maximum FAR will remain 1.5. Once the infrastructure is upgraded, the maximum allowable FAR will be increased to 3.5.

Three major building morphologies were established to guide building form and height:

- Street-Front Element: Along blocks planned for promenade sidewalks, the Street Front Element must house active uses, such as offices, residences, and retail. On the ground floor, building entries and windows are required. Parking structure uses are allowed above the ground floor on blocks not designated for Promenade treatment.
    - Maximum Height: 65 feet
    - Minimum Height: Four stories or 40 feet, which ever is greater.

- Mid-Height Element: the maximum height for this element is determined by view planes from shoreline parks (Kaka`ako Waterfront Park and Kewalo Basin Park) looking mauka towards the Ko`olau mountain range. The intent is to encourage projects that maintain mauka-makai view planes.
    - Maximum Height: Range of heights 80 – 215 feet.
    - Footprint: No restriction, aside from Street-Front Elements and height setback requirement.
- Tower Element: This building morphology is provided for taller buildings and variations in the skyline while keeping a slender profile as the building increases in height.
    - Maximum Height: 400 feet where allowed.
    - Maximum Footprint: 8,000 – 16,000 square feet based on the development parcel size.
    - Length-to-Width Ratio for Tower Footprint: Limited by a maximum distance of 210 feet between the two farthest points on the tower footprint.
    - Tower Orientation: Tower to be oriented Mauka-Makai.

Table 3-1: Floor Area Build Out in 2035 – Future Baseline Condition

	Residential Units	Hotel Units	Residential SF	Hotel SF	Civic SF	Office SF	Retail SF	Industrial SF
KAKA'AKO TOTAL	**20,542**	**-**	**27,889,276**	**-**	**1,637,865**	**8,834,706**	**4,030,547**	**1,817,075**

Makai Area	-	-	-	-	426,695	1,112,191	303,116	103,500
Aloha Tower Special District	-	-	-	-	-	30,000	120,000	-

The Future Baseline Condition assumes that the district will retain its current development parameters and land uses as allowed under the Mauka Area Rules (2011), Makai Area Rules (2005), and approved Ward Neighborhood Master Plan and Kamehameha Schools Master Plan. All existing planning and implementation policies and existing development regulations would continue to guide development decisions for properties within the District. This scenario would extend negotiated agreements in each of the Master planned areas and assumes that no new changes would occur to land use or transportation in the KCDD other than those already programed as part of existing City or HCDA plan or proposed by other agencies.

The Future Baseline Condition does not include direct coordination with the HART alignment or mitigations that will capture the value of this public investment.

3.3 Comparing the Future Baseline Condition and the TOD Alternatives

Table 3-2 presents the general difference between TOD Alternative A and the Future Baseline Condition in 2035 in terms of building density. For example, for Kaka`ako in total TOD Alternative A will result in approximately 7,892 more residential units than would be built out under the Future Baseline Condition, but would result in a decrease in office and retail space district wide. Table 3-3 presents the general difference between TOD Alternative B and the Future Baseline Condition.

As the Proposed Action (both TOD Alternatives A and B) would result in no transit-oriented development in the Makai Area (other than some possible street improvements), it would have no direct impact on that area in terms of new development. For the purposes of analysis, the entire KCDD was divided into numbered block areas. Figure 3-1 summarizes the block areas, or "sites", that were analyzed for TOD and compares the density increases under TOD Alternatives A and B.

A more extensive comparison is presented in Chapter Four in the discussion of specific project impacts.

Figure 3-1: Distribution of TOD by Block Area – Comparing TOD Alternatives A and B

Table 3-2: Additional Development Resulting from TOD Alternative A

	Residential Units	Hotel Units	Residential SF	Hotel SF	Civic SF	Office SF	Retail SF	Industrial SF

Central Kaka'ako	818	-	1,362,234	-	-	(333,885)	11,205	(152,454)
Civic	-	-	-	-	-	-	-	-
Kapiʻolani	891	-	1,483,665	-	(12,602)	43,003	(178,051)	-
Sheridan	-	-	-	-	-	-	-	-
Thomas Square	1,055	356	1,899,561	204,000	141,085	(1,261,047)	(295,107)	-
Makai	-	-	-	-	-	-	-	-
Aloha Tower Sp. Dist.	202	372	336,768	175,000	-	250,800	(58,360)	-

Note: Figures in parentheses are negatives.

Table 3-4 summarizes the difference between TOD Alternatives A and B for the total Kaka`ako area when compared to the Future Baseline Condition. For example, TOD Alternative B would result in 2,379 fewer residential units in all of Kaka`ako compared to TOD Alternative A.

However, TOD Alternative B would still provide 5,513 units more than the Future Baseline Condition. TOD Alternative B would result in 179,141 more square feet more office space compared to TOD Alternative A, but the office square footage for TOD Alternative B would be over 1.6 million square feet less than the Future Baseline Condition.

Table 3-4: Difference Between TOD Alternatives A & B Compared to Future Baseline Condition for the Total Kaka`ako Area

	TOD Alternative A	TOD Alternative B	Difference
Residential Units	7,822	5,443	(2,379)
Hotel Units	1,000	1,044	44
Residential SF	12,633,115	9,178,989	(3,454,126)
Hotel SF	482,735	482,735	0
Civic SF	128,483	128,483	0
Office SF	(1,493,517)	(1,672,658)	179,141
Retail SF	(236,623)	(228,698)	(7,925)
Industrial SF	(65,270)	(587,779)	522,509

Note: Figures in parentheses are negatives.

As summarized in Table 3-5, the additional residential units envisioned under either TOD Alternative A or Alternative B would result in increased population compared to the Future Baseline Condition, but a decrease in operational and office jobs. However, overall construction jobs would increase by approximately 20,588 for TOD Alternative A and approximately 13,695 for TOD Alternative B when compared to the Future Baseline Condition.

Table 3-5: Population Comparison in 2035 – Proposed Action vs. Future Baseline Condition

	Full Time Residential Population	Average De Facto Population (1)	Total Operational Jobs at Build-Out (2)	Office Jobs Only	Cumulative Construction Jobs from Full Build Out (3)
Future Baseline Condition	33,466	33,844	51,207	37,186	55,991
TOD Alternative A	46,273	48,312	45,159	30,397	76,549
Difference from FBC	12,807	14,467	(6,048)	(6,789)	20,588
TOD Alternative B	42,569	44,554	43,512	29,583	69,685
Difference from FBC	9,103	10,710	(7,695)	(7,603)	13,695

(1) "De Facto" Population = Full-time residents minus those temporarily away, plus part-time residents and (for Proposed Action) hotel guests.

(2) Total full- and part-time jobs, all shift and days of week.
(3) In worker-years (e.g., two half-time jobs = one worker-year); includes some "soft-cost" (architect – engineer) jobs

The Proposed Action will also result in changes to urban design, building form, and streetscapes in the District over those proscribed in the Future Baseline Condition. Under TOD Alternative A, floor area ratios (FAR) would have a slightly higher range in the Pauahi Neighborhood than under TOD Alternative B (5.0-10.0 for TOD A vs. 5.0-9.0 for TOD B). Figures 3-2 and 3-3 present a graphic comparison of FAR under the Alternatives.

Building heights on identified properties could increase from the current limit of 400 feet (plus appurtenant utilities) to approximately 550 feet, with a maximum of three properties capable of accommodating an *iconic* tower of up to 700 feet in height, under TOD Alternative A, but would remain the same as the Future Baseline Condition under TOD Alternative B. See Figures 3.4 and 3.5 for a graphic comparison of heights. Figure 3-6 presents the location of *iconic towers* envisioned in TOD Alternative A.

Table 3-6 presents a comparison of the total estimated square footage for parking in each of the TOD Alternatives as compared to the Future Baseline Condition.

Table 3-6: Comparison of Garage Parking (Future Baseline Condition vs. Proposed Action)

	Future Baseline Condition	TOD Alternative A	TOD Alternative B
Garage Parking (total SF)	18,496,225	20,916,071	20,086,628
Difference from FBC		2,419,846 (13.1% more)	1,590,403 (8.6% more)
Difference from TOD A			-829,443 (35% less)

Figure 3-2: Distribution of Maximum FAR for TOD Alternative A

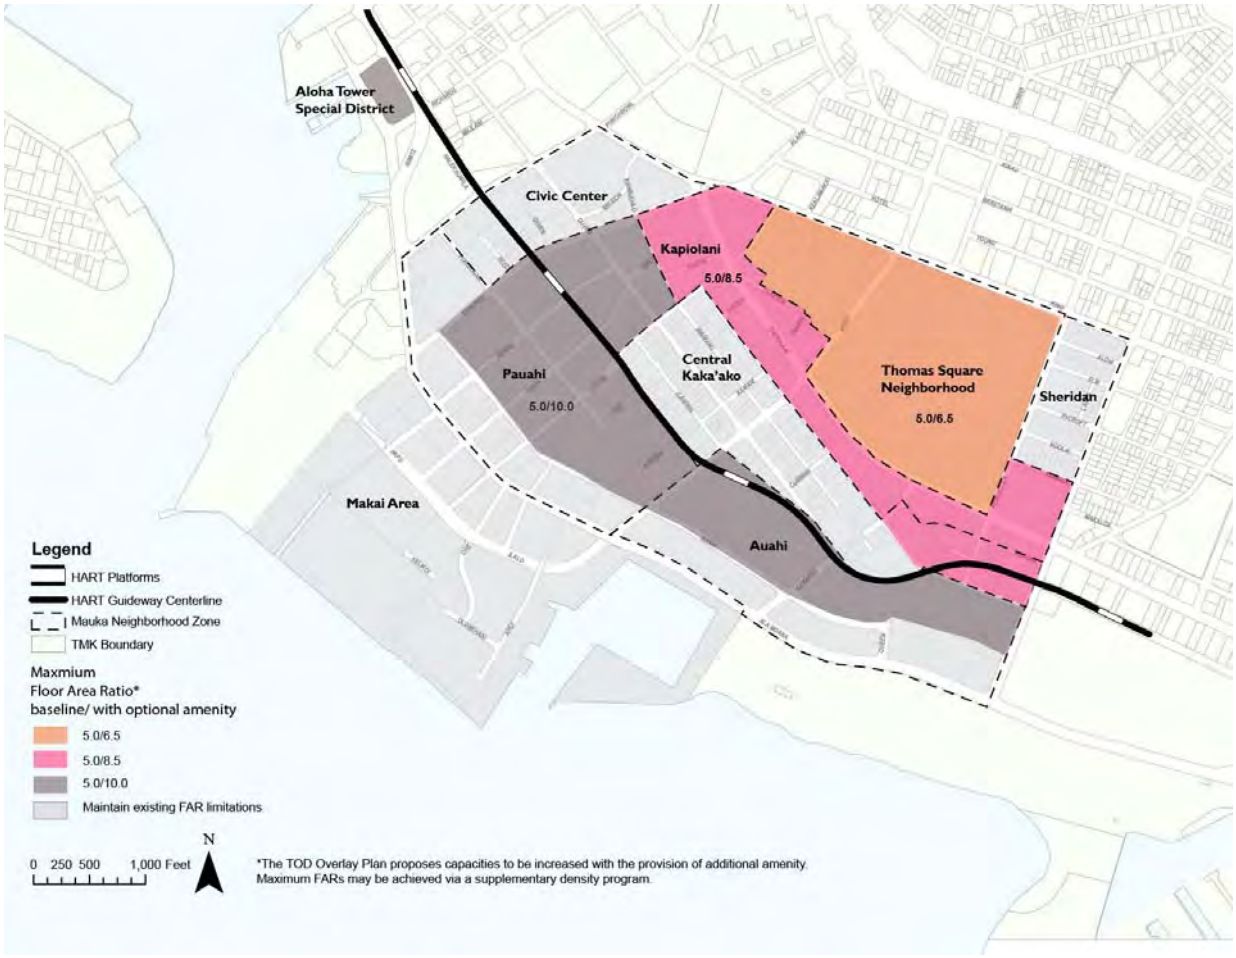

Figure 3-3: Distribution of Maximum FAR for TOD Alternative B

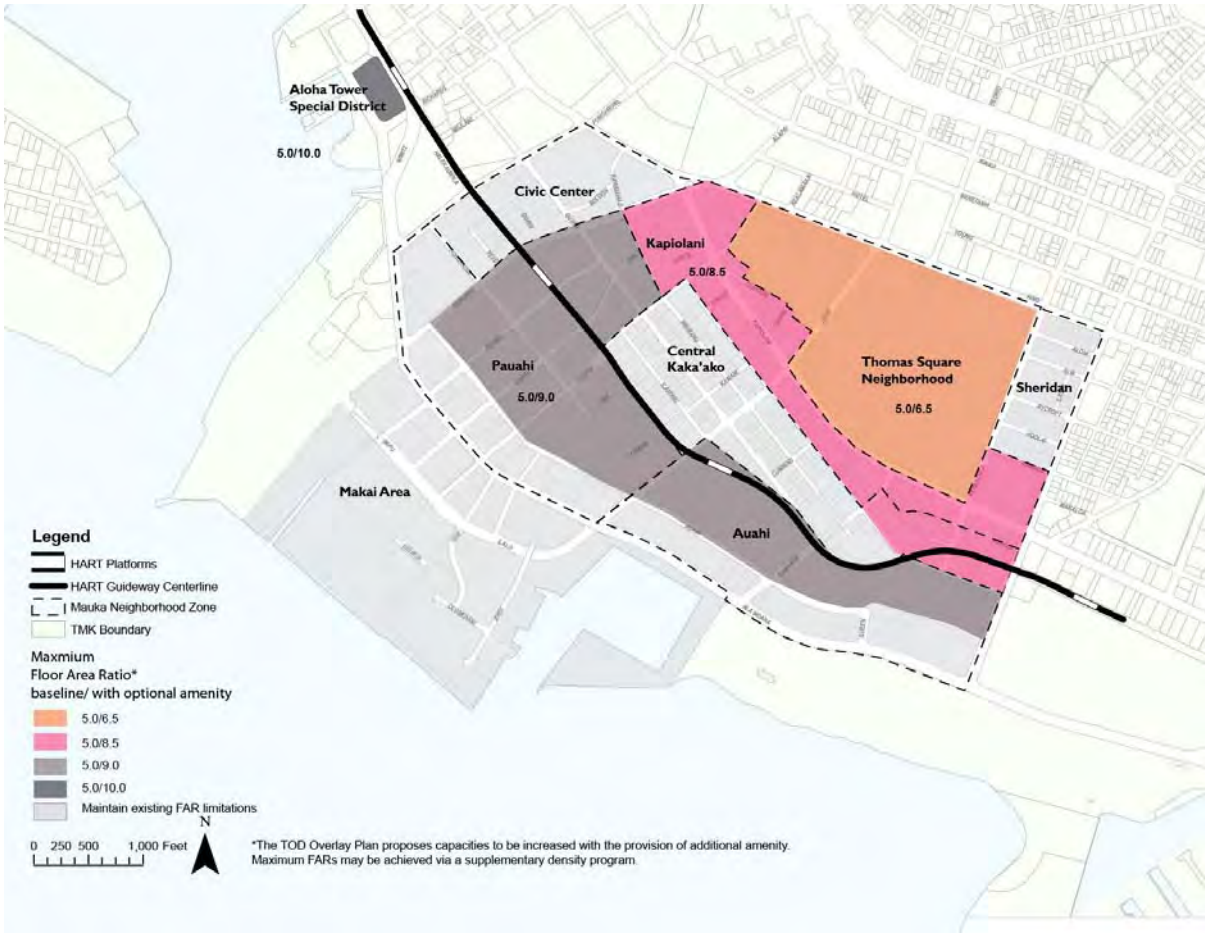

Figure 3-4: Height Limits Under TOD Alternative A

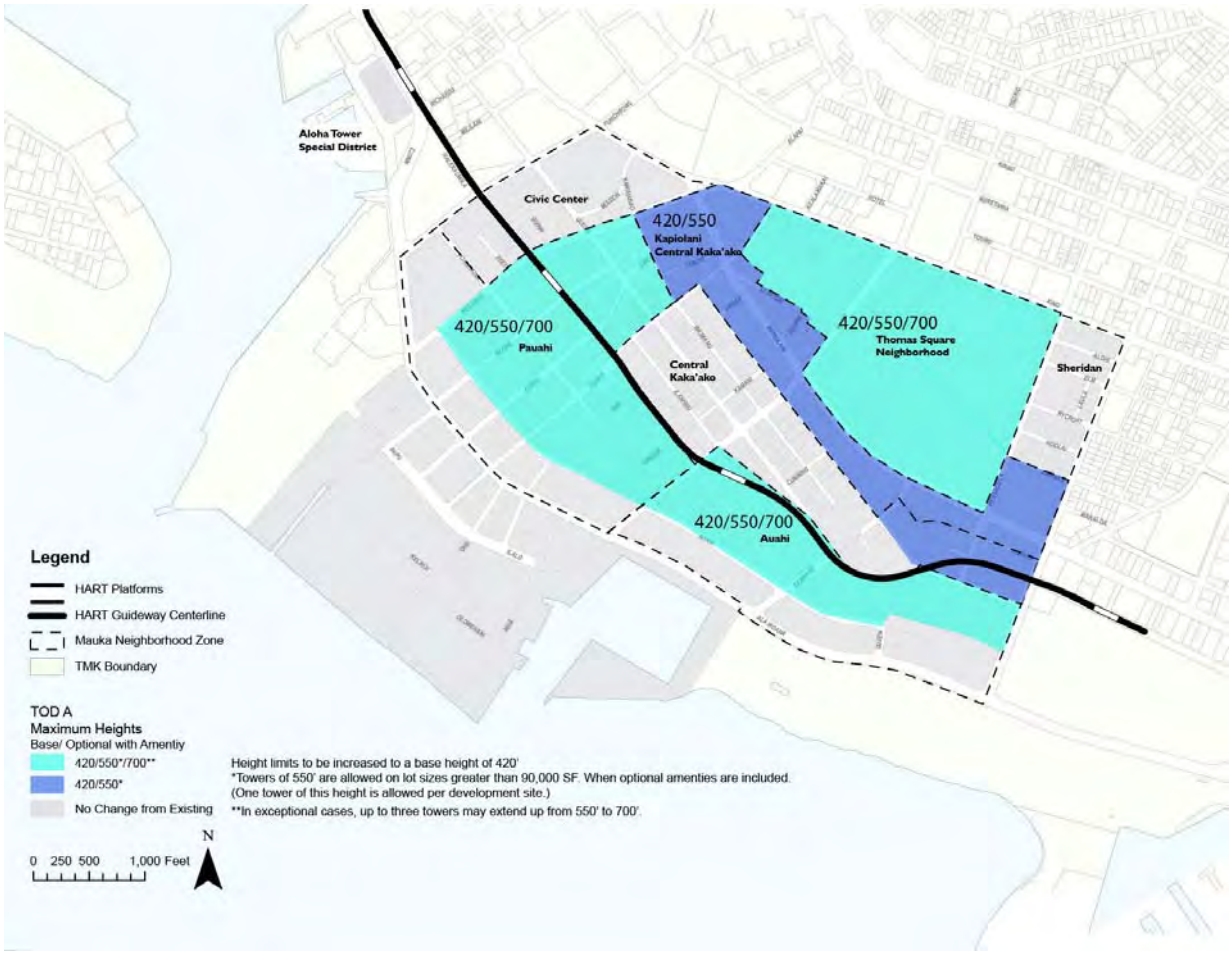

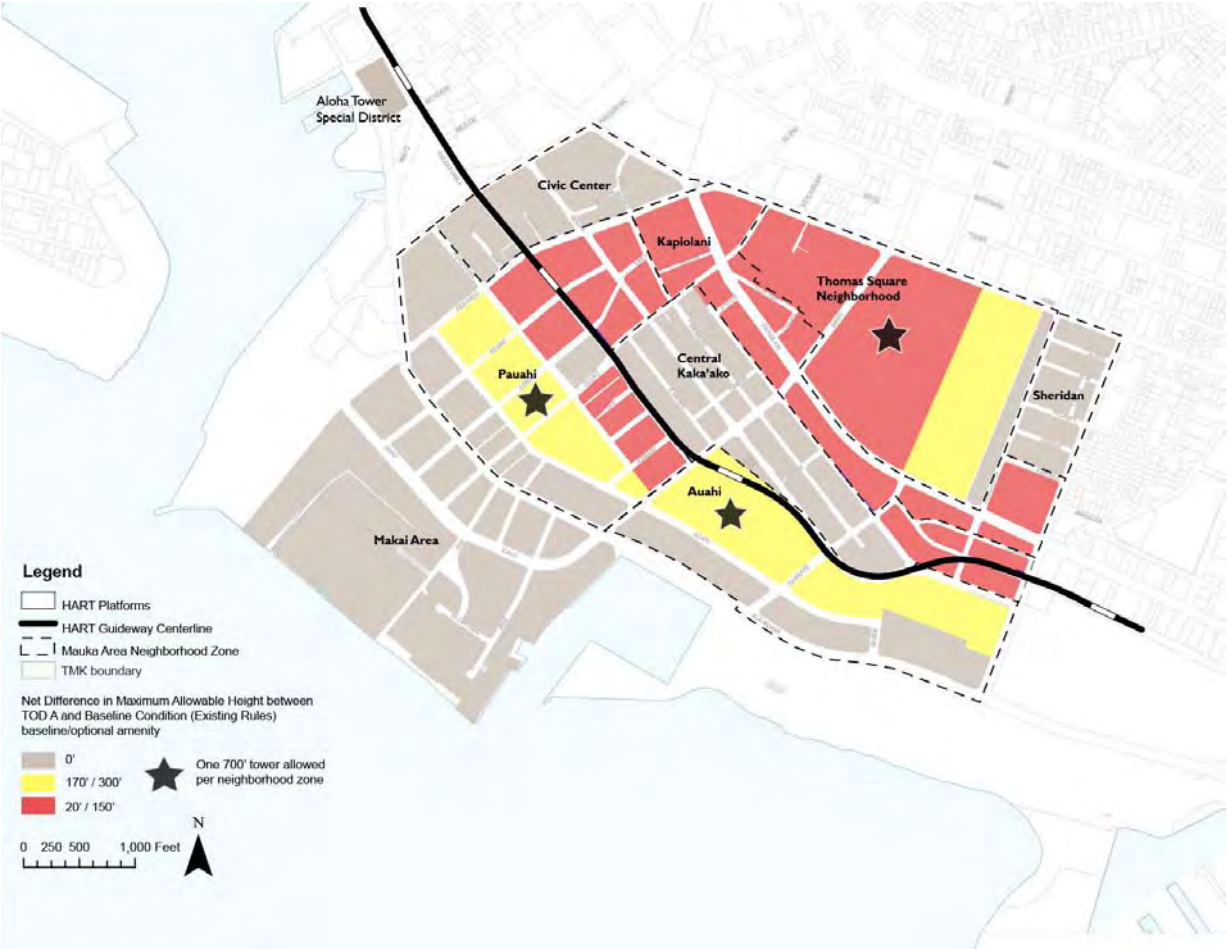

Figure 3-5: Height Limitations Under TOD Alternative B

Figure 3-6: Comparison of Height Limitations – TOD A vs. Future Baseline Condition

3.4 Other Alternatives

For the purposes of this environmental impact statement, the only reasonable alternative to the Proposed Action is the continued development of the KCDD under the existing rules (the Future Baseline Condition). The following alternatives have been rejected from further consideration as being unreasonable because they do not fulfill the objectives of the HCDA.

3.4.1 Community Development Plan and Land Uses

Established as the State's first Community Development District, pursuant to the passage of Chapter 206E, HRS, in 1976, Kaka`ako was considered to be underdeveloped and underutilized relative to its central location in urban Honolulu. Since then the rules governing development in the District have evolved with the adoption of the original Mauka Area rules in 1982 and its revision in 2009. Today, the District has changed significantly; from a low-rise, low-density industrial/commercial district to an area of

mixed uses including high-density residential projects and commercial and industrial land uses. Kaka`ako in 2014 continues to fulfill the legislature's vision for the District.

Alternative community development plans and land uses within the District are not possible, unless they either conform to the current Mauka and Makai Area Plans and Rules or conform to the approved Kamehameha Schools land Master Plan or Ward Neighborhood Master Plan. To implement an alternative vision for the District, action must first be taken to either A) amend Chapter 206E, HRS; B) amend the prevailing Mauka Area Plan and Rules; or C) amend the existing Kamehameha Schools Master Plan or the Ward Neighborhood Master Plan. While any of these actions is possible, the outcome is not foreseeable as each would involve an extensive public outreach process and prolonged regulatory review process. For these reasons, alternative community development plans and land uses are not considered to be reasonable alternatives to the Proposed Action for the purpose of evaluation in this EIS.

3.4.2 Alternative Locations

Because the KCDD is a physical area proscribed by law, it is not possible to relocate the Proposed Action to an alternate location.

While the Proposed Action is not solely focused on the HART elevated light rail system, the anticipated presence of the rail line in the KCDD presents specific transit-oriented development opportunities that are disclosed in Chapter Two. If the alignment of the HART system were to be altered to another alignment within the KCDD, the Proposed Action would still remain relevant. Even if the rail project was not constructed, the attributes of the Proposed Action would remain, although its implementation might not be fully realized because the alternative transportation opportunities the light rail system provides would not be available for the landowner intent on development, and density and height bonuses might not seem as attractive.

3.4.3 Alternative Implementation Strategies

As discussed in Chapter Two, the year 2035 has been identified as a target build-out year for the purposes of this environmental analysis. The actual rate of development may vary in response to market forces that cannot be predicted at this time. Alternative implementation strategies would involve bringing more residential units to market in a shorter time frame or a longer time frame. Because the vast majority of properties within the KCDD are privately owned, the decision about when to develop individual properties is beyond the control or authority of the HCDA.

The actual timing of implementing either TOD Alternative A or B will also be dependent upon decisions that must be made by the City and County of Honolulu with regard to implementing improvements to the regional wastewater collection and treatment system. A current plan to add a new region-serving sewer main to relieve wastewater collection issues in Waikiki has yet to be finalized by the City. Timely implementation of a new collection main, and possibly a new sewer pump station in, or near, the District by

the City would likely increase available collection capacity for new projects within the District. However, regardless of collection capacity issues, if the Honolulu Wastewater Treatment Plant does not have adequate capacity to treat wastewater generated in the KCDD or elsewhere in the East Mamala Bay service area, the timing of specific development projects will be affected.

Ultimately, the Proposed Action is a vision for the future of the KCDD and will remain relevant despite near-term or long-term decision making by the City or by individual property owners. The adequacy of infrastructure to serve the densities envisioned under the Future Baseline Condition and the Proposed Action is a pre-requisite for development.

3.4.4 Alternative Strategies for Providing Reserved Housing

HCDA's current program for the provision of affordable housing, called Reserved Housing, is geared toward a specific housing project type that targets the workforce or gap-group market instead of the entire affordable spectrum. There are other State agencies, such as the Hawaii Housing Finance and Development Corporation (HHFDC), which specialize in the development of affordable housing. Since the inception of the Mauka Area Plan, affordable housing units have been developed in the Mauka Area by state agencies. As such, HCDA's focus has been to stimulate the production of housing units for workforce buyers from 100 percent up to 140 percent of average monthly income (AMI) by ensuring that a portion of residential projects are set aside, or *reserved* for this income group. The reserved housing is different from *affordable* housing, which is usually targeted at lower income groups.

Under the existing Mauka Area Plan (and Future Baseline Condition), all new residential projects within the Mauka Area on lots of 20,000 square feet or more contribute to the development of Reserved Housing by producing the units or by paying fees to construct these units. In return for providing Reserved Housing, developers receive non-monetary offsets in the form of density (or height) bonuses, modifications to rules, and expedited permits. The existing Reserved Housing program requires that 20 percent of the new residential floor area for lots of 20,000 square fee or more be reserved and developed for buyers or renters with qualifying incomes not more than 140 percent of AMI, together with other restrictions. For rental projects, 15 percent of residential floor area shall be set aside for Reserved Housing.

The Proposed Action includes provisions to revise the Reserved Housing Program (see Chapter Four, Section 4.10.5.2). Alternatives to the existing Reserved Housing program have not been considered because of the acknowledged difficulties in developing any form of affordable housing, including Reserved Housing. Profitability is an extremely important consideration in encouraging landowners to undertake residential projects. The reservation of 20 percent of a new project's residential floor area for a Reserved Housing program (15 percent for rental projects) results in a project generating less revenue than what would be expected from market-rate units. Altering the Reserved Housing program to require a greater set aside provision would likely act as a

disincentive for residential development in general, and Reserved Housing development in particular.

Arbitrarily limiting the density standards of the Proposed Action will likely reduce affordable building options, which in turn, could further limit the provision of Reserved Housing units. As presented in Table 3-4 above, TOD Alternative B would generate approximately 2,379 less residential units than TOD Alternative A when compared to the Future Baseline Condition. This translates into about 475 less Reserved Housing units under TOD Alternative B than would be provided by TOD Alternative A, when compared to the Future Baseline Condition.

The provision of reduced parking standards and building height bonuses in TOD Alternative A is specifically intended to further incentivize the development of Reserved Housing units. These incentives are constrained in TOD Alternative B due to the restriction on building height.

3.4.5 Alternative Densities

The proposed set of High-Rise Building Types presented in Section 2.3.5 as part of either TOD Alternative A or B aim to strike a balance between constraints on building mass and volume, aesthetics, and market feasibility. This is because smaller tower floor plates (less than 11,000 square feet) tend to become more luxury-oriented as the ratio between a building's exterior surface area and interior is increased, bringing up the cost of the building envelope per interior salable square foot. Too heavy an emphasis on narrow floor plates means that fewer towers will be built, and the goal of making Kaka`ako a Hawai`i resident-focused, high capacity neighborhood would not be achieved. TOD Alternative A includes more affordable building options, together with a tall floor plate option of a mid-range of 11,000 square feet untethered from the previous lot size requirements found in the current Mauka Area Rules (the Future Baseline Condition).[1]

[1] It is still required that all buildings must have a parcel at a minimum lot size of 40,000 square feet to participate in the Proposed Action's height (TOD Alt. A) and density increases (TOD Alt. A & B).

Chapter Four:
Affected Environment, Potential Impacts and Mitigation Measures

Table of Contents

4.1 Climate and Climate Change 1
4.1.1 Affected Environment 1
4.1.2 Potential Impacts and Recommended Measures to Mitigate Them 2
4.1.3 Climate Change 2
4.1.3.1 Sea Level Rise 2
4.1.3.2 Reduced Precipitation 4
4.1.3.3 Increased Storm Intensity 5
4.1.3.4 Ocean Acidification 5
4.1.3.5 Changing Trade Wind Conditions 6

4.0 Affected Environment, Potential Impacts, and Mitigation Measures

This chapter discusses the existing conditions in the affected environment and analyzes the potential impacts that would result from implementation of the Proposed Action. Where impacts are deemed to be significant, measures to mitigate those impacts are identified.

However, it must be emphasized that ultimately the Proposed Action is incentive based: landowners can utilize the TOD Overlay Plan approved by the HCDA in developing their property, to the extent allowable, if they wish to take advantage of the development incentives it offers (in exchange for providing exemplary public benefits). However, if they choose not to utilize the TOD Overlay Plan, they can develop their property in compliance with the applicable Mauka or Makai Area Plan and Rules (the Future Baseline Condition).

4.1 Climate and Climate Change

4.1.1 Affected Environment

The climate of the Hawaiian Islands is generally characterized by mild temperatures year round and frequent northeast trade winds during the summer season from May through October. The warmest temperatures of the year can occur between late August and early October with an average high of 89 degrees F. The coolest temperatures typically occur in February with lows in the lower 60s. The winter season (November through April) is characterized by cooler temperatures, elevated precipitation, and variable winds, including Kona (southerly) winds and storms [Juvik and Juvik; 1998]. Annual rainfall in the general Honolulu area ranges between 20 and 30 inches. However, coastal areas tend to be drier than the lower slopes and valleys of the Ko`olau mountain range that defines the inland boundary of Honolulu. Relative humidity ranges in Honolulu from the mid-60s (percentage) to the upper 70s (percentage). It has been observed over the past decade that the frequency of trade wind conditions in Hawai`i has been declining. It is suspected that this phenomenon is related to global warming. A decline in trade winds can contribute to warmer ambient temperatures locally and to less wind-driven rainfall.

Honolulu's climate is typical of the leeward coastal lowlands, with mild temperatures and abundant sunshine. Infrequent storms tend to arrive from the northeast in the summer and the northwest in the winter.

Microclimates exist within the greater Honolulu area. The climate of Kaka`ako varies from less urbanized areas. Kaka`ako is likely to be slightly warmer because of the abundance of development in the form of streets, sidewalks, and concrete buildings

which all tend to reflect solar energy, and the limited number of trees that would otherwise provide cooling shade.

4.1.2 Potential Impacts and Recommended Measures to Mitigate Them

Under the Proposed Action, no significant adverse impact upon the climate is anticipated. Although the density of the area will be greater than the Future Baseline Condition, and some buildings may be taller under TOD Alternative A, the overall size of the Mauka Area is not large enough to influence the regional climate. Taller buildings will create more shade, but this will result in a negligible impact in terms of climate, and a beneficial impact in terms of adding to the comfort of pedestrians on the street, especially during the warmest months of the year.

The presence of new multi-story buildings pursuant to the Future Baseline Condition or the Proposed Action may change wind patterns within the District by creating a tunneling affect between some buildings. However, it is not possible to say with any certainty where this change might occur, because it depends on the physical shape of the buildings, their orientation to the wind, and their proximity to one another. Under the form-based zoning code adopted by the HCDA that guides urban design in the District, taller buildings will likely be more slender than mid-level buildings. For this reason, it is anticipated that taller buildings will have less of an impact on wind conditions at the street level. An observed decline in ambient trade wind conditions that may possibly be related to global warming may mitigate the cumulative impact of new construction in the District (see discussion in Section 4.1.3.5 below). Ambient temperatures are not anticipated to change because the Mauka Area is already a mature urban area with wide paved streets and building rooftops that absorb heat during daylight hours and radiate it back to the atmosphere as they cool at night.

No mitigation measures are proposed at a District wide level. Wind studies are typically commissioned by the architect during the design phase of individual buildings to determine the impact of wind on ground-level lobbies and foyers.

4.1.3 Climate Change

As the only state in the nation that is located in the tropics and surrounded by ocean, Hawai`i is likely to experience the impacts of global climate change in unique ways. Although these changes cannot be easily isolated to specific geographic areas, climate change may result in measurable impacts that are discussed below.

4.1.3.1 Sea Level Rise

The most reliable means of identifying sea level rise in a given area is a comparison of the height of mean sea level over a period of time. Dr. Charles Fletcher of the University of Hawai`i's School of Ocean and Earth Sciences and Technology (SOEST) stated in a briefing to the Hawai`i State Legislature in 2010, "Sea level has risen in Hawai`i approximately 0.6 inches per decade over the past century and probably longer…Sea level rise accelerates

and expands erosion, potentially impacting beaches that were previously stable…Although the rate of global mean sea level rise has approximately doubled since 1990, sea level did not rise everywhere, but actually declined in some large areas. The pattern of sea level rise is complex due to the fact that winds and ocean currents affect sea level, and those are changing also." [Fletcher; 2010]

For the purposes of this EIS, Professor Makena Coffman of the University of Hawai`i at Manōa, was asked to prepare a report focusing on issues pertaining to sea level rise. Following are excerpts from her report, which is presented in Appendix B.

There are two types of sea level rise. The first is global (eustatic) mean sea level and the second is local relative sea level. Global mean sea level rise is systematically used for sea level rise projections because it most accurately reflects the elevation of sea level due to climate change (Williams, 2013). There are two primary factors affecting global mean sea level rise. The first is the introduction of more fresh water into the ocean resulting from glacial melting and increased precipitation.

The second is the thermal expansion of seawater due to increases in its temperature. Local relative sea level includes a combination of phenomenon relating to regional and local geophysical and oceanographic factors (Williams, 2013). It should also be noted that sea level is not a uniform phenomenon. In the Pacific Ocean, for example, sea levels tend to be higher along the eastern coast of Asia, especially in Southeast Asia, than in the mid-Pacific, due primarily to the rotation of the Earth and the movement of ocean currents.

Global Mean Sea Level Rise Projections

Global mean sea levels have been fairly stable for the past 3,000 years until mid-19th century. Global mean sea level in the 20th century began rising at an average rate of 1.7 mm per year and the current average rate is nearly double, at 3.1 mm per year (Williams, 2013). Scientists have shown that acceleration in global mean sea level rise is primarily due to the phenomenon of global warming, or human-induced climate change (Nicholls et al., 2007).

Projections of increases in global mean sea level vary. IPCC (Intergovernmental Panel on Climate Change) 2007 predicted a range of 0.18 to 0.59 meter increase (relative to 1980-1999) by the year 2100 (IPCC, 2007). However, this model excludes "dynamical changes in ice flow," or rapid glacial melting. As more information becomes available, particularly about the impact of glacial melting, it seems that actual increases are on the more extreme end of the spectrum. A more recent synthesis of the science suggests that planning for a range between 0.5 to 2 meters by the year 2100 is advisable (Williams, 2013). Though a range of 4 to 8 meters is possible by 2100, it is not likely until after the 2100 time frame (Williams, 2013).

Hawaii's Sea Level

Local factors affecting sea level are tremendously complex, including issues of land subsidence, isostatic adjustment of the earth's crust, tectonic forces, gravitational changes, ocean circulation and wind patterns (Williams, 2013). While under-standing all of the components of local relative sea level would be ideal for planning purposes, it is difficult to "down-scale" global climate models for regional predictions. There is, however, global positioning system (GPS) monitoring of tide gauges in Honolulu as well as data that goes back to the turn of the 20th century. Based on GPS monitoring, there was an increase of approximately one half (0.50) meter of mean sea level in Honolulu between 1905 and 2006, which amounts to a mean sea level rise trend of approximately 1.5 mm per year (NOAA, 2013). This is slightly lower than the global mean sea level rise of the 20th century. Whereas global mean sea level rose approximately 6 to 8 inches over the past century, Hawaii's sea levels rose approximately 6 inches (though it differs by island) (Codiga and Wager, 2011). That Hawaii's rate of sea level rise is lower than the global average is due to a variety of factors (Codiga and Wager, 2011) and is not necessarily evidence that it will remain so in the future.

In 2011, the University of Hawaii Sea Grant College Program Center for Island Climate Adaptation and Policy released the report *Sea-Level Rise and Coastal Land use in Hawaii: A Policy Tool Kit for State and Local Governments* (Codiga and Wager, 2011). Through consultation with local experts, and considering both global and local factors, Codiga and Wager suggest planning for sea level rise of approximately 1-foot by 2050 and 1-meter by 2100. This is much in line with the planning occurring in other places (see for example Parkinson and McCue, 2011).

4.1.3.2 Reduced Precipitation

Discussions with National Weather Service (NWS) staff indicate that in general terms the Hawaiian Islands have been experiencing a drying trend in the past few years. Whether this trend is directly related to global climate change is unknown. But the NWS observes that rainfall patterns may now differ from those that occurred in the 1980s. Along windward slopes, while the number of rain-days has been near normal, the amount of rain per day is only about half as much on average. This is believed to result from a lowered inversion layer (that point in the upper atmosphere that caps the height of cloud buildup), resulting in less windward showers being blown into leeward areas. (Personal communication; Kevin Kodama (Lead Forecaster, National Weather Service, 11/8/11)

According to the Rainfall Atlas of Hawaii, "…the rainfall evidence and other data point to a downward trend in mean rainfall that may persist at least through the end of this century." [Hawaii Rainfall Atlas 2011, http://rainfall.geography.hawaii.edu/rainfall.html]

Decreasing precipitation rates have also been attributed to the increased vog in the atmosphere since the mid-1980s when Pu`u O`o began erupting on the Island of Hawai`i. It is now understood that the presence of increased amounts of particulate matter in the atmosphere attracts water molecules to bond with the volcanic particles. The result is

that when the particles bond with water molecules, they tend to create more clouds, but the clouds produce less rain because the water molecules are dispersed and do not bond with each other to form rain droplets large enough to fall to earth: they stay suspended in the atmosphere. [Kodama; ibid]

4.1.3.3 Increased Storm Intensity

While there is evidence that rainfall rates are decreasing, there is some evidence of higher periods of episodic rainfall, where several inches of rain can fall in a matter of a few hours. This appears to be global phenomenon that has also manifested in the Hawaiian Islands. Examples of these episodic precipitation events (derived from NWS on-line data) include:

- September 5, 1996: 12 inches of rain at Ewa Beach, O`ahu in 3 hours;
- November 29 to December 8, 2003: 33 inches of rain at Windward O`ahu;
- August 3, 2004: 10 inches of rain at Windward O`ahu in 24 hours; and
- October 30, 2004: 10 inches of rain at Manoa, O`ahu in 12 hours.

In addition to rainfall, an increase in thunderstorm activity has occurred. Most recently, on May 3, 2011, Windward O`ahu experienced an intense electrical storm that resulted in nearly 26,000 recorded lightning strikes in a 24-hour period according to the NWS. It has been suggested that the phenomenon of increased particulate matter in the atmosphere discussed above also increases static electricity that may be the source of increasing incidences of lightning. (http://www.hawaii.edu/news/article.php?aId=6652)

Periods of intense rainfall can also obscure longer-term precipitation trends. If a given area has an average annual rainfall of 40 inches, but in a given year a quarter of that is attributable to a single event, the total rainfall for that year may seem normal but actually disguises a possible drying trend, and equally as problematic, declining groundwater recharge, because much of the episodic rainfall is runoff resulting in very little percolation to the groundwater aquifer.

4.1.3.4 Ocean Acidification

Ocean acidification results from increased volumes of carbon dioxide mixing with seawater. Measurements at a monitoring station (Station ALOHA) over two decades document that the surface ocean around Hawai`i has grown more acidic at exactly the rate expected from chemical equilibration with the atmosphere. Continued acidification may have a host of negative impacts on marine biota and the potential to alter the rates of ocean biogeochemical processes. [Fletcher; ibid, page 4] The principal concern is the destructive effect of acidification on the ability of shell-producing marine biota, including coral, to produce their protective shells. At a large scale, ocean acidification can undermine the stability of coral reefs. The loss of a coral reef that serves as a barrier to help dissipate wave energy can expose coastal areas to stronger storm surge.

4.1.3.5 Changing Trade Wind Conditions

The frequency of trade wind conditions in Hawai`i appears to have been declining over the past several years (ibid. personal communication; Kevin Kodama, 11/8/11). A "trade wind day" is identified by the NWS as a day when the winds are blowing predominately from the northeast and strong enough to eliminate the effects of on-shore and offshore breezes that typify calmer wind conditions. It has been noted by the NWS that over the past several years, the number of trade wind days has been declining. While it is not certain whether this change is directly related to global warming, it appears to coincide with changing regional climatic conditions in the North Pacific and is, therefore, unlikely to be a localized phenomenon. A loss of trade winds equates to a loss in their cooling effect, especially during the warmest months of the year.

4.1.4 Potential Impacts and Recommended Measures to Mitigate Them

4.1.4.1 Sea Level Rise Impacts

While no comprehensive vulnerability assessment exists for the KCDD, there are three existing studies and sources that suggest much of the KCDD will experience persistent flooding with a 1-meter sea level rise.

The Coastal Geology Group at SOEST at the University of Hawaii at Manōa has mapped a meter of sea level rise contour line (during high tide) in the broader Honolulu area (CGG, 2009). Much of the KCDD is within this zone: the entire *makai* area and much of the *mauka* area.

The National Oceanic and Atmospheric Administration (NOAA) recently released their Sea Level Rise and Coastal Flooding Impacts Viewer (NOAA, 2013a)[1], which maps between 1 and 6-feet of sea level rise throughout the U.S. Within Honolulu, while the map is at a relatively high level, it is possible to see the inundation of the KCDD. The map additionally shows that NOAA classifies the KCDD as *vulnerable.*

Providing more context, a report released by the NOAA Coastal Storms Program (2013) looks at the impacts of a of 1-meter sea level rise coupled with additional flooding due to hurricane, tsunami and riverine overflow[2]. The study covers the greater Honolulu area, from Pearl Harbor to Diamond Head. The 1-meter sea level rise is considered a baseline for analysis of storm events and thus it is not possible to isolate the mapping of 1-meter of sea level rise. However, given this has been done in previous studies, the added value is in building understanding the relationship between sea level rise and storm events.

In the hurricane storm surge and tsunami run-up scenarios, the KCDD is entirely inundated during or immediately following intense hurricanes or destructive tsunami.

---

1 http://csc.noaa.gov/digitalcoast/tools/slrviewer

2 http://seagrant.soest.hawaii.edu/csp/risk-and-vulnerability-assessment-sea-level-risk-impact-honolulu-hawaii

Parts of the region would experience up to 10-feet of flooding. Within the greater Honolulu area, the study estimate that 87% of the tourism sector, 79% of construction and manufacturing activity, 75% of the health sector, and 81% of retail and wholesale activity are affected by the aggregate flooding. It is unknown what proportion of the loss of economic activity occurs in the KCDD.

The KCDD's waterfront is generally a combination of sea walls and harbors. The two largest impacts to the KCDD as a result of accelerated sea level rise will likely be: 1) more common and persistent flooding, and 2) coastal erosion and damage to protective structures and harbors. Flooding will likely be associated more with groundwater and seawater intrusion into the drainage system, resulting in upwelling from manhole covers, and localized flooding of certain streets (Rotzoll and Fletcher, 2012). However, in the long-term, storm surge overtopping existing seawalls may occur. Storm events will exacerbate flooding.

Persistent flooding within the KCDD will have the effect of 1) further challenging wastewater and drainage systems, and eventually rendering current systems inadequate and 2) causing damage to roads, buildings and other infrastructure (potentially subterranean utilities) not designed for flooding (with both rain and saltwater). The issue of wastewater will tax existing wastewater systems regardless of measures taken at the coast due to the interaction between the water table and storm activities. Damages to infrastructure like roads will require on-going maintenance. While the planned rail transit stations in the KCDD will be elevated, there may be impacts to connectivity with other modes of transportation.

Accelerated sea level rise will also impact existing sea walls, harbors/piers and other coastal infrastructure within the KCDD.

There is sound reason to adopt the sea level rise planning benchmark of 1-foot-by-2050 and 1-meter-by-2100 for Hawaii, based on the previous work of ICAP (Codiga and Wager, 2011). Moreover, there is strong evidence that much of the KCDD will experience persistent flooding by the year 2100 (CGG, 2009). Within the context of the KCDD, however, understanding the longevity of existing and new infrastructure is crucial to decision-making. Thus, a study that builds understanding of the interaction between sea level, critical infrastructure, and population is an important next step.

In this context, it is crucial to understand that the effects of sea level rise are not limited to Kaka`ako; the entire coastline of urban Honolulu, as well as the coastal areas of every island in the Hawaiian archipelago will likely be affected. Thus, decision-making must be focused statewide. With regard to Kaka`ako, sea level rise will likely affect the district regardless of the extent of future development.

4.1.4.2 Sea Level Rise Mitigations

Planning responses to sea level rise are generally to *accommodate*, *retreat*, *avoid*, and *protect* (Walsh et al., 2004). These are all considered forms of climate change adaptation.

Accommodate means to continue occupation of the coastal area, but with adjustments to infrastructure and lifestyle. A common example is to alter building codes such that dwellings are raised enough to allow storm water to travel beneath without substantive damage. Another example is the use of "green infrastructure" such as park areas that are designed to accommodate flooding.

Retreat is the antithesis of accommodate. It implies abandonment of the coastal area by moving infrastructure and peoples. This can mean both the moving of existing infrastructure as well as abandoning and rebuilding in less vulnerable areas. This can occur quickly or slowly, as well as dramatically change location or just mildly. A more mild form of retreat is simply to increase setback laws for new development. Other mechanisms include policies such as rolling easements and government purchase of vulnerable properties (California State Lands Commission, 2009).

Avoidance is a form of "slow retreat," where new development is not allowed in vulnerable coastal areas. Over time, as the old infrastructure reaches the end of its useful life, this effectively results in the relocating of infrastructure and peoples to less vulnerable areas.

Protection entails defending vulnerable areas with engineering-based solutions. This includes "soft" measures such as beach and dune restoration as well as more "hard" measures such as building seawalls, levees, and revetments. Enhancing drainage systems, mainly through pumping, also offers a form of protection.

The decision to accommodate, retreat/avoid or protect ultimately depends on the value of the threatened land (both natural ecosystems and built), the cost of protection, and the existence of other inhabitable areas (Parkinson and McCue, 2011). In terms of mitigating sea level rise and determining which of the four responses cited above is best suited to the KCDD, planners and relevant agencies should consider several factors.

1) There is a need for a comprehensive vulnerability assessment and mitigation plan for the KCDD. This should include estimates of *exposure*, *sensitivity* and, *adaptive capacity*. This includes robust scenarios of future sea level rise and impacts to the KCDD, which will help to build understanding of "critical thresholds" in the impact of sea level rise to critical infrastructure and population, as well as inform risk and vulnerability in regards to new development.

Discussion: With an approximate 36-year time frame for the 1-foot benchmark, and an 86-year time frame for the 1-meter benchmark, there is still adequate time to undertake a detailed vulnerability assessment and mitigation plan for the KCDD. Such a study is beyond the scope of this EIS. However, it should be implemented within the next decade to ensure that government is able to respond as needed.

2) At a minimum, information on sea level rise and vulnerability for the KCDD should be made public and widely available to developers, prospective home

buyers/renters, and businesses. This would allow private developers and residents to more optimally respond to market signals in regards to risk (for example, to enhance building design). Education and outreach for the expected impacts to the KCDD are needed – particularly because no broader state level adaptation plan current exists.

Discussion: This EIS represents a first-step in this educational process.

3) There should be community engagement in building understanding of risk and resiliency. This is because the concept of vulnerability is somewhat relative – where it is important to understand community needs and willingness to accept risk, as well as have strong mechanisms to educate the community on expected climate change impacts. The iterative decision-making framework described by Sahin and Mohamed (2013) provides a comprehensive approach (see page 11 of Appendix B), though a more traditional collaborative planning strategy could be employed.

Discussion: Again, this EIS represents a first-step in the community engagement process.

4) A study is needed to estimate the potential costs of sea level rise to the KCDD and detailed planning responses. Key considerations are the use of appropriate flood-resilient building materials and design, the upgrading of wastewater and drainage systems within the KCDD as well as road maintenance. Because Kaka`ako is an existing urban area, some of these costs would be born with or without redevelopment or densification. Costs associated with sea level rise will be distributed between state and county government, developers, residents, and taxpayers. These costs, and their distribution, must be understood to aid long-term decision-making.

Discussion: Work has already begun in this area. Planners with New York City's Municipal Transit Authority have been consulted to learn how the MTA has responded to changes in ground water levels as they relate to the city's subway system. Essentially, the subway system was built at a time when groundwater levels were extremely low. Now that they have risen, the City of New York utilizes pumps to reduce flooding in subway tunnels resulting from groundwater intrusion. To that end, daily pumping has become an infrastructure maintenance cost. Sea level rise in Honolulu may have a similar impact on groundwater levels. Thus, the New York City experience will hopefully begin to guide planners in the determination of whether a pumping system would be effective in reducing potential flooding on a regional scale.

Similarly, the retrofitting of storm drains with one-way flaps to allow storm water to drain in a makai direction but prevent ocean water from infiltrating a system in a mauka direction could help mitigate sea level rise impacts in the District. Knowing the extent of such a retrofit and its cost would greatly aid in decisions concerning the feasibility of its implementation.

4.1.4.3 Reduced Precipitation Impacts and Mitigations

Over the long-term, reduced precipitation could result in less recharge of the aquifer. However, the precise relationship cannot easily be quantified because the amount of rainfall lost to runoff is directly related to the intensity of any particular rain event and its duration. The Proposed Action will have no direct, indirect, or cumulative impact upon regional precipitation rates. As a mature urban area, the great majority of the area is developed with impermeable surfaces and served by an extensive storm water drainage system that was installed in the late 1980s. In addition, as a coastal development, the KCDD is too near the shoreline to contribute to the recharge of the aquifer. Therefore, no measures to mitigate reduced precipitation rates are warranted.

4.1.4.4 Increased Storm Intensity Impacts and Mitigations

The Proposed Action will have no direct, indirect, or cumulative impact upon the intensity of storms that affect the KCDD or the larger Honolulu area in the future. Given the character of the development associated with the Proposed Action (largely high-rise construction), new development will not likely be impacted by rainfall and wind associated with storms. To mitigate against the impacts of more intense storms, buildings will continue to be constructed in compliance with prevailing building codes to minimize their vulnerability to storm events.

4.1.4.5 Ocean Acidification Impacts and Mitigations

As the Proposed Action involves no development that abuts the ocean or activities that impact ocean water quality, the Proposed Action will have no direct or indirect impact upon ocean water acidification. Thus, no mitigation measures are warranted. From a broader perspective, the Proposed Action's impacts on regional drainage (and therefore ocean water quality) are addressed in Section 4.11.5 of this chapter.

From a cumulative perspective, the on-going consumption of fossil fuels by the population of Hawai`i, primarily in the form of reliance upon automobiles for transportation and the use of electricity generated by burning of oil and/or coal, will continue to generate green house gases, a portion of which will be absorbed by the Pacific ocean and contribute to acidification.

This activity can be mitigated through the use of alternate forms of transportation, especially pedestrian and bicycle, and increased efforts to generate energy from renewable resources as envisioned in the Proposed Action. The introduction of the ~~HART~~ ***light metro*** rail system in Kaka`ako creates a unique opportunity for alternative forms of transportation in the district. The extent to which current and future residents of the District decrease their dependency upon automobiles for travel will have a corresponding effect upon the reduction in the amounts of green house gases they generate. Similarly, the construction of greener buildings in Kaka`ako will help to reduce electrical energy consumption and increase the use of renewable resources for energy. To that end, the redevelopment of the KCDD presents greater Honolulu with a transformative

opportunity: a community-wide commitment to take collective action to change the way that we live, work, and play for the benefit of not only the neighborhood, the community, the city, or the state, but for the planet.

4.1.4.6 Trade Wind Loss Impacts and Mitigations

A continuing decline in trade wind conditions will primarily impact the general population's ability to endure tropical conditions in the summertime, and will likely lead to increased dependency upon air conditioning, which may result in higher energy consumption. This impact can be mitigated by improved architectural design of new buildings to allow for improved heat transfer and cooling efficiency. The introduction of a seawater cooling system presently proposed for Downtown Honolulu may lead to the implementation of this system in Kaka`ako, which would greatly mitigate the energy demands created by increased reliance upon air conditioning.

4.2 Topography, Geology, and Soils

4.2.1 Affected Environment

4.2.1.1 Topography

With the exception of the mounds that comprise a portion of the Kaka`ako Waterfront Park, the terrain of the KCDD is relatively flat, averaging approximately 5 feet above mean sea level (MSL), and gently slopes toward the coastline. The mounds within the park are landscape features that correspond to the location of an historic landfill.

4.2.1.2 Geology

Kaka`ako is located on the seaward edge of the Honolulu Coastal Plain. Much of the KCDD was originally submerged land.

The geologic substratum of the KCDD consists of emerged fossil reef and sedimentary deposits that formed approximately 120,000 years ago [MacDonald & Abbott; 1970]. Over time, coral reefs were formed during periods of higher sea level, but were eroded by coastal streams as sea levels fell. An analysis conducted for the 2009 Final Supplemental EIS for the Draft Mauka Area Plan indicates that at one time, the former shoreline was located just makai of what is now Queen Street. As sea levels receded in ancient times, a stream channel formed, generally paralleling the shoreline and bisecting the Mauka Area in an east-west direction. Today, the buried channel is filled with soft alluvium to depths of between 40 and 180 feet [HCDA & HUD; 1985].

About 67,000 years ago, volcanic eruptions occurred along the lower slopes of the Ko`olau mountain range in the vicinity of what is today known as Round Top and Tantalus along the western ridge of Mānoā Valley. These eruptions deposited layers of

black sand and cinder along the coastal plain. Random deposits of this black sand and cinder have been found in portions of the Mauka Area.
During historic times, much of the KCDD was reclaimed with soils composed of soft mixtures of sand, silt, and clay extending from the subsurface coral layer to sea level. Over the last century, the area was filled with dredged coral to achieve the existing ground elevation. The limit of the reclaimed area generally extends along the lines indicated in Figure 4-1.

4.2.1.3 Soils

As determined by the Natural Resources Conservation Service (NRCS) of the U.S. Department of Agriculture, the soils of the KCDD are comprised of three soil types:

- EmA: Ewa silty clay loam, moderately shallow with a zero to two percent slope. Depth to coral limestone is approximately 20 to 50 inches.
- MkA: Makiki clay loam, dark brown clay loam 20 inches thick with 10-inch thick subsoil, and containing cinders and rock fragments.
- FL: Fill land, mixed, typically used for urban development and described as "material dredged from the ocean or hauled from nearby areas, garbage, and general material from other areas.

The vast majority of the area is comprised of Fill land. See Figure 4-2.

4.2.2 Potential Impacts and Recommended Measures to Mitigate Them

The Proposed Action will have no significant impact upon the geology of the KCDD, but it may impact the topography of the District. Additional fill material may be imported from elsewhere on O`ahu as needed in the redevelopment of individual properties. The on-going redevelopment of the District pursuant to the Future Baseline Condition and the Proposed Action provides an additional opportunity to mitigate sea level rise issues to some extent: as individual properties are redeveloped, their at-grade elevation can be raised by the use fill material to create a higher base elevation. Over the long term, raising the base elevation of properties will improve storm water drainage to abutting streets. Eventually, street elevations can also be gradually raised, which would help to the reduction in flooding.

Development associated with the Proposed Action will impact soils in the KCDD as the result of construction activities that will likely include grading, excavation, drilling, and pile driving. Impacts are anticipated to be localized and will be mitigated on a case-by-case basis in accordance with Best Management Practices. Although predominantly composed of fill material, which is considered to be relatively poor quality, the soil characteristics of the KCDD are able to accommodate high-rise development so long as special foundations are developed to support taller structures. Geotechnical analyses will be conducted for each new project preceding development to assess the need for adequate foundation support systems.

Figure 4-1: Historic Coastline

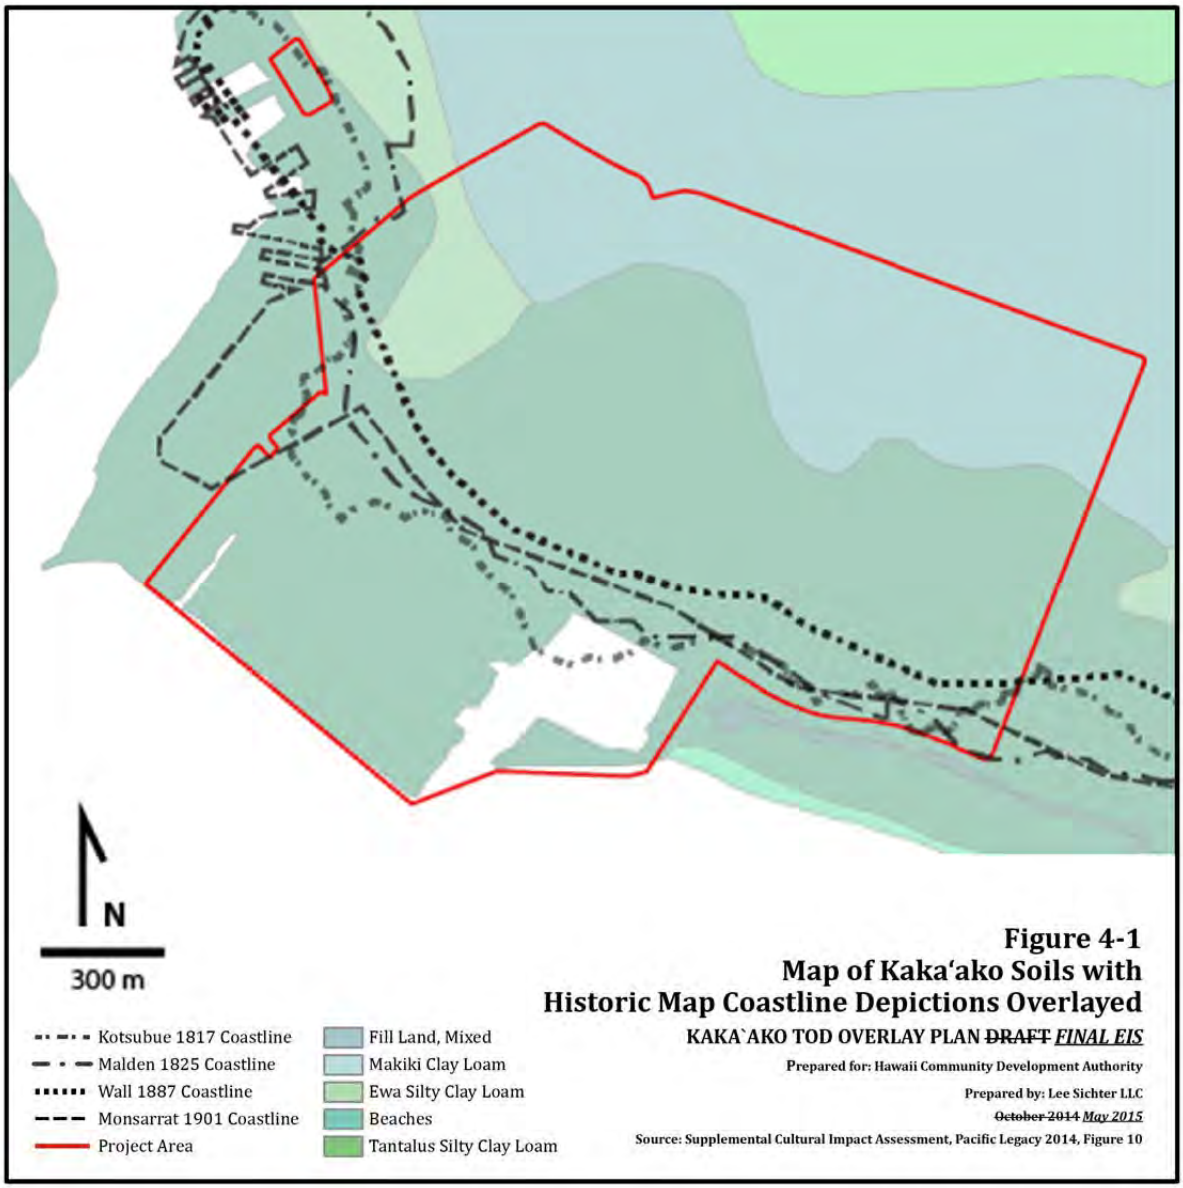

Figure 4-2: Kaka`ako Soils

As evidenced by construction in Downtown Honolulu, especially in areas makai of Queen Street, high-rise development is not constrained by the presence of subsurface fill material. Generally speaking, Queen Street delineates the Honolulu shorefront of the 1830s in Downtown Honolulu. Much of the land there makai of Queen Street is fill and has been successfully redeveloped with high-rise structures.

4.3 Flora and Fauna

4.3.1 Affected Environment

The KCDD is a highly modified urban environment with no significant naturally occurring vegetation. Landscaping accounts for virtually all the vegetation in the area. Fauna is limited to birds and mammals that have adapted to the urban development. There are no endangered or threatened species and no critical habitats with the KCDD.

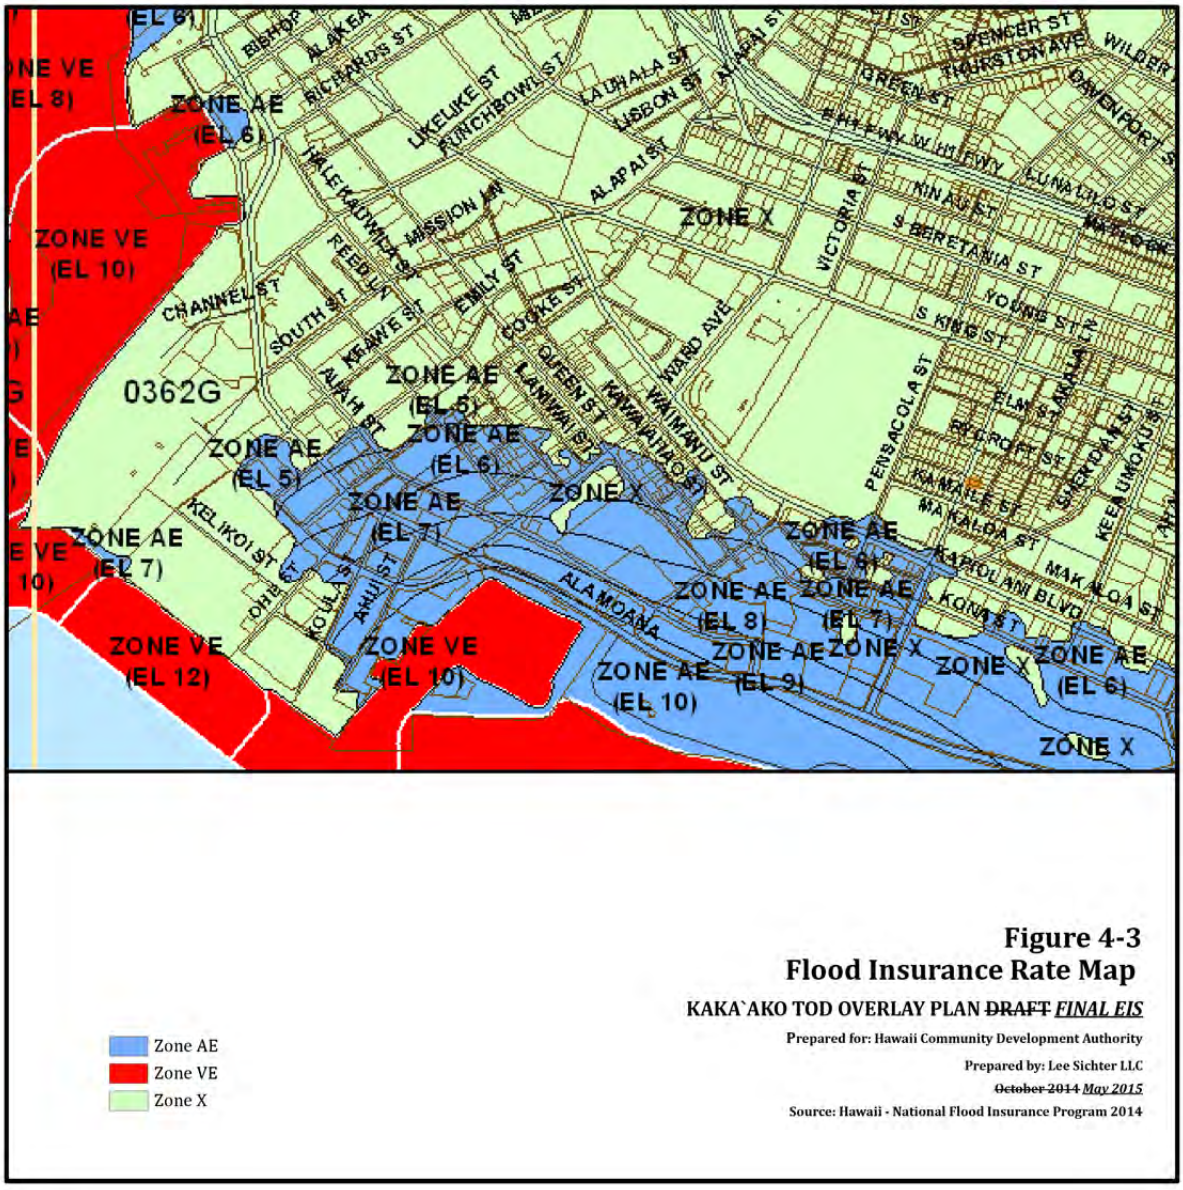
4.3.2 Potential Impacts and Recommended Measures to Mitigate Them

Development associated with the Proposed Action will result in the loss of some existing landscaped areas and the creation of new landscaped areas. While some vegetation will be permanently lost, this is not considered to constitute a significant adverse impact. No mitigation measures are warranted. If the Proposed Action is implemented as envisioned, the result will likely include a general increase of shade trees along streetscapes and the creation of new open space areas with a variety of landscaped vegetation.

Fauna including birds and mammals will be temporarily displaced by construction activity. This is not considered to constitute a significant adverse impact and does not warrant mitigation. Urban fauna is typically resilient and will adapt to changes in the urban environment. An increase in street trees as envisioned in the Proposed Action will increase habitat for avifauna.

4.4 Natural Hazards

4.4.1 Affected Environment



4.4.1.1 Flooding

In an island environment, flooding can occur from three sources: storm water inundation caused by intense short-term rainfall and/or sustained rainfall; storm surge inundation in coastal areas resulting from higher than normal ocean waves; and tsunami inundation.

Potential flooding hazards are identified by the Federal Emergency Management Agency (FEMA) National Flood Insurance Program and are mapped on the Flood Insurance Rate Maps (FIRM). The maps classify lands into two general zones (Special Flood Hazard Areas and Non-Special Flood Hazard Areas) with more specific and detailed categories in each.

As indicated on FEMA's FIRM Panel 15003C0362G (January 19, 2011), approximately two thirds of the KCDD is identified as being located in Subzone X (a Non-Special Flood Area that has been determined to be outside the 0.2 percent annual chance floodplain). The areas most susceptible to flooding are located around Kewalo Basin and are identified as being located within Subzone AE, with base flood elevations ranging from 6 to 10 feet (see Figure 4-3). Subzone AE is a Special Flood Hazard Area subject to inundation by the 1 percent annual chance flood (100-year flood).

Figure 4-3: Flood Insurance Rate Map (FIRM)

As depicted in the figure above, a large portion of the KCDD lies within the Federal Emergency Management Agency (FEMA) designated Special Flood Hazard Area[3] (SFHA).

The SFHA Zone VE and Zone AE for this particular area were determined by the anticipated impact of floodwaters resulting from a tsunami or hurricane. Zone VE, the coastal high hazard area, has an additional hazard due to storm-induced velocity wave action. Zone VE is located in near shore areas and primarily encompasses Ala Moana Beach Park, Kewalo Basin, and the submerged land offshore of Kaka`ako Makai.

Zone AE, the area within a floodway, extends inland from Zone VE, for distances up to 2,500 feet from the shoreline. Flood elevations within Zone AE were determined by FEMA and range from elevations 5 feet above mean sea level inland to elevation 12 feet at the shoreline. Figure 4-3 graphically shows the extent of: Zone VE, Zone AE and associated flood elevations.

4.4.1.2 Tsunami

A tsunami is a series of very long-period waves that are usually triggered by a disturbance at the seafloor that displaces the water above, typically the result of an earthquake, an undersea landslide, or the eruption of an undersea volcano. These waves can move across the ocean at speeds approaching 500 miles per hour and inundate coastal areas with water reaching several meters in height and causing extensive destruction. Tsunami can also occur locally as the result of a coastal landslide or coastal subsidence event.

On March 11, 2011, an 8.9 magnitude earthquake off the east coast of the Japanese island of Honshu resulted in a tsunami that caused unprecedented damage in Japan and limited damage in Hawai`i. Approximately six hours after the event, tsunami waves ranging in height from three to seven feet reached the Hawaiian Islands. The most significant damage reported in Hawai`i was generally limited to portions of the Island of Hawai`i's northwestern coastline.

Portions of the District have been designated by Hawai`i's Civil Defense Agency as tsunami evacuation areas. While the topography of the Kaka`ako Waterfront Park may serve to some degree as a protective berm for properties mauka of it, the eastern and western sides of the District are exposed to tsunami flow emanating from Honolulu Harbor and Kewalo Basin. In these more exposed areas, the Civil Defense Agency recommends evacuation in response to a tsunami warning.

In mid-November, 2014, the City and County of Honolulu's Department of Emergency Management released draft maps depicting areas on O`ahu that could be inundated by what it terms to be an "extreme" tsunami that could theoretically be generated by a 9.0 earthquake in the Aleutian Islands. Draft Map #19 includes the coastal area extending

[3] A Special Flood Hazard Area is defined as an area that will be inundated by a flood event having a 1-percent chance of being equaled or exceed in any given year; i.e., 100-year flood.

from the western edge of Honolulu Harbor to the Ala Wai Yacht Harbor. It depicts everything makai of King Street, including the KCDD, being impacted by an "extreme" event.

4.4.1.3 Volcanic Hazards

Hazards associated with volcanic eruptions include lava flows, tephra (airborne particulate matter ejected by a volcano), volcanic gases, and earthquakes (including ground cracks and subsidence). As there are no active or dormant volcanoes on O`ahu, the threat of lava flow inundation is non-existent. The threat of tephra is usually limited to areas immediately downwind of an active eruption, and for that reason, O`ahu is not subjected to tephra hazards. Ground cracks and subsidence of the earth can occur as the result of earthquake activity associated with volcanic eruptions, but these phenomenon are not known to impact O`ahu.

Since the eruption of Pu`u O`o in Puna in 1984, continuous volcanic activity associated with that vent and sporadic activity in recent years at Kilauea crater has resulted in the near constant emission of volcanic gas composed of water vapor, carbon dioxide, and sulfur dioxide in the range of approximately 300 to 700 tonnes per day. During normal trade wind conditions, most of this volcanic gas, known as *vog*, is blown out to sea in a southwest direction. However, during those times when the winds shift to the southeast (blowing southeast to northwest), the plume of *vog* can reach O`ahu, resulting in hazy atmospheric conditions that constitute a health concern for people suffering from acute asthma and lung-related illnesses.

4.4.1.4 Earthquakes and Seismic Activity

Earthquake activity on O`ahu is linked to volcanic activity that is generally focused on the Island of Hawaii and the surrounding seafloor. Earthquakes can occur before or during volcanic eruptions or when magma (molten rock) migrates underground without breaking through to the surface.

The largest known earthquake to occur in the Hawaiian Islands was an event with an estimated magnitude of 7.9 in Ka`u on the Island of Hawai`i in 1868. The next largest event was a 7.2 magnitude event on that island's Kalapana coast in 1975. However, smaller magnitude quakes on the Island of Hawai`i are capable of inflicting damage and disruption as far away as O`ahu. On October 15, 2006, a 6.7 earthquake under the seafloor just offshore of Hualalai mountain on Hawaii Island caused a near total electrical blackout on O`ahu.

The United States Geological Service has designated four seismic hazard zones in the main Hawaiian Islands, ranging on a scale from 1 to 4 with 4 being the most severe. The island of Kaua`i is designated as Zone 1; O`ahu as Zone 2A; Maui County as Zone 2B; and the Island of Hawai`i as Zone 4. [USGS:1997]

4.4.1.5 Landslides, Rock-Falls, and Subsidence

Landslides and rock-falls are typically associated with steep mountainous areas where prolonged rainfall events or strong earthquake activity can dislodge soil from the subsurface rock.

Subsidence, or the sudden collapse of soil in relatively flat coastal areas, is associated with strong earthquake activity. The most recent notable event of subsidence was during the 1972 Kalapana earthquake mentioned above, when a large stretch of Hawai`i Island's Kalapana coastline collapsed several feet, causing an immediate tsunami as the ocean rushed in to replace the void created by the collapsed beach.

Subsidence also occurs regularly along the coast downslope from Pu`u O`o and Kilauea craters on Hawai`i Island where lava drains into the sea. Where the lava enters the sea, it cools and over time forms a large shelf of new land. However, because the shelf is not supported from beneath, once it reaches several acres in size, it tends to break off from the coast and sink. This event has occurred repeatedly over the past two decades but is not known to have resulted in any destructive tsunami.

4.4.1.6 Severe Winds

Air-borne debris dislodged by strong winds can pose a threat to life and property. In Hawai`i, strong winds can be caused by three phenomenon:

- Tropical cyclones, including tropical storms and hurricanes;
- A steep air pressure gradient across the islands resulting from the proximity of a high pressure area; or
- Tornadoes or water spouts that make landfall.

The Hawaiian Islands are situated at the northern edge of the area extending north of the equator that is most closely associated with tropical cyclone activity in the North Pacific. During the period from May 15 to November 30 each year, tropical depressions tend to form in the warm waters off the western coast of Mexico and Central America, and then often move in a west to northwest direction. If climatic conditions are favorable for intensification, the depression can become a tropical storm or eventually a hurricane. In rare instances, these East Pacific storms are able to reach the Hawaiian Islands. However, because of cooler sea surface temperatures around Hawai`i, and due to the summer-time presence of the North Pacific high pressure area several hundred miles north of the islands that generates the trade winds, tropical cyclones originating in the East Pacific usually dissipate before reaching the islands. Nevertheless, the residual moisture associated with dissipated cyclones is an important contributor to summertime rainfall in the islands. Hurricane Iselle, which approached the Island of Hawai`i on August 8, 2014, made landfall as a tropical storm causing significant damage to homes, infrastructure, and vegetation primarily in the Puna District. This storm represented the first landfall of a tropical storm on the Big Island in recorded history.

When tropical cyclones form west of 140 degrees longitude, they are considered to have formed in Hawaiian waters and are given Hawaiian names. While these storms are also exposed to the same influences that help to dissipate East Pacific storms, Hawaiian tropical cyclones pose a greater threat to the islands because of their tendency to form rapidly and move swiftly, resulting in as little as two to three days of warning time, as opposed to the 10 days or more it takes an East Pacific storm to cross the 2,000+ miles to the Hawaiian Islands.

The National Weather Service has established categories of wind speeds as a means of identifying the strength of a tropical cyclone. Tropical storm storm-force winds range in speed from 39 to 73 miles per hour (mph). If wind speeds exceed tropical storm force, the storm is classified as a hurricane. The Saffir-Simpson Hurricane Wind Scale for Hawaii is a 1 to 5 categorization based on the intensity of a hurricane at a particular time. The scale was most recently modified on May 15, 2012.

- Category One: Sustained winds 74-95 mph. Hurricane Iwa (passing just northwest of Kauai in 1982) and Hurricane Dot (landfall on Kauai in 1959) are examples of category one cyclones.
- Category Two: Sustained winds 96-110 mph. There is no record of a category two cyclone directly impacting the Hawaiian Islands.
- Category Three: Sustained winds 111-129 mph. There is no record of a category three cyclone directly impact the Hawaiian Islands.
- Category Four: Sustained winds 130-156 mph. Hurricane Iniki, which made landfall on Kauai in 1992, is an example of a category four cyclone.
- Category Five: Sustained winds greater than 157 mph. There is no record of a category three cyclone directly impact the Hawaiian Islands.

Steep air pressure gradients across the islands can also generate strong winds. As air heats at the equator and rises, causing air pressure at the Earth's surface, it moves north towards the pole. But as it flows north at a high altitude, it cools and begins to sink back to Earth, creating high air pressure at the surface. The phenomenon of tropical air sinking back to Earth occurs around 30 degrees latitude in the North Pacific, several hundred miles north of Hawai`i. As this sinking air is then drawn back toward the low air pressure at the equator, it begins to warm, and when it reaches the equator it rises, creating a perpetual cycle of air, called the Hadley Cell, rising and falling in the atmosphere. The Hadley Cell is predominant during the summer months, giving Hawai`i its trade winds. Although the trade winds are not particularly strong, they can reach speeds up to the high thirties (miles per hour). In leeward areas characterized by south or southwest facing mountain slopes, trade winds speeds can sometimes accelerate downslope and damage roof shingles or unanchored outdoor furnishings.

However, during the winter when the Hadley Cell is less active, winter storms blowing in from the west can occasionally create a low-pressure system west or northwest of the islands. Known as a Kona Low, this wintertime phenomenon is known for delivering strong winds and copious amounts of rain to the islands. Wind speeds associated with

Kona Lows can approach 100 miles per hour. (These storms are not considered to be hurricanes because they do not form as tropical cyclones…and yet, they can have hurricane-force winds.)

At times during the winter season, large low-pressure systems set up west or northwest of the Hawaiian Islands that do not form into Kona Lows. Yet, because nature abhors a vacuum, air from the east is pulled in towards the low; creating a high-pressure gradient across the islands. Strong winds ranging from 50 to 60 miles per hour are associated with this phenomenon, which tends to occur in the period from January to March.

While tornadoes and water spouts have been known to occur in the Hawaiian Islands on rare occasions, they appear to have become more frequent in the past several years, for reasons not fully understood. On O`ahu, tornadoes have been documented in Waipahu and Kunia. Most recently in 2011, a waterspout made landfall in Lanikai on O`ahu, and moved about a mile inland, causing incidental damage before dissipating.

4.4.2 Potential Impacts and Recommended Measures to Mitigate Them

4.4.2.1 Floods and Tsunami

FEMA regulates the development in flood hazard areas as administered by the City's Department of Planning and Permitting. Potential flooding can occur in the 100-year flood plain from flash floods resulting from episodic rainfall, storm surges generated by hurricanes or severe winter storms, or large tsunami events. Flooding can also occur as the result of sea level rise, but ***while*** the likelihood of sea level induced flooding occurring by the 2035 planning horizon is considered at this point in time to be negligible***, it is relevant when considering the overall life of a building constructed during 20-year time frame of this EIS***.

Development associated with the Proposed Action will be susceptible to flooding to the extent it is situated within the 100-year flood plain, or is subjected to unpredictable events of significance such as hurricanes or tsunami. Under both County flood hazard ordinances and requirements of the National Flood Insurance Program, new structures built in regulatory flood plain areas must be elevated or flood proofed to or above the 100-year flood levels established by the Federal Insurance Administration Flood Insurance Rate Map. No habitable spaces are permitted to be built below the identified maximum 100-year tsunami/flood elevations and the lower parts of structures can be designed to withstand bore attack.

A flood study may be required to validate that individual projects will not alter the character of the flood zone within Zone AE impacted areas. FEMA also requires purchase of flood insurance when homes and buildings within SFHAs have mortgages from federally regulated or insured lenders.

Areas outside of Zone VE and Zone AE are classified as Zone X; and are not subject to flood proofing or FEMA flood insurance requirements.

Well-constructed multi-storied buildings have repeatedly demonstrated an ability to withstand tsunami induced flooding. Thus, the redevelopment of Kaka`ako as envisioned by the Future Baseline Condition as well as the Proposed Action will greatly improve the overall safety of the population by providing safe refuge for District residents and workers during tsunami warnings. Enabling people to stay in place during such events, rather than having to evacuate, will help to reduce congestion on evacuation routes. In the event of an "extreme" tsunami, the entire coastal plain of Honolulu, including the KCDD could be impacted. While residents of residential towers could conceivably survive the tsunami event, the chaos and hardships following such a catastrophe would likely equal or exceed the experience of Honshu residents in March 2011.

4.4.2.2 Other Natural Hazards

Volcanic Hazards: As there are no active volcanoes on the island of O`ahu, the KCDD Is not directly threatened by volcanic hazards, including lava flows, tephra falls, or toxic emissions.

Earthquakes and Seismic Activity: The KCDD, with and without the Proposed Action, is susceptible to earthquakes and seismic activity to the same extent as the entire island of O`ahu. Earthquakes of large magnitude can cause catastrophic damage to buildings and infrastructure. Generally, in the United States with its sophisticated building codes and enforcement procedures, earthquake damage is usually associated with events that have a magnitude of greater than 6 on the Richter scale. Each new building constructed as part of the Proposed Action will be obligated to comply with all building code requirements.

Rock fall and Subsidence: Consisting of a coastal plain, the KCDD is not susceptible to rock fall hazards. No incidences of subsidence are known to have occurred in the region, and none are anticipated.

Severe Winds: The KCDD is as susceptible to severe winds as the entire southern coast of O`ahu, including Honolulu, Waikiki, and Kapolei. Multi-story buildings constructed in compliance with building codes, are capable of withstanding wind speeds in excess of 100mph. During severe wind events, usually associated with hurricanes, the principal threat is air-borne debris that can damage break windows, expose building interiors to wind damage, and threaten injury to building occupants, and pedestrians and motorists on the street. Civil defense preparations offer the best opportunity to avoid physical threats to residents. In the event of a severe storm, building occupants are typically advised to seek safe shelter in designated disaster relief centers.

4.5 Archaeological and Historic Resources

4.5.1 Affected Environment

The following information is derived from the Supplemental Cultural Impact Assessment prepared for the Proposed Action (see Appendix C). The KCDD is within the *ahupua`a* of Honolulu and encompasses several smaller *ili* including *Kaka`ako, Kaakaukukui, Kukuluaeo* (along the shore – west to east), and *Kewalo* (mauka of the three *ili*). Thus, the modern area known as Kaka`ako is larger than the traditional named place and now encompasses several other areas whose names are no longer used.

The cultural character of the district is addressed in the following section. With regard to archaeological and historic resources, as a highly urbanized area that has undergone development and redevelopment for well over a hundred years, there are no longer structures in the KCDD that predate or reflect the style of construction employed by Native Hawaiian culture prior to western contact. With the exception of Kawaiahao Church and the Mission Houses, most buildings in Kaka`ako were built in the 20th century. The church and the Mission Houses were built in the 19th century and inspired by the architectural preferences of the 19th century missionaries.

Pre-contact Kaka`ako was a place of recreation and limited habitation; both concentrated along the shoreline. While, no major pre-contact habitation areas have been found in Kaka`ako (it appears, based on previous archaeological work, that all or most the permanent habitation sites were located further inland in the region), post-contact habitation refuse and fill layers are found throughout the Kaka`ako area. Several refuse dumps have been dated to the late 19th and early 20th centuries, when the expansion of street construction east of the main Honolulu urban area brought in businesses and a large number of occupants, some of whom, lived in separate ethnic enclaves.

The likelihood of burials associated with habitation in beach areas is high. Of greater importance is the history of the area over the past 120 years. In the 19th century, the area of Kaka`ako extending east of the Mission Houses was a rural area on the fringe of the seaport of Honolulu. At that time it was sparsely populated and due to its relative remoteness was deemed to be an appropriate location for quarantine and burial. Waves of epidemics that swept through the Hawaiian Islands in the 19th century, along with other factors, reduced the Hawaiian population from about 300,000 (other estimates vary from 100,000 to 1 million) at contact in the year 1778 to only 71,019 native Hawaiians at the end of the 19th century, as counted in the census of 1896. The most devastating of these crises was the 1853 smallpox epidemic, which resulted in 5,748 deaths in a population of about 70,000 in the entire archipelago (discussed in O'Hare et al., 2006). The high number of victims in then-urban Honolulu resulted in many being buried in shallow graves throughout the area of Kaka`ako. Others were buried at cemeteries in Kaka`ako.

Given the area's rich history, it is likely that sub-surface archaeological, historic and/or cultural resources remain. Burials will continue to be found in sand deposits, while others may be found in pumice deposited from ancient eruptions of the crater now known as Punchbowl.

Kaka`ako became the focus of archaeological work during the 1980s as a result of construction of county, state, and federal government buildings and state planned redevelopments (Bush and Hammatt, 2002). A 1987 report titled, "Kakaako: Prediction of Sub-surface Archaeological Resources, Detailing Archival Research and Archaeological Assessment of the Kakaako Community Development District" (Griffin et al., 1987) provided background information and summarized the historical importance of the Kaka`ako area.

In the Mauka Area between Punchbowl Street and Piikoi Street, there are four large historically documented cemeteries: Kaakaukukui Cemetery (site 2918 – eight burials recorded), utilized from the 1700s to the early 1800s; the Honuakaha Smallpox Cemetery (site 3712 – 56 burials recorded), used from 1853-1854; Kawaiahao Cemetery (site 4534 – 129 burials recorded), used from 1875 to 1920; and the King Street Roman Catholic Cemetery (site 5455 – 33 burials recorded), used from the mid-1800s to the 1920s. The full extent of these cemeteries has not been excavated, and there are probably hundreds of burials still within these cemeteries or under modern structures and road alignments.

There is also a cluster of at least 28 historic coffin burials at the Kaka'ako ID 10 area (site 6658), a cluster of 16 coffin burials at the Koolani Condominium project area (site 6911), two coffin burials at the Kaka'ako ID 4 area (site 5598), and two historic burials (one coffin and one with historic grave goods) at the Kaka'ako ID 3 area (site 5280). There is no historic documentation on these small burial areas and their extent or time of use is not fully known. Thus, a total of 274 historic burials have been recorded in some way (recorded *in situ* or disinterred) in the Kaka`ako Mauka Area as of 2009.

An additional 130 burials found (including burials found at Victoria Ward Village Shops project area) were not buried in coffins, or do not have associated grave goods, or consist of partial, previously disturbed burials. Some skeletons were found in a traditional flexed position, suggesting a traditional Hawaiian burial practice. These may date to the pre-contact period or the early post-contact period before the mid 19th century when most Hawaiians adopted Western style burial practices (usually extended within a coffin). Many of these burials cannot be assigned to a specific time period.[4]

Also found within the Mauka Area are wetland/fishpond deposits (sites 6636 and 6856) and historic deposits/trash pits (sites 1973, 3984, 6637, 6639, 6641, 6660, 6766, 9917, and 9991), which usually date around the last decade of the 19th century to the early decades of the 20th century.

Continuing development in the KCDD will occur on a property-by-property basis. As each landowner determines the redevelopment potential of their respective property, they will need to conduct an archaeological inventory survey in the form of sub-surface testing to determine the presence of archaeological, historic, and/or cultural features below the surface.

---

[4] Author's Note: out of respect for lineal descendants, no maps of burials or cemeteries are provided.

Table 4-1 presents existing structures in the district identified in the 2009 Final Supplemental EIS for the Mauka Area Plan that are either registered or eligible for registration on the National Register of Historic Places. The State Legislature has declared that these sites of historical or cultural significance be preserved.

With respect to the privately owned historic and cultural sites and buildings on HCDA's list, additional assistance to the owners shall be considered. HCDA shall review and consider the possibility of providing tax incentives, governmental grant-in-aid, and other financial and technical assistance to such owners. HCDA may propose amendments to existing laws and rules to implement these concerns. In addition, other sites of historic and cultural significance within the KCDD may be identified and subsequently added to the HCDA's preservation list.

Properties listed in the National or State Register are afforded the same protection by HCDA as those sites included in the Mauka Area Plan. HCDA requires property owners to obtain a certificate of appropriateness from HCDA before demolishing, altering, or improving any of the abovementioned historic properties. HCDA must grant an application for a certificate of appropriateness if: (1) the proposed action will not hinder the protection and use of the historic property; (2) the property as it exists is totally inadequate for the owner and/or lessee's legitimate needs; or (3) the owner or lessee is unable to earn a reasonable return unless the proposed project is undertaken. The Mauka Area Plan also recommends that HCDA provide grants-in-aid and/or suggest alternatives to proposed projects to encourage property owners to project historic properties. HCDA may also acquire property by eminent domain.

Table 4-1: Sites of Historic or Cultural Significance

Historic Resource	Recommendation	National Register	Hawaii Register	SHIP*
Mission Houses (c. 1821-1830)	Preservation	Yes	Yes	50-80-14-9991
Kawaiahao Church and grounds (c. 1842)	Preservation	Yes	Yes	50-80-14-9991
McKinley High School (c. 1923-1928)	Rehabilitation	Yes	No	50-80-14-9926
Old Kaka`ako Fire Station (c. 1929)	Rehabilitation	Yes	Yes	50-80-14-1346
Mother Waldron Neighborhood Park (c. 1936)	Preservation	No	Yes	50-80-14-1388
Makiki Christian Church (c. 1933)	Preservation	No	Yes	50-80-14-9719
Yee/Kobayashi Store	Restoration	No	Yes	50-80-14-9739
Royal Brewery Building	Preservation	Yes	No	50-80-14-9917

Note: "Preservation" means keeping a property in its present condition. "Rehabilitation" means returning a property to a useful state while preserving significant features.

* State Inventory of Historic Places – site designation number (50 – Hawaii, 80 – O`ahu, 14 – Honolulu Quad)
Source: 2009 Final Supplemental EIS for the Draft Mauka Area Plan, Kaka`ako Community District Development Plan and Rules 1982

In situations where a federal action may impact a historic site listed or eligible for listing on the National Register, a Determination of Effect must be made. The regulations of the Advisory Council on Historic Preservation (ACHP – Code 36 of the Federal Regulations [CFR] Part 800) indicate the procedures that federal agencies must follow to comply with the National Historic Preservation Act (NHPA) of 1966. No federal agency can undertake, fund, issue permits for, or provide loan guarantees to any project that will adversely affect a property eligible for the NRHP without consent of the ACHP in a Memorandum of Agreement.

Section 4.6 below addresses the presence of cultural resources in the district.

4.5.2 Potential Impacts and Recommended Measures to Mitigate Them

Ongoing and future development/redevelopment efforts resulting in excavation may result in the destruction or permanent burial of essentially all of the cultural remains encountered. For at least two thousand years, native Hawaiians have placed the earthly remains and spirits of their *Kupuna* within the landscapes of Hawaii. When a departing *Kupuna* was laid to rest, it was the belief that the remains would empower the descendants until they themselves were buried. The State Historic Preservation Division (SHPD) of the Department of Land and Natural Resources (DLNR) has specific procedures and protocol that must be followed in the event that *iwi* and/or artifacts are uncovered during property excavation or ground disturbance.

To address the potential for impact to archaeological sites, HCDA has implemented a requirement that all developers and applicants consult with SHPD prior to submission of any plans for project eligibility. Developers must comply with the requirements of Chapter 6E-8, 42 and 43 of Hawai`i Revised Statutes, as amended, as well as SHPD Administrative rules. A written letter of concurrence from the SHPD will be required prior to acceptance of an application for project eligibility review. This policy has already been implemented for projects within the KCDD and will continue to be implemented with regard to the Proposed Action.

If any archaeological features are found during construction activities, all work must cease immediately and await SHPD's determination on how to proceed. Additional site-specific archaeological surveys may be required for any improvements that may be undertaken outside the vicinity of a project area. The proper treatment of disinterred *iwi* and artifacts is vital to ensure research and studies related to the site are not inhibited by development activities. In all cases, treatments of any remains or artifacts would be in accordance with procedures required by the Oahu Island Burial Council (OIBC) and the SHPD.

Historic sites listed in the Mauka Area Plan are already listed on either the National Register or the Hawaii Register, and in some cases, both, and are protected by the HCDA permit requirements. Provisions in the Mauka Area and Makai Area Plans supplement, but do not replace other Federal and State programs, procedures, and requirements of historic preservation. Therefore, no adverse impacts are anticipated as a result of implementing the Proposed Action, and consequently, no further mitigation measures beyond those already in place are proposed.

4.6 Cultural Resources, Practices, and Traditions

4.6.1 Methodology

Act 50 (2000) of the Hawai`i State Legislature (ACT 50, SLH 2000) requires that a Cultural Impact Assessment (CIA) be included as part of a Chapter 343 environmental assessment. For the purposes of the current EIS, the cultural resource management firm, Pacific Legacy Inc., was retained to 1) review the scope of previous CIA's conducted for the KCDD or projects therein and determine if they were sufficient for the Proposed Action; and 2) conduct additional cultural impact assessment as needed. Pacific Legacy subsequently conducted a document search to identify any existing CIA performed in or around the Kakaʻako TOD Overlay project area. To do so, the Office of Environmental Quality Control (OEQC) and State Historic Preservation Division (SHPD) Library were researched to find any CIAs conducted for the project area. All archaeological reports, Environmental Impact Statements (EIS), and Environmental Assessments (EA) pertaining to the general area of Kakaʻako were reviewed to determine if any CIA were conducted concordantly. A total of 5 CIAs previously conducted for the project area were identified and are as follows:

- Wilson Okamoto and Associates, Inc., 2002, Cultural Impact Assessment in the Final Environmental Assessment University of Hawaii Health and Wellness Center. Prepared for the University of Hawaii, John A. Burns School of Medicine. Prepared by Wilson Okamoto and Associates, Inc., Honolulu.
- Spearing, Mishalla, Constance O'Hare, and Hallett H. Hammatt, 2008, Cultural Impact Assessment for the Kakaʻako Community Development District Mauka Area Plan, Waikīkī Ahupuaʻa, Honolulu (Kona) District, Oʻahu Island. TMK: [1] 2-1-29-32, 44, 46-56 and 2-3-01-11. Prepared by Cultural Surveys Hawaiʻi, Inc., Kailua
- Vogeler, Kuhio, Lehua Kauhane, and Hallet H. Hammatt, 2010, Cultural Impact Assessment for the Proposed McKinley High School Athletic Complex Master Plan Project, Honolulu (Kewalo) Ahupuaʻa, Honolulu District (Kona Moku), Island of Oʻahu. TMK: [1] 2-3-009:001 por. Prepared by Cultural Surveys Hawaiʻi, Inc., Kailua.
- Genz, Joseph H. and Hallett H. Hammatt, 2010, Cultural Impact Assessment for the Kewalo Basin Repairs Project, Kakaʻako Ahupuaʻa, Honolulu (Kona District), Oʻahu. TMK: [1] 2-1-058. Prepared by Cultural Surveys Hawaiʻi, Inc., Kailua.
- Elison, Mina and Windy K. McElroy, 2011, Final – Cultural Impact Assessment for Kakaʻako, Ahupuaʻa of Waikīkī, Kona District, Island of Oʻahu, Hawaiʻi. TMK: [1] 2-3-006:017. Prepared by Keala Pono Archaeological Consulting, LLC, Hauʻula.

In addition, three ethno-historical investigations and one Traditional Cultural Property (TCP) Study (with its Oral History – Consultation Interview Program component report) performed for areas that occur within or partially within the Kakaʻako TOD Overlay project area were reviewed, including:

- University of Hawaiʻi (UH) 1978, *Remembering Kakaʻako: 1910-1950.* Ethnic Studies Oral History Project, Ethnic Studies Program, University of Hawaiʻi at Mānoa, Honolulu.
- McElroy, W.K., A. Sims, and M. Desilets 2008, *Ethno-Historical Inventory Study of Kakaʻako*. Performed for Kamehameha Schools. Garcia and Associates, Kailua.
- Maly, Kepā, Onaona Pomroy Maly and Kawena Maly. 2013, Draft He Moʻolelo ʻĀina - Traditions and Storied Places in the District Of Kona – Honolulu Region (Lands of Kalihi to Waikīkī), Island of Oʻahu. A Traditional Cultural Properties Study – Technical Report. Prepared for SRI Foundation, New Mexico.
- Elison, Mina 2013, Oral History – Consultation Interview Program – Ahupuaʻa of Kalihi to Waikīkī, District of Kona, Island of Oʻahu. Component to Maly et al. 2013, Appendix D. A Traditional Cultural Properties Study Technical Report. Prepared by Kahiwa Cultural Heritage Consulting with Kumu Pono Associates LLC, Lanai City.

After reviewing and compiling all findings, it was determined that for the purposes of the Proposed Action, additional data collection and assessment was appropriate. Subsequently, Pacific Legacy was directed to prepare a Supplemental CIA (SCIA). The analysis was completed in January 2014 and is presented as Appendix C to this EIS. A summary of its findings is presented in the following sections.

The purpose of the current SCIA is to identify cultural resources and practices, in the broader sense, for areas in and around the Kakaʻako TOD Overlay project area that have not been identified by previously conducted CIAs as determined from the lists above.

Due to its vast area, complex history, population density, as well as rapid land-use changes, Kakaʻako currently has many cultures and sub-cultures that co-exist. There have been a series of demographic changes as well as land use changes in Kakaʻako since its initial pre-Contact settlement that have ushered in new groups and forced out others. In the last fifty years, cultural diversity in Kakaʻako has increased dramatically and is comprised of an array of ethnic groups as well as cultural groups bound by a common custom, belief, or "any other capabilities and habits," (Tylor 1871:1).

Native Hawaiians were the first to settle the area and, therefore, have the longest cultural history in the area. The primary focus of all previous cultural studies for Kakaʻako has been on Native Hawaiians. These assessments have provided a wealth of knowledge about past and present Native Hawaiian land-use of Kakaʻako. However, little attention was paid to other ethnic groups or other cultural groups. Further, no non-ethnic based cultural groups have been represented in previous studies. Many of the cultural resources identified in the SCIA are of significant only to non-Hawaiian cultural groups and are contemporary in nature. It is important to note that cultural resources are no less important for cultural groups that exist today than those utilized by cultural groups in previous eras. Thus, efforts were made in the SCIA to identify contemporary cultural

resources and practices and to be inclusive of all cultural groups in Kaka‘ako as well as those that come from other areas to access these unique resources.

According to ACT 50, SLH 2000, an Environmental Impact Statement (EIS) “…should identify and address effects on Hawai‘i’s culture, and traditional and customary rights (ACT 50, SLH 2000: Section 1).” Essentially, a CIA, as a supporting document of the EIS, has the goal of promoting and protecting cultural beliefs, practices, and resources of “Native Hawaiians, other ethnic groups, and groups” (OEQC 1997:1). To date, the term “groups” has been left undefined by the 1997 Office of Environmental Quality Control (OEQC) Guidelines and ACT 50, SLH 2000. However, ACT 50, SLH 2000 goes to some length to stress the importance of this act in promoting and preserving cultural practices and resources of Native Hawaiians and other ethnic groups, stating:

> The legislature also finds that native Hawaiian culture plays a vital role in preserving and advancing the unique quality of life and the “aloha spirit” in Hawaii. Articles IX and XII of the state constitution, other state laws, and the courts of the State impose on government agencies a duty to promote and protect cultural beliefs, practices, and resources of native Hawaiians as well as other ethnic groups (ACT 50, SLH 2000: Section 1).

Yet, as declared in Act 50, SLH 2000, the legislation has the stated purpose to:

1) Require that environmental impact statements include the disclosure of the effects of a proposed action on the cultural practices of the community and State; and

2) Amend the definition of “significant effect” to include adverse effects on cultural practices. [emphasis added]

The law remains unclear what defines “community and State” in terms of demographics and cultural groups or its sub-sets. “Hawai‘i’s culture“(ACT 50, SLH 2000: Section 1) and the community of Kaka‘ako consists of many cultural groups, centered on common cultural values, beliefs, and interests, including (but not limited to) Native Hawaiian and other ethnic groups. Other cultural groups in the area (e.g. religious, arts, sports, political, commercial, etc.) are united as cultural groups by the special interest that they share, but rarely represent or consist of a single ethnic group. Additionally, these groups regularly commune and organize ceremonial and secular events; exhibiting various hallmarks of a distinct culture. Thus, a CIA should make every effort to include these groups and transcend the constraints of ethnicity. The current SCIA assumes that “groups” include those bound by a common cultural interest, concentrating on those that are recognized as a distinct cultural group by the community. It is intended to supplement the previous CIAs conducted for the area.

4.6.2 Affected Environment

The land to which we now refer to as Kaka‘ako has a long and rich cultural history. From traditional Hawaiian accounts, *mo‘olelo*, historical documents, and the archaeological record it is evident that this locale has been the backdrop to many significant acts in the long drama of O‘ahu’s pre- and post-Contact history. Thorough archival research was

performed by Spearing et al. (2008), Vogeler et al. (2010), Hammatt and Shideler (2010), Elison and McElroy (2011), and Maly et al. (2013), to describe the cultural landscape of pre-Contact to present day Kakaʻako.

The KCDD's current boundaries are a modern construct with no evidence of distinct Traditional or Historic boundaries to affirm them (Spearing et al. 2008; Vogeler et al. 2010; Elison and McElroy 2011). Rather, Kakaʻako is composed of several *inoa ʻāina* (traditional Hawaiian localities), including Kakaʻako, Honokaʻupu, Kaʻākaukukui, Kukuluāeʻo, Kālia, Kewalo, Kou, Kuloloia, Māmala, and Pākākā, that were situated between the two major population centers, Kou (now Honolulu) and Waikīkī.

The original configuration of Kakaʻako's traditional boundaries is unclear, though the area that is widely held as Kakaʻako appears to have grown and morphed significantly since the early European Contact period. Spearing et al. (2008:12) cite the ethnographer and long-time resident of Oʻahu, Henry Kekahuna (1958:4), who placed the western boundary for Kakaʻako "on the Ewa side of Kuloloia Stream where the Honolulu Iron Works and Fort Armstrong are now," an area now covered by One Waterfront Plaza (between South and Punchbowl Streets). Further, Historic maps (Bishop 1884; Monsarrat 1897; Lyons 1872) show Kakaʻako in a variety of configurations if they show the locality at all. Mid 19th century documents and maps describe Kakaʻako as a small *ʻili* located in the *ahupuaʻa* of Honolulu (Spearing et al 2008:12).

4.6.2.1 Traditional Place Names

The area now referred to as Kakaʻako has a long and colorful past. Many *inoa ʻāina* within Kakaʻako were derived from legendary people and events. Some locations have been the backdrop of *moʻolelo* and are, thus, *wahi pana*. In the modern era, these *inoa ʻāina* and *wahi pana* are not always used as place names for the areas that they once described. Westervelt (1915) offers very comprehensive explanations for these ancient place names in *Legendary Places in Honolulu* as does Spearing et al. (2008) and Maly et al. (2013).

Figure 4-3 is a map of the approximate locations of *inoa ʻāina* and *wahi pana* located within the KCDD, which is based upon written descriptions and maps created by The SRI Foundation. **[Please note: an asterisk (*) follows the place-names that appear on the map in Figure 4-4.]**

ʻĀina Hou *
The land stretching from Pākākā to Kakaʻako (lower Fort Street to Kewalo Basin) on the east side of the harbor was referred to as ʻĀina Hou, according to Kamakau (1961:419).

ʻĀpua *
The place name translates as "woven fish basket," which is shared with its namesake who was a fisherman from the area between Richards, Queen, and Punchbowl Streets (Maly et al. 2013). This location is mentioned in Thrum's (1900) version of the legend of Kūʻula as an area that his son, Aiai stayed

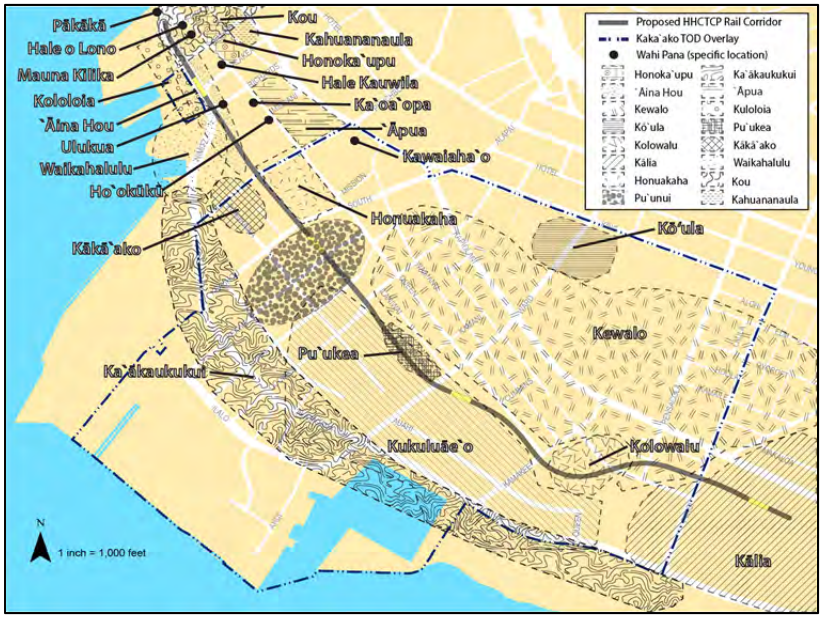
while on his journey in O‘ahu and was the home of his companion Apua, who shares the name.

‘Auwaiolimu

The name ‘Auwaiolimu translates as “water channel of algae or mossy stream” and was the name of the area between the coastal lands of Waikahalulu and Honuakaha, which is now near Hale Kauwila and Queen streets (Maly et al. 2013).

Awalua

Ancient surf break, also called Kaawalua located in the Māmala Channel (Ī‘ī 1959:82).



Hale Kauwila *

Hale Kauwila, which means, “house made of *kauwila* wood,” is a Historic era name of the area that connects Pākākā and the old Fort. The name actually referred to one of the large thatched structures near the shore of Kuloloia, which was built for the *ali‘*i [Maly et al. (2013)]. Hale Kauwila is the location where the King and his officials met and made decisions for the Hawaiian Government.

Hale o Lono *

According to Ī‘ī (1959), Hale o Lono was a *heiau* that at one point had been the residence of Liholiho (Kamehameha II). Maly et al. (2013:30) states that Hale o Lono once stood near the corner of Fort and Queen Streets.

Figure 4-4: *Inoa `āina* and *wahi pana* in Kaka`ako

Source: Kaka`ako TOD Overlay SCIA, Pacific Legacy, 2014.

Honokaʻupu *

The ancient locality of Honokaʻupu, which means "Albatross Bay," is named after Chief Honokaʻupu. It is mentioned in Ī`ī (1959:91), where he describes it as a bathing pool or spring located "…above Queen Street, north of a pier at the corner where Queen and Alakea Streets now meet..." and states that this property, belonging to Kaiwikokoole, was located near to King Kamehameha's son, Kekuaiwa. To the east of Kou was a pond surrounded by a grove of coconut trees that was named after Chief Honokaʻupu (Westervelt 1915). Ī`ī (1991:161) later writes that Honokaʻupu is Kekauluohi's coral stone house located at Pohukaina, which is said by Pukui et al. (1974:187) to have been located behind the Hawai'i State Library. The *Saturday Press Dictionary of Hawaiian Localities* (September 22, 1883:5), stating "Honokaupu Land in Honolulu on Queen Street, and between Fort and Alakea Street" (as cited by Maly et al. 2013:51). Westervelt (1915:4) holds that Honokaʻupu was noted as a court for playing *ulu maika.* Further, the *mele* for Chiefess Mamala, who was the wife of Chief Honokaʻupu, mentions Honokaʻupu as being the location of a small *kōnane* board (Westervelt 1915:52-54). Maly et al. (2013:108) describes Honokaʻupu as a being a trail junction as well.

Honolulu (aka Kou) *

Honolulu, which means "calm/peaceful cove", is the location once referred to as Kou (Maly et al. 2013) and is the name of the *ahupuaʻa* that contains much of Kakaʻako. Westervelt (1915) offers a description of the original location of Honolulu:

"Honolulu" was probably a name given to a very rich district of farm land near what is now known as the junction of Liliha and School Streets, because its chief was Honolulu one of the high chiefs of the time of Kakuhihewa according to the legends. Kamakau, the Hawaiian historian, describes this farm district thus "Honolulu was a small district, a pleasant land looking toward the west, - a fat land, with flowing streams and springs of water, abundant water for taro patches. Mists resting inland breathed softly on the flowers of the hala tree."

Kakuhihewa was a king of Oahu in the long, long ago, and was so noted that for centuries the island Oahu has been named after him "The Oahu of Kakuhihewa." He divided the island among his favorite chiefs and officers, who gave their names to the places received by them from the king. Thus what is now known as Honolulu was until the time of Kamehameha I., about the year 1800, almost always mentioned as "Kou," after the chief Kou who was an "Ilamuku," or "Marshal," under the king Kakuhihewa. "Kou" appears to have been a small district, or, rather, a chief's group of houses and grounds, loosely defined as lying between Hotel Street and the sea and between Nuuanu Avenue and Alakea Street (Westervelt 1915:1-2).

Kamakau (1961) mentions the place name of "Honolulu" as being used during the time of Alapaʻi:

Then Alapaʻi determined to sail to Oahu and take possession of that island; for he had heard that it was without a ruling chief, Pele-io-holani being at that time ruling chief of Kauai. Alapaʻi therefore sailed to Oahu with his chiefs and fighting men, accompanied by the chiefs

of Molokai. Inquiring about the harbors on Oahu, he was told by those skilled in such things that, "Waikiki has a harbor, Waiʻalae has a harbor; these are both good harbors; at Waikiki and Honolulu live most of the chiefs" (Kamakau 1961:71).

This statement of Alapaʻi also mentions that most of Oʻahu's chiefs dwelt in Honolulu. Further, Kamakau (1961:82) refers to the war between Kahekili and Kahahana in 1782 as the "battle of Honolulu." He later writes of Kou as being a harbor of Honolulu in the early Contact period, stating: "But during the early days of the war a couple of foreign ships entered the harbor of Kou at Honolulu, the first to enter that harbor" (Kamakau 1961:168).

Honuakaha *

Honuakaha, which means "marked earth or coastal land," is an area bound by Queen and Punchbowl Streets (Maly et al. 2013), although, Thrum (1922:633) translates it as "flat land." This area was the location of a royal coconut grove and the former residence of Chief Kinau, father of Miriam Kekauonohi. Spearing et al. (2008) cites a legal suit over a *lele* of the Ili of Kaalaa at Honuakaha that consisted of 1.6 acres that were formerly fishpond and dry land (Hawaii Reports 1903:321, 324 as cited by Spearing et al. 2008:40).

Hoʻokūkū *

The area referred to as Hoʻokūkū, which was between Honuakaha and Honokaʻupu, is where a healing heiau and home of Liholiho once stood. Queen Street now runs through the area (Maly et al. (2013).

Huʻehuʻe

The name translates as "overflowing" and represents an area that is bounded by Queen Street and Honokaʻupu (Maly et al. 2013).

Kaʻākaukukui *

Kaʻākaukukui was once a reef that has been covered with fill. The name translates as "the right (or north) light," referring to a navigation landmark for seafarers (Spearing et al. 2008). Kekahuna (1958:4) states that Kaʻākaukukui was "a beautiful sand beach and reef that formerly extended a quarter mile along Ala Moana Park to Kewalo Basin. Other translations of Kaʻākaukukui consist of "radiating place for lamp" (Thrum 1922:635) and "to the right of the lighthouse" (Gessler 1937:187), as the 1869 Honolulu Lighthouse, no longer standing, was east of this location. Kaʻākaukukui was a "jump land" or *lele*, which is a non-contiguous portion of land belonging to an *ʻili*. One lot of the *lele* was located on the coast and the other two were inland (Spearing et al. 2008:15-16).

Maly et al. (2013:32) translates Kaʻākaukukui as "The north/right light," and describes it as a coastal land "east of Waikahahulu, and adjoining Kukuluʻāeʻo." Further, Maly et al. (2013:32) holds that the area, once fronted

by fishponds and salt works, was cited in historical accounts, Māhele Claims 6236, 7712, 7713 and 10605, and Register Map numbers 241, 395, 611, 861, 900, 1090, and 1471.

Spearing et al. (2008) found that Kaʻākaukukui was briefly mentioned in the Hiʻiaka legends, where Hiʻiaka and her companions decided to travel from Puʻuloa (Pearl Harbor) to Waikīkī by canoe after traveling around Oʻahu by trail. While in Puʻuloa, Hiʻiaka met a party who were en route to visit the chiefess Peleʻula in Waikīkī by land trail. Hiʻiaka informed people that she would travel by sea and meet them in Kou. The chant Hiʻiaka recited is as follows:

And what of me, O Honokaʻupu, my love	*A pehea lāau, e Honokaʻupu, kuʻu aloha*
Upon the crest of the surf at Uhi and ʻOā	*I ka welelau nalu kai o Uhi, o ʻŌa*
Eyes in the living realm (night) of oblivion	*ʻO nā makai ke ao (pō) o poina*
Where am I, O my love	*Ma hea lā wau, e ke aloha lā*
Kou is the coral flat	*ʻO Kou ka papa*
Kaʻākaukukui is the pool	*ʻO Kaʻākaukukui ka loko*
Some ʻalamihi indeed	*ʻO ka ʻalamihi aʻe nō*
Wait all day until night	*ʻO ka lā pō iho*
Friends shall meet in Kou.	*Hui aku i Kou nā maka.*

(Hoʻoulumāhiehie 2006a:277; Hoʻoulumāhiehie 2006b:297)

Kaheiki

Kaheki, which means "little flow," is described as a *heiau* of *poʻokanaka* (human sacrifice) class, according to Maly et al. (2013:33) as well as the name of a land area and stream, however, the location is only noted as Honolulu. In "The Career of Boki," Kamakau (1961) describes a large boulder in Kaheiki Stream named Hōʻeu, which was the guardian of Keheiki:

> Boki started to work at the makai road leading to Kaʻalaʻa and when he reached the stream of Kaheiki there stood a great rock over the stream blocking the way. Boki was trying to remove it when a man came forward and said, "Hear, O chief! leave that rock alone. The god made this rock a guardian for this place and his house is yonder (pointing upward to Kaheiki). It is a guardian for the house of the god and its name is Hoʻeu. The nature of this rock is that if you move it aside it will make you move to a foreign land and you will no longer live in Hawaii. Lucky for you if a year passes before you depart." Boki's pipe lighters, Hohopa and Hukiki, reproved the man, to whom he answered, "Take care lest you be thrown onto a bed of thistles!" While working on the Luakaha road Boki found a long, pointed rock in his way and was starting to remove it when a divining kahuna named Luʻau who was skilled in pointing out locations came forward and said to him, "Do not disturb this rock; it is named Ku-of-exceeding-great-mana (Ku-manamana) and Rock-of-exceeding-great-mana (Pohaku-manamana). Not even a high chief should disturb that rock, for it covers the waters of Ka-papa-i-kawa-luna which lie below it and supply the waters of Kunawai, Kahoa-kane, Koʻula, and Kewalo." Boki instantly ordered the men to remove the rock, but it extended into the soil so far that when they had dug some ten fathoms down and about the same distance either way, he gave up in despair. Luʻau also showed him Kukui-puka and other kupua objects mauka of this place (Kamakau 1961:292).

In addition, Kamakau (1961:136) tells of a battle between Kahekili and Kahahana in 1783 that was fought at Kaheiki, where the "waters of the stream of Kahe-iki ran red with blood from the heaps of broken corpses that fell into the water; the stream was dammed back with the corpses of those who died in battle."

Kaholoakeāhole

The translation of Kaholoakeāhole is "the running/schooling of the āhole fish," according to Maly et al. (2013:33) and is the "point along the shoreline below Kākāʻako, near where fishermen resided in the time of Kamehameha I."

Kahuananaula *

According to Maly et al. (2013:33), Kahuananaula is the traditional place name of the area "situated between King and Merchant Streets, and bounded between Fort and Alakea Streets."

Kaimukanaka or Umukanaka

Kaimukanaka translates as "the human oven" and is the name of an area and pond in Kaʻākaukukui (Spearing et al. 2008; Maly et al. 2013). The pond is said to be referred to as Kaimukanaka, Umukanaka, or Ka-imu-hai kanaka, all of which appear to be associated with human sacrifice.

Kakaʻako *

Kakaʻako, which means "to strike and gather," is described as a land area situated between Honuakaha and Kaholoakeāhole that contained a fishing village in the pre-Contact era (Maly et al. 2013). There is no meaning given for the place name Kakaʻako in *Place Names of Hawaiʻi* (Pukui et al. 1974). However, Pukui and Elbert (1986:110) provide a translation for the word *kākāʻāko* as "dull, slow." Alternatively, Thrum (1922:639) suggests *kākāʻāko* means to "prepare the thatching," based on the meaning of the name's first half, *kākā*, "to chop, beat, or thresh" and its last half, *ako,* which means "thatch." Spearing et al. (2008) speculate that the name could tie into the fact that tall *pili* grass, used to thatch traditional structures, thrived in salt marshes, such as those in Kakaʻako - provided that Thrum's translation is correct.

In Thrum's (1900:123-128) version of the legend of Kūʻula, Kakaʻako is mentioned as the location that Aiai, son of Kūʻula, stayed for several days and was befriended by a local named Apua.

Kālia *

The name Kālia translates as "waited for," and is a coastal *ʻili* of Waikīkī Ahupuaʻa, once famous for its salt production and fishponds (Maly et al. 2013). This location was also mentioned in Thrum's (1900) version of the

legend of Kūʻula as the location where Aiai first came to on the island of Oʻahu from Molokaʻi.

Several proverbs were found regarding Kālia:

He kai hului ko Kālia. A sea for fishing with a drawnet is the sea of Kālia. (Pukui 1983:71)

This proverb suggests, according to Pukui (1983:71) that the water at Kālia is very shallow.

Ke kai wawalo leo leʻa o Kālia. The pleasing, echoing sea of Kālia.

Pukui (1083) places the sea of Kālia as the current location of Ala Moana (Pukui 1983:186).

Kaʻoaʻopa *

According to Maly et al. (2013:36), Kaʻoaʻopa is a section of coastal land situated between Mokuʻaikaua and Honuakaha. The trail from Kou to Waikīkī ran through this location. Kaʻoaʻopa is also the location where the attendants of Kamehameha II (Liholiho) lived during the reign of Kamehameha I (Maly et al. 2013).

Kauanonoʻula

Roughly located at the intersection of Merchant and Alakea Streets, Kauanonoʻula is said to have been a regular haunt for ghosts. Westervelt (1915:4) holds that Kauanonoʻula, or "rain with the red rainbow," was a place where *wailua* (ghosts) were known to gather "for nightly games and sports." Kamakau (1961) holds that Kauanonoʻula is named for an ancient chiefess, and wife of Honokaʻupu. Kauanonoʻula, translated by Maly et al. (2013:128) as "the red glowing rain" and provides a background story for the name from an article in the *Nūpepa Kuokoa*, "*Kuu Kamaaina i ka ua Kukala Hale*" (January 24, 1919:3). The story is as follows:

It is because of a beautiful chiefess that this place is named Kauanonoʻula. It was there that she and her family resided. This is the chiefess who took Honokaʻupu as her chiefly husband, and it was at this place that they played their favorite game of kōnane. This is why the famous saying came about, "Huhuhui aku nā maka i Kou" (The eyes will meet at Kou) and "Hāhā pōele ka pāpaʻi o Honolulu" (The crabs of Honolulu grope about in the dark).

Here is the tradition: It is said that the kōnane playing area of the chiefs was there by Fort Street, close to Queen Street, where the bank of Spreckles is; and at this place many people, attractive men and women, gathered for these pleasurable kōnane games of the chiefs.

The kōnane board of this story was made from a large kou tree that was taken from a place nearby what is now Kapiolani Park in Waikīkī. And on the board, were marked lines and four corners in which the various pieces were set.

It was in those days that the name, Kou was given to that place, because of the pastime of the chiefs, and the murmuring voices of the sweethearts could be heard about, "Huhuhui aku na makai Kou," that is the saying was spoken there [sic], inviting the desire of those who were entwined in the embrace of love to meet. Auwe!

As night set out its cover, the men and women would begin to ask and seek out their companions and the saying was uttered "Hāhā pōele ka pāpaʻi o Honolulu," [sic] Thus the night was not without the groping hands - So that which was seen is finished (translated by Maly et al. 2013:128).

This story describes the general tone of this location during *kōnane* games as being a party-like atmosphere.

Kawaiahaʻo *

The area in which Kawaiahaʻo Church is located was once the location of a fresh water spring that belonged to a chief named Hao, hence the name Kawaiahaʻo, which translates to English as "The water belonging to Hao," according to Westervelt (1915:3). Pukui et al. (1974) describes Kawaiahaʻo as an *ili* land once noted for its spring and healing waters. Haʻo is mentioned as both a chief and chiefess in accounts for the area (Maly et al. 2013). Kawaiahaʻo is cited in traditional and historical accounts; Māhele Claim 10605, and Register Map No.'s 111 and 900, and 1912 map by Baldwin & Alexander (SRI Foundation 2013:B-8).

Pukui (1988) recaps a *mo olelo* of the Waters of Haʻo, which describes two springs in Kewalo. In this story, two of chief Haʻo's children ran away from their malicious stepmother and hid for a time at Kewalo Spring. This spring is thought to have been near the trail that connected Waikīkī and Kou. When the children heard that the chiefess had sent men to look for them, the children took the trail across the plain to Kou that night, but succumbed to exhaustion and dehydration. At the western end of the trail, near Kawaiahaʻo Church in Kakaʻako is where the children stopped to rest. One of the children had a dream while he slept, where the boy's mother told him to pull up a plant near his feet. After pulling up the plant, a spring was found. This spring came to be known as the Water of Haʻo, or Kawaiahaʻo, after the childrenʻs father (Pukui 1988:87-89).

Ke-kai-o-Mamala

Ke-kai-o-Mamala was the name of a surf break at the outer entrance of the harbor of Kou, which was named after the chiefess Mamala. Westervelt (1915:2) describes the chiefess as a remarkable woman "who loved to play konane Hawaiian checkers drink awa and ride the surf."

Kekaukukui *

Several Historic maps exhibit a location referred to as Kekaukukui, which is said to have been close to Ulakua (Westervelt 1915:4). Kekaukukui was

reportedly a hub for *kōnane* (a type of pebble board game). Westervelt (1915:4) states:

> Kekaukukui was the place where small konane (checker) boards were laid. These were flat stones with rows of little holes in which a game was played with black and white stones. Here Mamala and Ouha drank awa and played konane (Westervelt 1915:4).

Westervelt (1915:4) also holds that Kamehameha V's father, Kekuanaoa, built his home at Kekaukukui.

Kewalo *

Kewalo, which is translated as "the calling," represented a vast *kula* and coastal region, but is now a name that refers to a manmade basin on the coastline of Kakaʻako. Westervelt (1915) provides a glimpse of ancient Hawaiian practices that took place in this area, stating:

> Kewalo was the place where the Kauwa, a very low class of servants, were drowned by holding their heads under water, according to the law known as "Ke-kai-he-hee." "Kai" means "sea" and "hee" means "surf-riding" or "sliding along." The law meant the sliding of the servants under the waves of the sea (Westervelt 1915:3).

He also holds that Kewalo is the nesting place of the owl responsible for initiating the great battle between the legendary owls who gathered from Hawaiʻi to Kauaʻi and chief Kakuhihewa's army. In this story, the protagonist, Kapoʻi, came across pueo eggs as he was gathering pili grass on the slopes of Punchbowl. Kapoʻi collected the eggs for his dinner, but the owl pleaded for Kapoʻi to return the eggs. After the pueo shamed the protagonist and correctly answered the correct number of eggs he found, Kapoʻi gave in to the pueo and returned the eggs. His acquiescence and return of the eggs reflects his acceptance of the owl as his *ʻaumākua*." As Kapoʻi was beholden to the owl, he was commanded to erect a *heiau*, make it *kapu* (sacred), and perform rites there. These actions were strictly prohibited by the ruling chief of Oʻahu, Kekuhihewa. Upon hearing the actions that Kapoʻi took, Kekuhihewa ordered the lawbreaker to be captured and killed upon Kūpalaha Heiau. However, the pueo then amassed an army of owls who successfully freed Kapoʻi from his gruesome fate at Kūpalaha Heiau (Westervelt 1915: 135-137). Kukaeunahiokapueo, which means "the confused noise of owls rising in masses," is the traditional place name of the great battle of the owls (Spearing et al. 2008).

In the legend of Pumaia, Kewalo was the location of a battle in which Pumaia killed all of Kualii's warriors and officers (Fornander 1917:492).

Hua-nui-ka-lā-laʻilaʻi, one of Oʻahu's distinguished chiefs, was born at Kewalo. The following *mele* recorded by Kamakau (1991) describes this event:

ʻO Hua-a-Kamapau ke ʻliʻi	Hua-a-Kamapau the chief
O Honolulu o Waikīkī	O Honolulu, of Waikīkī
I hanau no la i kahua la i Kewalo,	Was born at Kewalo,
ʻO Kālia la kahua	Kālia was the place [the site]
O Makiki la ke ēwe,	At Makiki the placenta,
I Kānelāʻau i Kahehuna ke piko,	At Kānelāʻau at Kahehuna the navel cord,
I Kalo i Pauoa ka ʻaʻa;	At Kalo at Pauoa the caul;
I uka i Kahoʻiwai i	Upland at Kahoʻiwai, at
Kanaloahoʻokau . . .	Kanaloahoʻokau. . .

(Kamakau 1991:24)

Kolowalu *

Kolowalu, which encompassed a large fishpond, is located within Kukuluāeʻo and abutted the lands of Kālia and Kewalo. Kolowalu is an ancient benevolent law that existed during the reign of Kualii, which is explained by Fornander (1917) as:

> It was strict, unvarying and always just. It was for the care and presentation of life; it was for the aged men and women to lie down in the road with safety; it was to help the husbandmen and the fishermen; to entertain (morally) strangers, and feed the hungry with food. If a man says, "I am hungry for food," feed [him] with food, lest he hungers and claims his rights by swearing the kolowalu law by his mouth, whereby that food becomes free, so that the owner thereof cannot withhold it; it is forfeited by law. It is better to compensate. He who swears must observe the law faithfully, lest he be accountable to the law of the king which he has sworn to observe, and the punishment be upon him. If it is simple robbery of others' food, or of others' property, then severe punishment shall be meted out to the person who violated the law. A transgressor, or one who is about to die, is, under the application of this law exonerated of his death or other penalty. Through the uprightness of his [Kualii's] law, and the honesty with which he administered the government, God preserved him, so that he lived a long life, and his is that notable life spoken of in the annals of the ancient people, of the king of Oahu, who lived four times forty and fifteen years. In the last stage of life he was bent with age and withered, with the eyes reddened and bedimmed; and was carried about in a netting. He died at Kailua, in Koolaupoko, in A.D. 1730, in the one hundred and seventy-fifth year of his life (Fornander 1917:432).

Kou *

The area now referred to as Honolulu (lit. Sheltered or Protected Cove) was traditionally referred to as Kou, due to the fact that *kou* tree groves were prominent features in its landscape. According to Kamakau (1976), Honolulu as the name of a locality originally referred to a *loʻi kalo* (taro patch) located at what is now the intersection of Liliha and School Streets, which bore the name of its caretaker, Honolulu. Because Honolulu was so well loved, Kamakau states "his descendents gave this name to the whole ahupuaʻa" (1976:7). Westervelt (1915:1) holds that there are various translations for the place name of Honolulu, including "Sheltered Hollow" and "abundance of peace." He further states:

> "Honolulu" was probably a name given to a very rich district of farm land near what is now known as the junction of Liliha and School Streets, because its chief was Honolulu, one of the high chiefs of the time of Kakuhihewa, according to the legends. Kamakau, the Hawaiian historian, describes this farm district thus: "Honolulu was a small district, a pleasant land

looking toward the west, — a fat land, with flowing streams and springs of water, abundant water for taro patches. Mists resting inland breathed softly on the flowers of the hala- tree."

Kakuhihewa was a king of Oahu in the long, long ago, and was so noted that for centuries the island Oahu has been named after him "The Oahu of Kakuhihewa." He divided the island among his favorite chiefs and officers, who gave their names to the places received by them from the king. Thus what is now known as Honolulu was until the time of Kamehameha I., about the year 1800, almost always mentioned as "Kou," after the chief Kou, who was an "Ilamuku," or "Marshal," under the king Kakuhihewa. "Kou" appears to have been a small district, or, rather, a chief's group of houses and grounds, loosely denned as lying between Hotel Street and the sea and between Nuuanu Avenue and Alakea Street (Westervelt 1915:1-2).

Westervelt (1915:8) also states that Kou was likely the most prominent place on Oʻahu to play *kōnane,* which is an ancient board game played with pebbles. He describes the *kōnane* hub as being located near to the temple; likely Pākākā Heiau. This is upheld in a proverb from Pukui's *ʻŌlelo Noʻeau*:

Hāhā pōʻele ka pāpaʻi o Kou. The crabs of Kou are groped for in the dark.
(Pukui 1983:50-51)

This proverb refers to one who "goes groping in the dark," but alludes to the days in which the chiefs of Kou held *kōnane* games at the shoreline of Kou, which often lasted into the night, causing the spectators to "grope for their companions" (Pukui 1983:51). The *kōnane* games also drew spectators from all over the island, as is suggested in the next proverb:

Hui aku na maka i Kou. The faces will meet in Kou.
(Pukui 1983:120)

She explains, "We will all meet there, Kou (now central Honolulu) was the place where the chiefs played games and people came from everywhere to watch" (Pukui 1983:120).

Kukuluāeʻo *

Kukuluāeʻo means "to walk on stilts" and shares the name with the Hawaiian Stilt (*Himantopus himantopus*), which would have frequented the marsh area. Pukui et al. (1974) holds that Kukuluāeʻo once fronted Kewalo Basin and described it as being marsh lands with salt ponds and fishponds. Kamakau (1865) states that Kukuluāeʻo was a well-known area in the pre-Contact era with a *heiau* called Puʻukea. Maly et al. (2013) describes the area as near shore.

Kulaokahuʻa

Kulaokahuʻa translates "the plain of the boundary" in Pukui et al. (1974:123). Alternatively, it may be translated as "plain of Kahuʻa," Kahuʻa being the name of a star; or if the *okina* is left out, *kahua* is generally a site for habitation or sports, such as *ʻulu maika* (Pukui and Ebert 1986:113,178). This

area consists of the plain that abuts the northern boundary of the project area, defined in the story of Peapea, famed warrior during the time of Kahahana, in Fornander (1819:458) as "the level section between Waikīkī and Punchbowl." Kulaokahuʻa has been described as barren and dry in several accounts (Gilman 1909:9-91; Fornander 1819:458; Pukui 1983:84-85).

Emerson mentions Kulaokahuʻa in the legend of Hiʻiaka, the goddess Pele's sister as she passed through the area:

> ... Their route lay eastward across the dusty, wind-swept plain of Kula-o-kahu'a - destined in the coming years to be the field of many a daring feat of arms; - then through the wild regions of Ka-imu-ki, thickset with bowlders [sic] - a region at one time chosen by the dwarf Menehune as a sort of stronghold where they could safely plant their famous ti ovens and be unmolested by the nocturnal depredations of the swinish Kama-pua'a. Hi'iaka saw nothing or took no notice of these little rock-dwellers. Her gaze was fixed upon the ocean beyond, whose waves and tides they must stem before they reached and passed Moloka'i and Maui, shadowy forms that loomed in the horizon between her and her goal (Emerson 1915:185-186).

The area has been the backdrop of several pre-Contact *moʻolelo*, such as the stories of Pikoi, the rat hunter, Hanaaumoe, the trickster hero, and the story of the famed runner, Kaohele. Kulaokahuʻa was also the setting of several pre- and early Contact battles (Fornander 1819:474; 496; O'Hare and Hammatt 2004:8-9). Kulaokahuʻa has also been referred to as a sports and game playing field. In *The Islander* (Thrum 1875), Kulaokahuʻa is described as a fair ground in which games are played as well as celebratory events in a proposed exposition for the discovery of Hawaiʻi by Captain Cook in 1778:

> Probably the most practical way for to celebrate the occasion, will be to hold a national fair at Kulaokahua grounds in Honolulu, which exhibit all possible Hawaiian resources; which exhibition may be supplemented with sports, match games of ball, boat and canoe racing, &c., &c., [sic] military and other parades, and exercises of a more literary and artistic character, -addresses and music. There is little doubt but that the whole population, natives and foreigners, would enter into such celebration with enthusiasm… (Thrum 1875: Vol. 1; No. 25, p.1).

Thus, the vast plain of Kulaokahuʻa has been well documented in accounts from the pre-Contact era to well into the Historic era.

Kuloloia *

The shore of Kuloloia is mentioned by Thrum in the story of *Aiʻai, Son of Ku-Ula* (Thrum 1900:123-128). In the passage, Aiai walked along the shore of Kulolia to Pākākā and Kapapoko. Maly et al. (2013:42) describes Kuloloia as having been a beautiful sandy beach as well as some of the figures associated with it. Also, a number of *aliʻi* dwelt there and there were *heiau* spread across its shoreline, between Pākākā and Honuakaha. Ī`ī (1959) states that the chiefess Nāmahana lived at the shore of Kuloloia and died in her home.

He adds that one of her nephews present during her death was named Kuloloia in afterwards. A single proverb was found referring to Kuloloia in Pukui (1983):

Ka iʻa maunu lima o Kuloloia. The hand-baited fish of Kuloloia.
(Pukui 1983:149)

As Pukui explains, "Small eels (*pūhi ʻōilo*) that were caught by placing bait on the open palm of one hand with the fingers held wide apart. When the eels came up to take the bait, the fingers were clenched into a tight fist, grabbing the eels tightly by the heads" (Pukui 1983:149). This provides some information on what marine resources were available as well as what fishing methods were used.

Kōʻula *

Kōʻula, which translates as "red sugar cane," was a locality in or adjacent to Kewalo (to the north). Maly et al. (2013:41) cite Kamakau (1865) who stated that these lands were cultivated under the orders of the chief, Hua, who is said to have taken care of his people. This land is located partially within the Catholic Cemetery and the Ward property.

Māmala

Māmala, or Kekaiomamala, is the Traditional name for Honolulu Harbor and translates as "fragmented or broken." This bay was the most prominent waterway and boat landing for Kou. As a result, Māmala was the backdrop of many key events and legends of pre-Contact Hawaiʻi. Māmala Bay was named after the famed chiefess who was known to be an ardent surfer. According to Westervelt (1915),

> Ke-kai-o-Mamala was the name of the surf which came in the outer entrance of the harbor of Kou. It was named after Mamala, a chiefess who loved to play konane (Hawaiian checkers), drink awa, and ride the surf. Her first husband was the shark-man Ouha, who later became a shark-god, living as a great shark outside the reefs of Waikiki and Koko Head. Her second husband was the chief Hono-kau-pu, to whom the king gave the land east of the land of Kou. This land afterward bore the name of its chief, Hono-kau-pu. In this section of what is now called Honolulu were several very interesting places (Westervelt 1915:2).

Several proverbs referring to Māmala were found in Pukui (1983):

He *kai hele kohana ko Māmala*. A sea for going naked is at Māmala.
(Pukui 1983:71)

Ka nuku o Mālama. The mouth of Mālama.
(Pukui 1983:163)

Ke kai ʻau umauma o Māmala. The sea of Māmala, where one swims at the surface.
(Pukui 1983:184)

Kaʻale kuehu o Māmala. The billows of Māmala with wind-blown sprays. (Pukui 1983:235)

To elucidate the first proverb, Pukui (1983:71) holds that "The entrance to Honolulu Harbor was known as Māmala. In time of war the people took off their clothes and traveled along the reef to avoid meeting the enemy on land." The second proverb refers to a shark goddess who once lived in Honolulu Harbor and is who the entrance is named after. The last two proverbs provide some visuals of what the conditions could be at Māmala and what activities occurred there.

Mauna Kilika *

Mauna Kilika, is translated by Maly et al. (2013:44) as "Silk Mountain," which is named for the mounds of silk cloth brought in by foreigners in the Historic era that were often traded for Hawaiian products. Mauna Kilika is also the location of the former residence of Judge Mataio Kekuanaʻoa on the shore of Kuloloia. Mauna Kilika was later named Hale Kauwila. According to Goodale (1897:5), Mauna Kilika was also referred to as the Armory. It was built in 1840 and was one of the first Government buildings in Honolulu. The building is where the Parliament and Land Commission met and is the location of several historical events, including writing of the first constitution.

Pākākā *

Pākākā, which means "to glide as on the surf," (Andrews 1922:664) is the Traditional name for the coastal lands at the south end of what is now Fort Street (Īʻī1959). Although the most prominent structure of Pākākā was its *heiau*, several historic accounts speak of houses, likely those of the *aliʻi*, being located in the area (Īʻī 1959:82). In fact, Pākākā was the location in which Kaʻahumanu and Kaumualiʻi lived together from 1822-25, before Kaumualiʻi died in 1825 (Kamakau 1992:265). The article, "Famous Men of Early Days," in *Fornander's Collection of Hawaiian Antiquities and Folk-lore*, Pākākā is mentioned:

> KEKUAWAHINE was a master hand at deceiving and falsifying; he could turn an untruth into a reality; from correct to incorrect, and so forth. When Kamehameha was residing at Pakaka, Kona, Oahu (that is the place where "White man Jim" lives), at the time that the islands from Hawaii to Niihau were subjugated by him, he was living with his wife, Kaahumanu (Fornander 1917:421).

According to Īʻī (1959:82) the wharf at Pākākā was where people crowded to greet the canoes and boats of Kaumualiʻi upon his arrival to meet with Kamehameha.

Puʻuiki

Puʻuiki translates to "little hill or mound" and is a surf break in Māmala (Maly et al. 2013).

Puʻukea *

Puʻukea, which literally means "white hill," is a *heiau* in Kukuluāeʻo, east of Kaʻākaukukui. This *heiau* is said to have been built for Hua-nui-ka-lā-laʻilaʻi, who was born Hua-a-Kamapau at Kewalo (Kamakau 1991: 24-25). In "A Chant for Kualii," Puʻukea is where *mahiki* grass danced (Fornander 1917:396). Pukui and Ebert (1986) maintain that *mahiki* grass is used to exorcise evil spirits.

Puʻunui *

Puʻunui translates as "large hill or mound" and is a land division in Nuʻuanu that has several coastal *lele* located from Queen Street past Hale Kauwila Street into Kaʻākaukukui and bounded by South and Coral Streets. These *lele* were known to have salt making ponds.

ʻUlakōheo

According to Maly et al. (2013:48), ʻUlakōheo translates as "Red penis head" and is the name for an area located near the shore between situated near the shore and Queen, Maunakea, Nuʻuanu, and Marine Streets.

Ulukua *

Westervelt (1915:3) holds that Ulukua, which was located "near the lumber-yards at the foot of the present Richards Street," was once "the place where idols were made." The waters off of Ulukua is where Kamehameha's single canoe greeted the fleet carrying Kauaʻi's regent, Kaumualiʻi (Īʻī 1959:82). Maly et al. (2013:49) states that Ulukua is the site of the Honolulu Lighthouse, which is no longer standing.

Waikahalulu *

Translated as "roaring water," Waikahalulu is an ʻili between lower Nuʻuanu and Pauoa Streams as well as below Hale Kauwila Street where it meets ʻĀina Hou, Kuloloia, and Kaʻākaukukui (Maly et al. 2013:49). This area is mentioned in the canoe story where Kakae, a descendant of Menehune, needed a canoe to search for her brother. Thus, the Menehune built a canoe for her overnight to help Kakae, but did not get it into the water by daylight and left the canoe in a ditch near Waikahahulu (Beckwith 1970:333). Figure 3 illustrates the approximate locations of the *inoa ʻāina* and *wahi pana* in what is now referred to as Kakaʻako.

4.6.2.2 Traditional *Heiau*

Several *heiau*, varying in scale, antiquity, and purpose, once stood in the area now referred to as Kakaʻako.

Pākākā Heiau

Pākākā Heiau was located west of the south end of Fort Street and was built sometime prior to the reign of Chief Kakuhihewa (Westervelt 1915:8). Kuhoʻoneʻenuʻu, the

principal god of Oahu ruling chiefs, was the god of Pākākā Heiau (Beckwith 1970:29). This *heiau* was also the headquarters for all of Oʻahu's priests and that its walls were "adorned all around with heads of men offered in sacrifice" (Westervelt 1915:8). Thrum (1905:45, 57) also holds that Pākākā Heiau was of the *poʻokanaka* (human head) class and located in Honolulu but the actual site was not found. However, he later states:

> Search for the Pakaka and Kaheiki heiaus mentioned by Kamakau, and classed as pookanaka, has not given satisfactory results, though in a native description of early Honolulu, following the Okuu pestilence of 1804, there was located at Pakaka (known later as Robinson's point), heiaus of a medical class under one Papa, termed "na heiau kahuna lapaau." Kamakau having classed his of this name or location as a sacrificial heiau relieves it from confusion with this medical kahuna school (Thrum 1905:60).

In the "Myth of Haumea as Kamehaikana," (Beckwith 1970:281-282) Kou's ruling chief at the time of Papa and Wākea was Leleho'omao, who attempted to sacrifice Wākea at Pākākā Heiau for his crime of trespassing.

A prominent *kōnane* playing area and famous boulder was located on one side of the *heiau* (Westervelt 1915:8). In the Historic period, Pākākā Heiau came under the ownership of Kinau, mother of Kamehameha V (Westervelt 1915:8).

Kaheiki Heiau

According to Beckwith (1970:332) Kaheiki Heiau "built by the Menehune and presided over by the kahuna who founded the priesthood called Moʻo-kahuna." A foreigner called, Kahanai-o-ke-akua (Adopted by the gods), was raised by Kane and Kanaloa at Waolani heiau before residing at Kaheiki (Beckwith 1970:332). Kamakau (1961:292) reiterates a story where Boki is warned against disturbing a large boulder in the stream that is the guardian of Kaheiki, lest bad luck befall him and to the surrounding areas.

Beckwith (1970:345) summarizes as story told by Westervelt (1915) about a cannibal "dog-man," named Kaupe, who lived at Lihue on Oʻahu. The story of Kaupe involves a great *kahuna* from Kaheiki Heiau. The story is as follows:

> Among dog-men represented as overthrowing the chief of a district and terrorizing the country, the most famous is the cannibal dog-man Kaupe who overthrew the government of Ka-hanai-a-ke-akua (Reared by the gods) and ruled the land from Nuʻuanu to the sea.
>
> Kaupe lives at Lihue on Oahu. He never attacks a high chief but eats some of the people both of Oahu and Maui. At last he crosses over to Hawaii and brings back a chief's son to sacrifice in the heiau at Lihue. The father follows to Oahu and consults Kahilona, the great kahuna at the heiau of Kaheiki just below the hill called today Pacific Heights, which was built by the Menehune and which becomes under Kahilona the center for the moʻo-kahuna class of priests; that is, for kilokilo who read the signs of earth and sky and sea. This kahuna teaches the chief from Hawaii the prayer to recover his son, which runs
>
> "O Ku, O Lono! O Kanaloa! By the power of the gods, by the strength of this prayer, Save us two, save us two!"

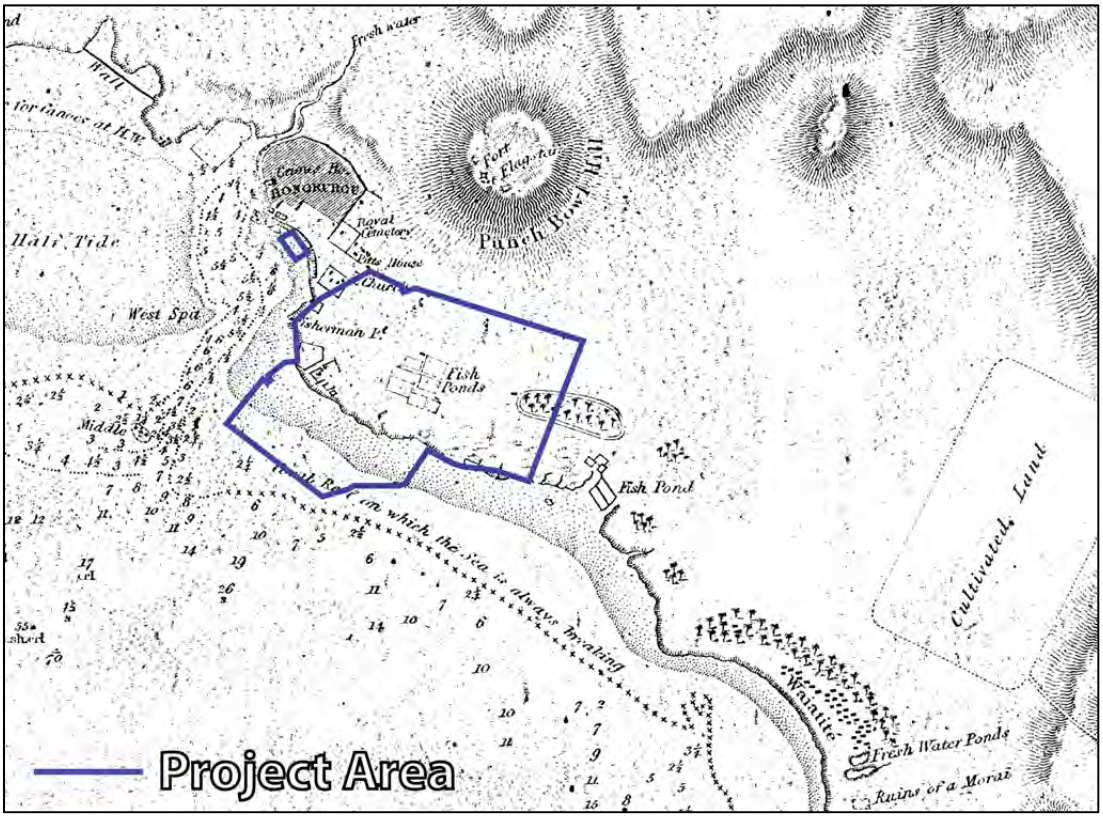
> The prayer unfastens the boy's fetters and father and son flee and hide under a rock at Moanalua while Kaupe goes on to look for them on Hawaii. The father learns the prayer for killing an enemy, and overcomes Kaupe on Hawaii (Beckwith 1970:345).

Puʻukea Heiau

The name Puʻukea literally means "white hill" and is said to be a *heiau* built under the management of a chief named, Hua-nui-ka-lā-laʻilaʻi, who hailed from Kewalo. This chief was born under the name Hua-a-Kamapau, but received the name from his subjects for his benevolent rulership (Spearing et al. 2008; Maly et al. 2013).

4.6.2.3 Post-Contact History

As discussed extensively in the SCIA (see Appendix C), the islands of Hawaiʻi have undergone dramatic changes since their discovery by Native Hawaiians, which is now debated to be no earlier than 1200 years before present (Kirch and McCoy 2007). The arrival of Europeans in the late 1700s sets the scene for a different drama to unfold. After European contact until the present, Kakaʻako has gone through even more radical changes in the physical and cultural landscape due to the decline of the Native Hawaiian population and the increasing influence of Western and Asian immigrants. In this period, Kakaʻako has gone from a hinterland between the two major localities, Kou and Waikīkī, to the governmental seat and recreational area of Oʻahu's royalty and *aliʻi*, subsequently, the urban and industrial heart of the island.



The 19th Century proved to be a time of total transformation for the area now referred to as Kakaʻako. Traditional Hawaiian dwellings, transportation, and cultural practices quickly succumbed to Western customs – forever changing the people and their landscape from Kou to Waikīkī and *mauka* to *makai.*

Figure 4-5 provides a glimpse of what the early 19th Century Kakaʻako vicinity landscape was like. The upper map is a portion of an 1817 map drawn by a European named Kotzebue. The lower map is a portion of a map drawn in 1825 by a European named Malden. Note that both maps depict the coastline at that time to be located in the general vicinity of what is now Ala Moana Boulevard; all of the land makai of today's boulevard appears to have been reef flats that were partially or fully submerged. The 1825 map also shows several fishponds in the central area of what is today the Mauka Area of the KCDD.

A map produced in 1887 (see Figure 4-6) depicts a dramatic change to the rapidly expanding seaport of Honolulu to the immediate west of Kaka`ako. Yet, with the exception of Kawaiahao Church in the northwest corner, and the extension of Queen Street, the area of Kaka`ako appears to be relatively unchanged from 60 years earlier.

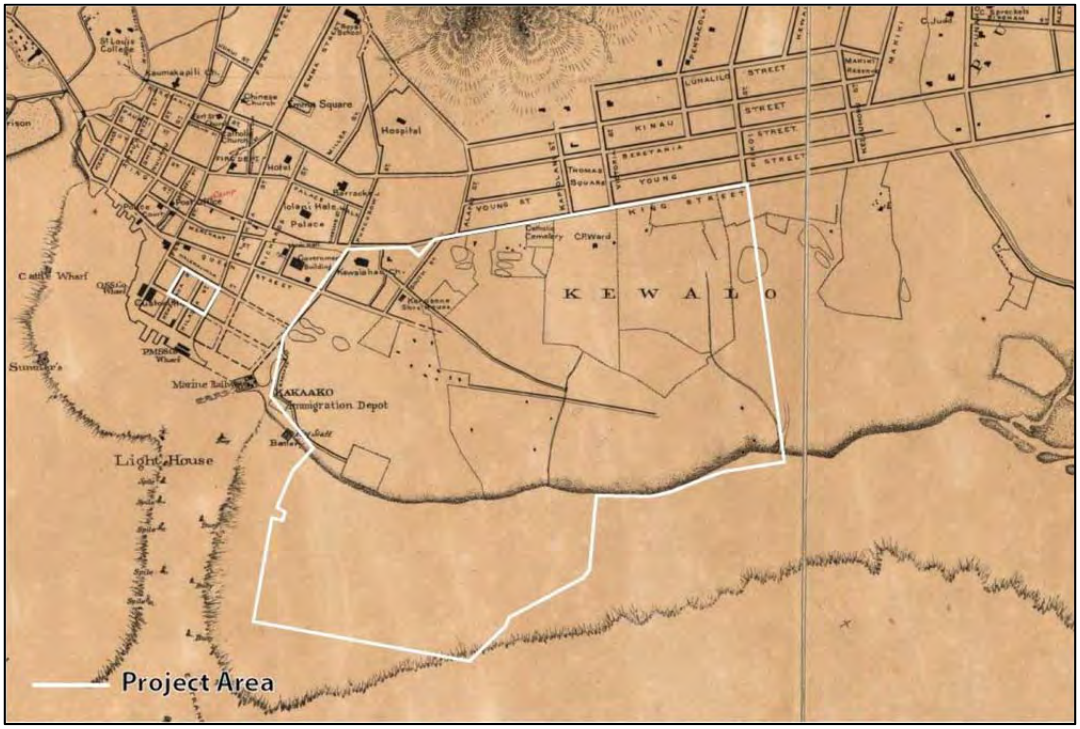


Figure 4-5: Maps of Kaka`ako Area Approximately 100 Years Ago (1817 & 1825)

Source: SCIA 2014 (see Appendix C)

Figure 4-6: Kaka`ako in 1887

Source: SCIA 2014 (see Appendix C)

The distinctive street-grid of downtown Honolulu, as well as the King/Beretania Street corridor is clearly evident in the map above.

Kaka‘ako continued to change drastically following the annexation of the islands in 1899 by the United States. Changes in Kaka‘ako and surrounding areas were marked by the spread of tenement housing, industry, and infrastructure as well as development on “reclaimed lands” along the coast.

As Honolulu expanded, demand for affordable housing increased, which was partially driven by the exodus of people fleeing the bubonic plague that broke out in Chinatown. Chinatown tenements were destroyed by “controlled burning” to control the outbreak of bubonic plague. After several successful controlled burns, the burn of 20 January 1900 was blown off the prescribe burn area, unintentionally destroying 38 acres of homes and businesses and displacing nearly 6,000 Hawaiian, Japanese, and Chinese. Many of the displaced rebuilt in Chinatown, but the majority settled in tenements built by Bishop, Magoon, and Ward Estates. Joining those relocating from Chinatown were Hawaiians from rural areas and families leaving the plantations for work in Kaka‘ako’s industrial district, coastal fishing industries, and civic or business jobs in Honolulu. Typically, these new Kaka‘ako neighborhoods were ethnically segregated out of convenience and comfort, yet socializing and commerce continued between the ethnic communities (McGregor 1989). By 1940, over 5,000 people of Hawaiian, Portuguese, Chinese, Japanese, and Filipino descent were living in Kaka‘ako (Spearing et al. 2008).

However, because these tenements were built with such haste, the communities were not well planned, in terms of health and safety, and structures were substandard. As a result, a cholera outbreak occurred in 1911 as well as a trend of physical and mental deficiencies in Kakaʻako's children. Further, structures quickly became dilapidated and unfit for habitation (McGregor 1989). For a short period, many Hawaiians from Kakaʻako resettled in coastal "squatter" camps; living off the land and ocean much as their ancestors did.

Small industry was also on the rise in early 20th Century Kakaʻako, including fish processing and canning iron works, *poi* processing, flour milling, beer brewing, and brick production. According to McGreggor (1989), the population of Kakaʻako's 600 acres was over 2,500. Small businesses, such as grocery stores, restaurants, meat markets, barbershops, theatres, and specialty shops were established as the neighborhoods grew. Schools, public parks, fire and police stations, municipal buildings, a public landfill and incinerator, animal quarantine and shelter, and improved roadways also followed. In addition to commercial developments, the U.S. military installation, Fort Armstrong, was constructed on the reef of Kaʻākaukukui as part of the Coastal Defense System after the annexation of the islands by the United States in 1899 (Spearing et al. 2008: 52).

The coast and wetlands of Kakaʻako and Waikīkī underwent dramatic changes as well. The "Reclamation" Project was, perhaps, the most transformative event in the area's history. On the face of it, the project was an undertaking to fill in mostly agricultural ponds and wetlands that were supposedly compromising public health by acting as a breeding ground for disease bearing mosquitoes. However, according to Nakamura (1979), this project served to generate capital for Hawaiian construction companies while increasing residential land and land value as well as gentrifying the area by forcing out farmers and underprivileged families. This decade-long project not only transformed the coastlines of Kakaʻako and Waikīkī, but altered the ecology and cultural landscape forever. While most of the coast was extended makai, Kewalo Basin was dredged to expand the small harbor for the lumber industry, which soon gave way for the fishing industry (Spearing et al. 2008).

4.6.3 Relationship of the SCIA to Previous Cultural Studies

Section 4.2 of the SCIA (see Appendix C) presents extensive detail about five previous Cultural Impact Assessments that were reviewed by Pacific Legacy (and were briefly mentioned above).

- Wilson Okamoto and Associates, Inc. 2002, Cultural Impact Assessment in the Final Environmental Assessment University of Hawaii Health and Wellness Center. Prepared for the University of Hawaii, John A. Burns School of Medicine. Prepared by Wilson Okamoto and Associates, Inc.

- Spearing, Mishalla, Constance O'Hare, and Hallett H. Hammatt 2008, Cultural Impact Assessment for the Kakaʻako Community Development District Mauka Area Plan, Waikīkī Ahupuaʻa, Honolulu (Kona) District, Oʻahu Island. TMK: [1] 2-1-29-32, 44, 46-56 and 2-3-01-11. Prepared by Cultural Surveys Hawaiʻi, Inc.

- Vogeler, Kuhio, Lehua Kauhane, and Hallet H. Hammatt 2010, Cultural Impact Assessment for the Proposed McKinley High School Athletic Complex Master Plan Project, Honolulu (Kewalo) Ahupuaʻa, Honolulu District (Kona Moku), Island of Oʻahu. TMK: [1] 2-3-009:001 por. Prepared by Cultural Surveys Hawaiʻi, Inc.

- Genz, Joseph H. and Hallett H. Hammatt 2010, Cultural Impact Assessment for the Kewalo Basin Repairs Project, Kakaʻako Ahupuaʻa, Honolulu (Kona District), Oʻahu. TMK: [1] 2-1-058. Prepared by Cultural Surveys Hawaiʻi, Inc.

- Elison, Mina and Windy K. McElroy 2011, Final – Cultural Impact Assessment for Kakaʻako, Ahupuaʻa of Waikīkī, Kona District, Island of Oʻahu, Hawaiʻi. TMK: [1] 2-3-006:017. Prepared by Keala Pono Archaeological Consulting, LLC.

The project area covered by Wilson Okamoto and Associates, Inc. (2002) is on two parcels, totaling 9.9 acres, bound by Kakaʻako Waterfront Park to the south, Ilalo Street to the north, Fort Armstrong Street to the west, and Cooke Street and Kakaʻako Makai Gateway Park to the east (Figure 11 of Appendix C). Spearing et al. (2008) covers The Kakaʻako Community Development District Mauka Area, which is bound by King Street to the north, Piʻikoi Street to the east, Ala Moana Boulevard to the South, and Punchbowl Street to the south (Figure 12 of Appendix C). The project area covered by Vogeler et al. (2010:17) "…is a portion of the present McKinley High School campus, located north-east of Kapiʻolani Boulevard and between the Neal Blaisdell Exhibition Center on the west and Pensacola Street on the east" (Figure 13 of Appendix C). While the CIA prepared for McKinley High School (Vogeler et al. 2010) was focused on a property within the Kakaʻako Community Development District Mauka Area, which is the subject location for the CIA prepared by Spearing et al. (2008), additional cultural resources were identified by Spearing et al. (2008), as it was conducted more recently. Thus, both were included in the SCIA review. The Genz and Hammatt (2010) CIA focuses on the Kewalo Basin, which is comprised of 22 marine acres of the mixed-use harbor, including the immediately adjacent "reclaimed " lands (Figure 14 of Appendix C). Elison and McElroy (2011) covers the 1.73 acre parcel bound by Waimanu Street to the north, Piʻikoi Street to the east, Ala Moana Boulevard to the south, and Kamakeʻe Street to the west (Figure 15 of Appendix C).

The SCIA presents a composite list of cultural practices and resources identified through the extensive community consultation that occurred during these previous studies (see Table 4-2). The background and community consultations sections of Spearing et al. (2008), Vogeler et al. (2010), and Genz & Hammatt (2010) revealed a number of cultural practices that have occurred and/or are currently occurring in the Kakaʻako TOD Overlay area. As with other sections of these CIAs, a very comprehensive attempt at identifying past and present cultural practices and resources of Native Hawaiian groups was made. However, those of other ethnic groups and groups united by non-traditional Hawaiian cultural practices were scarcely covered. Further, the scope of each report was limited to the project area's boundaries. The following list represents the baseline of cultural resources identified within the KCDD. The following section presents newly identified cultural resources.

Table 4-2: Cultural Practices & Resources Identified in Previous Cultural Impact Assessments

Practice/Resource	Practice/Resource Area	Time Period	Cultural Group	CIA Identifying Cultural Practice
Agriculture (*loʻi kalo, niu,* & non-traditional; animal husbandry)	Various locations within project area	Pre-Contact to Historic	Hawaiians (no longer practiced in area); Ward Family (no longer practiced); Kakaʻako residents (small scale subsistence & supplemental agriculture); Hālau Kū Māna (diverse array of native Hawaiian plants for education & traditional use)	Wilson Okamoto and Associates, Inc. (2002); Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010); Elison and McElroy (2011)
Aquaculture, fishponds (*loko iʻa*)	Makai areas of Kakaʻako & Kewalo	Pre-Contact to Historic	Hawaiians (no longer practiced in area)	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Archaeological Sites	Various locations within project area (in marked & unmarked locations)	Pre-Contact to Present	Hawaiians, other ethnic groups, & Community members (no specific ethnic group)	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Cemeteries & burials (*iwi kūpuna*), traditional Hawaiian & post-Contact	Various locations within project area (in marked & unmarked locations)	Pre-Contact to Historic	Pre-Contact & early Contact Hawaiians (no longer practiced); Historic era no specific ethnic group	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Canoe landing & boat moorage	Kewalo Basin	Pre-Contact to Historic (canoe); Historic to present (boat)	Hawaiians (canoe landing no longer practiced in area); boat moorage practiced by various commercial, cultural, & ethnic groups	Genz & Hammatt (2010)
Ceremony & Religious Congregation	Various locations within project area	Pre-Contact to Present	Hawaiians (no longer practicing at *heiau;* human sacrifice abandoned; Catholic Church groups (Annual Holy Ghost Ceremony)	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Feasting (*lūʻau*) & traditional food preparation (*aku* drying)	Kewalo Basin area	Undeter-mined to Present	Hawaiians & other ethnic groups	Vogeler et al. (2010); Genz & Hammatt (2010)
Fishing (net & pole)	Kewalo Basin & Ala Moana areas (shoreline & from boats)	Pre-Contact to Present	Fishermen (no specific ethnic group)	Vogeler et al. (2010); Genz & Hammatt (2010)
Fishing, *aku sampan*	Kewalo Basin area	Historic to Present	Fishermen of the *Kula Kai*, last remaining *aku sampan* at Kewalo Basin	Genz & Hammatt (2010)
Fish processing & canning	Kewalo Basin area	Historic	Local, mostly Japanese, Korean, & Filipino	Genz & Hammatt (2010)
Fisherman's Wharf	Bounded by Ala Moana Blvd., Ward Ave., & Kewalo Basin	Historic to Recent years	Community members (no specific ethnic group); tourist & local patrons	Spearing et al. (2008)

Habitation	Various locations within project area	Pre-Contact to Present	Hawaiians & other ethnic groups; modern era no specific ethnic group	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Historic Buildings	Various locations within project area	Historic to present	Community members (no specific ethnic group); commercial groups & individuals	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Memorial statue of Mother Marianne Cope	Kakaʻako Waterfront Park	Modern/ Present	Community members (no specific ethnic group)	Genz & Hammatt (2010)
Memorial statue of the *Pueo ʻAumākua*	Kakaʻako Waterfront Park	Modern/ Present	Community members (no specific ethnic group)	Genz & Hammatt (2010)
McKinley High School & Memorial statue of President William McKinley	Bound by King St., Pensacola St., Kapiolani St., & Neal S. Blaisdell Center	Historic to present	Community members (no specific ethnic group); current students & alumni	Vogeler et al. (2010)
Mother Waldron Neighborhood Park	Bounded by Halekauwila St., Coral St., Pohukaina St., & Cook St.	Historic to present	Community members (no specific ethnic group)	Spearing et al. (2008); Vogeler et al. (2010);
Plant & *limu* gathering for traditional purposes	Various locations within project area; McKinley High School campus	Pre-Contact to Present	Practitioners of *lāʻau lapaʻau;* gatherers of *pili* & *mahiki* grass (no longer practiced in area)*; limu* for traditional dishes	Spearing et al. (2008); Genz & Hammatt (2010)
Quarantine, human & animal	Kakaʻako Makai	Historic	Past smallpox, cholera, bubonic plague, & leprosy victims (no specific ethnic group); domesticated animals (pets & livestock)	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Arms storage, & practice; coastal defense	Kakaʻako Makai	Historic	U.S. Army & Honolulu Rifle Association	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Salt (*paʻakai*) gathering & production (*kai hoʻolulu*)	Much of Kakaʻako & Kewalo	Pre-Contact to Historic	Hawaiians, other ethnic groups, & commercial groups	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Surfing/Body Surfing & Swimming	*Makai* of Kewalo Basin and Kakaʻako Waterfront Park	Pre-Contact to Present	Surfers/Body Surfers, (no specific ethnic group)	Spearing et al. (2008); Genz & Hammatt (2010)
Trails (*ala hele*)	Leading from Waikīkī to Honolulu (Kou) & connecting various communities to each other & resources	Pre-Contact to Present	Hawaiians, other ethnic groups, & Community members (no specific ethnic group)	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Storied Places (*wahi pana*) & spiritual land associations	Various locations within project area	Pre-Contact to Present	Hawaiians, other ethnic groups, & Community members (no specific ethnic group)	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)
Ward Farmer's Market	Bound by Auahi St., Ward Ave., Queen St.,	Historic to present	Community members (no specific ethnic group)	Spearing et al. (2008)

	& Kamakee St.			
Waste Management, Historic era	*Makai* areas of Kaka'ako & Kewalo	Historic	Public & municipal	Spearing et al. (2008); Vogeler et al. (2010); Genz & Hammatt (2010)

4.6.4 Newly Identified Cultural Resources

Due to the fact that the project area of the Proposed Action is spatially larger than the project areas of the previously conducted Cultural Impact Assessments (CIAs), there were several areas not covered by these assessments (see Figure 17 in Appendix C). It is also noted that cultural resources were not identified for areas adjacent to the previous CIA project areas, which are required to be included in these assessments according to the official CIA guidelines (OEQC 1997).

A number of cultural practices and resources that occur in or adjacent to the project area of the Proposed Action were either overlooked or outside of the scope of previous CIAs, but were identified in the course of the current SCIA. Further, cultural resources valued by non-Traditional and non-ethnic based cultural groups were considered in the current supplemental assessment, as contemporary Kaka'ako is a community of multiple cultures and a hub for cultural activities for the entire island community.

Table 4-3 summarizes the findings of the SCIA. Extensive descriptions and discussion of each individual resource are presented in Section 5 of the SCIA (Appendix C). Figure 4-6 maps the location of the cultural resources identified in the SCIA. (Note: the numbers in the left column of the table correspond to the numbers on the map.) Section 5 of the SCIA also includes summaries of community consultations that were conducted.

Within Table 4-3, cultural resources have been grouped as: Historic Places and Landmarks, Cultural Learning Facilities, Public Parks and Grounds, Memorials and Commemorations, Religious and Spiritual Gathering Places, and Public Art Installation and Entertainment Centers. Collectively and individually, these locations function as cultural resources in a sense that community members frequent them to tap into the institutional knowledge held by members of the same cultural group or sub-group who also frequent the location in addition to the resource (i.e. memorials, art, music, and food) that they identify with. Further, regular and intermittent gatherings by those united by a common tradition, practice, ideal, identity, belief, and/or memory generates an institutional knowledge within the group and serves to perpetuate their cultural practices and values. In some cases, cultural resources are not necessarily tangible in nature, but are locations that serve as repositories for various shared traditions, practices, ideals, identities, beliefs, and memories.

Figure 4-7: Map of Newly Identified Cultural Resources

(Adapted from Google Earth Map)

Table 4-3: Newly Identified Cultural Resources

Map Location	Resource	Resource Area	Period & Frequency	Comments
Historic Places & Landmarks				
1	Hawai'i Capitol Historic District	57 acre area includes: 20 Historic Structures	1794 - present	Located partially within and adjacent to project area. Includes: Kawaiaha'o Church, Hawaiian Mission Houses, Kapuāiwa Building, Hawai'i State Library, Honolulu Hale, Honolulu Hale Annex (Mission Memorial Building Complex), and State (Territorial) Office Building. These structures are in or adjacent to the project area.
2	Hawaiian Electric Company (HECO) Downtown Plant	222 Ala Moana Boulevard	1929 - present	Architectural resource; in project area
3	Aloha Tower (State Site No. 80-14-9929), Aloha Tower Marketplace & Entertainment Complex	Pier 9, Honolulu Harbor	1926 - present	Architectural resource and Historic events relating to Hawaiian history; adjacent to project area
4	The *Falls of Clyde*	Pier 7, Honolulu Harbor	Ship 1878-present, (in repair)	Maritime and Historical resource; adjacent to project area; No estimated date of reopening
5	Mabel Smyth Memorial Building	corner of Punchbowl St.& Ala Moana Blvd.	1941 - present	Architectural resource and Historic events relating to Hawaiian medical history; in project area
6	Post Office, Customhouse, and Courthouse Building (King David Kalākaua Building)	335 Merchant Street across Punchbowl Street from the project area's western boundary	1922 - present	Architectural resource and Historic events relating to Hawaiian history; adjacent to project area
7	Dillingham Transportation Building	*makai* end of Bishop Street, across from the HECO Downtown	1929 – present	Architectural resource and Historic events relating to Hawaiian history; adjacent to project area
8	U.S. Immigration Office	595 Ala Moana Boulevard	mid-1930s - present	Architectural resource and Historic events relating to Hawaiian history; adjacent to project area

Cultural Learning Facilities				
9	African American Diversity Cultural Center of Hawai'i (AADCCH)	1311 Kapiolani Blvd Suite 203	Modern/ present	In project area
10	Diverse Art Center	1034 Queen Street	Modern/ present	In project area
11	Hawai'i Children's Discovery Center	111 Ohe Street	Modern/ present	In project area
12	Maritime Museum	Pier 7, Honolulu Harbor	1988-2009	No estimated date of reopening; adjacent to project area
13	Nā Mea/Native Books Hawai'i	1050 Ala Moana Blvd, Suite #1000	Modern/ present	In project area
14	The Refuge (808 Urban)	683 Auahi Street	Modern/ present	In project area
15	Home of the Brave Tour	Waimanu Street	Modern/ present	In project area
Public Parks and Grounds				
16	Kaka'ako Waterfront Park (major venue for various cultural activities & events)	Bound by Pier 1 complex; John Burns School of Medicine Campus; Kelikoi St., & Kewalo Basin	Intermittent use	In project area; includes the surf breaks Point Panic, Flies, & Incinerators; fishing and diving, takes place along entire coastline (various fish species)
17	Kewalo Basin Park (significant venue for various cultural activities & events)	End of Kewalo Basin access road, between sea wall & harbor	Intermittent use	In project area; various marine activities associated with coastline of park, including fishing and surfing; harbor is moorage for dinner cruises, parasailing, commercial fishing, glass bottom boats, and jet-ski rentals
18	Kaka'ako Makai Gateway Park (significant venue for various cultural activities & events)	Bound by Cooke St., Ala Moana Boulevard, & Ohe St	Intermittent use	In project area; various activities, from organized events to random usage
19	Mother Waldron Neighborhood Park (significant venue for various cultural activities	525 Coral St.	1937-present; Intermittent use	Site#80-14-1388; a "C & C of Honolulu Art Deco Park"; Within project area; from numerous regularly occurring activities, to major annual events, to random usage of park

	& events)			
20	Ala Moana Beach Park (major venue for various cultural activities & events)	Bound by Kewalo Basin, Ala Moana Boulevard, Ala Wai Harbor, & ocean.	Historic-present; Intermittent use	Adjacent to project area; from numerous regularly occurring activities, to major annual events, to random usage of park
21	Irwin Park (minor venue for various cultural activities & events)	Bound by Aloha Tower Dr., Bishop St., Ala Moana Boulevard, & Fort St.	1930-present; Intermittent use	Adjacent to project area; random usage of park, possible small scale regular usage
22	Thomas Square (minor venue for various cultural activities & events)	925 S Beretania St.	Intermittent use	Adjacent to project area; from numerous regularly occurring activities, to major annual events, to random usage of park
Memorials and Commemorations				
23	Ehime Maru Memorial	Kakaʻako Waterfront Park	2002-present	Tragic sinking of a Japanese educational fishing vessel in 2001; in project area
24	MADD Memorial	Kakaʻako Waterfront Park	Modern / present	Multiple services, random visits; in project area
25	Nagasaki Peace Bell (MLK Day & Anniversary of bombing Aug. 9th)	F. F. Fasi Civic Grounds (South Beretania parking entrance)	1990-present, Annual, 2 ceremonies	Adjacent to project area
26	Florentino Das Commemorative Plaque	Kewalo Basin Park	2011-present	1955 solo 1 year voyage from Kewalo to Philippines; in project area
Religious and Spiritual Gathering Places				
27	First Chinese Church of Christ	1054 South King Street	1929 – present	Regular Sunday service, additional religious and cultural activities held on grounds; Historic structure, likely eligible for NRHP; adjacent to project area
28	Kawaiahaʻo Church	Corner of Punchbowl * King Streets	1840s - present	Regular Sunday service, additional religious and cultural activities held on grounds; Historic structure with NRHP status; in project area
29	Ke Alaula Oka Malamalama (The Bright Morning Rays of the Church of Reasonable Service)	910 Cooke Street	1880s – present	Regular Sunday service in Hawaiian language; hymns in Hawaiian; Historic religious organization

30	Makiki Christian Church (Site No. 80-14-9719)	829 Pensacola Street	1904 – present	Regular Sunday service; service in Japanese language; Historic structure, Historic structure with NRHP status; adjacent to project area
Public Art Installation & Entertainment Centers				
31	POW! WOW!	Between Queen Street and Ala Moana Boulevard	2010 - present	Various locations of murals featuring local and international artists; week long annual festival
32	Neal S. Blaisdell Concert & Exhibition Complex	Bound by S. King Street, Ward Avenue, & Kapiolani Boulevard	1964-present, used intermittently	Three major venues; multiple points of interest; in project area
33	Fresh Café & Loft in Space	831 Queen Street	2009-present, intermittent & regular events	Hosts regular community events; cultural resource for arts community; in project area
34	Vacant Lots & Thoroughfares	Various locations in Kakaʻako	Modern / present	Events include: Art & Flea; Eat the Street; Honolulu Night Market; Honolulu 5K and 1 Mile Keiki Run/Walk; King Kamehameha Floral Parade; Pow!Wow! Hawaiʻi; Three Walls Music Festival

For the current SCIA, numerous community consultations were performed, which focused on several different types of cultural groups representing the cultural landscape of the area that is now considered Kakaʻako (see Section 5 of the SCIA). Cultural groups identified for the SCIA consisted of groups united by ethnicity, religion and spirituality, memorials, arts and entertainment, as well as sports and recreation. A total of 78 cultural groups and cultural informants were contacted for consultation, 29 of which agreed to participate. Participation consisted of 5 referrals to other informants, 7 email communications providing information on cultural resources, 2 informants granting permission to use prior interview data for Kakaʻako, 9 online questionnaire submittals, and 6 interviews. However, one interview was not included as the cultural resource was to be discontinued and one online questionnaire was retracted.

In addition to documentation research and community consultations, five site inspections were performed on the 27th July as well as the 2nd, 10th, 15th, and 22nd of August 2013 by Kimberly M. Mooney of Pacific Legacy, Inc. to determine the extent of cultural usage of the property. These inspections consisted of largely of pedestrian survey and photographic documentation of portions of the project area. The area designated as Kakaʻako Makai and the HECO Downtown Power Plant portion of the Proposed Action's project area were

investigated on 27 July and 15 August 2013. Portions of the area designated as Kakaʻako Mauka was investigated on the 2nd, 10th, 15th, and 22nd of August 2013, sweeping streets generally from *mauka* to *makai* and ʻEwa to Diamond Head.

A total of 34 cultural resources consisting of Historic Places and Landmarks (n=8), Cultural Learning Facilities (n=7), Public Parks and Grounds (n=7), Memorials and Commemorations (n=4), Religious and Spiritual Gathering Places (n=4), and Public Art Installation and Entertainment Centers (n=4) were identified in this assessment. A significant number of cultural resources (n=21) were identified as occurring within the project area and numerous resources occurring in areas adjacent to project area (n=13). Many of these cultural resources are unique locations where events and activities that are vital to various cultural groups are held. While some groups (e.g. contemporary and urban arts groups and the LGBT community) are often discounted by cultural studies due to their contemporary and/or "sub-culture" nature, they exhibit all of the hallmarks or a distinct cultural group. Thus, it was deemed necessary to fully assess what cultural impacts may be caused by the Proposed Action, if implemented.

Taken together, Tables 4-2 and 4-3 present the total number of cultural resources identified that may be impacted by the Proposed Action.

4.6.3 Potential Impacts and Recommended Measures to Mitigate Them

To be inclusive of all cultural groups, including "Native Hawaiians, other ethnic groups, and other groups" (OEQC 1997: 3-4), and to address areas not previously assessed, the SCIA has added over thirty new cultural resources to the existing record of cultural resources for Kakaʻako. The existing record of cultural resources is based upon five Cultural Impact Assessments (CIA), two Ethno-Historical Inventory studies, and a Traditional Cultural Property (TCP) study that have been performed in the Kakaʻako area (UH 1978; Wilson Okamoto and Associates, Inc. 2002; McElroy et al. 2008; Spearing et al. 2008; Vogeler et al. 2010; Genz & Hammatt 2010; Elison and McElroy 2011; Maly et al. 2013).

A total of 34 cultural resources consisting of Historic Places and Landmarks (n=8), Cultural Learning Facilities (n=7), Public Parks and Grounds (n=7), Memorials and Commemorations (n=4), Religious and Spiritual Gathering Places (n=4), and Public Art Installation and Entertainment Centers (n=4) were identified in the SCIA. A significant number of cultural resources (n=21) were identified as occurring within the project area and numerous resources occurring in areas adjacent to project area (n=13).

4.6.3.1 Historic Places and Landmarks

A total of eight Historic Places and Landmarks have been identified that were not previously identified in CIAs performed in the area, consisting of the following seven Historic properties located within or adjacent to the project area: Kawaiahaʻo Church, Hawaiian Mission Houses, Kapuāiwa Building, Hawaiʻi State Library, Honolulu Hale, Honolulu Hale Annex, State (Territorial) Office, Hawaiian Electric Company (HECO)

Downtown Plant, Aloha Tower, *Falls of Clyde*, Mabel Smyth Memorial Building, Post Office, Customhouse, and Courthouse Building (King David Kalākaua Building), Dillingham Transportation Building, and U.S. Immigration Office.

The Hawaiian Capitol Historic District, which contains Kawaiahaʻo Church, Hawaiian Mission Houses, Kapuāiwa Building, Hawaiʻi State Library, Honolulu Hale, Honolulu Hale Annex, State (Territorial) Office, is currently active on the NRHP and State Register of Historic Places (NRHP Reference No. 78001020; State Site No. 80-14-1321); thus, protected by state and federal laws. Located within the project area are Kawaiahaʻo Church and Hawaiian Mission Houses, both of which have historic and contemporary cultural significance. In the case of Kawaiahaʻo Church, cultural practices, such as regular church service, visitation of the cemetery, and ceremonial events continue to be important to the Island-wide community. The Hawaiian Mission Houses are repositories and active interpretive centers that continue to serve the community as well. While the Hawaiʻi State Library, Honolulu Hale, and Honolulu Hale Annex are located outside of the project area, they are important institutions that have been serving the community for over a century. The Kapuāiwa Building and State (Territorial) Office are less important in terms of significant cultural usage in the modern era. As state and federal law already protect these properties, no impact is expected from the Proposed Action. However, visual impacts from encroaching skyscrapers may occur if a sensible distance is not kept from these properties. In addition, access and parking is still an important necessity for the properties that carry contemporary cultural significance, such as Kawaiahaʻo Church, Hawaiian Mission Houses, Hawaiʻi State Library, Honolulu Hale, and Honolulu Hale Annex. Reduction of public parking may be a resultant impact from Kakaʻako TOD Overlay developments. It is recommended in the SCIA that parking and accessibility to these properties is not reduced in project related developments.

The 1929 Hawaiian Electric Company (HECO) Downtown Plant is located in the project area and is not yet recognized by the State of Hawaiʻi or NRHP as a Historic site although it likely is eligible based on its antiquity, architecture, and historic significance. However, there were no signs of contemporary cultural utilization of the property and, therefore, no foreseen impacts as a result of the Proposed Action. It is recommended that the building be protected until the proper authorities evaluate its significance and submit a nomination form to NRHP and/or State Register of Historic Places.

The Aloha Tower, which continues to be an icon for the State of Hawaiʻi, is adjacent to the HECO Downtown Plant portion of the project area. Due to its cultural and historic significance, it has been recognized by its NRHP and State Register of Historic Places status (State Site No. 80-14-9929 and NRHP Reference No. 76000660) for over thirty years. Potential impacts to this property may come in the form of visual impacts from increasing building heights for properties located adjacent or near to the Aloha Tower. Current cultural usage consists of visitation of the interpretive displays within the structure, use of the observation deck located at the top floor of the structure, as well as a variety of commercial activities that occur in the surrounding Aloha Tower Market Place. Parking and access is also important to maintain. It is recommended that parking and accessibility to these properties is not reduced in future developments.

The *Falls of Clyde* is currently moored in waters adjacent to the HECO Downtown Plant portion of the project area as well. The vessel is also registered under the NRHP (Reference No. 73000659) and State Register of Historic Places (Site No. 80-14-9700). While the vessel is under major repairs, thus not accessible to the public, it remains a significant nautical attraction on the coastal landscape. No impacts to the *Falls of Clyde* by the Proposed Action are foreseen. In the event that the vessel is deemed fit for boarding by the public in an interpretive context, access and public parking should fit the demand of visitors.

Located in the southwest corner of the project area is the Mabel Smyth Memorial Building, which is currently registered with NRHP and State Register of Historic Places (Reference No. 93001558; State Site No. 80-14-9765). This structure has not been identified as a cultural resource in previous CIAs. As state and federal law already recognized the building, no project related impacts are foreseen for the structure.
The Post Office, Customhouse, and Courthouse Building (King David Kalākaua Building), Dillingham Transportation Building, and U.S. Immigration Office are properties with NRHP and State Register of Historic Places status and are adjacent to the project area. These properties have not been identified in previous CIA. However, no potential impacts caused by the project are foreseen.

4.6.3.2 Cultural Learning Facilities

A total of seven cultural learning facilities were identified within the Kakaʻako project area of the Proposed Action, consisting of the African American Diversity Cultural Center of Hawaiʻi (AADCCH), Diverse Art Center, Hawaiʻi Children's Center, Maritime Museum, and Nā Mea/Native Books Hawaiʻi. Each learning facility is a unique cultural resource for the community of Kakaʻako and the island-wide community.

The AADCCH is a one-of-a-kind repository of archival documents, researched data, and artifacts pertaining to Africans and African Americans in Hawaiʻi's History. In addition, the facility is a location in which knowledgeable individuals can be accessed for guidance on the subject. The AADCCH is a Non-Profit that currently rents a humble office space for its growing collection, which leaves little room for visitors. While the AADCCH hopes to expand, the rising cost of rent in Kakaʻako may be a huge obstacle in meeting their goal. Therefore, potential impacts from the Proposed Action are increased lease fees. It is recommended in the SCIA that the topic of impacts to contemporary cultural resources, such as AADCCH, be addressed in upcoming discussions regarding the Kakaʻako TOD Overlay project rulemaking. One mitigation measure may be to encourage lessors to offer adjusted rent spaces for this and comparable institutions.

Similarly, the Home of the Brave Tour and museum is an irreplaceable cultural learning facility. This World War II repository has an extensive collection of artifacts and replicas as well as oral histories of the amazing personal experiences relayed to the tour operators by the WWII veterans themselves. As we are losing our WWII veterans at an increasing rate due to "old age," Home of the Brave Tour and museum is a vital cultural resource. Unlike other cultural learning facilities, this facility is dependent on the

structure that it is currently housed, due to twenty years of painstaking modifications to create and incorporate interpretive displays in to the structure. Impacts to the cultural resource would be loss of the current space it is housed in. Community discussions for the Kakaʻako TOD Overlay should involve the topic of impacts to contemporary cultural resources, such as the Home of the Brave Tour and museum, which could bolster support for this valuable institution. It is recommended that project related developments work around the structure and lessors be encouraged to offer adjusted rent spaces for this and comparable institutions.

The Diverse Art Center and The Refuge, run by 808 Urban, are unique urban and street art cultural learning facilities that service the youth and young adults of Kakaʻako and surrounding areas. These organizations are also Non-Profits that provide a safe space for creating art and access to artists for mentorship. The major foreseeable impact to these institutions is loss of leased space in Kakaʻako due to increased rent from project related developments. The SCIA recommendation is to address the topic of impacts to cultural resources during Kakaʻako TOD Overlay community discussions on rulemaking to increase awareness of resources of this nature as important features of Kakaʻako's cultural landscape. One mitigation measure may be to encourage lessors to offer adjusted rent spaces for these and similar institutions.

The Hawaiʻi Children's Center is also an important cultural resource that helps inner city children and children island-wide to interact with other children while interfacing with educational exhibits. Unlike school, this resource is not regimented and allows the parents to participate in the child's experience. One impact would be loss of leased space due to increased rents. Again, the recommended action in the SCIA is to incorporate the subject of contemporary cultural resources in upcoming Kakaʻako TOD Overlay rulemaking discussions, which could bolster support for this valuable institution.

The Maritime Museum was an operable museum until recent years, closing in 2009. As the former museum is not planned to be re-opened in the near future, it is not possible to determine if it will be impacted by the proposed development.

Nā Mea/Native Books Hawaiʻi is another unique cultural resource in Kakaʻako that retails an array of Hawaiiana books and music, arts and crafts, and raw materials to create Traditional Hawaiian crafts. It also hosts free workshops and lectures almost daily in Hawaiian traditions, such as storytelling, music making, *hula*, *lei* making, quilting, etc. Access to *kūpuna* such as those who specialize in various traditional crafts and knowledge is rarely available otherwise. Thus, Nā Mea/Native Books Hawaiʻi should be recognized as a contemporary cultural resource. Potential impacts include increased rents that could force the institution out of Kakaʻako. However, population increases due to project related development might increase store visitation and revenue. One mitigative measure may be to encourage lessors to offer adjusted rent spaces for this and comparable institutions during Kakaʻako TOD Overlay rulemaking discussions.

4.6.3.3 Public Parks and Grounds

Seven public parks and grounds have been identified in or adjacent to the project area, including Kakaʻako Waterfront Park, Kewalo Basin Park, Kakaʻako Makai Gateway Park, Mother Waldron Neighborhood Park/Playground, Ala Moana Beach Park, Irwin Park, and Thomas Square. Kakaʻako Waterfront Park, Kewalo Basin Park, Kakaʻako Makai Gateway Park, and Mother Waldron Neighborhood Park are located in the Kakaʻako project area of the Proposed Action. Ala Moana Beach Park, Irwin Park, and Thomas Square are adjacent to the project area. By design, public open space parks and grounds are cultural resources and vital elements to the community, especially in urban settings.

All identified parks have individual characteristics, providing a particular physical attribute suitable for various specialized activities. A host of activities and events occur at these parks randomly, daily, weekly, monthly, and annually, and range from casual, random visitations to grand events attracting participants from all corners of the island. The general consensus from community consultations is that these spaces are irreplaceable and dear to the community.

As mentioned by CPAC Secretary and Archivist, Michelle Matson, in an email communication,

> "…community leaders and development planners should be mindful that the community deserves the following:
> - maintaining and increasing open park space;
> - maintaining open public access to our established ocean recreational areas;
> - mitigating problems from adverse overcrowding and over-development impacts on cultural and recreational shoreline park uses;
> - addressing ocean water quality concerns from storm water runoffs, as such may adversely impact and endanger shoreline recreation uses; and
> - establishing a critical ocean safety and lifeguard facility to ensure effective first-responder and emergency treatment of shoreline park water users."

She maintains, "…with all of the above being needed and necessary to support the present public recreational population of Kakaʻako Makai, as well as recreational needs of the anticipated population increase of 45,000 additional residents in the Kakaʻako area. Notably, our existing parks are at capacity on weekends and during events, and the National Standard for urban recreational open space to ensure the public health and welfare is 2 to 21/2 acres per 1000 capita (45,000 = 90 acres minimum)…" (Matson 2013)

Therefore, it is recommended in the SCIA that any impacts, such as project related development of park space to accommodate any activity other than public recreation be avoided. Access must remain open to the public and parking should be permanent elements of these parks, especially during large-scale events, to ensure accessibility to those coming from outer communities.

4.6.3.4 Memorials and Commemorations

A total of four memorials and commemorations have been identified for the project area. These include the Ehime Maru Memorial, MADD Victims' Memorial, Nagasaki Peace Bell, and Florentino Das Commemorative Plaque. Each of these cultural resources provides a unique space to remember and honor cherished individuals, victims of tragic events, and/or history makers. All memorials and commemorations are located in the project area, save for the Nagasaki Peace Bell.

Each memorial and commemoration appears actively used or visited by the community and should therefore be preserved in place. Potential impacts would be the removal of these cultural resources or encroachment of objects or structures in the dedicated space around the memorial or commemoration feature. It is recommended in the SCIA that development avoid these spaces.

4.6.3.5 Religious and Spiritual Gathering Places

In total, four long-standing churches in or adjacent to the project area have been identified, including the First Chinese Church of Christ, Kawaiahaʻo Church, Ke Alaula Oka Malamalama (The Bright Morning Rays of the Church of Reasonable Service), and Makiki Christian Church. Each church actively serves the community by providing a distinctive type of ceremonial and religious service, such as sermons in languages spoke in the respective community it represents. In addition, these intuitions are largely housed in Historic era structures that are eligible if not already listed in the NRHP and State Register of Historic Places. Impacts could be decreased access due to lack of parking. It is recommended in the SCIA that these properties be avoided in project related development.

4.6.3.6 Public Art Installation & Entertainment Centers

A total of four public art installation and entertainment centers were identified in this study, including POW! WOW!, Neal S. Blaisdell Concert and Exhibition Complex, FreshCafe & Loft in Space, and various vacant lots & thoroughfares. All of these cultural resources are located within the project area.

POW!WOW! is an annual weeklong event that showcases an array of large urban or street art murals installed throughout Kakaʻako. These murals are significant resources for the arts community as well as the general public who view these murals. The event also provides the opportunity for artists to interact and learn from other artists from around the globe. Potential impacts to this newer institution could be the loss of space for murals due to project related development. It is recommended in the SCIA that the topic of sanctioned public art, such as the art installed during the POW!WOW! events be addressed in upcoming Kakaʻako TOD Overlay rulemaking discussions to ascertain the importance of these cultural resources to the community.

The Neal S. Blaisdell Concert and Exhibition Complex is the main venue on Oʻahu for large-scale performances and exhibitions. This irreplaceable resource has been the home of numerous cultural events throughout its history and will be eligible for NRHP and State Register of Historic Places status in the near future. Impacts may include reduced access due to project related development. It is advised that this important cultural resource be avoided by development that is not supportive of arts and entertainment.

The Fresh Cafe & Loft in Space has become an important venue for up-and-coming artists and aspiring artists of all genres. This space allows artists to collaborate, present art, sell arts and crafts, lecture, learn, and debate all aspects of contemporary art. This creative space/artist think tank could be impacted by raised rent and reduced parking availability due to project related developments. Introducing the topic of project related impacts to contemporary cultural resources is recommended during upcoming Kakaʻako TOD Overlay rulemaking discussions. One mitigation measure may be to encourage lessors to offer adjusted rent spaces for these and similar institutions.

In addition to formal or dedicated areas for cultural activities, there are several vacant lots and thoroughfares that are venues for regular cultural events, perhaps unique to Kakaʻako, such as Art & Flea, Eat the Street, Honolulu Night Market, Honolulu 5K and 1 Mile Keiki Run/Walk, King Kamehameha Floral Parade, Pow!Wow! Hawaiʻi, and Three Walls Music Festival. These events are not dependent on the particular space that they occur on – they simply need open venues. However, these events have become part of the charm and attraction to the area. The main impact to these activities would be loss of space. Addressing the topic of contemporary cultural practices, such as the afore mentioned, as important facets of Kakaʻako's cultural landscape and how they might be impacted by the proposed action during upcoming rulemaking discussions is recommended.

4.7 Traffic

Following is a summary of the analysis of existing conditions and traffic related impacts that was conducted for the purposes of this EIS. The full traffic study is presented in Appendix D. However, the vast majority of the study is presented below.

4.7.1 Methodology of the Traffic Study

The transportation analysis provides an assessment of potential impacts to the following modes of transportation that would result from implementing the Proposed Action:

- Bicycle circulation
- Motor vehicle circulation
- Pedestrian circulation
- Public transit

As discussed in Section 1.6, the planning horizon for the TOD Overlay Plan is 2035. The transportation analysis is based on a comparison of transportation conditions under each of the following three scenarios:

- **Existing Conditions** –A review of existing multi-modal transportation conditions within the study area based on observations and data collected in 2013.
- **Year 2035 Conditions with No Action (Future Baseline Condition)** – An assessment of future multi-modal transportation conditions in the 2035 horizon year, based on planned transportation network changes and anticipated future allowable development under the current adopted land use plan for the area. The Future Baseline Condition constitutes "no action" because it represents what will happen in the district under the existing Rules (without implementation of the TOD Overlay Plan).
- **Year 2035 Conditions with TOD Overlay (Proposed Action)** – An assessment of future multi-modal transportation conditions in the 2035 horizon year, based on proposed transportation network changes and anticipated development under the Proposed Action.

The Oahu Metropolitan Planning Organization (OMPO) travel demand model was utilized to develop 2035 travel demand forecasts for purposes of comparing the Future Baseline Condition and Proposed Action. Forecasts of total daily travel to, from and within the KCDD were derived from the model based on the anticipated land use and transportation network changes. Future-year changes to AM and PM peak hour turning movements at key intersections were also derived from the OMPO model, for purposes of comparing AM and PM Peak Hour traffic operations at key intersections selected for analysis.

A detailed breakdown of existing and future land uses, under the Future Baseline Condition and Proposed Action, was provided to the traffic consultant, Nelson Nygaard, for each transportation analysis zone (TAZ) in the project area. Based on that land use data, the OMPO model was updated for purposes of forecasting travel demand based under both the Future Baseline Condition and Proposed Action.

The Future Baseline Condition was used to provide a point of departure from which to measure the impacts of the Proposed Action. The Future Baseline Condition represents how the KCDD would appear if it were developed in accordance with the prevailing rules by the target year 2035. In other words, it considers the following question: if no action were taken other than the continued implementation of the Mauka Area and Makai Area Rules, what would be the result?

Under the Future Baseline Condition, the KCDD would be built out to the density envisioned by the Mauka Area Plan (2011) and the Conceptual Makai Area Plan (2011). Both the Proposed Action and the Future Baseline Condition investigate the capacity of the KCDD at full build out under existing and proposed regulatory environments. The resulting analysis of traffic conditions will guide actions to mitigate impacts associated with the implementing ordinance for the Draft TOD Overlay Plan (the Proposed Action).

The following principles are presented in the Urban Design element of the Mauka Area Plan. They describe the vision for the KCDD in 2035 under the prevailing rules:

- Create an outstanding pedestrian environment.
- Create a network of green streets.
- Provide a maximum of road connections.
- Connect pedestrian paths across major thoroughfare.
- Strong Mauka-Makai linkage.
- Support the small-lot, mixed-use pattern of Central Kaka`ako.
- Support TOD.

Future Baseline Condition: The Future Baseline Condition assumes that the project site will retain its current development parameters and land uses as allowed under the Mauka Area Rules (2011), Makai Area Rules (2005) and adopted Master Plans for Kamehameha Schools and Ward Center. All existing planning and implementation policies and existing development regulations would continue to guide development decisions for properties within the project area. This scenario would extend negotiated agreements in each of the Master Planned Areas and assumes that no new changes would occur to land use or transportation in the KCDD other than those already programmed as part of existing City or HCDA plan or proposed by other agencies. The Future Baseline Condition does not include direct coordination with the ~~HART~~ ***light metro rail*** alignment or mitigations that will capture the value of this public investment. The Future Baseline Condition does not include Complete Streets planning policies.

Proposed Action: As discussed in Chapter Two, the Proposed Action consists of two alternatives: TOD Alternative A and TOD Alternative B. However, for the purposes of the following traffic impact analysis, TOD Alternative A has been used to compare traffic impacts with the Future Baseline Condition because it represents the "worst-case" scenario, as summarized in Table 3-4 in the previous Chapter. TOD Alternative B is essentially a modification of TOD Alternative A; it provides a similar development pattern as envisioned in TOD Alternative A but with a height limit of 418 feet that precludes the construction of "iconic" towers, resulting in a decrease in population as well as overall density. Because traffic impacts are derived from population plus the square footage of new non-residential development, utilizing the TOD alternative with the greatest potential impacts, that is to say, the highest population and the greatest amount of non-residential development represented in square feet, constitutes a reasonable basis for analysis. For the remainder of the traffic discussion and analysis, the term "Proposed Action" implies the worst-case scenario (TOD Alternative A) but is equally applicable to TOD Alternative B.

The primary purpose of the Proposed Action is to coordinate future urban redevelopment with the provision of ~~HART rapid transit~~ ***light metro rail*** so that residents, employees and visitors can take advantage of improved mobility choices. Land use policies in the Plan focus intensive mixed-use redevelopment into identified areas near to proposed ~~HART~~ ***light metro rail*** ~~transit~~ stations.

The Proposed Action also provides a comprehensive set of policies that aim to create a network of safe and comfortable streets with convenient access to ~~HART~~ ***light metro rail*** stations. Both TOD Alternatives A and B provide tools to introduce integrated transportation management, requirements for improved street connectivity, trip reduction (transportation demand management) measures, transit enhancements (feeder service, connectors and local bus enhancements), pedestrian and bike improvements, shared parking, and parking pricing. Neither TOD Alternative A or B proposes new development in the Makai District related to the proposed transit stations; however, either alternative envisions the integration of the Complete Streets concept throughout the Mauka and Makai Districts.

The Proposed Action responds to the development of the ~~HART~~ elevated ***light metro*** rail system and the designation of three transit station locations within the KCDD. The coming introduction of rail transit - in parallel with community-driven interest in creating a city that is highly walkable, friendly and safe for cyclists – is an important reason for adopting the Proposed Action. However the rail system is only one outcome of a much broader movement to bring vitality to urban Honolulu, reflecting the values of the native Hawai`ian culture, particularly stewardship of the land and environment, preservation of the native culture, openness to the visiting world, and responsibility to local people and their prosperity.

The analysis of TOD Alternative A tests the policy measures included in the Proposed Action. This analysis includes a likely "best guess" scenario for the maximum development envelope, given location and general economic factors. It explores the potential for proposed high-rise building types and more intensive density allocations. A primary consideration of the Proposed Action is how land use change might both respond to and support the ~~HART rapid transit~~ ***light metro rail*** system as well as supplementary improvements for walking and cycling to create a pedestrian and transit friendly environment.

4.7.2 Significance Criteria

For purposes of the EIS, transportation impacts are considered significant if the Proposed Action results in unacceptable conditions based on local significance criteria. This analysis applies the multi-modal significance criteria that were identified in the *2009 Kaka`ako Mauka Area Plan Supplemental EIS* (2009 SEIS). The criteria are as follows:

Motor Vehicle Traffic Impact Criteria

- *The operational impacts on intersections are considered significant if plan-related traffic causes the level of service to deteriorate from LOS E or better under the Future Baseline Condition to LOS F under the Proposed Action.*
- *The operational impacts on signalized intersections operating at LOS F under both the Future Baseline Condition and Proposed Action are considered significant if the volume-to-capacity (v/c) ratio under the Proposed Action exceeds that of the Future Baseline Condition.*

Transit Impact Criteria

- *The operational impacts on transit facilities are considered significant if the plan causes a substantial increase in transit demand that could not easily be accommodated by available transit capacity, resulting in unacceptable levels of transit service. A capacity utilization above 80 to 90 percent is generally considered unacceptable for urban transit services.*
- *The operational impacts on transit facilities are considered significant if the plan causes a substantial increase in operational delay or costs that could result in adverse impacts to transit service.*

Bicycle Impact Criteria

- *The operational impacts on bicycle facilities are considered significant if the plan would create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas.*

Pedestrian Impact Criteria

- *The operational impacts on pedestrian facilities are considered significant if the plan would result in substantial overcrowding on public sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site and adjoining areas.*

4.7.3 Affected Environment (Existing Conditions)

Following is a description of the existing traffic-related conditions in the KCDD.

4.7.3.1 Street Network in the KCDD

The KCDD is bisected by two major Ewa-Diamond Head (east-west) connections: Ala Moana Boulevard, and Kapiolani Boulevard. Queen Street, although not a regional connector, is considered to be a secondary collector street:

- **Ala Moana Boulevard** (State Route 92) is a 6-lane east-west arterial street through the southern portion of the KCCD that connects to the west with Nimitz Highway to the west, and connects Downtown Honolulu, Kaka`ako, Ala Moana Center and areas to the east near Waikiki. Pedestrian crossing distances are over 70 feet at most locations. No bicycle lanes are provided.
- **Kapiolani Boulevard** is a 6-lane east-west arterial street through the northern portion of the KCCD that connects areas to the east near Waikiki with Kaka`ako, and Downtown Honolulu via King Street. Pedestrian crossing distances are approximately 64 feet at most locations. No bicycle lanes are provided.
- **Queen Street** is a 2-lane collector street between Kamakee and Cooke Streets, widening to 4 lanes west of Cooke Street to downtown. Pedestrian crossing

distances are generally 44 feet or less. Sidewalks are missing on some segments. No bicycle lanes are provided.

The major Mauka - Makai (north-south) connections providing access to the KCDD are: Ward Avenue, Piikoi Street, and Punchbowl Street. Secondary connections are South Street, Cooke Street, and Kamakee Street.

- **South Street** and **Punchbowl Street** are north-south collector streets at the western edge of the study area that connect Ala Moana Boulevard and King Street. Crossing distances vary, generally between 54 to 64 feet. No bicycle lanes are provided.
- **Cooke Street** is a 4-lane street that extends from south of Ala Moana Boulevard to King Street. Crossing distances are approximately 44 feet at most locations. No bicycle lanes are provided.
- **Ward Avenue** is a 4-lane north-south collector that extends from the south of Ala Moana Boulevard to the north of King Street. Crossing distances are approximately 64 feet at most locations. No bicycle lanes are provided.
- **Kamakee Street** is a 4-lane north-south street that connects Ala Moana Boulevard and Kapiolani Boulevard, to the east of Ward Avenue. Crossing distances vary between approximately 44 to 58 feet. No bicycle lanes are provided.
- **Piikoi Street** is a north-south arterial street at the eastern edge of the study area that connects with Ala Moana Boulevard to the east of the KCCD, adjacent to the Ala Moana Center. North of Kapiolani Street: Piikoi serves one-way northbound motor vehicle traffic, while southbound traffic travels one block west on Pensacola Street. Crossing distances vary, generally between 60 to 64 feet. No bicycle lanes are provided.

A map of the roadway network serving the KCDD is depicted in Figure 4-8. Estimated daily traffic volumes on key corridors are presented in Figure 4-9. It should be noted that in August 2014, the City and County of Honolulu announced that it intends to convert the section of Waimanu Street between Piikoi and the Queen Street extension to two-way traffic.

Prepared by: Nelson\Nygaard Consulting Associates Inc.
~~March 2014~~ *May 2015*
Reference: Mauka Area Plan, 2011
GIS Data Source: State of Hawaii Office of Planning State GIS Program; Honolulu Land Information System

Figure 4-9: Traffic Corridors with KCDD

A description of right-of-way widths within the study area is provided in Table 4-4.

Table 4-4: Street Types and Roadway Widths

Street Name	Road Type	Right-of-Way Width (feet)
King	Avenue	90’
Kapiolani	Boulevard	100’
Queen	Street	Varies, 50’-60’
Queen Extension/ Waimanu	Street	100’
Halekauwila	Street	60’
Pohukaina	Promenade Street	60’
Auahi (Ward to Queen Lane)	Promenade Street	60’
Auahi (Ahui Ext. to South)	Promenade Street	60’
Ala Moana Boulevard	Promenade Boulevard	100’
Waimanu (Dreier to Kamakee)	Service Street	40’
Kawaiahao	Street	50’
Ilaniwai	Service Street	40’
Kona	Service Street	40’
Hopaka	Alley	19’
Punchbowl	Promenade Avenue	70’
South	Avenue	Varies, 66’-80’
Cooke	Promenade Street	60’
Ward Avenue	Promenade Avenue	80’
Kamakee	Promenade Street	76’
Piikoi	Avenue	80’
Pensacola	Avenue	76’
Keawe	Street	50’
Coral	Service Street	40’
Emily	Service Street	40’
Curtis	Service Street	40’
Dreier	Service Street	40’
Koula (Ala Moana to Halekauwila)	Service Street	40’
Ahui & Ahui, Extension to Ala Moana	Street	50’
Cummins Extension (Queen to Ala Moana)	Street	50’

Cross-section drawings showing existing lane allocations and travel-way widths are presented for each of the primary streets serving the KCDD in Figure 4-10.

Figure 4-10: Cross-Sections of Existing Streets

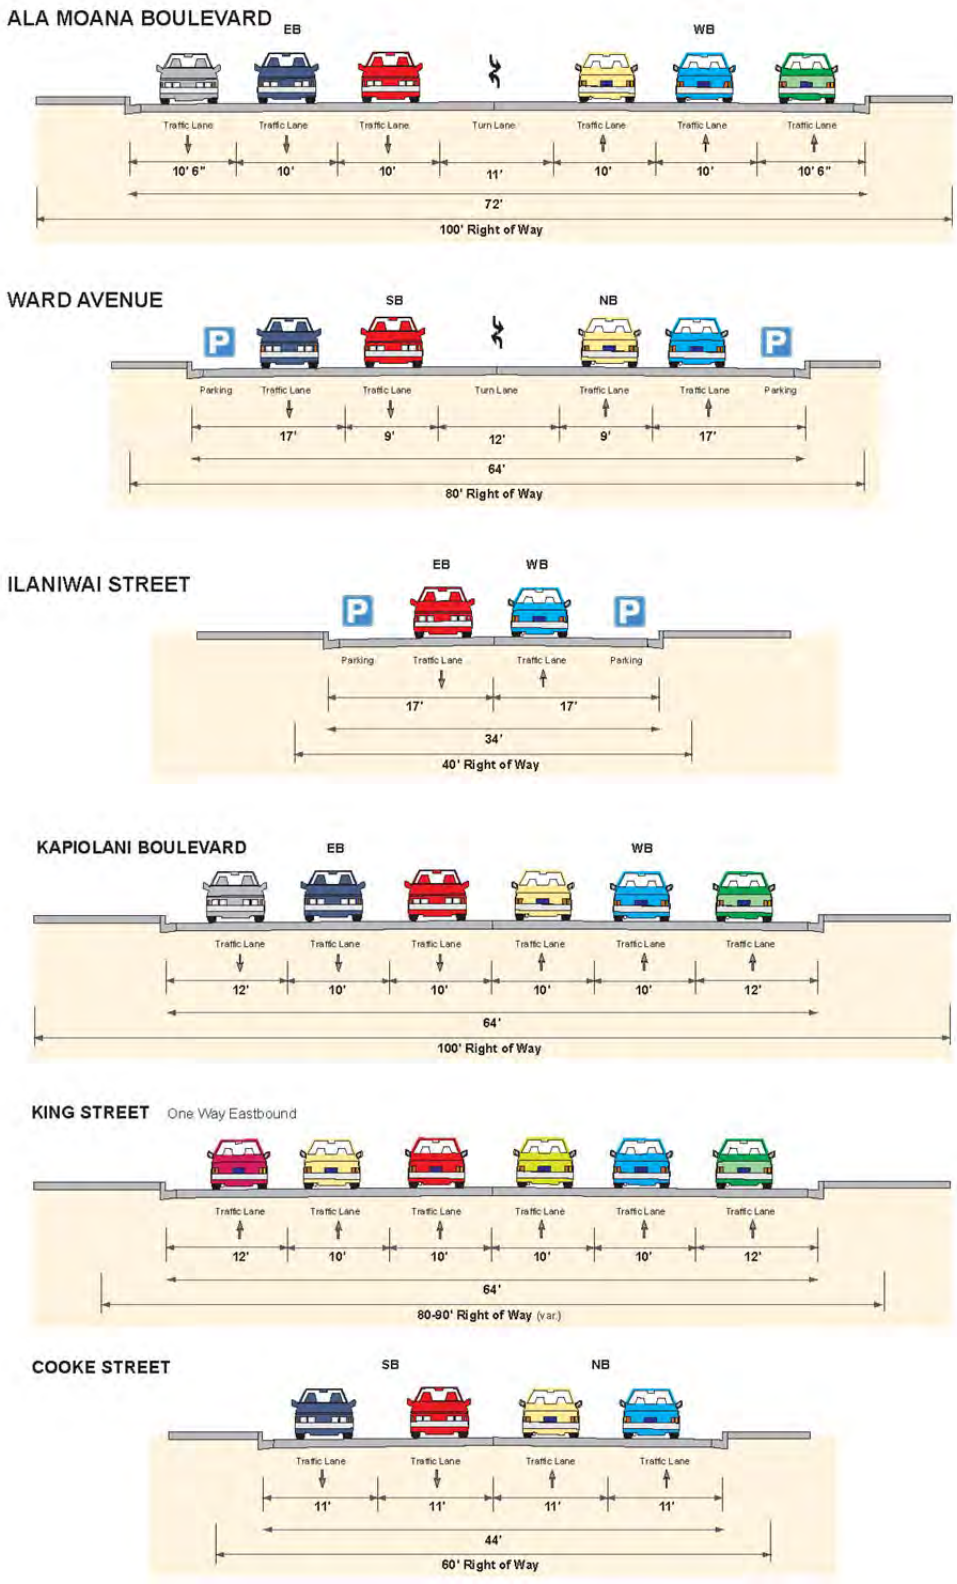

Figure 4-10 (continued)

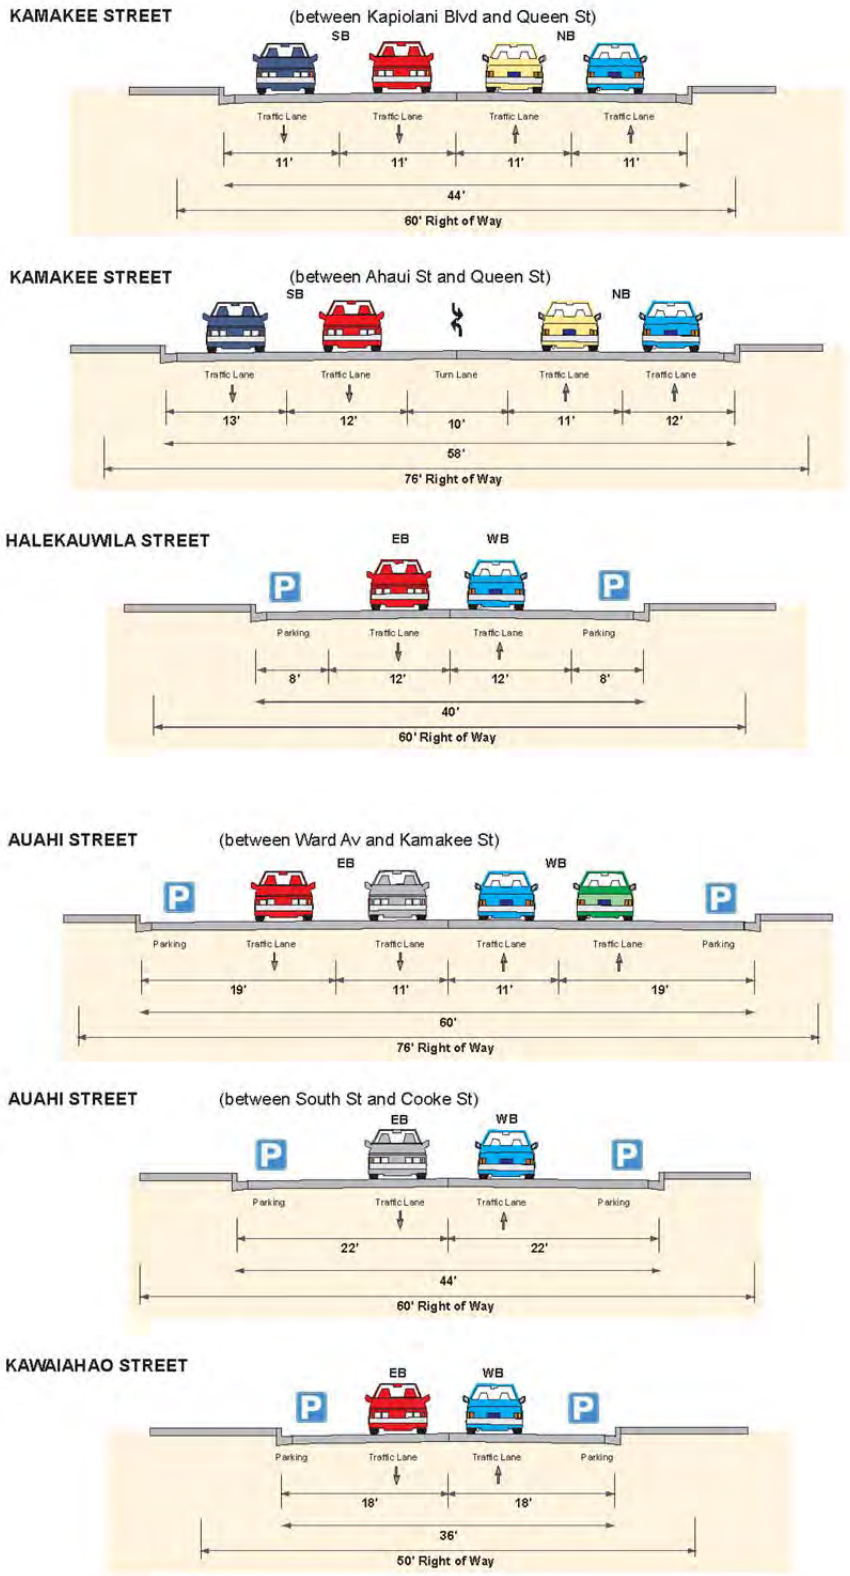

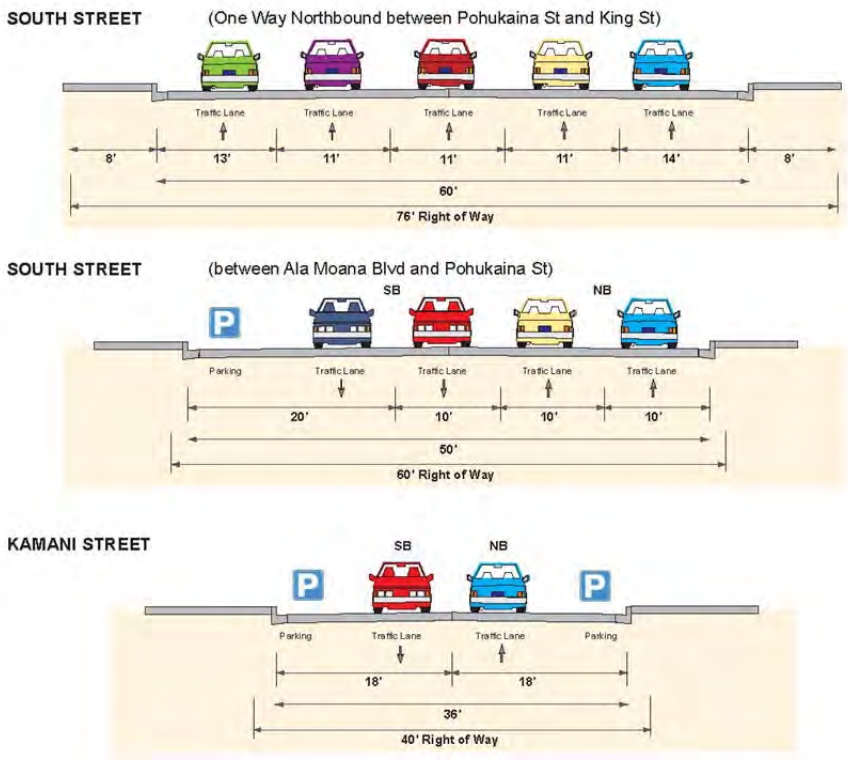

Figure 4-10 (continued)

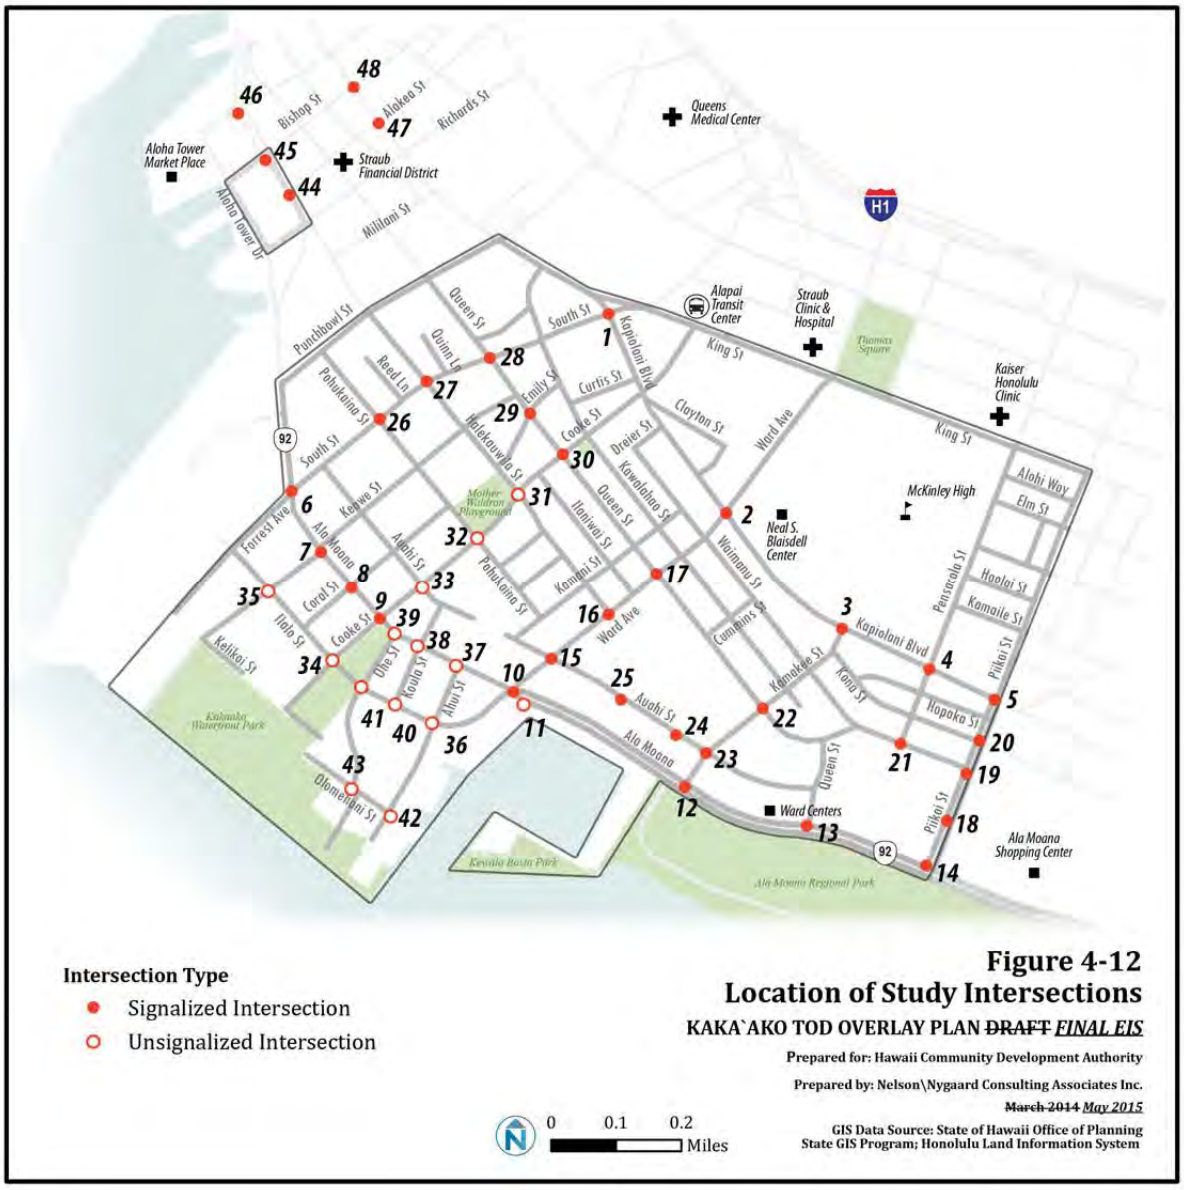
On-street parking restrictions by street frontage are presented in Figure 4-11.

Figure 4-11: Motor Vehicle Parking Restrictions



Based on the criteria discussed above, the significance of impacts resulting from the Proposed Action is based on the effect that implementation will have on key intersections. The majority of study intersections are located on the key east/west and north/south transportation corridors that provide access to KCDD, downtown, and Ala Moana Center. Figure 4-12 shows the location of the 48 intersections that HCDA selected for the analysis:

1. Kapiolani Boulevard/South Street/King Street
2. Kapiolani Boulevard/Ward Avenue

3. Kapiolani Boulevard/Kamakee Street
4. Kapiolani Boulevard/Pensacola Street
5. Kapiolani Boulevard/Piikoi Street
6. Ala Moana Boulevard/South Street
7. Ala Moana Boulevard/Keawe Street
8. Ala Moana Boulevard/Coral Street
9. Ala Moana Boulevard/Cooke Street
10. Ala Moana Boulevard/Ward Avenue
11. Ala Moana Boulevard/Kewalo Basin
12. Ala Moana Boulevard/Kamakee Street
13. Ala Moana Boulevard/Queen Street
14. Ala Moana Boulevard/Piikoi Street
15. Ward Avenue/Auahi Street
16. Ward Avenue/Halekauwila Street
17. Ward Avenue/Queen Street
18. Piikoi Street/Ala Moana Shopping Center/Hawaiki Tower
19. Piikoi Street/Waimanu Street

47. King Street/Alakea Street
48. King Street / Bishop Street

Figure 4-12: Location of Study Intersections

4.7.3.2 Trip Generation and Travel Modes

The regional trip generation model utilized by the Oahu Metropolitan Planning Organization (OMPO) accounts for a range of factors affecting transportation demand including land uses, number of households, and employment. Based on the regional distribution of land uses and transportation facilities, the model estimates the number of trips between origins (e.g. residences) and destinations (e.g. retail, employment). The model further estimates the portion of trips that occur via motor vehicle, transit, bicycling and walking.

Volume of daily trips (by all modes) is estimated by the OMPO model based on the existing mix of land uses within the TAZs that include the KCDD.

- The TAZs in the KCDD are currently developed with an estimated 11,887 residential units
- Non-residential uses within the TAZs provide an estimated 36,219 jobs (7,916 retail jobs and 28,303 non-retail jobs).

Based on the existing mix of land uses, the OMPO model estimates that 286,000 daily trips are made to, from, and within the study area:

- **Approximately 77 percent of daily trips are made via automobile** – including carpool trips. Based on estimated vehicle occupancy, the OMPO model estimates that existing land uses generate 184,797 daily vehicle trips. Since traffic studies frequently focus on traffic operations during the "peak hours" that coincide with morning and afternoon work-commute periods, the OMPO model also provides an estimate of peak-hour motor vehicle trip generation. It forecasts 13,822 vehicle trips generated during the AM Peak Hour and 9,249 vehicle trips generated during the PM Peak Hour.
- **Approximately seven percent of daily trips are made by transit** – an estimated 20,655 daily transit riders. The OMPO model does not provide an estimate of peak-hour transit ridership (instead, the peak-period transit ridership forecast is based on multi-hour morning and afternoon peaks).
- **Approximately 16 percent of daily trips are pedestrian or bicycle trips** – an estimated 44,466 daily pedestrian or bicycle trips.
- **Approximately 37 percent of daily trips are internal to the study area.** The portion of "internal trips" is a function of the mix of land uses.

Table 4-5 summarizes the estimate of existing daily trip generation derived from the OMPO Model.

Table 4-5: Trip Generation by Existing Land Uses (OMPO Model Estimate)

	Vehicle Trips			Transit Trips	Walk/Bike Trips
	AM Peak Hour	PM Peak Hour	Daily	Daily	Daily
Existing Conditions (2015 Base Year)	13,822	9,249	**184,797**	**20,655**	**44,466**

An addition source of information is derived from Census-based data. Table 4-6 summarizes the mode of travel to work for existing Kaka`ako residents over the age of 16, based on this Census data.

Table 4-6: Existing Travel Modes: Work Trips by Existing Residents

Workers 16 years and over	Census Commute Mode Share
Car, truck, or van	70.6%
Drove alone	58.1%
Carpooled	12.5%
In 2-person carpool	10.4%
In 3-person carpool	0.0%
In 4-or-more person carpool	2.0%
Public transportation (excluding taxicab)	3.8%
Walked	16.2%
Bicycle	3.6%
Taxicab, motorcycle, or other means	2.4%
Worked at home	3.4%

Table 4-7 provides a comparison of travel mode shares for total daily trips, based on the OMPO model, and work trips for Kaka`ako area residents, based on the US Census data summarized above.

- Rates of walking and bicycling to work are high for work trips by Kaka`ako residents – nearly 20 percent walk or bicycle to work – reflecting the proximity of Kaka`ako residences with nearby jobs, within KCDD and in adjacent employment and commercial areas including downtown and the Ala Moana Center.
- The overall rate of walking and bicycling to and from Kaka`ako (Total Daily Trips based on the OMPO model), which includes non-work trips by residents and non-residents, is estimated at under 15.5 percent.
- The rate of transit use is over 7 percent for all trips to and from Kaka`ako, compared to less than 4 percent for Kaka`ako residents. This difference reflects residents' greater propensity for walking and bicycling to nearby jobs as noted above.
- Note that the data comparison shown on the above table is not strictly an "apples to apples" comparison, since the percentage of workers that "work at home" is also included in the U.S. Census data.

Table 4-7: Existing Travel Mode Comparison

	Total Daily Trips to/from Kaka'ako (Base Year 2015 OMPO Model)	Work Trips Only – Kaka`ako Residents (US Census Journey-to-Work Data)
Motor Vehicle (including motorcycle & taxi)	**77.3%**	**73.0%**
Walk + Bicycle	**15.5%**	**19.8%**
Public Transit	**7.2%**	**3.8%**
Work at Home	**N/A**	**3.4%**

4.7.3.3 Existing Vehicular Traffic Volumes and Operations

Peak-period intersection volume counts were conducted during the week of January 15, 2013 at each study intersection:

- Travel counts included motor vehicle movements and pedestrian crossings at each study intersection. Count sheets from each location are provided in Appendix A of the Traffic Study (Appendix D) of this EIS.
- Morning counts were conducted from 7:00 AM to 9:00 AM. Afternoon counts were conducted from 4:00 to 6:00 PM. Using on those 2-hour counts, the "peak hour" was determined at each study intersection based on the highest consecutive 60-minute volume.

Peak-hour motor vehicle volumes at each study intersection are shown on Figures 11 to 13 of the Traffic Study (Appendix D).

Traffic operations are typically evaluated based on Level of Service (LOS) standards described in the U.S. Department of Transportation's 2010 Highway Capacity Manual (HCM). LOS is a qualitative description of traffic flow based on such factors as speed, travel time, delay, and freedom to maneuver. Six levels are defined from LOS A, which represents free flowing operating conditions, to LOS F, which represents the most congested conditions. LOS E represents "at-capacity" operations. When traffic volumes exceed the capacity, stop-and-go conditions result, and operations are designated as LOS F. Table 4-8 summarizes the LOS definitions for each rating (A though F) for both signalized and stop-sign controlled intersections.

Table 4-9 summarizes Existing AM & PM Peak Hour LOS at each study intersection, based on the Existing Conditions analysis steps described above.

Table 4-8: Intersection Level of Service (LOS) Definitions

LOS	Flow Type	Operational Characteristics	Intersection Control Delay (seconds/vehicle)	
			Signal Control	2-Way-Stop or All-Way Stop Control
A	Stable Flow	Free-flow conditions with negligible to minimal delays. Excellent progression with most vehicles arriving during the green phase and not having to stop at all. Nearly all drivers find freedom of operation.	< 10	0 – 10
B	Stable Flow	Good progression with slight delays. Short cycle-lengths typical. Relatively more vehicles stop than under LOS A. Vehicle platoons are formed. Drivers begin to feel somewhat restricted within groups of vehicles.	> 10 – 20	> 10 – 15
C	Stable Flow	Relatively higher delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear. The number of vehicles stopping is significant, although many still pass through without stopping. Most drivers feel somewhat restricted.	> 20 – 35	> 15 – 25
D	Approaching Unstable Flow	Somewhat congested conditions. Longer but tolerable delays may result from unfavorable progression, long cycle lengths, and/or high volume-to-capacity ratios. Many vehicles are stopped. Individual cycle failures may be noticeable. Drivers feel restricted during short periods due to temporary back-ups.	> 35 – 55	> 25 – 35
E	Unstable Flow	Congested conditions. Significant delays result from poor progression, long cycle lengths, and high volume-to-capacity ratios. Individual cycle failures occur frequently. There are typically long queues of vehicles waiting upstream of the intersection. Driver maneuverability is very restricted.	> 55 – 80	> 35 – 50
F	Forced Flow	Jammed or gridlock type operating conditions. Generally considered to be unacceptable for most drivers. Zero or very poor progression, with over-saturation or high volume-to-capacity ratios. Several individual cycle failures occur. Queue spillovers from other locations restrict or prevent movement.	> 80	> 50

Table 4-9: Peak Hour Level of Service at Study Intersections (Existing)

* Reflects estimate of additional delay due to downstream capacity constraints.				
**All Way Stop Controlled				
***Two Way Stop Controlled				

As shown above:

- The following intersections operate at LOS E during the AM or PM Peak Hour, indicating congested conditions:
  - Ala Moana & South/Forest
  - Ala Moana & Ward
  - Bishop & King
- During the peak periods, the peak-direction traffic flow in the "peak direction" (westbound AM, eastbound PM) results in queues that affect downstream intersections. Lengthy signal cycle lengths on the major east/west arterial corridors contribute added delay to motorists, pedestrians and cyclists, during peak as well as off-peak hours. The east/west cycles vary from 100 to 140 seconds. Such cycles are much longer in duration than found in most central-city or downtown areas, and may conflict with goals aiming at creating a walkable, multi-modal environment

A key distinction when determining LOS pertains to the assessment of side street stop-signed controlled intersections:

- At signalized intersections, and at "all-way stop-sign controlled intersections", the methodology for calculating LOS is based on average motor vehicle delay for all approaches.

The LOS methodology differs slightly for side-street stop sign controlled intersections. For these intersections, LOS is based on average delay to the side-street (approaching the stop-sign). This study includes several side-street stop-sign controlled intersections, including the stop-sign controlled to Ala Moana Boulevard at Ahui Street and Kaula Street.

4.7.3.4 Existing Transit Service

The City and County of Honolulu is served by The Bus, one of the most highly used public bus systems of any city in the nation on a per capita basis. TheBus is operated by Oahu

Transit Services (OTS) and provides fixed-route public transit and paratransit service in the KCDD Mauka Area, Honolulu, and throughout the island of O`ahu. TheBus operates a "hub-and-spoke" network, with the majority of services centralized along major corridors and serving major destinations. Within the Mauka Area, most lines run along major corridors such as King Street, Kapiolani Boulevard, and Ala Moana Boulevard.

Major trunk lines such as the 1/1L and 2/13 provide high-frequency service all day, with the remainder operating at lower and sometimes irregular frequencies. Feeder lines connect various neighborhoods within Honolulu to major destinations or transfer points. Peak express buses run a limited number of runs in the peak period in the peak direction, connecting various parts of O`ahu with Downtown Honolulu and the Mauka Area. TheBus also operates four rapid bus lines through the Mauka Area: CityExpress A, CityExpress B, CountryExpress C, and CountryExpress E. TheBus service was formerly complemented by ferry service operated as TheBoat, which ran between the Aloha Tower in Downtown and Kalaeloa on the west side of Oahu. However, the ferry service has been discontinued. Existing transit service in the Mauka Area in the AM and PM peak periods is mapped in Figure 14 of the Study presented in Appendix D.

An analysis of existing transit ridership and system capacity was conducted and produced the results presented in Table 4-10.

Table 4-10: Existing Transit Capacity Utilization

Screenline	Existing Conditions		
	Ridership	**Capacity**	**Capacity Utilization**
AM Beak Hour - Inbound			
East	4,635	10,500	44%
West	2,943	6,720	44%
North	351	480	73%
Total	**7,929**	**17,700**	**45%**
PM Peak Hour - Outbound			
East	2,915	6,300	46%
West	4,645	10,590	44%
North	440	660	67%
Total	**8,000**	**17,550**	**46%**

4.7.3.5 Existing Bicycle Circulation

Bicyclists traveling to and through the KCDD generally must share travel lanes with automobiles to access destinations because there are limited designated bicycle facilities. The Aloha Tower Special District is not served by existing bicycle facilities. The most direct routes for bicycle travel—including King Street, Kapiolani Boulevard, and Ala Moana Boulevard—are not popular or comfortable cycling routes due to heavy vehicle volumes, high off-peak travel speeds, and the absence of dedicated bicycle facilities. There are only three short bikeway segments within the project area. They include:

- **Kaka`ako Waterfront Park multi-use path:** A bicycle and pedestrian only path facility fully separated from the nearest parallel roadway (Ala Moana Boulevard). The path continues from Kaka'ako Waterfront Park in the Makai Area east through Kewalo Basin and Ala Moana Park. Travel to and from neighborhoods and destinations Diamond Head of the project area can be made by bicycle on this facility; however, a variety of gaps make this connection challenging and exposes cyclists to various conflicts with turning automobiles.
- **Keawe Street southbound bike lane:** This one-way dedicated striped and signed bicycle facility spans from Ilalo Street southbound to the Keawe Street end at Kaka`ako Waterfront Park. The bike lane is proximate, but does not connect with the Kaka`ako Waterfront Park multi-use path due to a chain link fence barrier. This is the only existing bike lane in the KCDD Mauka Area.
- **Queen Street/Waimanu Street bike route:** This unmarked partially signed bicycle route connects cyclists from Kamakee Street to Piikoi Street. This facility is overlaid on a 4-lane configuration (two lanes in each direction from Pensacola Street to Kamakee Street; four lanes in one direction from Pensacola Street to Piikoi Street). No pavement markings—like shared lane markings (also known as sharrows)—are provided for safe riding location or wayfinding. The only signage indicating the bicycle route designation is provided on the Waimanu Street segment from Pensacola Street to Piikoi Street. (It is unclear at this point in time how the City's proposed conversion of the Waimanu segment between Piikoi and the Queen Street extension will impact bicycle usage on this street.)

Other designated facilities in the vicinity of the KCDD that provide access to Kaka`ako include:

- Ala Moana Regional Park multi-use path connecting cyclists to Ala Moana Center and Waikiki.
- Young Street bike lane and bike route—a key east-west bicycle street connecting bicyclists between the Kaka`ako and McCully-Mo`ili`ili neighborhoods.
- Capital Historic District/Alapai Transit Center multi-use path linkage from Kealamakai Street to Richards Street connecting cyclists to the Alapai Transit Center, the Hawai`i Capital Historic District, and Downtown.
- Hotel Street bike route—a shared bus and bike only street from Richards Street to River Street at the edge of Downtown Honolulu.

In addition, several low-speed, low volume internal streets provide relatively comfortable and direct shared-roadway bicycle connections *within* the project area. This includes Ilalo Street, Keawe Street, Pohukaina Street, Waimanu Street, and Kawaiahao Street. Although these streets provide comfortable shared roadway operating environment for bicycles, nearly all of the connections are bookended by a major arterial crossing barrier, a street end (i.e., cul-de-sac), or off-set intersection that requires travel on a short high speed, high volume segment. It should be noted that only one viable north-south shared roadway connection is available (Cooke Street), which requires bicycles entering or exiting the district to use one of the higher speed and volume streets.

As part of the transportation analysis, bicycle counts were collected in the PM peak travel period. The most heavily travelled bicycle corridors during PM peak include Kapiolani Boulevard (up to 70 east-west crossings), Ala Moana Boulevard (up to 72 east-west crossings), Piikoi Street (up to north-south 84 crossings), Kamakee Avenue (up to 74 north-south crossings), and Ward Avenue (up to 35 north-south crossings). Because most bicyclists do not prefer bicycle travel along high traffic corridors and freeway access routes for automobiles, there are limited routing options for cyclists that seek direct travel and limited delay at unsignalized crossings.

Bicyclists observed during the bicycle count typically used the right-most travel lane adjacent to curbside parking (or adjacent to the curb where parking is not permitted), or rode on the sidewalks. A map of the existing bicycle network and a map of existing bicycle volumes at intersections are presented as Figures 17 and 18, respectively, in the Traffic Study presented in Appendix D.

4.7.3.6 Existing Pedestrian Circulation

Existing pedestrian conditions vary in quality and facility availability (sidewalks, crossings, amenities, etc.). Many streets in Central Kaka`ako, including Queen Street and Waimanu Street, exhibit curbless industrial character. These streets lack curbs and sidewalks, forcing pedestrians to walk in the street without the necessary design features to ensure pedestrian comfort and safety. Other streets, like those bounding the Ward Centers, are highly oriented towards pedestrians.

This variance is due, in part, to the diversity of land uses in the project area (particularly the industrial land use character in Central Kaka`ako) and the related level of pedestrian orientation along and across each street. Pedestrian orientation is based on a variety of factors, including, but not limited to, sidewalk coverage and width, pedestrian-supportive amenities (e.g., shade tree canopy, benches, landscaping, etc.), walk distances, availability of marked crossings and short crossing distances, pedestrian delay acceptable for urban conditions, and traffic conditions (distance from adjacent traffic, traffic speed and volumes, etc.). Only a few streets in Kaka`ako have the qualities typical of a highly pedestrian oriented environment. These pedestrian-friendly streets include portions of Ilalo Street, Kapiolani Boulevard, Ward Avenue (immediately makai of Ala Moana Boulevard), Auahi Street, Kamakee Street, and Piikoi Street.

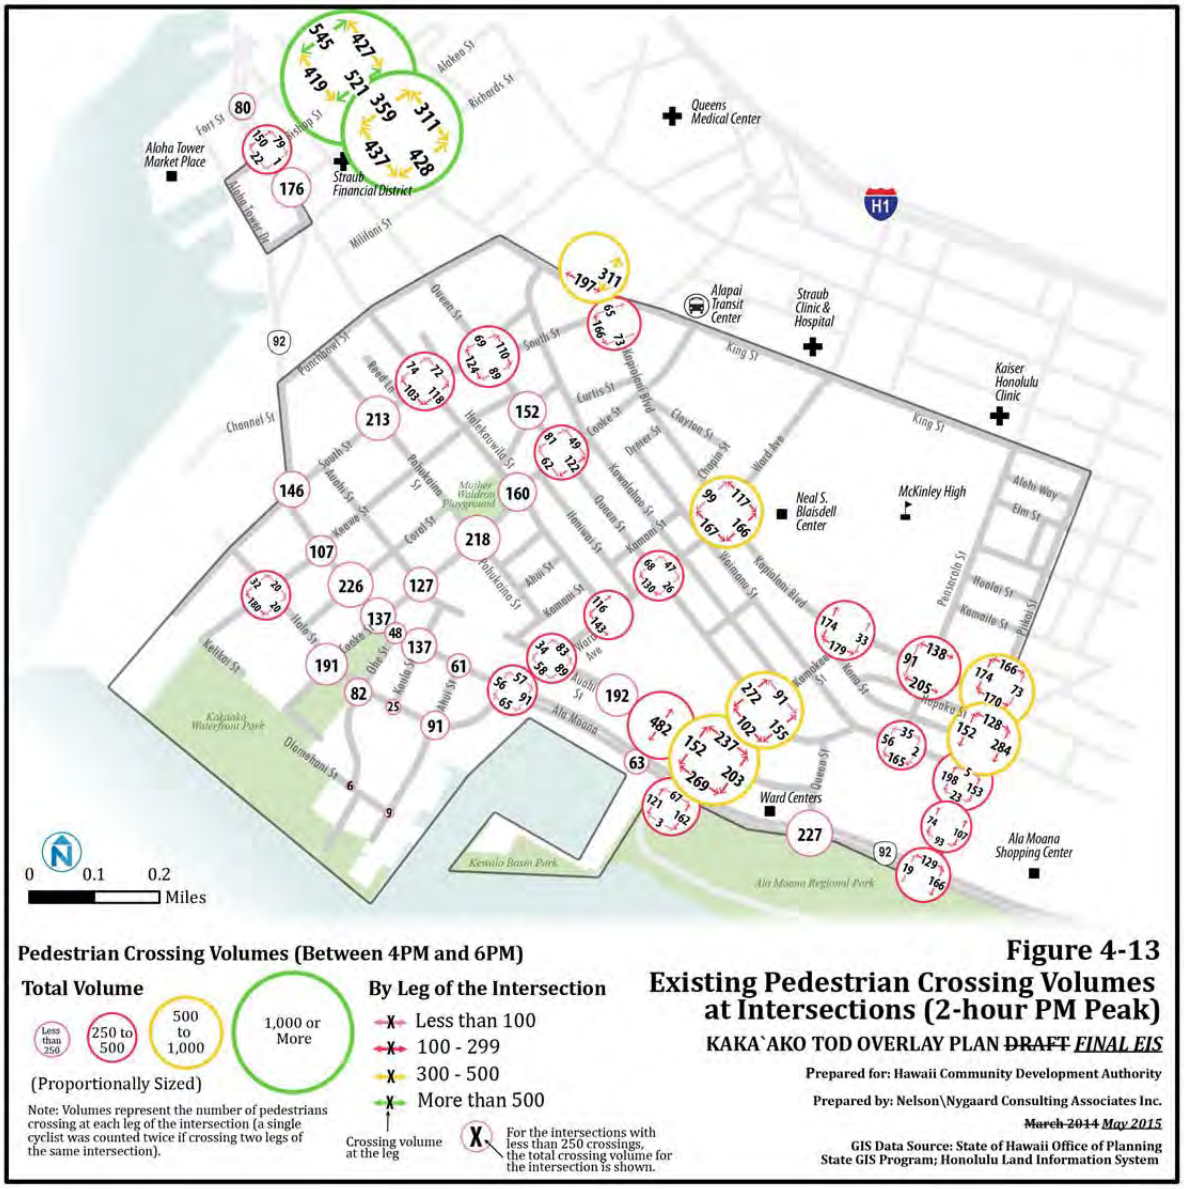
In general, pedestrian facilities in Kaka`ako can be characterized as follows:

- **Street Frontages.** Activating street frontages with pedestrian-oriented land uses and inviting pedestrian and bicycle environments helps to encourage walking to work, retail, and other commercial destinations. These active environments can be found in small pockets of Auahi Street and Cooke Street. Without the appropriate zoning regulations to ensure active street environments, very large retail establishments (100,000 square feet or larger) like Ward Centers and Ala Moana Center are typically antithetical to this pedestrian orientation factor.

- **Sidewalk coverage and width.** For the purposes of the Traffic Study, existing sidewalk in the Mauka Area is defined as either obstructed (effective width less than 4' feet) or unobstructed (effective width greater than or equal to 4'). Sidewalk widths in the KCDD range between spacious (Kapiolani = 17') and very constrained (makai side of Ala Moana = 3-4'). Most commercial streets (e.g., Cooke, Ward, Pensacola) have 10-foot sidewalks to support pedestrian activity, while many residential serving streets offer 4-6' sidewalks. Most streets outside of Central Kaka`ako and the Makai area have sidewalks on both sides of the street. The industrial character of many internal streets requires that pedestrians share space with cars and parking storage. Some streets like Ala Moana Boulevard and King Street have obstructions like utilities, landscaping, and transit benches that may impact people using mobility devices, e.g. wheelchairs.

Some streets provide generous pedestrian amenities like shade trees, benches, landscaped buffers, and planters that enhance the pedestrian experience and attract pedestrians. Kapiolani Boulevard, Ilalo Street, and parts of Auahi Street, Waimanu Street and Piikoi Street are model examples of high amenity streets.

Block size, which defines intersection density, is an enormously important factor that influences the accessibility and walkability of an area. Smaller block sizes decrease walking distances and, coupled with good urban design, tend to increase walkability and improve the pedestrian experience. Limited mid-block crossing opportunities either require longer walking distances to destinations (depending on routing and trip origin), or could encourage risky walking behavior, such as jaywalking and ignoring traffic control devices. Providing throughways or internal accessways within a larger development site breaks up the massive scale of large blocks and improves circulation through and around the site. This feature is only available in a few locations.



There are limited marked crossings throughout the KCDD. Most marked crossings are striped at signalized intersections, most of which are marked on all four legs. There are a variety of crossing conditions that create long crossing distances for pedestrians including wide arterial curb-to-curb widths (4 lanes and over), skewed intersections (the King/Kapiolani and Ala Moana/Ward intersections), intersection legs closed to pedestrians, large curb radii at intersection corners, and a general lack of curb extensions. Many of these conditions are prevalent throughout the project area.

Pedestrians experience long delays while crossing some arterials. In highly urbanized areas, pedestrian delay ranging from 70 to 80-second cycles is generally viewed as acceptable. Pedestrians crossing (north-south) at Ala Moana Boulevard commonly experience 140-second cycles, while street pushes through AM and PM peak auto volumes.

Figure 4-13 displays PM peak period pedestrian crossings throughout the project area. Pedestrian traffic is low in much of the project area, particularly compared to Downtown or Waikiki; many more people travel on foot on the western edge of the district adjacent to downtown and the government office areas. The highest level of pedestrian activity

occurs near major transit stops on Ward Avenue and Kapiolani Boulevard and in areas where there are higher concentrations of retail and services. Bishop Street, Richards Street, Kamakee Street, Piikoi Street, Ward Avenue, and Kapiolani Boulevard are corridors that produce the highest number of PM peak period crossings in the project area.

Figure 4-13: Existing Pedestrian Crossing Volumes at Intersections (2-hour PM Peak)

4.7.4 Comparing the Future Baseline Condition (Future Without The Proposed Action) with the Existing Conditions

4.7.4.1 Travel Mode and Trip Generation

The OMPO model was utilized to provide a forecast of trip generation based on Future Baseline Condition (Year 2035 Baseline) land uses. The net change to trip generation was derived based on existing land uses under the OMPO Model Year 2015 Baseline scenario. Table 4-11 provides a summary of the travel demand forecast.

Table 4-11: Travel Mode Comparison (Year 2035 vs. Existing)

	Existing Conditions (Model Base Year)	Future Baseline Condition (Model Year 2035 Baseline)
Households	11,867	38,221
Retail Employment	7,916	16,840
Non-Retail Employment	28,303	44,739
Daily Trips (all modes)	286,878	569,295
Transit Mode Share	7.2%	8.7%
Walk + Bike Mode Share	15.5%	20.1%
Automobile Mode Share	77.3%	71.3%
Internal Capture (portion of daily trips with origins & destinations within the study area)	36.7%	51.3%

As shown:

- Total trips by all modes to, from, and within the study area will approximately double as a result of expected development under the Future Baseline Condition.
- Rates of walking and bicycling – as a portion of total trips – will increase from 15 to 20 percent, while rates of driving – as a portion of total trips – will decrease from 77 to 71 percent.

The portion of daily trips internal to the study area (Internal Capture) will increase from approximately one-third to over one-half of daily trips.

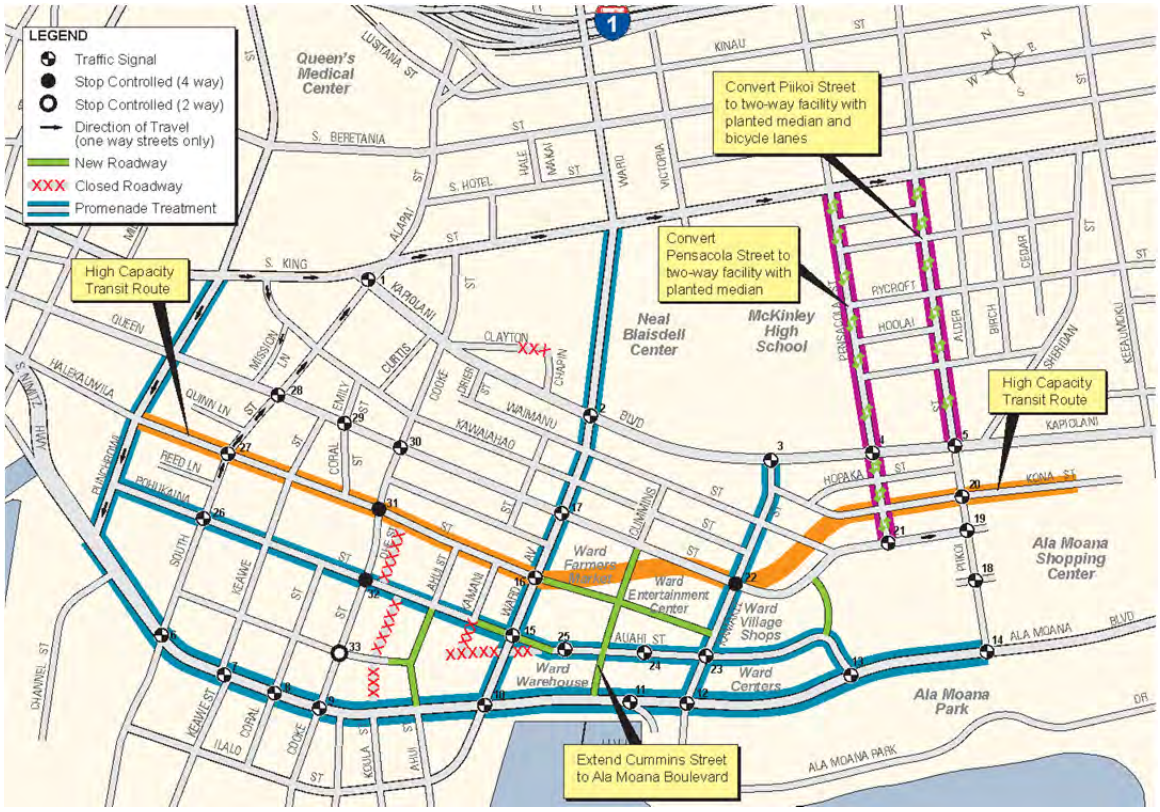
Table 4-12 provides a comparison of motor vehicle, transit and walk/bike trips generated by land uses within the Plan Area, based on the regional model, under Existing and Year 2035 Future Baseline Conditions. As shown:

- Motor vehicle trips will increase by approximately 80 percent over existing conditions – from approximately 185,000 daily under Existing Conditions to approximately 338,000 daily in Year 2035 under the Future Baseline Condition.
- Transit trips will more than double – from approximately 20,000 daily transit trips under Existing Conditions, to nearly 50,000 daily trips to/from the study area in Year 2035.

- Bicycle and walking trips will nearly triple – from approximately 44,000 under Existing Conditions to over 114,000 in Year 2035.

Table 4-12: Trip Generation Comparison (Year 2035 vs. Existing)

	Vehicle Trips			Transit Trips	Walk/Bike Trips
	AM Peak Hour	**PM Peak Hour**	**Daily**	**Daily**	**Daily**
Existing Conditions	13,822	9,249	184,797	20,655	44,466
Year 2035 Baseline (Future Baseline Condition)	25,380	28,313	338,256	49,528	114,428
Net Trip Generation (Future Baseline Condition***)***	***11,558***	***19,064***	***153,459***	***28,873***	***69,962***



4.7.4.2 Future Baseline Roadway Network

Analysis of the Future Baseline Condition without the Proposed Action is based on an assumed future roadway network. This network includes some *but not all* of the roadway network changes that were analyzed as part of the 2009 SEIS (displayed in Figure 4-14). Changes to key roadways that are anticipated under the Future Baseline Condition without the Proposed Action include:

- Widening of Ala Moana Boulevard from 72 feet (under Existing Conditions) to 84 feet (under Year 2035 conditions), in order to provide additional left-turn capacity.
- Restriping of Ward Avenue to modify lane widths (but with no change to number of lanes or curb-to-curb width).

A proposal to implement a 2-way conversion of Piikoi and Pensacola is not included in the Future Baseline, based on the findings of the 2009 SEIS that identified a significant cumulative traffic impact resulting from the proposed conversion. As a result, the recommended mitigation, as described in the 2009 SEIS, was to maintain two-way operation on Piikoi and Pensacola.

Figure 4-14: Planned and Proposed Roadway Network Changes (Future Baseline Condition)

4.7.4.3 Year 2035 Traffic Operations Without The Proposed Action

Year 2035 Baseline traffic volumes at each study intersection were estimated based on the anticipated net change in traffic volumes as determined by the OMPO model outputs. Forecast daily traffic volumes are summarized graphically in Figure 4-15. Forecast AM and PM Peak Hour volumes are presented in Figures 29 to 31 of the Traffic Study presented in Appendix D. A comparison of Existing PM peak hour traffic volumes and the forecast Future Baseline Condition PM peak hour traffic volumes yields the following findings:

- Traffic volumes at study intersections in the PM peak hour would be an average of 12 percent higher in the Future Baseline Condition alternative than under Existing Conditions.
- The largest increases in PM Peak Hour intersection volumes under the Future Baseline Condition would occur at the following five intersections, where the total 4-way approach volume is forecasted to increase by over 1,000 vehicles (representing an increase of over 30 percent at these locations):
  - Pensacola at Kapiolani
  - Ward at Kapiolani
  - Ward at Ahui

- Ward at Queen
- Cooke at Queen

- PM Peak Hour volumes at intersections on Ala Moana Boulevard are forecast to increase within a range varying from approximately 250 to 600 vehicles per intersection – representing an increase in volume at each intersection varying between approximately 7 to and approximately 14 percent as compared to Existing volumes.

Figure 4-15: Year 2035 Daily Traffic Volume (Future Baseline Condition)

4.7.4.4 Year 2035 Level of Service Without The Proposed Action

Based on the forecast peak-hour traffic volume under Year 2035 Baseline Conditions without the Proposed Action, the anticipated LOS was determined for each study intersection. Table 4-13 provides a comparison of Existing and Year 2035 Baseline (Future Baseline Condition) LOS at each study intersection during the AM and PM Peak Hours.

Table 4-13: Comparison of Peak Hour Intersection Level of Service (2035 vs. Existing Conditions)

			Existing		2035 Baseline (Future Baseline Condition)	
#	Street Names	Control Type	AM LOS (Delay)	PM LOS (Delay)	AM LOS (Delay)	PM LOS (Delay)
1a	South at Kapiolani	Signalized	B (19)	C (24)	C (21)	C (25)
1b	King at Alapai	Signalized	C (24)	C (21)	D (40)	C (22)
2	Ward at Kapiolani	Signalized	D (46)	D (39)	F (>80)	F (>80)
3	Kamakee at Kapiolani	Signalized	A (<10)	C (24)	A (<10)	D (44)

* Reflects estimate of additional delay due to downstream capacity constraints.

**Planned signalization described as mitigation in 2009 EIS.

4.7.4.5 Year 2035 Public Transit Without The Proposed Action

is building an elevated rapid transit line that will serve the City and County of Honolulu. The system will begin in East Kapolei and connect with the Honolulu International Airport and downtown Honolulu, ending at Ala Moana Center. Ridership is estimated at 116,300 weekday passenger trips by the year 2030, with trains arriving every three minutes during peak travel times, every six minutes during the day, and every ten minutes in the evenings.

The light rail system is scheduled to be in full operation by 2019 and is therefore included in the transit analysis because it will provide significant new transit capacity to the KCDD. The initial section of the rail transit system, from Kapolei to Aloha Stadium, is slated to open in 2017; the entire system, from Kapolei to Ala Moana Center, is scheduled to open in 2019.

The introduction of rapid transit to the KCDD will significantly change the dynamic for access to the district and mobility between the district and adjacent areas on the line. Much of the Mauka Area is within 5 to 10 minute walking distance (approximately .25 to .5 miles) of the three planned ~~HART rapid transit~~ ***light metro rail*** stations in the District, (see Appendix A: TOD Overlay Plan Figure 5-12). These stations will provide a previously unattainable level of connectivity and convenience in travel for those moving between KCDD and many other parts of the Honolulu metro area.

- **Civic Center Station:** Located on Halekauwila Street between South and Keawe Streets, this station site is adjacent to land that is part of Kamehameha School's *Kalaulu O Kaka`ako Master Plan* area.
- **Kaka`ako Station:** This station is planned by the City to be located on property that is part of the Ward Neighborhood Master Plan. The station site is positioned on the corner of Ward Avenue and Queen Street and will operate as the closest stop to Kewalo Basin boat harbor, the Ewa side of Ala Moana Beach Park, the Diamond Head side of Kaka`ako Waterfront Park and the Blaisdell Arena, Exhibition and Concert Halls.
- **Downtown Station (at the Aloha Tower Special District):** Located adjacent to the Aloha Tower Special District. The City intends this station to serve Honolulu's Central Business District.

Additionally, the KCDD has significant access to TheBus transit service, with major service corridors provided on King, Kapolani, and Ala Moana. Stops on Punchbowl, King, and Ala Moana are among the busiest transit boarding locations in Honolulu.
The expected transit network after implementation of the fixed guideway system is illustrated in Figure 4-16.

~~HART~~ ***Light metro rail*** is expected to substantially increase capacity in the west and east directions. ~~HART~~ ***It*** is also expected to draw new riders to transit because of planned improvements in speed, reliability, and frequency, thus causing an increase in ridership.

Table 4-14: Transit Capacity Utilization (2035 vs. Existing Condition)

Screenline	Existing Conditions			Future Baseline Condition		
	Ridership	Capacity	Capacity Utilization	Ridership	Capacity	Capacity Utilization
AM Beak Hour - Inbound						
East	2,943	6,720	44%	5,713	13,850	41%
West	4,635	10,500	44%	9,677	15,680	62%
North	351	480	73%	1,195	2,280	52%
Total	**7,929**	**17,700**	**45%**	**16,585**	**31,810**	**55%**
PM Peak Hour – Outbound						
East	2,915	6,300	46%	6,108	15,440	40%
West	4,645	10,590	44%	9,873	16,490	60%
North	440	660	67%	1,338	2,220	60%
Total	**8,000**	**17,550**	**46%**	**17,489**	**34,150**	**51%**

Figure 4-16: 2035 Planned Transit Network

As shown on Table 4-14, under the Future Baseline Condition without the Proposed Action, capacity utilization in the AM and PM peak periods is still well below the 80 to 90 percent threshold of significance for this analysis (this is the same threshold that was identified in the 2009 EIS). It should be noted that the directions presented in the table relate to the screenlines identified for purposes of analysis. A screenline is an imaginary line used to evaluate traffic flow across a boundary. The East screenline corresponds to Ward Avenue. The West screenline corresponds to Punchbowl Street. The North screenline corresponds to King Street[5].

4.7.4.6 Year 2035 Bicycle Circulation Without The Proposed Action

The Future Baseline Condition applies the proposed street network improvements from the existing Mauka and Makai Area Plans.

- No bicycle lanes are included in the Future Baseline Condition, based on the proposed street changes identified in the 2009 SEIS.

Based on the Mauka Area Plan EIS planning process in 2009, the following bikeway improvements were proposed for the Mauka Area:

- Suggested future restriping of existing four-lane roadways to accommodate bicycle lanes (but specific corridors were not identified at that time)
- Recommended change Cooke Street, Pohukaina Street, and Kamakee Street into bicycle-friendly streets that allow for safe bicycle connections to existing open space in the area (but no project extent, bikeway type, or facility recommendation was identified).

Compared to the Existing Condition, the Future Baseline Condition without the Proposed Action is expected to generate an additional 1,030 bicycle trips in the AM peak period and an additional 1,387 bicycle trips in the PM peak period. However, the projected increase in bicyclists is not yet supported by targeted safety or connectivity improvements under the Future Baseline Condition.

4.7.4.7 Year 2035 Pedestrian Circulation Without The Proposed Action

The Future Baseline Condition (existing Mauka and Makai Area Plans) proposes crosswalks at all intersections and sidewalks along all or most streets. These improvements are intended to better orient Kaka`ako's streets and buildings to pedestrians and improve pedestrian safety, particularly in Central Kaka`ako where many streets lack curbs and sidewalks.

In general, the Future Baseline Condition calls for a well-developed network of pedestrian-friendly streets with wide, landscaped sidewalks and active building frontage

[5] For purposes of consistency, screenlines correspond to those used in the 2009 Final Supplemental EIS for the Mauka Plan Rules, and do not necessarily correspond to geo-political boundaries.

that invites pedestrian traffic. Cooke Street, Pohukaina Street, and Kamakee Street are designated as "green" streets and connect pedestrians and bicyclists with park and open space facilities. Several streets (Auahi Street, Pohukaina Street, Ala Moana Boulevard, Punchbowl Street, Cooke Street, and Kamakee Street) are planned to undergo "Promenade" treatments with 15-foot sidewalks. This would be accomplished by a combination of either curb-to-curb width reduction and/or requiring redevelopment setbacks.

The Future Baseline Condition also proposes intersection improvements at:

- Cooke Street / Ala Moana Boulevard;
- Ward Avenue / Queen Street;
- Ward Avenue / Pohukaina Street;
- Ward Avenue / Ala Moana Boulevard;
- Kamakee Street / Ala Moana Boulevard; and,
- Piikoi Street / Ala Moana Boulevard.

These six intersections would be reconstructed with high visibility crosswalk design—such as ladder striping, flashing beacons, and improved signage—in order to encourage mauka-makai connectivity and improve crossing safety across major thoroughfares. The Future Baseline Condition also proposed planters, street furniture such as benches, and on-street parking to help create a buffer zone between pedestrians and street traffic. The planned widening of Ala Moana Boulevard from 72 to 84 feet (identified as a mitigation in the 2009 SEIS) would increase pedestrian crossing distances under Year 2035 conditions.

Compared to the existing condition, the Future Baseline Condition without the Proposed Action is expected to generate an additional 4,637 pedestrian crossings in the AM peak period and an additional 6,239 pedestrian crossings in the PM peak period. Given the projected increase in pedestrian crossings spread across the project area's pedestrian network, the lack of sidewalks along various industrial streets and pedestrian delay at some arterial signalized intersections could limit pedestrian circulation at some locations under the Future Baseline Condition.

4.7.5 Comparing 2035 Future Traffic Conditions With The Proposed Action To Baseline Conditions Without The Proposed Action And To Existing Conditions

This section provides a comparison of travel conditions in Year 2035 under the Proposed Action, focusing on TOD Alternative A. The travel demand forecast under Year 2035 conditions was derived from the OMPO Regional Model, based on the projected level of development under TOD Alternative A. It is important to remember the following when viewing these findings:

- Because the Proposed Action is an "overlay" on the current development rules for the Mauka Area and the Makai Area, future conditions forecast for 2035 are equivalent to the Future Baseline Condition PLUS the Proposed Action. In 2035,

the Proposed Action does not replace the Baseline Condition, it adds an optional development program to it, whether it be Alternative A or B.

4.7.5.1 Travel Mode and Trip Generation

The OMPO Regional Model was utilized to provide a forecast of trip generation based on Future Baseline Condition and Proposed Action land uses. The net change to trip generation was derived based on existing land uses under the OMPO Model Year 2015 Baseline scenario. Table 4-15 provides a summary of the travel demand forecast.

Based on the travel demand model forecast:

- **Total volume of travel:** Total daily person trips by all modes traveling to, from, or within the KCDD, would essentially double under the Future Baseline Condition, with a 98 percent increase over the Existing Condition. Under TOD Alternative A, total daily person trips by all modes would increase by 136 percent over the Existing Condition. The impact would be slightly less under TOD Alternative B.
- **Trips internal to the KCDD:** The portion of trips internal to the KCDD would increase from 36 percent under Existing Conditions to 51 percent under the Future Baseline Condition, with a further increase to 53 percent under TOD Alternative A, with a lesser impact under TOD Alternative B.

Table 4-15: Travel Demand Comparison

	Existing Condition (2015 Model Base Year)	Future Baseline Condition (2035 Model Baseline)	Future Baseline + Proposed Action (2035 TOD Alt. A)
Households	11,867	38,221	51,393
Net Change from Existing		26,354	39,526
Percent Increase over Existing		222%	333%
Retail Employment	7,916	16,840	15,706
Non-Retail Employment	28,303	44,739	39,923
Total Daily Person Trips	286,878	569,295	679,059
Net Change from Existing		282,417	392,181
Percent Increase over Existing		98%	136%
Internal Capture	36.7%	51.3%	53.2%
External Person Trips (daily)	181,594	277,247	317,800
Net Change from Existing		95,653	136,206
Percent Increase over Existing		53%	75%

Table 4-16 provides a comparison of travel mode choice predicted by the OMPO Regional Model forecast, which indicates that:

- Walk and bike trips would increase from 15.5 percent of total daily trips under Existing Conditions to:
  - 20.1 percent under the Future Baseline Condition

    - up to 21.7 percent of daily trips under the Proposed Action
- Motor vehicle trips would decrease from 77.3 percent of total daily trips under Existing Conditions to:
    - 71.3 percent of under the Future Baseline Condition
    - up to 69.6 percent under the Proposed Action
- Transit trips would increase from 7.2 percent of total daily trips under Existing Conditions to 8.7 percent under both the No Action and Proposed Action.

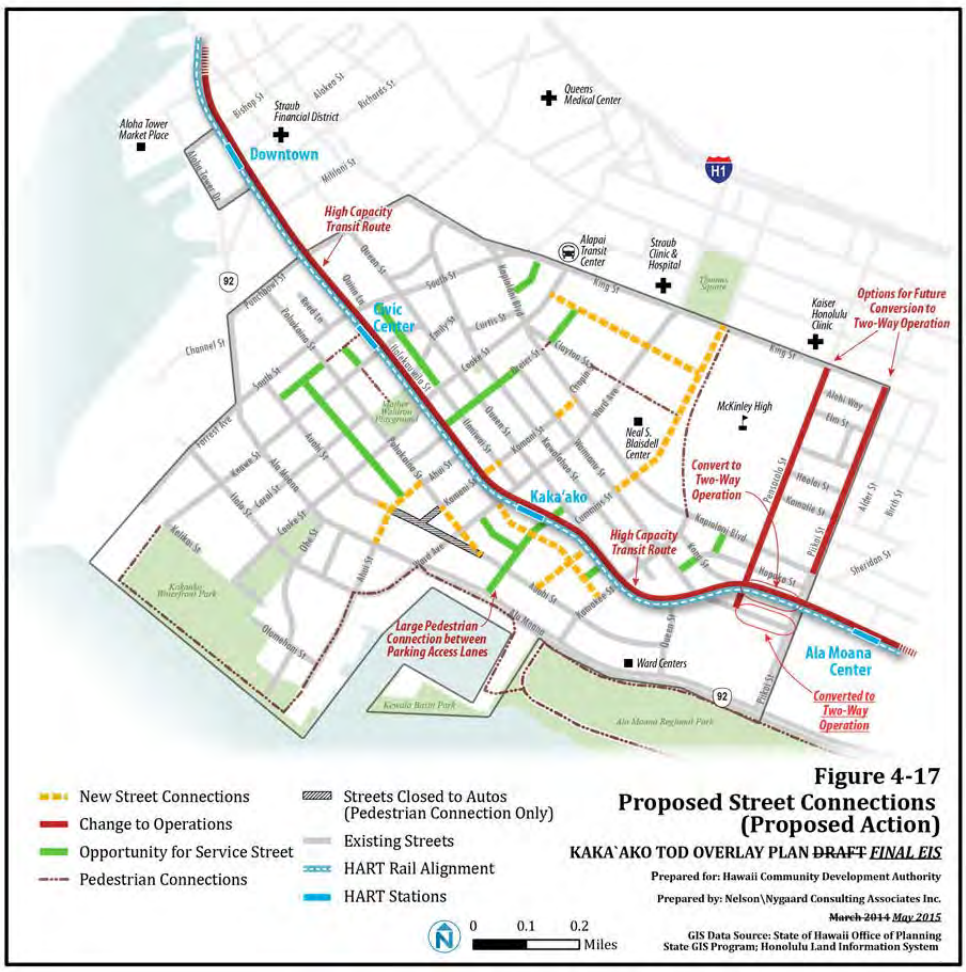
Table 4-16: Travel Mode Comparison

	Existing Conditions (2015 Model Base Year)	Future Baseline Condition (2035 Model Baseline)	Future Baseline + Proposed Action (2035 TOD Alt. A)
Public Transit	7.2%	8.7%	8.7%
Walk + Bike	15.5%	20.1%	21.7%
Motor Vehicles	77.3%	71.3%	69.6%

The OMPO Regional Model forecast of daily motor vehicle, transit and bike/walk trips under Existing and Year 2035 conditions, under both the Future Baseline Condition and Proposed Action, is shown in Table 4-17.

Table 4-17: Trip Generation Forecast – Proposed Action (TOD Alternative A)

	Motor Vehicle Trips			Transit Trips	Walk/ Bike Trips
	AM Peak Hour	**PM Peak Hour**	**Daily**	**Daily**	**Daily**
Total Trip Generation					
Existing Land Uses	13,822	9,249	184,797	20,655	44,466
Future Baseline Condition	25,380	28,313	338,256	49,528	114,428
Future Baseline + Proposed Action	27,191	30,783	393,854	59,078	147,356
Pct Increase over Existing	***97%***	***233%***	***113%***	***186%***	***231%***
Pct Change over Future Baseline Condition	***7%***	***9%***	***16%***	***19%***	***29%***
Net Trip Generation Comparison					
Future Baseline Condition	11,558	19,064	153,459	28,873	69,962
Future Baseline + Proposed Action	13,369	21,534	209,057	38,423	102,890
Proposed Action : Net Change over Future Baseline	***1,811***	***2,470***	***55,598***	***9,550***	***32,928***



Based on this forecast, the Proposed Action will generate the following net increases in trips in comparison to the Future Baseline Condition:

- Walk/bike trips: up to 29 percent increase over the Future Baseline Condition
- Transit trips: up to 19 percent increase over the Future Baseline Condition
- Motor vehicle trips: up to 16 percent increase over the Future Baseline Condition based on daily trips, while the increase in peak-hour motor vehicle trips would be smaller:
    - up to 7 percent increase over the Future Baseline Condition during the AM Peak Hour
    - up to 9 percent increase over the Future Baseline Condition during the PM Peak Hour

4.7.5.2 Year 2035 Roadway Conditions With The Proposed Action

Potential changes to the roadway network under the Proposed Action described in TOD Alternative A include proposed roadway network connections to facilitate internal circulation within the KCDD as shown in Figure 4-17 ***(and discussed on page 5-15 of Appendix A)*** and the designation of priority streets for Motor Vehicles, Bicycles, and Pedestrians as shown on Figures 4-18 to 4-21.

Figure 4-17: Proposed Street Connections – Proposed Action

Analysis of the potential restoration of two-way operation on Piikoi and Pensacola Street was excluded from the analysis because the regional-serving character of the roadways, with their direct connections to the H-1 freeway, is beyond the scope of the present analysis.

Figure 4-18: Proposed Motor Vehicle Priority Streets – Proposed Action

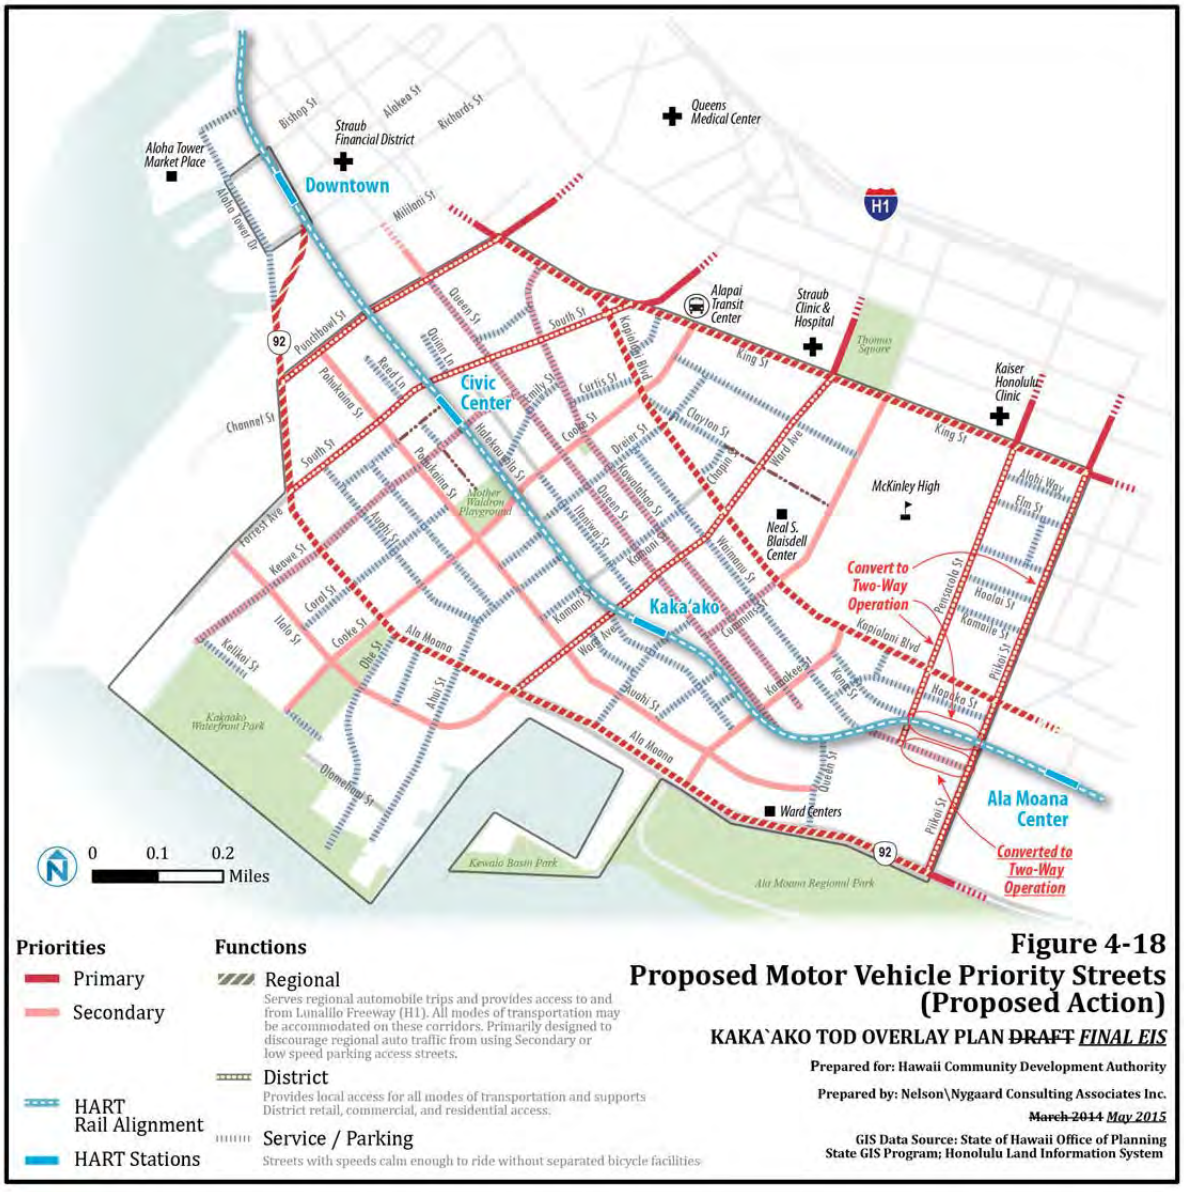


Figure 4-19: Proposed Bicycle Priority Streets – Proposed Action

Figure 4-20: Proposed Pedestrian Priority Streets

Figure 4-21: Year 2035 Traffic Volumes on Key Corridors – Proposed Action

4.7.5.3 Traffic Operations With The Proposed Action

Based on the anticipated change in traffic volumes comparing the Proposed Action model (TOD Alternative A) results to the Future Baseline Condition, the anticipated distribution of daily traffic volumes are shown on Figure 4-19. Detailed intersection volumes for each of the key study area intersections are shown in Figures 40 through 42 of the Traffic Study presented as Appendix D of this EIS.

4.7.5.4 Year 2035 Level of Service With The Proposed Action

Based on the forecasted peak hour traffic volume, Table 4-18 compares the Year 2035 projected Level of Service for key study area locations under both the Future Baseline Condition and the worst-case scenario under the Proposed Action (TOD Alternative A).

4.7.6 Traffic Impacts of the Proposed Action

Traffic impacts are considered significant if the worst-case scenario under the Proposed Action (TOD Alternative A) causes the level of service to deteriorate from LOS E or better under the Future Baseline Condition to LOS F under the Proposed Action. There are no intersections in the study area that deteriorate from LOS E or better under the Future Baseline Condition to LOS F under the Proposed Action.

Traffic impacts are also considered significant if the operational impacts on signalized intersections operating at LOS F under both the Future Baseline Condition and worst-case scenario under the Proposed Action if the volume to-capacity (v/c) ratio under the Proposed Action exceeds that of the Future Baseline Condition. The following study intersections would operate at LOS F under both the Future Baseline Condition and Proposed Action:

- Ala Moana & South (study intersection #6)
- Ala Moana & Cooke (study intersection #9)
- Ala Moana & Ward (study intersection #10)
- Queen & Ward (study intersection #17)
- Kapiolani & Ward (study intersection #2)

Additional study intersections would operate acceptably based strictly on volume/capacity ratios at each intersection, but could be impacted by downstream delay at adjacent intersections on Ala Moana Boulevard west of Ward Street:

- Ala Moana & Keawe (study intersection #7)
- Ala Moana & Coral (study intersection #8)
- Ala Moana & Koula (study intersection #38)

Table 4-18: 2035 Peak Hour Intersection Level of Service – Proposed Action (TOD Alternative A)

			Future Baseline Condition (2035 Baseline)		Future Baseline + Proposed Action (2035 TOD Alt. A)

Intersections shown in bold operate at LOS F under the Future Baseline Condition and Proposed Action.						
*LOS as shown reflects downstream delay. **Intersection LOS based on planned signalization described as mitigation in 2009 EIS.						

The identified intersections were analyzed to determine whether significant traffic impacts might exist.

Ala Moana & South: Intersection is forecast to operate at LOS F under peak-hour conditions based on the Year 2035 traffic forecast under both the Future Baseline Condition and the worst-case scenario under the Proposed Action. Since the volume to-capacity (v/c) ratio under the Proposed Action exceeds that of the Future Baseline Condition, this impact is significant. *Finding: potentially significant.*

Ala Moana & Keawe: The volume to-capacity (v/c) ratio at this intersection would be acceptable under both the worst-case scenario of the Proposed Action and Future Baseline Condition. However, downstream delay results in delay that could affect the operation of this intersection. *Finding: less than significant.*

Ala Moana & Coral: The volume to-capacity (v/c) ratio at this intersection would be acceptable under both the worst-case scenario under the Proposed Action and the Future Baseline Condition. However, downstream delay results in delay that could affect the operation of this intersection. *Finding: less than significant.*

Ala Moana & Cooke: Intersection is forecast to operate at LOS F under peak-hour conditions based on the Year 2035 traffic forecast under both the Future Baseline Condition and the worst-case scenario under the Proposed Action. Since the volume to-capacity (v/c) ratio under the Proposed Action exceeds that of the Future Baseline Condition, this impact is significant. *Finding: potentially significant.*

Ala Moana & Koula: The volume to-capacity (v/c) ratio at this intersection would be acceptable in both the worst-case scenario under the Proposed Action and Future Baseline Condition. However, downstream delay results in delay that could affect the operation of this intersection. *Finding: less than significant.*

Ala Moana & Ward: Intersection is forecast to operate at LOS F under peak-hour conditions based on the Year 2035 traffic forecast in both the Future Baseline Condition and the worst-case scenario under the Proposed Action. Since the volume to-capacity (v/c) ratio in the Proposed Action exceeds that of the Future Baseline Condition, this impact is significant. *Finding: potentially significant.*

Queen & Ward: Intersection is forecasted to operate at LOS F under peak-hour conditions based on the Year 2035 traffic forecast in both the Future Baseline Condition and the worst-case scenario under the Proposed Action. Since the volume to-capacity (v/c) ratio under the Proposed Action exceeds that of the Future Baseline Condition, this impact is significant. *Finding: significant and unavoidable impact (SU). No feasible mitigations as described in the 2009 EIS.*

Kapiolani & Ward: Intersection is forecast to operate at LOS F under peak-hour conditions based on the Year 2035 traffic forecast in both the Future Baseline Condition and Proposed Action. Since the volume to-capacity (v/c) ratio under the worst-case scenario under the Proposed Action exceeds that of the Future Baseline Condition, this impact is significant. The 2009 EIS included the finding that no mitigation would be feasible at this intersection; therefore this impact was identified as significant and unavoidable. *Finding: potentially significant.*

4.7.7 Transit Impacts of the Proposed Action

The fixed guideway ~~transit~~ ***light metro rail*** system ~~– HART –~~ is presently under construction. ~~HART~~ ***It*** will provide faster, more reliable transit along the corridor where many transit vehicles must operate in mixed-flow traffic, and serve as an attractive alternative to the private automobile. The project would strengthen the connection between Kapolei, Downtown Honolulu and Kaka`ako~~, UH Manoa, and Waikiki~~.

A major goal of the Proposed Action is to encourage transit oriented development. The Proposed Action is intended to facilitate and encourage transit use by placing relatively high-density development adjacent to or within easy walking access of major transit facilities such as stations on the fixed guideway system or transfer points between bus lines. TOD projects also typically encourage the use of non-motorized modes of travel, including pedestrian and bicycle travel, and discourage the use of private automobiles.

For the purposes of analysis, Proposed Action capacity was taken from the 2009 EIS. Proposed Action ridership was estimated using the following assumptions:

- Based on a comparison of the Future Baseline Condition (2035 Baseline) and Proposed Action (2035 TOD Plan) outputs from the OMPO model, the Proposed Action will generate approximately 10,000 additional transit riders per day (net change compared to the Action).
- The assumption was made that 10 percent of daily transit trips will occur during the peak-hour. Therefore, 10,000 daily riders would correlate to 1,000 peak-hour riders in the AM peak and 1,000 peak-hour riders in the PM.
- Using the model, the 1,000 additional trips were assigned to the east, west, and north screenlines proportionally.

The resulting capacity and utilization for the Proposed Action transit analysis is presented in Table 4-19.

Table 4-19: Proposed Action Transit Capacity Utilization

	Existing Conditions			Future Baseline Condition			Future Baseline + Proposed Action		
Screenline	Ridership	Capacity	Capacity Utilization	Ridership	Capacity	Capacity Utilization	Ridership	Capacity	Capacity Utilization
AM Beak Hour - Inbound									
East	2,943	6,720	44%	5,771	13,850	42%	5,430	13,850	39%
West	4,635	10,500	44%	9,732	15,680	62%	10,814	15,680	69%
North	351	480	73%	1,198	2,280	53%	1,195	2,280	52%
Total	7,929	17,700	45%	16,701	31,810	53%	17,439	31,810	55%
PM Peak Hour – Outbound									
East	2,915	6,300	46%	6,194	15,440	40%	5,825	15,440	38%
West	4,645	10,590	44%	9,954	16,490	60%	11,010	16,490	67%
North	440	660	67%	1,341	2,220	60%	1,341	2,220	60%
Total	8,000	17,550	46%	17,489	34,150	51%	18,173	34,150	53%

The fixed guideway system is expected to substantially increase capacity in the west and east screenlines. The guideway system is also expected to draw new riders to transit because of its improvement over existing bus services in terms of speed, reliability, and frequency, thus causing an increase in ridership across the west screenline. Given the increased capacity from the fixed guideway system, however, utilization will still be below the 80 to 90 percent threshold typically considered acceptable for urban areas. Peak hour screenline results are summarized on Figures 44 and 45 of the Traffic Study presented in Appendix D of this EIS.

Based on the transit impact criteria described in the 2009 EIS, transit impacts are considered significant if:

- The plan causes a substantial increase in transit demand that could not easily be accommodated by available transit capacity, resulting in unacceptable levels of transit crowding. Capacity utilization above 80 to 90 percent is generally considered unacceptable for urban transit services.
- The plan causes a substantial increase in operational delay or costs that could result in adverse impacts to transit service.

The fixed guideway system is expected to substantially increase capacity on the west and east screenlines. The capacity utilization on all screenlines (north, east, and west) in the AM and the PM peak is not expected to exceed 69%. Therefore, there is no significant transit impact resulting from the Proposed Action and no additional mitigations are required.

Regarding operational delay, traffic delay under the Proposed Action is not anticipated to result in a level of delay to buses that would require additional buses or operating costs compared to the Future Baseline condition. Therefore, there is no significant transit operations impact resulting from the Proposed Action and no additional mitigations are required.

4.7.8 Bicycle Circulation Impacts of the Proposed Action

4.7.8.1 Bicycle Circulation Recommendations in the Proposed Action

The Proposed Action improves several forms of bikeway types as compared to the Future Baseline Condition to ensure greater separation from motor vehicle traffic, and proposes additional bikeways to facilitate east-west and north-south bicycle connectivity and safe bicycle operation. The Draft TOD Overlay Plan recommends the following revisions to the Future Baseline Condition bicycle network:

- Bike lanes on King Street from Piikoi Street to Punchbowl Street;
- Cycle track (path)[6] or bike lanes on Ala Moana Boulevard from Piikoi Street to the Ewa edge of the Aloha Tower Special District;
- Cycle track (path) or bike lane couplet on Punchbowl Street and South Street between King Street and Ala Moana Boulevard;
- Signed and marked bike route on Queen Street from Kamakee Street to Punchbowl Street;
- Cycle track (path) or bike lanes on Halekauwila Street from Ward Avenue to the Diamond Head edge of the Aloha Tower Special District;

[6] A cycle track is a dedicated bicycle facility type that is physically separated from adjacent travel lanes by bollards, planters, on-street parking, curbs, or any other raised material. Cycle tracks can be situated at street level, between sidewalk and street level, or at sidewalk level.

- Signed and marked bike route on Auahi Street from Ala Moana Boulevard to Ward Avenue;
- Signed and marked bike route on Ilalo Street from Ahui Street and Keawe Street;
- Bike lanes on Cummins Street (developed with proposed street extension);
- Bike lanes on Ward Avenue from King Street and Ala Moana Boulevard;
- Bike lanes on Kamakee Street between Kapiolani Boulevard and Ala Moana Boulevard;
- Cycle track (path) or bike lane couplet on Pensacola Street from King Street to Punchbowl Street and Piikoi Street from King Street to Ala Moana Boulevard;
- Signed and marked bike routes on Pohukaina Street from Ward Avenue to Punchbowl Street;
- Bike path connecting the Ala Moana Regional Park multi-use path to the Kaka`ako Waterfront Park multi-use path (via Ahui Street); and
- Bike path between the Neil S. Blaisdell Center and McKinley High School connecting the Kamakee Street end with King Street

The recommended improvements listed above and displayed in Figure 4-17 only address bikeway project extents within the project area. However, it is important to note that these recommended improvements are not stipulated as part of the Proposed Action because HCDA does not have jurisdiction over streets in Kaka`ako. Thus, the recommendations in the Draft TOD Overlay Plan are only strategies and are not required improvements.

4.7.8.2 Summary of Findings of Significance

The following list encapsulates the potential impacts that could be observed along key bicycle corridors throughout the project area, as many corridors exhibit a variety of impacts. These impact types are based on the significance criteria listed in Section 4.7.2, the change in bicycling movements between the Future Baseline Condition and Proposed Action, and the ability of the Future Baseline Condition to connect the forecast increase in bicyclists with existing and new destinations based on the Year 2035 Land Use Comparison.

- Up to a threefold increase in daily bicycle volumes with no commensurate or appropriate increase in bicycle capacity.
- Lack of east-west connectivity to support the substantial increase in bicycle volumes (definition of substantial increase depends on the corridor).
- Lack of north-south connectivity to support the substantial increase in bicycle volumes (definition of substantial increase depends on the corridor).
- Lack of bicycle facilities to facilitate access to all three rail stations.
- Substantial increase in turn volumes at a number of intersections along key bicycle corridors increases exposure to collision.

Compared to the Future Baseline Condition, the Proposed Action is expected to generate up to an additional 485 bicycle trips in the AM peak period and up to an additional 652

bicycle trips in the PM peak period. The increase in AM and PM peak period bicycle movements is summarized in Table 4-20.

Table 4-20: Bicycle Volumes – Proposed Action

	Existing Condition (2015 Model Baseline)	Future Baseline Condition (2035 Model Baseline)	Future Baseline + Proposed Action (2035 TOD Alt A)	Future Baseline + Proposed Action (Percent Change over Existing)	Proposed Action (Percent Change over Future Baseline)
Daily	8,084	20,805	26,792	231%	29%
AM Peak Hour	654	1,685	2,170	231%	29%
PM Peak Hour	881	2,267	2,920	231%	29%

The following corridors would exhibit impacts in as a result of the Proposed Action based on one or more of the potential impacts listed in the section above. *In each impacted corridor, up to a 331% increase in peak period bicycle volumes (from existing bicycle volumes to Proposed Action conditions) and up to a 129% increase in peak period bicycle volumes (from Future Baseline Condition bicycle volumes to Proposed Action conditions) with no corresponding available bicycle capacity triggers a significant impact.* Although bike sharing is not included in the analysis, bike share implementation (projected to produce between 1.6 and 2.1 million trip per year) will make the lack of bicycle capacity an even more severe issue. In addition, because none of the corridors that offer direct travel are furnished with dedicated bicycle facilities, increased auto turn volumes are assumed to create a potentially significant impact.

Punchbowl Street: As part of the South-Punchbowl one-way couplet, Punchbowl Street is a critical southbound bicycle connection on the Ewa boundary of the project area. The projected increase in bicycle volumes along Punchbowl Street is not supported by dedicated bicycle facilities. Punchbowl Street is also a key bicycle access route to future ~~HART~~ ***light metro rail*** stations for bicyclists originating mauka of the H1 freeway. Each of these factors and the increase in bicycle volume between the Future Baseline Condition and Proposed Action contributes to a significant impact.
Finding: Potentially significant

South Street: As part of the South-Punchbowl one-way couplet, South Street is a critical northbound bicycle connection on the Ewa boundary of the project area. This corridor currently accommodates up to 440 daily bicycle movements.[7] The projected increase in bicycle volumes (AM, PM, and daily bicycle trips) along South Street is not supported by

[7] Daily bicycle movements were extrapolated from AM and PM peak period (2-hour) bicycle counts.

dedicated bicycle facilities. South Street is also a key bicycle access route from the future HART Civic Center Station for bicyclists destined for points mauka of the H1 freeway. Each of these factors and the increase in bicycle volumes between the Future Baseline Condition and Proposed Action contributes to a significant impact. *Finding: Potentially significant*

Cooke Street: Cooke Street is a critical north-south bicycle connection that provides direct access to the future HART Civic Center Station. This corridor currently accommodates up to 512 daily bicycle movements. Cooke Street is anticipated to exhibit a 48% increase in motor vehicle turn volumes at Pohukaina Street, which will increase bicycle exposure to turn conflicts. Because this is a key transit access route, there is an effective increase in bicycle conflicts, and there is a substantial projected increase in bicycle volumes (both due to demand for transit access and intra-district travel), Cooke Street's lack of dedicated bicycle facilities with a corresponding increase in bicycle volume between the Future Baseline Condition and Proposed Action contributes to a significant impact. *Finding: Potentially significant*

Ward Avenue: Bisecting the project area, Ward Avenue is a key north-south bicycle connection that provides direct access to the future HART Kaka`ako Station and facilitates bicycle movement between the project area and areas mauka of the H1 freeway. This corridor currently accommodates up to 880 daily bicycle movements. Because this is a key transit access route, and there is a substantial projected increase in bicycle volumes between the Future Baseline Condition and Proposed Action (both due to demand for transit access and intra-district travel), Ward Avenue's lack of dedicated bicycle facilities is considered a significant impact. *Finding: Potentially significant*

Halekauwila Street: Although Halekauwila Street currently only accommodates up to 288 daily bicycle movements, this corridor will serve as a critical east-west bicycle connection. Given its alignment under the ~~HART~~ ***light metro*** rail alignment, Halekauwila Street provides direct access to the future Civic Center, Kaka`ako, and Downtown Stations. Because this is a key transit access route, and there is a substantial projected increase in bicycle volumes between the Future Baseline Condition and Proposed Action (both due to demand for transit access and intra-district travel), Halekauwila Street's lack of dedicated bicycle facilities with a corresponding increase in bicycle volume between the Future Baseline Condition and Proposed Action contributes to a significant impact. *Finding: Potentially significant*

Pensacola Street: Pensacola Street is a critical southbound bicycle connection at the Diamond Head edge of the project area. This corridor currently accommodates up to 288 daily bicycle movements. The projected increase in bicycle volumes along Pensacola Street between the Future Baseline Condition and Proposed Action is not supported by dedicated bicycle facilities. Pensacola Street is also a key bicycle access route to two future stations (Kaka`ako Station and Ala Moana Station) and Ala Moana Center for bicyclists originating from the Makiki neighborhood. Because this is a key transit access route, and there is a substantial projected increase in bicycle volumes between the Future Baseline Condition and Proposed Action (both due to demand for transit access and intra-

district travel), Pensacola Street's lack of dedicated bicycle facilities is considered a significant impact.

The City and County of Honolulu has expressed interest in potentially converting the Pensacola-Piikoi one-way couplet into two-way operation while providing high quality bicycle facilities. This should be studied in the future. *Finding: Potentially significant*

Piikoi Street: Piikoi Street is a critical northbound bicycle connection at the Diamond Head edge of the project area. This corridor currently accommodates up to 380 daily bicycle movements. Piikoi Street is anticipated to exhibit a 30% increase in motor vehicle turn volumes at Ala Moana Boulevard, which will increase bicycle exposure to turn conflicts. The projected increase in bicycle volumes along Piikoi Street between the Future Baseline Condition and Proposed Action is not supported by dedicated bicycle facilities. Piikoi Street is also provides bicycle egress from two future stations (Kaka`ako Station and Ala Moana Station) and Ala Moana Center, particularly for bicyclists destined for the Makiki neighborhood. Piikoi Street is anticipated to exhibit a 30% increase in motor vehicle turn volumes at Ala Moana Boulevard, which will increase bicycle exposure to turn conflicts. Because this is a key transit egress route, and there is a substantial projected increase in bicycle volumes between the Future Baseline Condition and Proposed Action (both due to demand for transit access and intra-district travel), Piikoi Street's lack of dedicated bicycle facilities is considered a significant impact. The City and County has expressed interest in potentially converting the Pensacola-Piikoi one-way couplet into two-way operation while providing high quality bicycle facilities. This should be studied in the future. *Finding: Potentially significant*

A bicycle and pedestrian crossing improvement at the King Street/Cooke Street intersection is recommended as a potential *future* improvement measure. This would help link cyclists between the project area/Civic Center station and the Alapai Transit Center/Young Street signed and marked bike route (an east-west connection). This improvement is not recommended as a mitigation measure in this EIS due to the location of the improvement relative to the project area (it is not under the jurisdiction of the HCDA).

4.7.9 Pedestrian Circulation Impacts of the Proposed Action

4.7.9.1 Pedestrian Circulation Recommendations in the Proposed Action

The pedestrian recommendations in the Proposed Action seek to develop a high-quality pedestrian environment in the KCDD in order to achieve the goals of a lively, active, and transit-oriented community. Figure 4-22 illustrates where pedestrian investment is recommended as the district develops and the Proposed Action is realized. These recommended improvements are not stipulated as part of the Proposed Action because the street network remains under the jurisdiction of the City and County of Honolulu. Thus, the recommendations in the Proposed Action are only strategies and are not required improvements.

The pedestrian priority types recommended in the Proposed Action include:

- **Primary pedestrian priority streets** are those that connect key destinations in or adjacent to the district, including rail stations, and that will ultimately support active street front uses such as retail stores, public plazas, and entertainment venues. These streets require spacious sidewalks and a high level of pedestrian amenity.
- **Secondary pedestrian priority streets** are those that do not provide direct connections to major destinations or have very high traffic volumes. While these streets may never be ideal for walking along for long distances, they must still be safe enough to accommodate walking, and they should be easy and safe enough to cross that they do not serve as a barrier to pedestrians.
- **Low speed streets** are generally service streets that may have narrow widths and where pedestrians and traffic may even be asked to mix in a shared right-of-way. Note that the term "low speed streets" should not be interpreted to suggest that high-speeds are promoted anywhere in the project area.
- **Greenway connections** are streets where there is opportunity to connect parks, green space, and public plazas with well-landscaped, shaded, and interesting walking routes.

Other pedestrian network changes recommended in the Proposed Action relate to conflict reduction, sidewalk expansion, and crossing distance reduction. Any street with on-street parking is proposed to include curb extensions at intersections. Driveway consolidation is proposed throughout the project area to reduce conflicts between motor vehicles and pedestrians and improve pedestrian safety. Building access is concentrated at smaller parking access or service streets in order to reduce search-for-parking traffic and eliminate conflicts with pedestrians. In addition, 5 feet of additional setback is recommended to achieve minimum 15 feet sidewalk widths. This is particularly critical in station areas, which will see an injection of pedestrian activity for at least 18 hours of the day. Mid-block crossings are also proposed to reduce some of the larger block sizes (those over 600-700 feet) and facilitate access to rail stations.

4.7.9.2 Summary of Findings of Significance

The following list encapsulates the potential impacts that could be observed along pedestrian corridors throughout the project area. These impact types are based on the significance criteria listed in Section 4.7.2, the change in pedestrian crossings between the Future Baseline Condition and the worst-case scenario of the Proposed Action, and the ability of the Future Baseline Condition to connect an increase in pedestrians with existing and new destinations based on the Year 2035 Land Use Comparison. Potential impacts for each corridor include:

- Threefold increase in daily pedestrian crossings with no commensurate or appropriate increase in pedestrian capacity.
- Pedestrian delay with the increase in pedestrian volumes (over 80 seconds of delay is the threshold for pedestrians). Average delay for all travelers is increasing

because as traffic disperses across the network away from overcapacity streets like Ala Moana Boulevard

- Prevalence of long crossing distances (depends on curb-to-curb width and underutilization of pavement space). Shorter crossing distances (achieved by limited intersection skew, corner radii, and/or availability of curb extensions) increase the effective pedestrian queuing capacity at intersection corners.
- Lack of pedestrian facilities to facilitate access to all three rail stations.
- Lack of adequate sidewalks to meet future pedestrian demand.

Figure 4-22: Recommended Pedestrian Network from the Draft TOD Overlay Plan (see Appendix A)

Compared to the Future Baseline Condition, the Proposed Action is expected to generate an additional 2,182 pedestrian crossings in the AM peak period and an additional 2,937 pedestrian crossings in the PM peak period. The increase in AM and PM peak period pedestrian crossings is summarized in Table 4-21.

Table 4-21: Pedestrian Volumes – Proposed Action

	Existing Condition (2015 Model Baseline)	Future Baseline Condition (2035 Model Baseline)	Future Baseline + Proposed Action (2035 TOD Alt A)	Future Baseline + Proposed Action (Percent Change over Existing)	Proposed Action (Percent Change over Future Baseline)
Daily	36,381	93,622	120,564	231%	29%
AM Peak Hour	2,946	7,583	9,765	231%	29%
PM Peak Hour	3,965	10,204	13,141	231%	29%

The following corridors would exhibit impacts in both the Proposed Action and Future Baseline Condition based on one or more of the potential impacts listed in the discussion above. In each impacted corridor, up to a 331% increase in peak period pedestrian crossings (from existing pedestrian crossings to Proposed Action conditions) and up to a 129% increase in peak period pedestrian crossings (from Future Baseline Condition pedestrian crossings to Proposed Action conditions) with no corresponding increase in pedestrian capacity triggers a significant impact. Some impacts are demonstrated throughout the district or along multiple corridors. These types of impacts are aggregated into a general "All corridors" category.

All corridors (district-wide impacts): A number of corridors throughout the project area exhibit a range of impacts stemming from the project area's increase in pedestrian activity between the Future Baseline Condition and Proposed Action. These include:

- A limited number of dedicated crosswalk facilities along each corridor funnels pedestrian volumes to a limited number of crossing locations (triggering a capacity impact) or encouraging crossing at unmarked intersections or at unmarked mid-block locations (triggering a safety impact due to reduced pedestrian visibility).
- Current crossing distances extend pedestrian's exposure time to motor vehicles (triggering a safety impact) and reduce the person throughput of cross walk facilities (i.e., short crossings exhibit greater pedestrian crossing capacity per pedestrian phase).

- The increase in pedestrian volumes between the Future Baseline Condition and Proposed Action will create some crowding issues on various commercial corridors with sidewalks widths less than 10 feet.

Finding: Each impact listed above is potentially significant

**Central Kaka`ako industrial streets:** Because of the industrial character of Central Kaka`ako, most streets in this neighborhood are not furnished with sidewalks or curbs. In addition, delivery trucks, cars, and mopeds are parked in different patterns and even double-parked. The lack of adequate sidewalk facilities and haphazard parking arrangement creates conflicts with pedestrians and reduces the potential utility of several direct and relatively calm streets that could provide access to future stations. These conditions, coupled with an increase in pedestrian volumes, factor into triggering an impact on the following streets:

- Waimanu Street
- Kawalahao Street
- Queen Street
- Hopaka Street
- Coral Street
- Kona Street
- Cummins Street
- Kamani Street
- Ilaniwai Street

HCDA has worked with the Central Kaka`ako community and determined that the industrial character of the area should remain. Curbless, shared street designs should be sought in order to reduce conflicts, create pockets of pedestrian space and ensure safe coexistence of street space between all users. *Finding: Potentially significant*

Ala Moana Boulevard (signal timing improvements): Intersections along Ala Moana Boulevard experience substantial pedestrian delay for an urban district. For the purposes of this assessment, over 80 seconds of delay is considered the impact threshold for pedestrians. Using Ala Moana Boulevard's intersection with Ward Avenue as an example, this intersection exhibits 140-second signal cycles—70 seconds to Ala Moana, 70 seconds to Ward. This cycle timing is inefficient and creates unacceptable delay. Pedestrians crossing Ala Moana are provided 35 seconds per pedestrian phase with 7 seconds of GREEN WALK time. With the projected increase in pedestrian volumes between the Future Baseline Condition and the worst-case scenario under the Proposed Action, unmitigated pedestrian delay can compound sidewalk and intersection queuing capacity issues. This constitutes an impact. *Finding: Potentially significant*

Ala Moana Boulevard (pedestrian improvements): Ala Moana Boulevard is not a key station access route, but it serves as the most direct east-west pedestrian and bicycle connection between Kaka`ako and Waikiki. This corridor currently accommodates up to

215 and 269 pedestrian crossings in the AM and PM peaks, respectively.[8] This is anticipated to increase threefold between the Existing and Proposed Action timeframes. Crossings between the Future Baseline Condition and the worst-case scenario under the Proposed Action are projected to increase 29%.

The likelihood of sidewalk riding by bicyclists due to the current traffic conditions can increase pedestrians' exposure to collisions with bicycles. With the simultaneous increase in pedestrians and bicyclists using sidewalks (because of the lack of bicycle facilities along Ala Moana Boulevard), the increased number of conflicts between these two modes triggers a significant impact. *Finding: Potentially significant*

4.7.10 Recommended Measures to Mitigate Significant Impacts

Recommendations to mitigate the traffic, bicycle and pedestrian impacts described in the Proposed Action are described in this section. Not all impacts can be fully mitigated, resulting in identified significant and unavoidable impacts at a limited number of specific locations.

4.7.10.1 Traffic Mitigations

Table 4-22 summarizes the potential traffic impacts, based on the findings of the analysis of the Proposed Action, and describes recommended mitigation measures.

4.7.10.2 Transit Mitigations

Impacts to transit capacity and operations resulting from the Project were found to be less than significant. Therefore, no transit mitigations are required.

4.7.10.3 Bicycle Mitigations

Table 4-23 summarizes the significant, yet avoidable bicycle impacts for the Future Baseline Condition and Proposed Action with their corresponding mitigation measures.

4.7.10.4 Pedestrian Mitigations

Table 4-24 summarizes the significant, yet avoidable pedestrian impacts for the Future Baseline Condition and Proposed Action with their corresponding mitigation measures.

---

8 This equates to roughly 3,872 daily crossings.

Table 4-22: Motor Vehicle Traffic Mitigations

Impacted Locations	Proposed Motor Vehicle Mitigation			Impact Finding with Mitigation	
	Impact Finding	Potential Mitigation	Secondary Impact of Mitigation	Level of Significance with Mitigation	Recommendation
Ala Moana & South	LOS F under Future Baseline Condition. Proposed Action would increase V/C.	Increase allocation of green time per cycle to Ala Moana.	Increased delay to side-street motorists, bicyclists and pedestrians.	Intersection remains at LOS F due to side-street delay.	Trip reduction mitigation to achieve 9% reduction in PM Peak Hour Traffic Volume (below model-forecasted volumes).
Ala Moana & Cooke					
Ala Moana & Ward	LOS F under Future Baseline Condition. Proposed Action would increase V/C.	Restripe north/south approaches to eliminate split signal phases. Reduce length of east-leg pedestrian crossing.	On east-leg only: would require wider curb-to-curb width.	Intersection remains at LOS F due to side-street delay.	
Queen & Ward	LOS F under Future Baseline Condition. Identified as significant and unavoidable in 2009 Kaka`ako Mauka Plan SEIS.	N/A	N/A	N/A	N/A
Kapiolani & Ward	LOS F under Future Baseline Condition. Identified as significant and unavoidable in 2009 Kaka`ako Mauka Plan SEIS.	N/A	N/A	N/A	N/A

Table 4-23: Bicycle Mitigations

Impacted Corridors	Proposed Bicycle Mitigation			Impact Finding with Mitigation	
	Impact Finding	Mitigation	Secondary Impact	Bicycle Impact	Secondary Impact
Punchbowl Street	Potentially significant due to forecasted increase in bicycle volume and lack of bicycle capacity.	Restripe with bollard-protected bike lane.	N/A – bicycle lane can be accommodated with restriping.	Less than significant.	N/A
South Street		Restripe with bollard-protected bike lane.	Removal of on street parking on one side.	Less than significant.	Less than significant – no reduction in traffic lane capacity.
Cooke Street		Restripe with 3 lanes and bike lanes	Removal of one motor vehicle travel lane.	Less than significant.	Less than significant – traffic LOS would remain acceptable.
Ward Avenue		Install bicycle lanes.	Removal of on-street parking.	Less than significant.	Less than significant – no reduction in traffic lane capacity.
Pensacola Street		Restripe with bike lane; study potential two-way conversion with 3 lanes and bike lanes	N/A – bicycle lane can be accommodated with restriping.	N/A	N/A
Piikoi Street*		Restripe with bollard-protected bike lane; study potential two-way conversion with 3 lanes and bike lanes	Bicycle lane can be accommodated with restriping. Potential impact from bollard.	N/A	N/A
Halekauwila Street		Construct cycle track or stripe bike lanes; cycle track alignment and design are contingent on the final design and location of ~~HART~~ *light metro rail* guideway columns.	Removal of on-street parking.	N/A	N/A

Table 4-24: Pedestrian Mitigations

Impacted Pedestrian Corridors (impact type)	Proposed Pedestrian Mitigation			Impact Finding With Mitigation	
	Impact Finding	Mitigation	Secondary Impact	Pedestrian Impact	Secondary Impact
All corridors (long crossing distances)	Potentially significant	Construct curb extensions at all intersections with on-street parking and that have 24' curb-to-curb walk distances of minor streets or 26' curb-to-curb walk distances of major streets; Reduce intersection skew; Tighten intersection geometry; Construct pedestrian refuge islands (Each mitigation measure requires further study)	Curb extensions may remove a small amount of on-street parking and reduce shy distance from parking and the curb face.	Less than significant with mitigation	Less than significant
All corridors (capacity issues due to change in pedestrian activity)	Potentially significant	Require redevelopment setbacks that ensure a minimum 15' pedestrian realm (sidewalk plus buffer including furniture zone and landscaping) regardless of existing pedestrian realm width. If the existing pedestrian realm is greater than 15', then there is no significant impact.	N/A	Less than significant with mitigation	Less than significant
Central Kaka`ako industrial streets	Potentially significant	Reconstruct streets as shared industrial streets while maintaining delivery and parking storage functions	Potential impact to parking supply.	Less than significant with mitigation	Less than significant
Ala Moana Boulevard (signal timing improvements)	Potentially significant	Reduce Ala Moana signal cycle lengths to 120 seconds and couple with other signal optimization features; this will create more lane capacity (from 800vph to 1200vph)	Reduces minor street signal phase by 20 seconds. Potential impact to vehicle turn storage, including deliveries.	Less than significant with mitigation	Less than significant
Ala Moana Boulevard (pedestrian improvements)	Potentially significant.	Construct makai side shared use path	Potential impact to pedestrians on makai side.	Less than significant with mitigation	Less than significant if adequate pedestrian path is maintained

Figures 48-55 in the Traffic Study presented in Appendix D of this EIS illustrate the proposed changes to streets with recommended mitigation measures for the Proposed Action. Streets with varying sidewalk widths are illustrated with ranges. All cross sections are conceptual and would require further engineering study prior to implementation.

4.8 Noise

An acoustic impact study was conducted for the Proposed Action by Y. Ebisu & Associates and is presented in Appendix E of this EIS. Following is a summary of its findings.

4.8.1 Methodology

The noise descriptor currently used by federal agencies (such as FHA/HUD) to assess environmental noise is the *Day-Night Average Sound Level* (Ldn or DNL). This descriptor incorporates a 24-hour average of instantaneous A-Weighted sound levels as read on a standard Sound Level Meter. Table 1 in the Noise Study (see Appendix E) presents current federal noise standards and acceptability criteria for residential land uses. As a general rule, noise levels of 55 DNL or less occur in rural areas, or in areas removed from high volume roadways. In urbanized areas that are shielded from high volume streets (central Manoa Valley, for example), DNL levels generally range from 55 to 65 DNL and are usually controlled by motor vehicle traffic noise. Residences that front major roadways are generally exposed to levels of 65 DNL, and as high as 75 DNL when the roadway is a high-speed freeway.

For purposes of determining noise acceptability for funding assistance from federal agencies (FHA/HUD and VA), an exterior noise level of 65 DNL or less is considered acceptable for noise sensitive properties. This standard is applied nationally including Hawaii. For commercial, industrial, and other non-noise sensitive land uses, exterior noise levels as high as 75 DNL are generally considered acceptable.

On the Island of O`ahu, the State Department of Health (DOH) regulates noise from construction activities through the issuance of permits for allowing excessive noise during limited time periods. State DOH noise regulations are expressed in maximum allowable property line noise limits rather than DNL. State DOH noise limits for residential, commercial, and industrial lands equate to approximately 55 DNL, 60 DNL, and 76 DNL, respectively.

The HCDA has established property line noise limits for the KCDD depending on the emphasis placed by its multi-use zoning districts. Although they are not direction comparable to noise criteria express in DNL, HCDA noise limits for residential, commercial, and waterfront industrial lands equate to approximately 60, 60, and 70 DNL respectively.

It should be noted that the noise compatibility guidelines and relationships to the DNL noise descriptor might not be applicable to impulsive noise sources such as pile driving. The State DOH limits for impulsive noise sources that exceed 120 impulses in any 20-minute period are 10 decibels above the limits for non-impulsive sounds. If impulsive sounds do not exceed 120 impulses in any 20-minute time period, there are no regulatory limits on their sound levels under the State DOH regulations.

Existing traffic noise levels were measured at twelve locations (A through L in Figure 4-23) in the project area to provide a basis for developing the Proposed Action's traffic noise contributions along the roadways that will service the KCDD. Traffic noise measurements were taken during late 2012 and early 2013. The results of the traffic noise measurements were then compared with calculations of existing traffic noise levels to validate the computer model used. Traffic noise calculations were developed for both the existing and future conditions in the KCDD for ground level and elevated receptors, and for traffic conditions with and without the Proposed Action. The anticipated noise levels from the planned elevated rail system were included in the forecasts of future noise levels in the KCDD with and without the Proposed Action. Calculations of average exterior and interior noise levels from construction activities were performed for typical naturally ventilated and air-conditioned dwellings. Predicted noise levels were compared with existing background ambient noise levels, and the potential for noise impacts was assessed. Potential noise and vibration impacts from pile driving operations were also addressed.

4.8.2 Existing Conditions

The existing background ambient noise levels within the KCDD are dependent upon receptor location relative to the high volume roadways, receptor elevation, and spatial relationships to fixed noise sources in the vicinity of the receptor. Residual background noise levels due to traffic noise may be higher at the higher elevations of residential towers than at ground level.

In the KCDD, traffic noise levels associated with Nimitz Highway, Ala Moana Boulevard, Kapiolani Boulevard, King Street, Ward Avenue, Piikoi Street, Punchbowl Street, Pensacola Street, South Street and Cooke Street, are typically greater than 65 DNL along their rights-of-way due to the large volumes of traffic on those major thoroughfares. Figure 4-24 depicts crosshatched areas where traffic noise levels generally exceed 65 DNL, and are considered to be "Significant Exposure – Normally Unacceptable" (SE-NU). However, actual traffic noise levels within the crosshatched regions could be less than 65 DNL if the receptor is shielded from the traffic lanes by intervening buildings or walls. They could also be higher if the receptor location is exposed to traffic noise from more than one major thoroughfare. The study of existing conditions determined:

- The Aloha Tower Special District (ATSD) is essentially all within the SE-NU noise exposure zone due to traffic noise from Nimitz Highway.
- The Makai Area's SE-NU noise exposure zone is located along its mauka boundary, and controlled by traffic on Ala Moana Boulevard.
- The Civic Center Neighborhood's SE-NU noise exposure zones are located along its district boundaries at King, South, and Punchbowl Streets.
- The Pauahi Neighborhood's SE-NU noise exposure zones are located along its district boundaries at Ala Moana Boulevard and Ward Avenue, and to a lesser extent at Punchbowl, Cooke, and Coral Streets. A relatively large portion of the district is not within the 65 DNL noise exposure zone.

Figure 4-23: Noise Measurement Locations

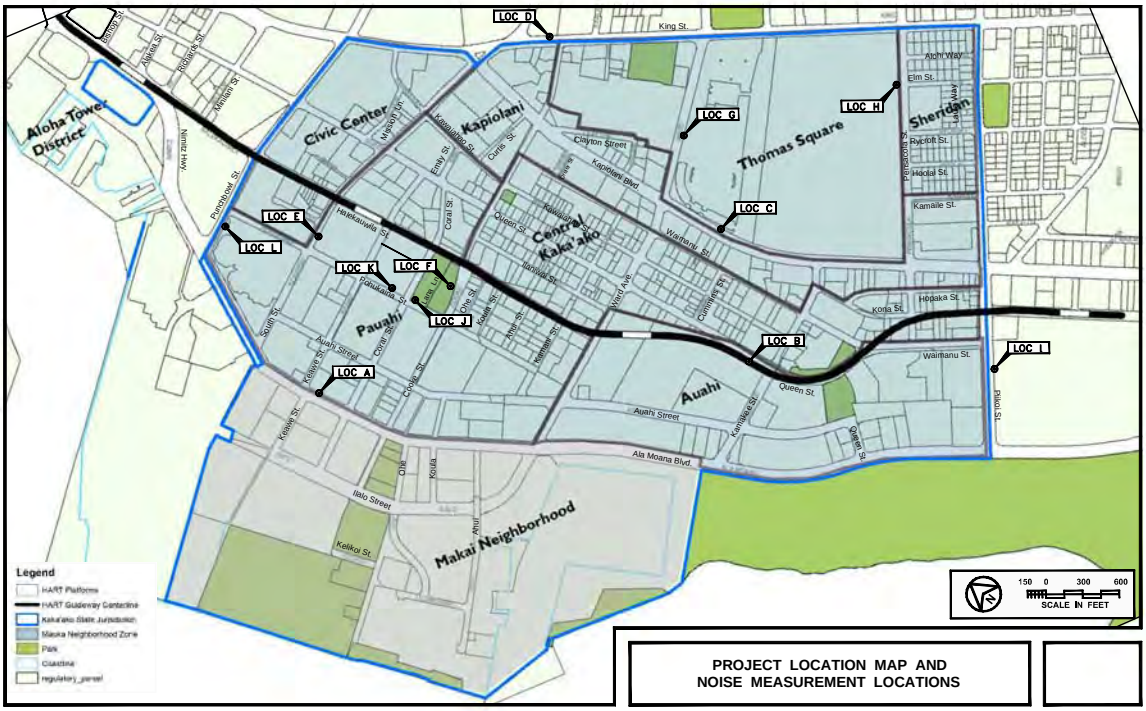

Figure 4-24: Existing Traffic Noise Exposure

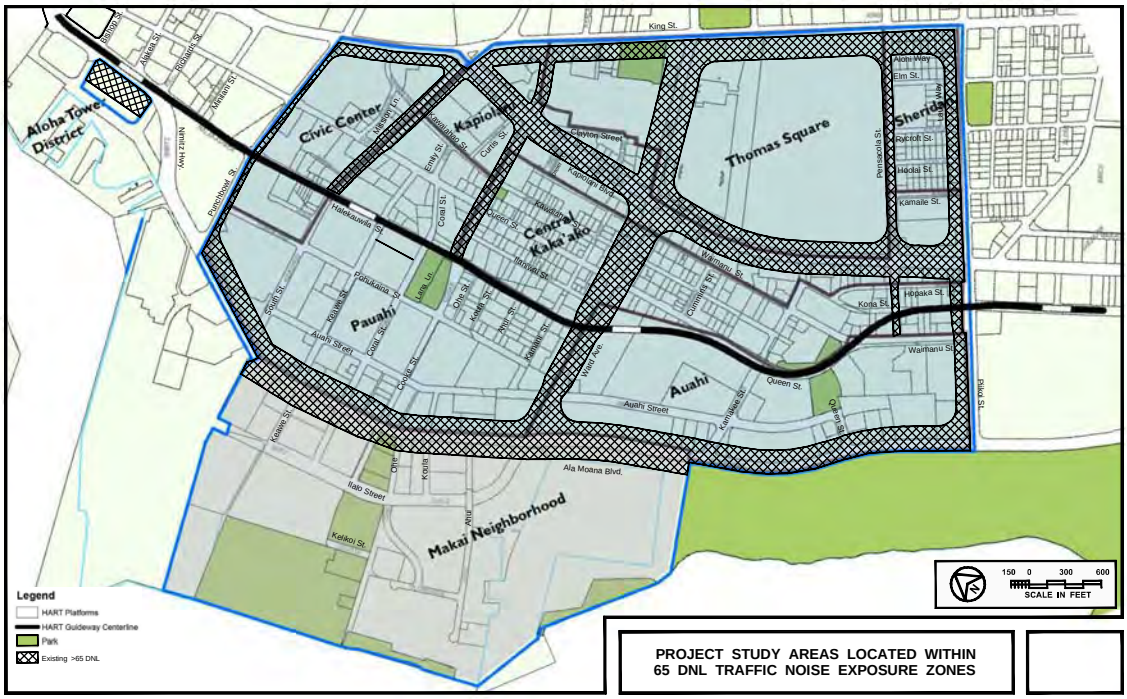

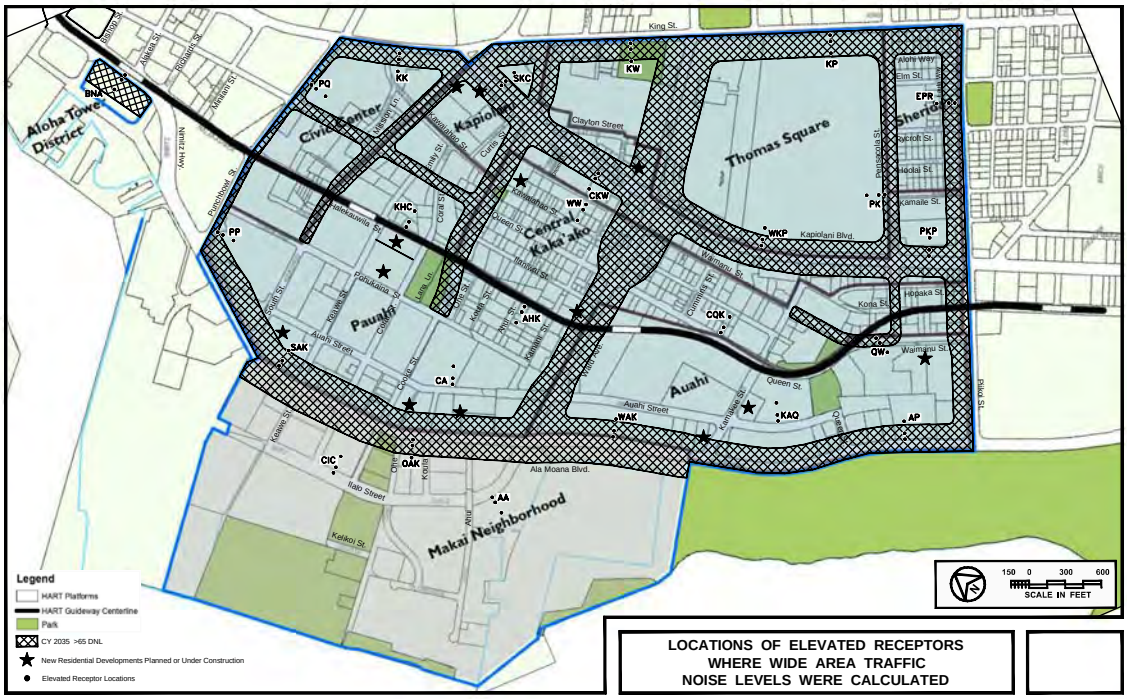

Figure 4-25: 2035 Traffic Noise Exposure

- The Kapiolani Neighborhood's SE-NU noise exposure zones represent approximately 50 percent of the total land area within its neighborhood boundaries because of its orientation alongside Kapiolani Boulevard, King Street, Ward Avenue, Pensacola Street, and Piikoi Street.
- The Thomas Square Neighborhood's SE-NU noise exposure zones are located along King, Pensacola, and Cooke Streets, and along Ward Avenue and Kapiolani Boulevard.
- The Central Kaka`ako Neighborhood's SE-NU noise exposure zones are located along Ward Avenue and Cooke, Pensacola, and Piikoi Streets.
- The Sheridan Neighborhood's SE-NU noise exposure zones are located along King, Pensacola, and Piikoi Streets.
- The Auahi Neighborhood's SE-NU noise exposure zones are located along Ala Moana Boulevard, Ward Avenue, and Piikoi Street.

4.8.3. Potential Impacts and Recommended Measures to Mitigate Them

4.8.3.1 Traffic and Rail Noise

Under full development of the worst-case scenario under the Proposed Action in 2035, essentially no significant increases in traffic noise levels are expected, except for the section of Kamakee Street between Ala Moana Boulevard and Auahi Street. Baseline traffic noise level increases not attributable to the Proposed Action are typically higher than those attributable to the Proposed Action. Figure 4-25 depicts SE-NU noise exposure zones in 2035. When compared to those depicted in the previous figure illustrating the existing condition, it can be see that some of the SE-NU areas have increased in size. However, the noise study concludes that those increases are largely due to increases in Baseline Condition traffic (without the Proposed Action), except for the aforementioned section of Kamakee Street between Ala Moana Boulevard and Auahi Street.

Figure 4-25 also includes locations of ground and high-rise receptors where existing and future noise levels were calculated. At each labeled receptor, multiple receptor locations (indicated by three black dots) at 50, 100, and 200-foot ground level setback distance from the roadway centerline were calculated, together with 50, 100, 150, 200, and 300-foot elevations. The results of the analysis indicate very small changes in 2035 traffic noise levels associated with the worst-case scenario under the Proposed Action.

The rail system is expected to cross through the Mauka Area. The elevated guideway is expected to range from approximately 29 to 42 feet above ground level, be of concrete construction, have 3-foot high sidewalls for noise mitigation, and include noise-skirts for transit vehicles. Based on data presented in the Elevated Fixed Guideway (Rail) Transit System 2008 EIS, the predicted noise levels for 2030 are summarized below:

- At 700 Richards Street, rail noise levels were predicted to range from 67 DNL to 62 DNL or less without sound walls or wheel skirts. With "current design",

predicted rail noise levels ranged from 65 to 62 DNL. The use of 3-foot high sidewalls did not seem to be included in the "current design".

- At 610 Cooke Street, rail noise levels were predicted to range from 71 DNL to 72 DNL without sound walls or wheel skirts. With "current design", predicted rail noise levels ranged from 56 to 62 DNL. The use of 3-foot high sidewalls seemed to be included in the "current design".
- At Mother Waldron Neighborhood Park, rail noise levels were predicted to be 62 DNL without sound walls or wheel skirts. With "current design", predicted rail noise levels of 47 DNL. The use of 3-foot high sidewalls seemed to be included in the "current design". The specific location of the receptor within the park was not indicated, but was estimated to be approximately 200 feet from the vertical plane through the rail centerline.
- At 860 Halekauwila Street, rail noise levels were predicted to range from 72 DNL to 62 DNL or less without sound walls or wheel skirts. With "current design", predicted rail noise levels ranged from 57 to 61 DNL or less. The use of 3-foot high sidewalls seemed to be included in the "current design".
- At Uraku Tower on the makai side of Kapiolani Boulevard, just east of Piikoi Street, rail noise levels were predicted to range from 63 DNL to 61 DNL or less without sound walls or wheel skirts. With "current design", predicted rail noise levels ranged from 61 to 60 DNL or less. The use of 3-foot high sidewalls did not seem to be included in the "current design".

The results of the ~~HART~~ ***light metro*** rail system noise analysis indicates that a buffer distance of approximately 192 feet will be required in order to minimize the influence of the rail transit system noise contributions or exceedances of the 65 DNL federal noise standard due to the combined contributions from both rail and motor vehicle noise. At dwelling units located within 120 feet of the guideway system centerline, the rail transit system can be the dominant noise source if mitigation measures are not incorporated into the rail transit system design. Without mitigation measures, the rail transit system noise levels are expected to be similar to those along King Street or Ala Moana Boulevard in 2035 under the worst-case scenario of the Proposed Action.

As specified in the Honolulu High-Capacity Transit Corridor Project Final EIS, noise mitigation for the Honolulu Rapid Transit Project includes 3-foot high parapet walls, which are known as sound barriers, along the guideway, wheel skirts, and sound absorptive materials under the track along the following properties in the KCDD: 860 Halekauwila Street and 1133 Waimanu Street.

For the elevated receptor locations shown in Figure 4-23 that are closest to the elevated rail corridor, the noise from the rail transit system could make significant contributions to the future total noise levels, e.g. locations BNA, KHC, AHK, CQK, and QW. These five locations are all adjacent to the rail corridor. At locations further from the rail corridor (approximately 250 feet), the noise from the rail system should not make significant contributions to the future total noise levels.

Noise mitigation measures for residential units located in areas with exterior noise levels that exceed 65 DNL will typically involve the use of closure and air conditioning. The use of sound attenuating walls or barriers will be of limited effectiveness, particularly where mid-rise and high-rise developments are involved. It should be noted that the erection of mid- and high-rise buildings adjacent to roadways of the elevated rail corridor will serve as partial sound barriers to properties located behind these buildings and further away from the noise source. However, as the density of these mid- and high-rise structures increase along a transportation corridor, their reflective surfaces will tend to increase the background noise levels along the transportation corridor. The use of closure and air conditioning will probably be the only available noise mitigation measure for noise sensitive developments located within the high noise zones.

4.8.3.2 Construction Noise

Audible construction noise will probably be unavoidable during build out of the Proposed Action. However, the actual length of exposure to construction noise at any receptor location will probably be less the total construction period for the entire Proposed Action. Direct line of sight distances from construction equipment to existing and future residential and commercial buildings will probably range from 20 feet to 1,300 feet, with corresponding average noise levels of 95 to 55 decibel averages (plus or minus 5 dBA).

Adverse impacts from construction noise are not expected to be in the "public health and welfare" category due to the temporary nature of the work and due to the administrative controls available for regulation of construction noise. Instead, these impacts will probably be limited to the temporary degradation of the quality of the acoustic environment in the immediate vicinity of the construction site. Mitigation of construction noise to inaudible levels will not be practical in all cases due to the intensity of construction noise sources and due to the exterior nature of the work. The use of properly muffled construction equipment should be required on all job sites.

Peak airborne noise levels from pile driving may be as much as 15 dBA greater than noise levels for non-impulsive (steady) construction noise sources. Although the pile driving can produce more intense noise levels, each pulse is of short individual duration (less than 1 second). Therefore, its impact on speech communication is not as severe as that of a steady source of the same noise level.

Severe noise impacts are not expected to occur inside air-conditioned structures that are with 50-450 feet of a construction site. Inside naturally ventilated structures, interior noise levels (with windows and doors open) are estimate to range between 55 to 76 dBA at 50-450 feet or more from the construction site. Closure of all doors and windows facing the construction site would generally reduce interior noise levels by an additional 5-10 dBA.

The incorporation of State of Hawaii DOH construction noise limits and curfew times, which are applicable throughout the state, is another noise mitigation measure that is normally applied to construction activities. Noisy activities are generally not allowed on

Sundays and holidays, during the early morning, and during the late evening and nighttime periods under DOH permit procedures.

Pile driving may be necessary to implant piles into the ground at some construction sites. Impact driven concrete or sheet piles may both be used. Induced ground vibrations from the pile driving operations have the potential to cause architectural and structure damage to nearby structures. The following proscriptive measures are recommended for implementation during the planning and design phases of development for individual projects that together constitute either alternative of the Proposed Action:

- In addition to the normal planning and design concerns regarding potential damage due to settling and heaving during construction, consideration should be given to risks of damage due to vibration from pile driving. Damage criteria of 0.2 inches/second[9] should be used in conjunction with vibration prediction methods to identify the potential source of damage risk distances to the driven piles.
- If predicted vibration levels from pile driving exceed 0.2 inches/second at a building and predicted vibration levels cannot be reduced by adjusting the size of the pile driver, test piles should be driven and their vibrations monitored and recorded prior to completion of the foundation design. The monitoring of the test piles should be designed to measure the expected peak, 3-axis vibration levels at the building. The results of the monitoring should be used to define the empirical distance from the drive pile to the 0.2 inches/second damage risk location, and to evaluate the risks of structural damage to the adjacent structure during actual construction.
- If predicted vibration levels from pile driving exceed 2.0 inches/second at a building, the use of alternative types of piles or shoring should be considered for implementation during the design phase.

4.9 Air Quality

An Air Quality Impact Study was conducted for the worst-case scenario under the Proposed Action by B. D. Neal & Associates and is presented in Appendix F. A summary of the report's findings is presented below.

4.9.1 Air Quality Standards

Ambient concentrations of air pollution are regulated by both national and state ambient air quality standards (AAQS). National AAQS are specified in Section 40, Part 50 of the Code of Federal Regulations (CFR), while State of Hawaii AAQS are defined in Chapter

[9] Ground vibrations generated during pile driving are generally described in terms of peak particle (or ground) velocity in units of inches/second. The most commonly used damage criteria for structures is 2.0 inches/second derived from work by the U.S. Bureau of Mines. A more conservative limit of 0.2 inches/second is also used, and is suggested for planning purposes on this project because of the repetitive nature of pile driving operations, which can increase risks of damage due to fatiguing.

11-59 of the Hawaii Administrative Rules. Table 4-25 summarizes both the national and the state AAQS that are specified in the cited documents. As indicated in the table, national and state AAQS have been established for particulate matter, sulfur dioxide, nitrogen dioxide, carbon monoxide, ozone and lead. The state has also set a standard for hydrogen sulfide. National AAQS are stated in terms of both primary and secondary standards for most of the regulated air pollutants. National primary standards are designed to protect the public health with an "adequate margin of safety". National secondary standards, on the other hand, define levels of air quality necessary to protect the public welfare from "any known or anticipated adverse effects of a pollutant". Secondary public welfare impacts may include such effects as decreased visibility, diminished comfort levels, or other potential injury to the natural or man-made environment, e.g., soiling of materials, damage to vegetation or other economic damage. In contrast to the national AAQS, Hawaii State AAQS are given in terms of a single standard that is designed "to protect public health and welfare and to prevent the significant deterioration of air quality".

Each of the regulated air pollutants has the potential to create or exacerbate some form of adverse health effect or to produce environmental degradation when present in sufficiently high concentration for prolonged periods of time. The AAQS specify a maximum allowable concentration for a given air pollutant for one or more averaging times to prevent harmful effects. Averaging times vary from one hour to one year depending on the pollutant and type of exposure necessary to cause adverse effects. In the case of the short-term (i.e., 1- to 24-hour) AAQS, both national and state standards allow a specified number of times a standard can be exceeded each year.

The Hawaii AAQS are in some cases considerably more stringent than the comparable national AAQS. In particular, the Hawaii 1-hour AAQS for carbon monoxide is four times more stringent than the comparable national limit.

The national AAQS are reviewed periodically, and multiple revisions have occurred over the past 30 years. In general, the national AAQS have become more stringent with the passage of time and as more information and evidence become available concerning the detrimental effects of air pollution. Changes to the Hawaii AAQS over the past several years have tended to follow revisions to the national AAQS, making several of the Hawaii AAQS the same as the national AAQS.

4.9.2 Affected Environment

Regional and local climatology significantly affects the air quality of a given location. Wind, temperature, atmospheric turbulence, mixing height and rainfall all influence air quality. Although the climate of Hawaii is relatively moderate throughout most of the state, significant differences in these parameters may occur from one location to another. Most differences in regional and local climates within the state are caused by the mountainous topography.

Hawaii lies well within the belt of northeasterly trade winds generated by the semi-permanent Pacific high-pressure cell to the north and east. On the island of O`ahu, the Ko`olau and Waianae Mountain Ranges are oriented almost perpendicular to the trade winds, which accounts for much of the variation in the local climatology of the island. The KCDD is locate in the leeward area of the Ko`olau Mountains.

Wind frequency data for Honolulu International Airport (HIA), which is located about 10 miles to the east of the KCDD, show that the annual prevailing wind direction for this area of O`ahu is east-northeast. On an annual basis, 34.7 percent of the time the wind is from this direction, and more than 70 percent of the time the wind is in the northeast quadrant. Winds from the south are infrequent, occurring only a few days a year and mostly in winter in association with Kona storms. Wind speeds average about 10 knots (12 mph) and most vary between 5 and 15 knots (6 and 17 mph).

Table 4-25: Summary of State of Hawai`i and National Ambient Air Quality Standards

Pollutant	Units	Averaging Time	Maximum Allowable Concentration		
			National Primary	National Secondary	State of Hawaii
Particulate Matter (<10 microns)	µg/m^3	Annual 24 Hours	- 150[a]	- 150[a]	50 150[b]
Particulate Matter (<2.5 microns)	µg/m^3	Annual 24 Hours	15[c] 35[d]	15[c] 35[d]	- -
Sulfur Dioxide	ppm	Annual 24 Hours 3 Hours 1 Hour	- - - 0.075[e]	- - 0.5[b] -	0.03 0.14[b] 0.5[b] -
Nitrogen Dioxide	ppm	Annual 1 Hour	0.053 0.100[f]	0.053 -	0.04 -
Carbon Monoxide	ppm	8 Hours 1 Hour	9[b] 35[b]	- -	4.4[b] 9[b]
Ozone	ppm	8 Hours	0.075[g]	0.075[g]	0.08[g]
Lead	µg/m^3	3 Months Quarter	0.15[h] 1.5[i]	0.15[h] 1.5[i]	- 1.5[i]
Hydrogen Sulfide	ppm	1 Hour	-	-	0.035[b]

[a] Not to be exceeded more than once per year on average over three years.

[b] Not to be exceeded more than once per year.

[c] Three-year average of the weighted annual arithmetic mean.

[d] 98th percentile value of the 24-hour concentrations averaged over three years.

[e] Three-year average of annual fourth-highest daily 1-hour maximum.

[f] 98th percentile value of the daily 1-hour maximum averaged over three years.

[g] Three-year average of annual fourth-highest daily 8-hour maximum.

[h] Rolling 3-month average.

[i] Quarterly average.

Air pollution emissions from motor vehicles, the formation of photochemical smog, and smoke plume rise all depend in part on air temperature. Colder temperatures tend to result in higher emissions of contaminants from automobiles but lower concentrations of photochemical smog and ground-level concentrations of air pollution from elevated plumes. In Hawai`i, the annual and daily variation of temperature depend to a large degree on elevation above sea level, distance inland, and exposure to the trade winds. Average temperatures at locations near sea level generally are warmer than those at higher elevations. Areas exposed to the trade winds tend to have the least temperature variation, while inland and leeward areas often have the most. Based on 25 years of data collected at Honolulu International Airport, average annual daily minimum and maximum temperatures in the project area are about 70°F and 84°F, respectively. The extreme minimum temperature on record at the airport is 54°F, and the extreme maximum temperature is 95°F.

Rainfall can have a beneficial effect on the air quality of an area because it helps to suppress fugitive dust emissions, and it also may "washout" gaseous contaminants that are water-soluble. Rainfall in Hawaii is highly variable depending on elevation and on location with respect to the trade wind. The Kaka`ako area is one of the drier areas on O`ahu due to its leeward and near sea level location. Average annual rainfall measured at nearby downtown Honolulu amounts to about 24 inches. Most of the rainfall usually occurs in the winter months. Monthly rainfall may vary from as little as a trace to more than 10 inches.

Present air quality in the project area is mostly affected by air pollutants from motor vehicles, agricultural operations and to a lesser extent by natural sources. The State Department of Health operates a network of air quality monitoring stations at various locations on O`ahu. Table 4-26 shows annual summaries of air quality measurements that were made nearest to the KCDD for several of the regulated air pollutants for the period 2007 through 2011. These are the most recent data that are currently available.

During the 2007-2011 period, sulfur dioxide was monitored by the State DOH at an air quality station located at downtown Honolulu. Concentrations monitored were consistently low compared to the standards. Annual second highest 3-hour concentrations (which are most relevant to the air quality standards) ranged from 0.008 to 0.021 parts per million (ppm), while the annual second-highest 24-hour concentrations ranged from 0.002 to 0.005 ppm. Annual average concentrations were only about 0.001 ppm. There were no exceedances of the state/national 3-hour or 24-hour AAQS for sulfur dioxide during the 5-year period. It should be noted that the national AAQS for sulfur dioxide were revised during 2010, and data pertaining to the revised standards were only reported for 2011 (and are not shown in the table).

However, based on the information available, exceedance of the new 1-hour national AAQS for sulfur dioxide within the study area is very unlikely.

Particulate matter less than 2.5 microns in diameter (PM-2.5) is also measured at the downtown Honolulu monitoring station. Annual highest 24-hour PM-2.5 concentrations ranged from 9 to 50 micrograms per cubic meter ($\mu g/m^3$) between 2007 and 2011. The highest values were generally due to either fireworks on New Year's Eve or bad vog days. Only one exceedance of the 24-hour concentration limit occurred during this five-year period and it was due to New Year's Eve fireworks. (It should be noted that the City and County of Honolulu has now banned most fireworks and on New Year's Eve, Honolulu is now relatively silent and smoke-free.) Average annual concentrations ranged from 3.9 to 4.8 $\mu g/m^3$, which were within the state and national AAQS.

Carbon monoxide measurements were obtained at the downtown Honolulu monitoring station. The annual second-highest 1-hour concentrations ranged from 1.1 to 1.8 ppm. The annual second-highest 8-hour concentrations ranged from 0.8 to 1.0 ppm. No exceedance of the state or national 1-hour or 8-hour concentrations were reported.

Nitrogen dioxide is monitored by the state DOH at the Kapolei monitoring station, which is about 16 miles west of the KCDD. Annual average concentrations of this pollutant ranged from 0.003 to 0.005 ppm, safely inside the state and national AAQS. A new 1-hour standard was implemented in 2010. Data pertaining to this new standard is not shown in the table. But based on information available, exceedance of the new 1-hour standard for nitrogen dioxide within the KCDD is very unlikely.

The nearest available ozone measurements were obtained at Sand Island (just west of the KCDD). The annual fourth-highest 8-hour concentrations (which are most relevant to the standards) for the period 2007 through 2011 ranged between 0.033 and 0.048 ppm, which is well inside the state and federal standards. The 8-hour standard for ozone did not exist prior to 2002. Prior to 2002, the now obsolete state 1-hour standard was typically exceeded several times each year.

Although not shown in the table, the nearest and most recent measurements of ambient lead concentrations that have been reported were made at the downtown Honolulu monitoring station between 1996 and 1997. Average quarterly concentrations were near or below the detection limit, and no exceedances of the state AAQS were recorded. Monitoring for this parameter was discontinued in 1997.

Based on the data and the discussion presented above, it appears likely that State of Hawai`i AAQS for sulfur dioxide, nitrogen dioxide, particulate matter, ozone and lead are currently being met in the KCDD. While carbon monoxide measurements at the downtown Honolulu monitoring station suggest that concentrations are within the state and national standards, local "hot spots" may exist near traffic-congested intersections. The potential for this within the KCDD is examined below.

Table 4-26: Annual Summaries of Air Quality Measurements for Monitoring Stations Nearest Kaka`ako

Parameter / Location	2007	2008	2009	2010	2011
Sulfur Dioxide / Downtown Honolulu					
3-Hour Averaging Period:					
Number of Samples	2827	2876	2858	2869	2757
Highest Concentration (ppm)	0.021	0.011	0.023	0.010	0.012

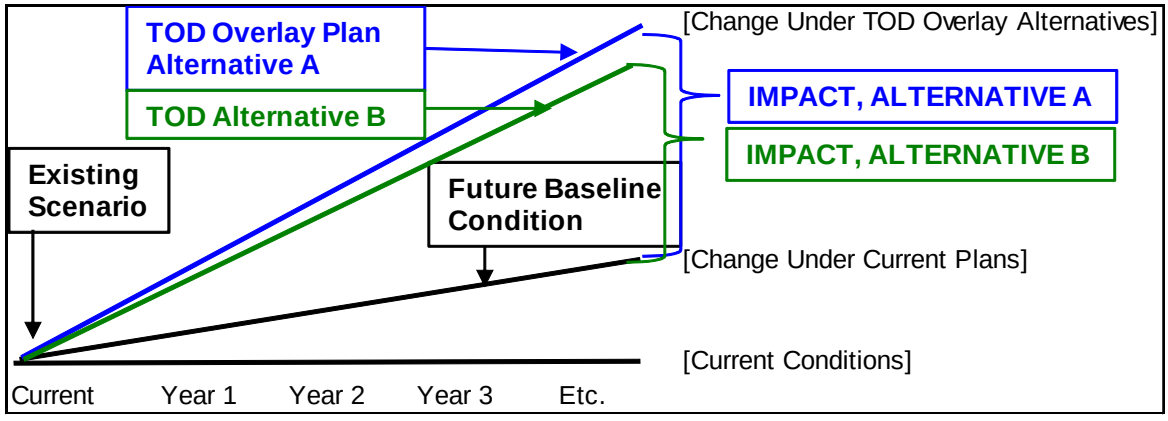
4.9.3 Potential Impacts and Recommended Measures to Mitigate Them

Implementation of the worst-case scenario under the Proposed Action could result in some short- and/or long-term impacts on air quality that may occur either directly or indirectly as a consequence of the transit-oriented development project.

Short-term impacts from fugitive dust could occur during the construction of additional residential developments. To a lesser extent, exhaust emissions from stationary and mobile construction equipment, from the minor disruption of traffic, and from workers' vehicles may also affect air quality during periods of construction. State air pollution control regulations require that there be no visible fugitive dust emissions at the property line. Hence, effective dust control measures will be to be implemented by contractors to ensure compliance with state regulations. Fugitive dust emissions can be controlled to a large extent by watering active work areas, using wind screens, keeping adjacent paved roads clean, and by covering open-bodied trucks. Other dust control measures include limiting the area that is to be disturbed at any given time and/or mulching inactive areas that have been worked. Exhaust emissions can be mitigated by moving construction equipment and workers to and from the project site during off-peak traffic hours.

To assess potential long-term impact of emissions from motor vehicle traffic operating on roadways in the KCDD after implementing the Proposed Action through the year 2035, a computerized air quality modeling study was undertaken. The study estimated current worst-case concentrations of carbon monoxide at roadway intersections in the project vicinity and predicted future levels both with and without the Proposed Action. During worst-case conditions, model results indicated that present 1-hour and 8-hour worst-case carbon monoxide concentrations are well within both the state and the national ambient air quality standards. In the year 2035, with the Proposed Action, worst-case carbon monoxide concentrations were predicted to generally decrease (improve) by about 10 to 20 percent. With the Proposed Action in 2035, estimated worst-case carbon monoxide concentrations indicated only minimal or no impact compared to the Baseline Condition. Concentrations would remain within the standards. Due to the negligible impact the worst-case scenario under the Proposed Action is expected to have, implementing mitigation measures for long-term traffic-related air quality impacts is unnecessary and unwarranted.

4.10 Socio-Economic Characteristics



A detailed socio-economic impact analysis was prepared by J.M. Knox & Associates to address the impacts of the Future Baseline Condition and the Proposed Action. It is presented as Appendix G to this EIS. If interested in this subject matter, the reader is strongly advised to review the report's Chapter 2 in its entirety, as it presents the assumptions upon which the analysis is based and the methodology it employs. Following is a brief discussion of some of the key assumptions employed in the analysis.

For physical environmental impacts, it usually makes sense to assume that conditions without the Proposed Action would simply involve a continuation of current conditions. But for socio-economic assessment, the future without the new Plan is not what is there now; rather, it would be development under the currently approved Mauka and Makai Area Plans. Therefore, an economic "impact" is not change from present conditions, but rather the ***difference between two estimated futures*** – i.e., the difference in population, jobs, etc. between what is estimated to be possible under the TOD Overlay Plan and Rules, versus what is estimated to occur under existing Plans and Rules. Figure 4-26 shows how these scenarios relate to the concept of socio-economic "impact."

The logic thus involves three scenarios, though only two of them are directly used to calculate numerical "impacts":

1. The **Existing Scenario** represents the best estimate of current conditions. It is not directly used for impact calculations, but is important for context and for some topics is necessary to calculate the numbers used for both future scenarios (for example, new building construction cannot be estimated without knowing what is there now).
2. The **Future Baseline Scenario** is the term that will be used to describe what is estimated to happen under current Plans and Rules – i.e., without adoption and implementation of the TOD Overlay Plan.
3. The **TOD Overlay Scenario** is the term that will be used to describe what is estimated to happen under the Proposed Action (either TOD Alternative A or B).

Figure 4-26: Summary of Development Scenario Impacts

Implication of the Term "Scenario" for This Analysis: Many EIS's use the term "scenario," because exact future realities can never be definitively known in advance, and so it is necessary to develop a reasonable set of assumptions about quantitative aspects in order to do calculations. For virtually any EIS, socio-economic "scenarios" mean an imagined but reasonable single version of the many possible outcomes that could describe the points in time being compared. It is therefore a standard rule of socio-economic assessment to create scenarios that are "conservative" in the sense of being more likely to err on the side of a larger impact than a smaller impact.

For this analysis, though, the term "scenario" is particularly apt. As previously noted, the Kaka'ako situation differs greatly from situations in many EIS's. Yet another difference is that many EIS's are triggered by proposed actions that have specific characteristics at the time of the proposal but may turn out to be somewhat different. For example, a resort development that seeks overall land use approvals may be initially described as having 500 hotel units and 500 timeshare units, but due to market conditions or other factors is actually later built to have 400 hotel units and 600 timeshares – i.e., the range of realistic outcomes can vary somewhat from the specific EIS scenario.

However, in the case of Kaka'ako, the range of possible future realities is particularly great. The HCDA is a development authority, not a landowner. How landowners will actually respond to opportunities under either the current or proposed Plans/Rules will depend on many factors that simply cannot be known for sure – economic cycles, availability of capital, idiosyncratic personal or geographical factors affecting possible land consolidation, etc. It would be impossible to conduct a quantitative analysis without making the sorts of assumptions that produce a "scenario." These assumptions are greatly facilitated by HCDA datasets, described further in Chapter 2 of the Socio-Economic Impact Analysis (Appendix G) that model Kaka'ako structures on a building-by-building, block-by-block basis.

Timeframe: The "Existing" scenario will be operationalized as meaning the year 2010. The building-specific, block-specific Kaka'ako datasets described in Chapter 2 of Appendix G were completed in 2009, shortly before the 2010 Census, and little actual new developments were finished in the interim (or, for that matter, the time between 2010 and 2013, though a substantial number of new projects are now underway).

Both the "Future Baseline" and the two TOD alternatives are nominally operationalized as potential situations in the year 2035, though in reality they depict a probable build-out situation (not necessarily maximal *total* development under the respective Plans/Rules, but the maximal *likely* development according to the various HCDA consultants who primarily developed them). An important unanswered, and currently unanswerable, question is the actual timing of this build-out. The socio-economic impact analysis is conservative, in the sense of assuming maximal likely impacts, by concentrating the full range of potential development into the 2010-2035 time period. The analysis truly considers build-out of HCDA visions of Kaka'ako whenever they really occur.

Geographical Levels of Analysis within Kaka‘ako: Although the methodology for the analysis in the socio-economic impact analysis involves use of building-specific and block-specific assumptions, results are presented only on a Kaka‘ako-wide basis, and by large areas such as Mauka/Makai and the various Mauka “Neighborhood Zones.”

Both the current Mauka and Makai Plans, as well as the TOD alternatives, provide landowners with the *opportunity* to redevelop in certain ways, but in no way *obligate* them to do so. Presenting block-specific results could be interpreted as attempting to influence landowner decisions, which would be inappropriate.

Another geographical level of analysis is the islandwide perspective, reserved for certain parts of the study, as per the following discussion.

Kaka`ako-Specific vs. Islandwide Impacts: A Kaka‘ako-specific impact would be one that is confined to Kaka‘ako itself (even if that impact is balanced by an accompanying reduction in some other part of the island). For example, increased residential population growth within Kaka‘ako due to higher densities under the Proposed Action generally means people already on O‘ahu would live in Kaka‘ako rather than somewhere else, reducing numbers elsewhere on the island. Kaka‘ako-specific impacts may in fact just be due to shifts in the geographical location of economic and population activity that would be happening elsewhere anyway; they may be “impacts” within the Kaka‘ako boundaries or any identifiable areas from which they attract population, but from an islandwide perspective their net impacts may be zero.

Kaka‘ako-specific impacts are of particular interest to HCDA and Kaka‘ako stakeholders, and so will be separately reported, labeled, and given detailed attention. Most of the report will focus on Kaka‘ako-specific impacts.

An islandwide impact would involve “net new” economic activity and/or population that either (a) occurs in Kaka‘ako but is for some reason not balanced by a reduction elsewhere on the island (hence is a “net” gain); or (b) occurs outside of Kaka‘ako as a result (via “ripple effects” from expenditures) of net new economic activity occurring within Kaka‘ako.

An example of the latter would be if the Proposed Action results in expanding O‘ahu’s economic base of “export” industries (primarily tourism and visitor expenditures) that bring new money into the state. Due to multiplier or “ripple effects” of outside money coming into the O‘ahu economy, there could be additional spending, employment, and population throughout the island.

Relatively small proportions of planned future development under either the Future Baseline or the Proposed Action would generate substantial “new” money, and so ***islandwide impacts will be fairly small*** compared to Kaka‘ako-specific ones. Islandwide impacts are nevertheless presented because (a) this is the proper level for assessing impacts on State and County costs and revenues; and (b) it is important to understand that Kaka‘ako-specific impacts for the most part are *not* islandwide ones – e.g., additional

full-time residential population in Kakaʻako does not mean growth in the islandwide population.

Project Components Generating Islandwide Impacts: Most of the Kakaʻako-specific impacts to be described would *not* be islandwide impacts. Just as with full-time residential population, most of the changes in economic activity (e.g., levels of retail, industrial, or office space) from the Future Baseline to the Proposed Action would simply be a matter of location – they are a function of the larger islandwide economy and market forces, and hence would be located somewhere on the island with or without this project.

However, the following elements *will* be assumed to be net new islandwide impacts –

- **Hotel Construction and Operations:** The Proposed Action permits up to three new hotels in Kakaʻako, and the scenarios for analysis assume development of three likely hotel types, as per guidance from HCDA – a business hotel, a condominium-hotel, and a traditional full-service hotel for travelers desiring to stay outside Waikīkī. Operational impacts of hotels flow from new visitor population and visitor spending throughout the island, not just in Kakaʻako.

Market forces will in reality determine the actual development, nature, location, and characteristics of any Kaka'ako hotels. It could be argued that if there is a market for three more urban Honolulu hotels, they would be developed somewhere on the island with or without this project. However, there is a very longstanding convention in Hawaiʻi EIS's for assuming that, without new entitlements, market forces would be thwarted and the requested new visitor units would not be developed elsewhere on island, at least without separate permits and entitlements subject to study in other EIS's.

- **Additional Levels of, and Spending by, Part-Residents:** Part-time residents are treated as "visitors" in most economic studies because, as with hotel guests, their spending represents new money in the economy and thereby generate new jobs. Census data indicate part-time residents already own units in Kakaʻako, and so their numbers would likely increase under either the Future Baseline or the Proposed Action scenarios. The object of this analysis is to estimate the likely *increment* in their numbers, spending, and associated economic impacts from the Future Baseline to the Proposed Action.

For purposes of this analysis, economic impacts associated with *construction* of new units ultimately occupied by this increment in part-time residents will conservatively *not* be counted among the islandwide impacts. No specific new buildings are (or, under existing or proposed Rules, could be) targeted for occupancy by part-time residents alone. If the part-time residential market were for some reason not to materialize after all, the additional residential capacity provided by the Proposed Action would still be in place – but actual full build-out would just be somewhat delayed if the market consisted entirely of full-time Honolulu residents. (However, because part-time residents often spend

significant sums to prepare new units for occupancy, impacts of such estimated initial one-time expenditures *will* be counted among the construction impacts.)

4.10.1 Units

4.10.1.1 Analysis of Units

As discussed above, the Existing Condition is assumed to be 2010 and provides a baseline for understanding levels of development anticipated under each future scenario. The number of residential units, hotel units, and commercial/industrial floor area is used as the basis for determining population.

Table 4-27 provides Kakaʻako-wide results for the number of Existing Units, as well as breakdowns by general area (Mauka, Makai, Aloha Tower Special District Site) and specific Neighborhood Zones for the Mauka area. The number of residential units in the Existing dataset (8,618 units, derived primarily from HCDA datasets) is considerably higher than that reported by the U.S. Census. Please refer to Chapter 2 in Appendix G for a discussion of these differences.

Table 4-28 provides overall results for the Future Baseline Scenario. Comparison to the "Existing" figures in the foregoing table indicates the level of development for likely build-out of Kakaʻako under current Rules – substantial increases in Residential and Retail (more than 200% each), and significant increase as well in Office (about 80%) and Industrial (about 25%), though with a modest decline in Civic space (about -15%).

Parking is anticipated to involve a consolidation into Garage Parking, leaving very little Surface Parking.

Tables 4-29 and 4-30 provide overall results for TOD Alternatives B and A, respectively. The alternatives under the Proposed Action provide even more Residential development than the Future Baseline Scenario, but less for most other uses, as detailed below.

4.10.1.2 Potential Impacts

Impacts are defined as the difference between the respective TOD Alternatives figures and the Future Baseline figures (TOD Alternative B minus Future Baseline and TOD Alternative A minus Future Baseline). Table 4-31 And 4-32 provide these results.

With regard to overall development on a Kakaʻako-wide basis, the TOD Alternatives would generate these impacts:

- At build-out, ***substantial increases in Residential square footage and units*** (for Alternative B, 26% more units and 32% more square footage than under the Future Baseline – and for Alternative A, 37% and 44% more). There would also be increases over the Future Baseline for Garage Parking space (9% for Alternative B, 13% for Alternative A), and for Civic (about 8% for each). And of course there would be limited new Hotel development under each of the TOD Alternatives.

- However, the TOD Alternatives both result in ***reduction in Office, Retail, and Industrial space*** compared to build-out for the Future Baseline Condition. The Office and Industrial reductions are roughly -20% and -4% for each TOD Alternative. The build-out scenario generated for Alternative B resulted in a somewhat greater drop in eventual Retail square footage for Alternative B (-13%) than for Alternative A (-6%). (Note that these negative percentages involve comparison to the Future Baseline figures, not to the Existing figures. Development of all these land uses is still foreseen as significant additions to the current inventory of Office, Retail, and Industrial activities, just not to the same extent as under the Future Baseline Condition.)

- Particularly in regard to Residential increases for the higher-density TOD Alternative A, the Neighborhood Zones with the greatest changes in absolute numbers of additional total units would be, starting with the most heavily affected: Pauahi, Thomas Square District, Auahi, Kapiʻolani, and Central Kakaʻako. The order is similar for the lower-density TOD Alternative B scenario, except that the Auahi Neighborhood Zone in this scenario would have much less (but still some) additional Residential-unit development.

- Unaffected by either TOD Alternative would be the limited Residential development projected under the Future Baseline Condition for the Civic Center Neighborhood Zone, the Sheridan Neighborhood Zone, and still zero Residential development for all of Makai (exclusive of the Aloha Tower Site, which is seen as shifting to a Residential and additional Retail emphasis).

4.10.2 Population

4.10.2.1 Results of Analysis

This section reports on results for several types of Kakaʻako-specific[10] populations –

- Full-time residential population; and
- "De facto" population – the number of residents or visitors actually present on an average day[11] – which has three components:
    - Full-time residents actually present (excluding people temporarily away);
    - Average part-time resident population;
    - Average visitor population in three presumed hotels.

Methods used to determine the following results are described in detail in Section 2-2 of Appendix G. It should be understood that the Future Baseline and TOD Alternative's population figures are order-of-magnitude estimates for a full build-out under each scenario, whether that actually occur in the year 2035 or sometime thereafter. Actual population will vary according to specific developer plans, and these numbers should be viewed as approximate maximal numbers.

Existing Conditions: As with estimated land use and unit counts, these "Existing" results ultimately do not affect the impact assessment – which is based on a comparison of Future Baseline and TOD Alternative results – but provide a baseline for understanding levels of development anticipated under each future scenario.

Table 4-33 provides Kakaʻako-wide results, as well as breakdowns by general area (Mauka, Makai, Aloha Tower Special District Site) and specific Neighborhoods for the Mauka area. As was discussed in Section 4.10.1.1, the HCDA data is considerably higher than that reported by the U.S. Census. Therefore, this table's estimated "existing" full-time resident population of 13,549 – based primarily on HCDA unit counts – is also higher than the 2010 Census figure (10,673).

---

10 As noted in the Socio-Economic Impact Analysis, Chapter 1, Section 1.6, islandwide population impacts are conceptually different.

11 A different interpretation of "de facto population" might include workers and retail/restaurant customers present at any particular point in time. Estimating customer counts exceeds the scope of this study. The following section on employment looks at total jobcounts, but not necessarily the number present at particular points in time. Caution should be taken in simply adding population and jobcount numbers, due to factors such as employee absences and the possibility that some Kakaʻako workers are also Kakaʻako residents.

Table 4-33: Estimated Population – Existing Scenario

	Total Full-Time Residential Population	Total De Facto Population	*De Facto Resident Population*	*De Facto Part-Time Resident Population*	*De Facto Visitor Population*
KAKA'AKO TOTAL	**13,549**	**13,824**	***12,804***	***1,020***	**-**
By General Area					
Mauka	13,326	13,613	*12,593*	*1,020*	-
Makai	223	211	*211*	-	-
ATSD (Aloha Tower Special District)	-	-	-	-	-
By Neighborhood Zone					
Pauahi N.Z.	1,912	1,865	*1,807*	*58*	-
Auahi N.Z.	3,796	4,364	*3,587*	*777*	-
Central Kaka'ako N.Z.	1,522	1,464	*1,438*	*25*	-
Civic Center N.Z.	209	197	*197*	*0*	-
Kapi'olani N.Z.	4,206	4,112	*3,975*	*137*	-
Sheridan N.Z.	863	819	*816*	*3*	-
Thomas Sq. Dist. N.Z.	818	793	*773*	*20*	-
Makai N.Z.	223	211	*211*	-	-
ATSD N.Z.	-	-	-	-	-

Notes: The Makai population, taken from the 2010 Census, consists solely of the non-residential Kewalo Basin population, who may have been transients or passenger/crew of cruising vessels temporarily in port. However, this number is assumed to hold constant in all three scenarios. This was the only population number taken directly from the U.S. Census, though the Census data were used to estimate things such as average household size for various building types and places within Kaka'ako, which were then applied to unit numbers in Appendix G, Table 3.1, in order to estimate the population figures above.

The Aloha Tower Special District site currently consists of a HECO power generation facility with no residential population of any type.

A column for "De Facto Visitor Population" (hotel guests) is inserted to maintain comparability with the later table addressing the Proposed Action, which includes this information.

Future Baseline Condition: Table 4-34 below shows population results for the Future Baseline Scenario. Comparison to the comparable "Existing" figures in the foregoing table indicates both full-time and de facto populations would more than double (to about 33,500 for full-time, a bit more for de-facto), consistent with the increased number of units estimated in Section 4.10.1.1. This projected population increase flows directly from increase in units under current Rules. Consistent with the geographical distribution of

Residential units discussed, the numbers in the table below indicate that theoretical full-time population for build-out of the Future Baseline Condition would be primarily concentrated in the Pauahi Neighborhood Zone (31%), as well as the Auahi (22%) and Kapiʻolani (21%) zones.

Table 4-34: Estimated Population – Future Baseline Scenario

	Total Full-Time Residential Population	Total De Facto Population	*De Facto Resident Population*	*De Facto Part-Time Resident Population*	*De Facto Visitor Population*
KAKAʻAKO TOTAL	**33,466**	**33,844**	***31,626***	***2,218***	**-**
By General Area					
Mauka	33,243	33,633	*31,415*	*2,218*	-
Makai	223	211	*211*	-	-
ATSD (Aloha Tower Special District)	-	-	-	-	-
By Neighborhood Zone					
Pauahi N.Z.	10,341	10,131	*9,772*	*358*	-
Auahi N.Z.	7,386	8,429	*6,980*	*1,450*	-
Central Kaka'ako N.Z.	3,354	3,258	*3,169*	*88*	-
Civic Center N.Z.	826	788	*780*	*8*	-
Kapiʻolani N.Z.	7,097	6,944	*6,707*	*237*	-
Sheridan N.Z.	824	783	*778*	*4*	-
Thomas Sq. Dist. N.Z.	3,416	3,301	*3,228*	*73*	-
Makai N.Z.	223	211	*211*	-	-
ATSD N.Z.	-	-	-	-	-

Table Notes: All indicated population is associated with residential housing structures, except for the assumed continuation of Kewalo Basin non-residential population in the Makai area.

No "De Facto Visitor Population" is shown because no short-term transient accommodations (e.g., hotels) are permitted in Kakaʻako under the present Rules.

The Aloha Tower Special District site is assumed under this scenario to be developed as a retail and office complex, with no residential component.

TOD Alternatives: Consistent with the increased Residential space discussed previously, ***both TOD Alternatives result in more population at build-out than under the Future Baseline Condition.***

Overall results are presented in Table 4-35 (TOD Alternative B) and Table 4-36 (Alternative A). For Alternative B, full-time residential and overall de facto populations are estimated at about 42,500 and 44,500 respectively. The higher-density Alternative A, the build-out numbers increase to about 46,200 and 48,200 respectively.

An average daily visitor population of roughly 1,700 people in each scenario would be spread among three assumed hotels (and thus represents just a small part of the estimated overall de facto populations).

Table 4-35: Estimated Population – TOD Alternative B

	Total Full-Time Residential Population	Total De Facto Population	*De Facto Resident Population*	*De Facto Part-Time Resident Population*	*De Facto Visitor Population*
KAKA'AKO TOTAL	**42,477**	**44,465**	***40,141***	***2,573***	***1,752***
By General Area					
Mauka	41,986	43,482	*39,676*	*2,522*	*1,283*
Makai	223	211	*211*	-	-
ATSD (Aloha Tower Special District)	268	772	*254*	*50*	*469*
By Neighborhood Zone					
Pauahi N.Z.	14,493	14,175	*13,696*	*480*	-
Auahi N.Z.	7,600	9,270	*7,182*	*1,490*	*598*
Central Kaka'ako N.Z.	4,562	4,452	*4,311*	*141*	-
Civic Center N.Z.	826	788	*780*	*8*	-
Kapi'olani N.Z.	8,664	8,476	*8,188*	*288*	-
Sheridan N.Z.	824	783	*778*	*4*	-
Thomas Sq. Dist. N.Z.	5,017	5,537	*4,741*	*111*	*685*
Makai N.Z.	223	211	*211*	-	-
ATSD N.Z.	268	772	*254*	*50*	*469*

Notes: All indicated population is associated with residential housing or transient accommodation structures, except for the assumed continuation of Kewalo Basin non-residential population in the Makai area. The Aloha Tower Special District site is assumed under this scenario (and under TOD Alternative A) to be even more intensively developed as a retail and office complex, but this time with a substantial residential component.

Compared to the percentages for the Future Baseline Condition noted above, the *proportionate* geographical distribution of full-time residential population would again change only slightly, with a few more percentage points in the Pauahi Neighborhood Zone (about 34% for each TOD Alternative) and a few less in the Auahi (18% for TOD Alternative B and 20% for Alternative B) and Kapiʻolani (20% for Alternative B and 19% for Alternative A) zones.

Table 4-36: Estimated Population – TOD Alternative A

	Total Full-Time Residential Population	Total De Facto Population	*De Facto Resident Population*	*De Facto Part-Time Resident Population*	*De Facto Visitor Population*
KAKAʻAKO TOTAL	**46,181**	**48,223**	***43,641***	***2,911***	***1,671***
By General Area					
Mauka	45,690	47,240	*43,177*	*2,861*	*1,202*

ATSD (Aloha Tower Special District)	268	772	*254*	*50*	*469*
By Neighborhood Zone					
Pauahi N.Z.	15,857	15,486	*14,985*	*501*	-
Auahi N.Z.	9,223	10,877	*8,715*	*1,794*	*367*
Central Kaka'ako N.Z.	4,562	4,452	*4,311*	*141*	-
Civic Center N.Z.	826	788	*780*	*8*	-
Kapiʻolani N.Z.	8,664	8,476	*8,188*	*288*	-
Sheridan N.Z.	824	783	*778*	*4*	-
Thomas Sq. Dist. N.Z.	5,734	6,378	*5,419*	*124*	*835*
Makai N.Z.	223	211	*211*	-	-
ATSD N.Z.	268	772	*254*	*50*	*469*

Notes: All indicated population is associated with residential housing or transient accommodation structures, except for the assumed continuation of Kewalo Basin non-residential population in the Makai area. The Aloha Tower Special District site is assumed under this scenario (and under TOD Alternative B) to be even more intensively developed as a retail and office complex, but this time with a substantial residential component.

4.10.2.2 Potential Population Impacts and Recommended Measures to Mitigate Them

Impacts are defined as the difference between the respective TOD Alternative figures and the Future Baseline figures (i.e., TOD Alternative B minus Future Baseline and TOD Alternative A minus Future Baseline). Tables 4-37 and 4-38 provide these results.

Table 4-37: Population – TOD Alternative B Impacts (Alternative B Results Minus Future Baseline Results)

	Total Full-Time Residential Population	Total De Facto Population	*De Facto Resident Population*	*De Facto Part-Time Resident Population*	*De Facto Visitor Population*
KAKA'AKO TOTAL	**9,011**	**10,621**	***8,515***	***354***	***1,752***
% Increase, TOD Alternative B over Future Baseline	26.9%	31.4%	*26.9%*	*16.0%*	*New*
By General Area					
Mauka	8,742	9,849	*8,262*	*304*	*1,283*
Makai	-	-	-	-	-
ATSD (Aloha Tower Special District)	268	772	*254*	*50*	*469*
By Neighborhood Zone					
Pauahi N.Z.	4,152	4,045	*3,923*	*122*	-
Auahi N.Z.	214	841	*203*	*40*	*598*
Central Kaka'ako N.Z.	1,208	1,194	*1,141*	*52*	-
Civic Center N.Z.	-	-	-	-	-
Kapi'olani N.Z.	1,568	1,533	*1,481*	*51*	-
Sheridan N.Z.	-	-	-	-	-
Thomas Sq. Dist. N.Z.	1,601	2,237	*1,513*	*38*	*685*
Makai N.Z.	-	-	-	-	-
ATSD N.Z.	268	772	*254*	*50*	*469*

- At build-out under the TOD Alternative B scenario, the full-time residential and total de facto populations would be respectively 27% and 31% greater than under the Future Baseline Condition (based on current Rules). Under the higher-density Alternative A, they would be 38% and 43%, respectively, greater than under the Future Baseline. Again, the population increase primarily reflects the estimated increase in total units shown in the previous section. The estimated population

increase percentages are slightly greater than the unit increase percentages (26% for Alternative B and 37% for Alternative A) because of growth in places or building types with slightly higher average household sizes or other parameters (such as vacancy rates). However, these differences in percentage points are quite small.

Table 4-38: Population – TOD Alternative A Impacts (Alternative A Results Minus Future Baseline Results)

	Total Full-Time Residential Population	Total De Facto Population	*De Facto Resident Population*	*De Facto Part-Time Resident Population*	*De Facto Visitor Population*
KAKA'AKO TOTAL	**12,715**	**14,379**	***12,015***	***693***	***1,671***
% Increase, TOD Alternative A over Future Baseline	38.0%	42.5%	*38.0%*	*31.2%*	*New*
By General Area					
Mauka	12,446	13,606	*11,762*	*642*	*1,202*
Makai	-	-	-	-	-
ATSD (Aloha Tower Special District)	268	772	*254*	*50*	*469*
By Neighborhood Zone					
Pauahi N.Z.	5,516	5,355	*5,213*	*143*	-
Auahi N.Z.	1,837	2,447	*1,736*	*344*	*367*
Central Kaka'ako N.Z.	1,208	1,194	*1,141*	*52*	-
Civic Center N.Z.	-	-	-	-	-
Kapi'olani N.Z.	1,568	1,533	*1,481*	*51*	-
Sheridan N.Z.	-	-	-	-	-
Thomas Sq. Dist. N.Z.	2,318	3,077	*2,191*	*51*	*835*
Makai N.Z.	-	-	-	-	-
ATSD N.Z.	268	772	*254*	*50*	*469*

- Percentage increases in full-time residential population impacts are estimated to outstrip percentage increases in part-time population impact. This is because additional development capacity assumed for both TOD Alternatives (A and B) would occur in many parts of Kaka'ako, whereas substantial numbers of part-time residents are attracted only to certain parts of the area, such as those with ocean views.

  However, the addition of visitor population (hotel guests) under both TOD Alternatives means the combined de facto population impact – including hotel guests,

part-time residents, and full-time residents actually present on any given day – is slightly larger than the full-time resident population impact for each of the TOD Alternatives (both A and B).

4.10.3 Operational Employment

This Section is concerned with "operational employment" – i.e., full- and part-time jobcounts associated with the *operation* of public and private economic activities, as opposed to the *construction* of new buildings or infrastructure. (Construction employment is addressed in a later Section, which includes public facility and infrastructure projects based in part on these operational jobcount estimates.)

The tables in this Section contain results for estimated total jobcounts in Kakaʻako under all scenarios – Existing, Future Baseline, and both TOD Alternatives – derived by first estimating jobcounts for each specific types of land/building use, and then summing.

It should be remembered that the following figures are not precise projections, but rather order-of-magnitude estimates for a full build-out under each scenario, whether that actually occurs in the year 2035 or sometime thereafter. They are based on previous HCDA datasets and current analyses conducted for the Proposed Action.

Finally, "total jobcount" should not be interpreted as a point-in-time estimate of workers actually present in Kakaʻako. Employees work different shifts (day/night, weekday/ weekend), and factors such as vacations and illnesses affect the actual number of workers present at any one time.

4.10.3.1 Results of Analysis

Existing Conditions: "Existing" results provide context for the subsequent impact assessment that involves comparing the two different future scenarios. The following Table 4-39 indicates a Year 2010 total Kakaʻako jobcount of approximately 31,600 – the vast majority located in the Mauka area, and more than 60% due to Office activity.

Future Baseline Scenario: Under the Future Baseline Scenario (i.e., under current Rules), Table 4-40 contains estimates that sum to a Kakaʻako-wide total jobcount of nearly 51,200 full- and part-time jobs – about a 62% increase over the estimated Existing total in the previous Table.

Note, however, that the vast majority of this employment growth is in the Office category (reflecting assumed growth in Office space), which would comprise about 73% of the operational jobs under this scenario.

Under this Future Baseline Scenario, most jobs still remain in the Mauka area, but Makai jobs increase as a proportion of the total, though again primarily due to assumed development of substantial Office space.

Table 4-39: Estimated Kaka'ako-Specific Operational Jobcount – Existing Scenario

	TOTAL	Residential Bldg. Jobs	Hotel Jobs	Civic Jobs	Office Jobs	Retail Jobs	Industrial Jobs	JABSOM Jobs	Surface Parking Jobs	Garage Parking Jobs

Notes: For purposes of this analysis, the "Community Center" (Children's Discovery Center) has been combined with "Civic" in this and subsequent tables. A column for "Hotel Jobs" is inserted to maintain comparability with the later tables, which include this information for the two TOD Alternatives (A and B).

At the level of Neighborhood Zones, the distribution of jobs at build-out (Table 4-40) is relatively more even across areas than was the distribution of population for the Future Baseline Condition (discussed previously in 4.10.2.1. However, the Pauahi Neighborhood Zone still would have the single largest share (25%), followed by the Thomas Square District zone (18%). Numbers in the table equate to 12% to 14% for each of these Neighborhood Zones: Auahi, Central Kaka'ako, Kapi'olani, and Makai (exclusive of the Aloha Tower Special District, or ATSD). Jobs in all these Neighborhood Zones, however, are dominated by the "Office" category, which has in reality been a very slow-growing category.

Table 4-40: Estimated Kakaʻako-Specific Operational Jobcount – Future Baseline Condition

Makai N.Z.	**7,180**	-	-	967	5,055	498	145	490	-	24
ATSD N.Z.	**336**	-	-	-	136	197	-	-	-	3

Proposed Action: Consistent with the decreased Office, Retail, and Industrial space discussed previously, ***both TOD Alternatives result in fewer jobs at build-out than under the Future Baseline Condition.*** That is, the fundamental nature of either one of the TOD Alternatives, A or B, is a relative switch in emphasis from commercial activity to residential development.

The theoretical ultimate total jobcount remains a little higher for TOD Alternative A (about 45,160 in Table 4-42) than for Alternative B (about 43,650 in Table 4-41). Office jobs also drop from the Future Baseline Condition level for TOD Alternative A, and even more for Alternative B, but still comprise more than two-thirds of the total jobcount under each scenario.

Table 4-41: Estimated Kakaʻako-Specific Operational Jobcount – TOD Alternative B

	TOTAL	Residential Bldg. Jobs	Hotel Jobs	Civic Jobs	Office Jobs	Retail Jobs	Industrial Jobs	JABSOM Jobs	Surface Parking Jobs	Garage Parking Jobs
KAKAʻAKO TOTAL	**43,651**	**1,130**	**634**	**3,726**	**29,474**	**5,532**	**2,388**	**490**	**1**	**277**
By General Area										
Mauka	**34,825**	1,113	388	2,758	23,142	4,933	2,244		1	245
Makai	**7,180**	-	-	967	5,055	498	145	490	-	24
Aloha Tower Special District (ATSD)	**1,647**	17	245	-	1,276	101	-		-	8
By Neighborhood Zone										
Pauahi N.Z.	**11,457**	317	-	2	8,649	1,638	772	-	-	79
Auahi N.Z.	**6,595**	481	183	-	3,886	1,583	412	-	-	50
Central Kaka'ako N.Z.	**4,761**	92	-	483	2,901	304	951	-	-	31
Civic Center N.Z.	**1,631**	14	-	835	540	221	9	-	1	11
Kapiʻolani N.Z.	**6,440**	135	-	86	5,497	579	100	-	-	42
Sheridan N.Z.	**360**	9	-	152	180	17	-	-	-	2
Thomas Sq. District N.Z.	**3,581**	65	205	1,200	1,490	590	-	-	-	30
Makai N.Z.	**7,180**	-	-	967	5,055	498	145	490	-	24
ATSD N.Z.	**1,647**	17	245	-	1,276	101	-	-	-	8

The projected reduction (compared to the Future Baseline) in jobs is all in the Mauka area, as the Makai jobcounts – exclusive of the ATSD – in both Tables 4-41 and 4-42 are identical to the Future Baseline jobcount number in Table 4-40 (7,180). However, the number of jobs associated with the ATSD site is larger for each TOD Alternative (about 1,650) than under the Future Baseline Condition, reflecting assumed additional development capacity there.[12]

12 The ATSD parcel is the site of the current HECO power plant facility. It should be noted that HECO has taken the power plant offline but currently plans to retain it for back-up purposes – *not* to redevelop it as assumed for the Future Baseline and TOD Overlay scenarios. Again, this study looks at what HCDA envisions and/or would permit under current or proposed Rules; it does not obligate landowners to implement the scenarios described here.

Table 4-42: Estimated Kakaʻako-Specific Operational Jobcount – TOD Alternative A

	TOTAL	Residential Bldg. Jobs	Hotel Jobs	Civic Jobs	Office Jobs	Retail Jobs	Industrial Jobs	JABSOM Jobs	Surface Parking Jobs	Garage Parking Jobs
KAKAʻAKO TOTAL	**45,157**	**1,259**	**608**	**3,726**	**30,397**	**5,970**	**2,418**	**490**	**1**	**289**
By General Area										
Mauka	**36,330**	1,242	363	2,758	24,065	5,371	2,273		1	257
Makai	**7,180**	-	-	967	5,055	498	145	490	-	24
Aloha Tower Special District (ATSD)	**1,647**	17	245	-	1,276	101	-		-	8
By Neighborhood Zone										
Pauahi N.Z.	**12,706**	338	-	2	9,601	1,880	801	-	-	84
Auahi N.Z.	**6,630**	582	112	-	3,886	1,583	412	-	-	55
Central Kaka'ako N.Z.	**4,761**	92	-	483	2,901	304	951	-	-	31
Civic Center N.Z.	**1,631**	14	-	835	540	221	9	-	1	11
Kapiʻolani N.Z.	**6,440**	135	-	86	5,497	579	100	-	-	42
Sheridan N.Z.	**360**	9	-	152	180	17	-	-	-	2
Thomas Sq. District N.Z.	**3,802**	73	250	1,200	1,461	786	-	-	-	32
Makai N.Z.	**7,180**	-	-	967	5,055	498	145	490	-	24
ATSD N.Z.	**1,647**	17	245	-	1,276	101	-	-	-	8

The *proportionate* geographic distribution of jobs, compared to the Future Baseline Condition percentages discussed above, shows more change than did population distribution – mostly a sharp reduction in potential future jobs in the Thomas Square District Neighborhood Zone (down to 8% in both TOD Alternatives) due to Office jobs declining more than anywhere else. However, as with population, the Pauahi zone gains some percentage points (up to 26% for Alternative B and 28% for Alternative A), as does the Auahi zone (up to 15% for each TOD Alternative). The Makai and ATSD zones also increase a few points proportionately. The reality of these shifts once more depends not only on landowner action to implement these changes, but also on a substantial increase in market demand for Office space.

4.10.3.2 Potential Impacts and Recommended Measures to Mitigate Them

Table 4-43 and 4-44 shows "impacts," as the difference between each of the TOD Alternatives and the Future Baseline Scenario results. These reflect the basic overall nature of the difference between either of the TOD Alternatives versus the Future Baseline Condition – substantially more residential development, somewhat less commercial activity – flowing from the land/building use changes documented in Section 4.10.1:

- About 12% fewer total Kakaʻako-wide jobs (about 6,050 in absolute number) under TOD Alternative A than under the Future Baseline Condition – and 15% fewer (about 7,560) under Alternative B – with total job reductions greatest in the Thomas Square District and Central Kakaʻako Neighborhood Zones. The density reductions in Alternative B would also result in the loss of more potential jobs in the Pauahi zone.

- A particularly large proportionate reduction (more or less 20% for each TOD Alternative) in Office jobs, accompanied by a proportionately large (33% for TOD Alternative A and 19% for Alternative B) increase in Residential management/ maintenance jobs – though the *absolute* number of projected additional Residential jobs is still relatively low (about 300 for Alternative A and under 200 for Alternative B).

- About 15% fewer total Kakaʻako-wide jobs (7,900 in absolute number) under the Proposed Action than under the Future Baseline Scenario, with job reductions greatest in the Pauahi and Thomas Square District Neighborhood Zones.

- A particularly large reduction (21%) in Office jobs, accompanied by a proportionately large (37%) increase in Residential management/maintenance jobs, though the absolute number of additional Residential jobs is still just about 340.

As the provision of new employment opportunities is considered to be a beneficial impact, no mitigative measures are warranted.

4.10.4 Construction Employment

4.10.4.1 Results of Analysis

This section provides estimates of the *cumulative* Kakaʻako-specific construction-related employment impacts, in terms of "job-years." Results are provided for Future Baseline Condition and the two TOD Alternatives only, as construction has already occurred for "Existing" Kakaʻako structures.

The construction impacts come primarily from development of new buildings – determined by comparing the Future Baseline (as well as the TOD Alternatives that represent adjusted versions of the Future Baseline) to the Existing conditions in order to identify new structures. However, some of the construction activity also comes from development of (a) additional public facilities, and (b) additional public infrastructure.

Future Baseline Condition: Exclusive of whatever jobs may be generated by Makai public infrastructure, Table 4-45 below indicates a total of about 55,600 job-years of construction for full build-out of the Future Baseline Condition, more than half associated with residential buildings.

Under the Future Baseline Condition, about 39% of the total construction job-years over time would be located in the Pauahi Neighborhood Zone, 23% in Auahi, and 11% in the Thomas Square District Neighborhood Zone.

4.10.4.2 Potential Impacts and Recommended Measures to Mitigate Them

Table 4-46 and Table 4-47 show significantly more estimated job-years of construction for the TOD Alternatives (about 69,000 for Alternative B and 76,000 for the higher-density Alternative A) than under the Future Baseline Condition.

As with the Future Baseline Condition, but to an even greater extent, construction activity and employment is concentrated:

- In development of Residential structures and Parking; and

- Primarily although not completely within the Pauahi (about 40% for both TOD Alternatives) and Auahi (20% for Alternative B and 23% for Alternative A) Neighborhood Zones – i.e., proportionately a little more in Pauahi and, for Alternative B, a little less in Auahi than the Future Baseline Condition figures above. The percentage for the Thomas Square District zone remains the same at 11% for each TOD Alternative.

Table 4-48 and Table 4-49 show "impacts," defined as the difference between results for each of the TOD Alternatives and results for the Future Baseline Condition.

Table 4-45: Estimated Kakaʻako-Specific Construction Jobcount – Future Baseline Condition

	TOTAL (Job-years)	Residential Bldg. Jobs	Hotel Jobs	Civic Jobs	Office Jobs	Retail Jobs	Industrial Jobs	Garage Parking Jobs	Infrastructure and Public Facilities

Unallocated*	**1,093**	**0**	**0**	**0**	0	0	0	0	1,093

* "Unallocated" refers to infrastructure and public facilities, as either exact future locations are unknown or else they may extend through various geographical areas.
Note: Small percentages of these figures consist of jobs generated through "soft costs" (primarily architectural and engineering) that would in all likelihood be located outside these specific geographical areas and quite possibly outside Kakaʻako itself. Some of the "Unallocated" infrastructure and public facility direct construction jobs could also be located outside Kakaʻako – e.g., construction of schools or other public facilities serving Kakaʻako but not located in Kakaʻako. Consistent with text discussion, however, public infrastructure jobs related to Makai development (outside the ATSD) are not counted, and so "Unallocated" jobs are most likely to be in the Mauka or ATSD areas.

Unallocated*	**1,374**	0	0	0	0	0	0	0	1,374

* "Unallocated" refers to infrastructure and public facilities, as either exact future locations are unknown or else they may extend through various geographical areas.

Note: (Small percentages of these figures consist of jobs generated through "soft costs" (primarily architectural and engineering) that would in all likelihood be located outside these specific geographical areas and quite possibly outside Kaka'ako itself. Some of the "Unallocated" infrastructure and public facility direct construction jobs could also be located outside Kaka'ako – e.g., construction of schools or other public facilities serving Kaka'ako but not located in Kaka'ako. Consistent with text discussion, however, public infrastructure jobs related to Makai development (outside the ATSD) are not counted, and so "Unallocated" jobs are most likely to be in the Mauka or ATSD areas.

* "Unallocated" refers to infrastructure and public facilities, as either exact future locations are unknown or else they may extend through various geographical areas.

Notes: (1) Figures in parentheses are negatives. (2) Small percentages of these figures consist of jobs generated through "soft costs" (primarily architectural and engineering) that would in all likelihood be located outside these specific geographical areas and quite possibly outside Kaka'ako itself. Some of the "Unallocated" infrastructure and public facility direct construction jobs could also be located outside Kaka'ako – e.g., construction of schools or other public facilities serving Kaka'ako but not located in Kaka'ako.

As with operational jobs, results for construction jobs reflect the basic overall nature of the difference in the Future Baseline versus the two TOD Alternatives – substantially more residential development, somewhat less commercial activity – flowing from the land/building use changes documented in Chapter Two:

- Overall, about 37% more construction job-years would be required to build out the TOD Alternative A scenario than the Future Baseline Condition, and 24% more than the Future Baseline for Alternative B.

- Most of the additional construction employment is associated with residential development (61% increase over Future Baseline number for TOD Alternative A, 42% for Alternative B), though with a proportionately high increase in construction job-years associated with needed new public facilities and infrastructure as well.

- For both TOD Alternatives, there are small decreases in construction employment associated with Office, Retail, and Industrial development, though these are roughly balanced by additional construction employment associated with additional Parking Garage and Hotel development.

Again, impacts are numerically most apparent in the Pauahi and Auahi Neighborhood Zones.

As the provision of new employment opportunities is considered to be a beneficial impact, no mitigative measures are warranted.

4.10.5 Housing

4.10.5.1 Results of Analysis

The enabling statue for the HCDA provides that as a condition of redevelopment in residential use within the KCDD, development should include a mixture of densities, building types, and configurations in accordance with appropriate urban design guidelines; the integration, both vertically and horizontally, of residents of varying incomes, ages, and family groups; and an increased supply of housing for residents of low- or moderate-income.

As described in Section 4.10.1.1, there are approximately 8,618 existing residential units in the Mauka Area. Under the Future Baseline Condition, that number would increase by approximately 12,258 units to a total of 21,146 units. Pursuant to the HCDA's current Reserved Housing program, twenty percent of new units constructed shall be reserved as for families/individuals that qualify under the Federal government's affordability guidelines. The Future Baseline Condition would, therefore, yield approximately 2,505 new affordable units.

4.10.5.2 Potential Impacts and Recommended Measures to Mitigate Them

Under TOD Alternative A, the total number of residential units in the Mauka Area at full build out is estimated to be 28,765; an increase of approximately 20,147 units over existing conditions, and about 7,619 more units than the Future Baseline Condition. Implementation of the current Reserved Housing program would yield approximately 4,029 affordable units.

Under TOD Alternative B, the total number of residential units in the Mauka Area is estimated to be 26,588; an increase of approximately 17,970 units over the existing condition. Implementation of the current Reserved Housing program would yield approximately 3,594 affordable units, or 435 less than under TOD Alternative A.

Redevelopment in the Mauka Area may result in the displacement of some tenants and/or apartment or condominium unit owners if the owner of an under-utilized property decides to redevelop to achieve the maximum allowable density.

In implementing the transit oriented development plan (TOD) overlay for the KCDD, HCDA's reserved housing program shall be geared toward housing product types that target the low- or moderate-income groups instead of the entire affordable spectrum. There are other State agencies such as the Hawaii Housing, Finance and Development Corporation (HHFDC) that specialize in the development of broad-spectrum affordable housing. Since inception of the Mauka Area Plan, affordable housing units have been developed there by state agencies. Up until now HCDA's focus has been to stimulate the production of housing units for workforce buyers from 100 percent up to 140 percent of area median income (AMI) by ensuring that a portion of residential projects are set aside, or *reserved* for this income group. However, given the lack of housing units that serve the low- to moderate-income families in urban Honolulu, HCDA will adjust its reserved housing focus to address the housing needs of this income group.

Therefore, as part of the TOD overlay for KCDD, HCDA's reserved housing will focus on providing housing needs for households earning between 80 to 120 percent of the area median income, which is considered to be the low to mid income range. A housing demand study prepared by the City & County of Honolulu projects housing demand from 2012 to 2016 to be in the range of 25,000 units and span the area median income of less than 30% to 140%. Approximately a third of this housing demand is from the 80-120 percent area median income group. Only about 6% of the housing demand is from area median income group between 120% to 140%. Given this concentration of demand at the 80-120 area median income, it is imperative that HCDA realign its reserved housing policy to address the housing needs of this income group. The HCDA will also develop a standard for what percentages of the required reserved housing should be provided for particular levels of AMI.

Given the extreme need for affordable housing on O`ahu and, especially within urban Honolulu, a broad strategy for developing affordable housing needs to be considered. Currently, only residential development in the KCDD is required to provide reserved

housing. Moving forward, HCDA will consider other types of development that generate housing demand and therefore will revise its requirement for providing reserved housing. For example, the TOD overlay provides for hotel uses in the KCDD, which generate additional employment opportunities within the district, and therefore, need for additional affordable housing.

It is therefore proposed that the TOD overlay include a reserved housing requirement for new land-use types such as hotel use as well as for commercial developments. In addition the TOD overlay will expand the requirement for providing reserved housing from a development lot area-based standard to a residential unit count-based standard.

The current Kaka`ako Reserved Housing rules require that multi-family residential developments on lots greater than 20,000 square feet provide reserved housing as a condition for development permit application approval. Given the increase in development envisioned in the TOD overlay plan, together with its incentive-based zoning program, it is reasonable that the reserved housing requirement be based on these parameters. Therefore, the TOD overlay plan proposes that any multifamily residential project of 10 residential units or more shall be subject to a requirement to provide reserved housing. The HCDA will also develop a rational formula for reserved housing requirements for hotel and other commercial use. To provide incentives to developers to build larger units as well as discourage over-building of efficiency units, the HCDA will also consider a multiplier factor for unit type and size. For example, a standard reserved housing unit could be a 2 bedroom, 1.5-bath unit and would be considered the standard unit (with a base factor of 1). Any unit bigger than that, such as a 2 bedroom/2 bath or a 3 bedroom/2 bath unit, would have a multiplier factor of greater than one. Units smaller than the standard unit would have a multiplier factor of less than 1.

Inclusionary Housing: The HCDA prefers that all reserved housing units be provided on the proposed project site, generally known as “inclusionary”. Inclusionary housing programs facilitate the creation of housing for the workforce and enable families of moderate means to benefit from urban redevelopment. The resulting mixed income communities generate several community-wide benefits. They broaden access to well-funded schools, strong municipal services, and emerging job centers. And they also provide opportunities for lower-wage earning families to buy homes in appreciating housing markets, to accumulate wealth, and to share a part of the “American Dream”. Inclusionary housing has a proven track record of meeting a community’s goal of providing housing available to residents of a wider economic range.

Although the preference is for inclusionary reserved housing units, the HCDA’s enabling statute provides for provisions of developing reserved housing units outside of the project within the KCDD or outside of the KCDD. If a developer finds it necessary to produce the reserved housing offsite, such a request will be evaluated on a project-by-project basis and could receive credits under HCDA’s housing program, although at a lower credit value than onsite units.

Preference for Units vs. In-Lieu Fees: In rare instances, when there is a compelling reason why reserved housing units cannot be included or developed offsite, HCDA may consider accepting an "in-lieu" fee. However, in-lieu fees place the burden of developing reserved housing units on HCDA; therefore, HCDA's preference is for the developers to construct the reserved housing units themselves rather than to allow payments of in-lieu fees. Except to resolve a case of fractional units, in-lieu fees will be discouraged. The HCDA will develop workable formula for determining the in-lieu fee. In-lieu fees received will be deposited in HCDA Reserved Housing Sub-Account.

Cost Offsets: An effective Reserved Housing program usually offers developers a range of cost offsets to achieve a double bottom line: reserved housing for the public and a reasonable overall return for the developer. Profitability in the Mauka Area is important to ensure that developers will actually build in Kaka`ako, and therefore will be factored into any Reserved Housing formula, especially since the development of any reserved housing depends on the development of housing in general. To achieve this, the TOD overlay plan proposes an incentive-based zoning program within the KCDD on land parcels identified as having potential for TOD.

Maintaining Affordability: Reserved housing units should remain affordable as long as is reasonable. Therefore, long-term constraints on sales of reserved housing for future generations are needed to preserve the inventory of these units. Long-term affordability may be achieved by different means, such as equity sharing upon resale, and/or a buy-back option in favor of HCDA. The HCDA enabling statute provides for a buy-back period of 10 years. Programs with long-term affordability terms can call for a sharing of equity upon resale that, while providing the incentive of the creation of wealth for the owner, makes reserved housing ownership financially less attractive for speculators. These terms allow the owner to build some equity while effectively eliminating profiteering. If homeowners decide to sell the unit prior to the expiration of the buy-back term, the purchase price to HCDA should be set as low as possible to the original reserved purchase price so the unit can be resold to another qualified buyer. Therefore, the buy-back price shall be based on the original reserved purchase price inflated only by an appropriate inflationary index and owner paid unit improvements.

Another method for establishing the buy-back price would be indexing the sale price to AMI. Both methods allow for the owner to extract some equity while keeping the unit still affordable.

On Reserved Housing units, HCDA proposes to require perpetual equity sharing with an allowance for the build-up of equity for the homeowner from the point of original purchase according to the homeowner's percentage share of ownership. The remaining portion of the equity would revert to HCDA's Reserved Housing Sub-Account upon resale. The equity-sharing feature suggests that the highest possible market sale price would be desirable. The proportion of the equity percentage will be established by the owner's purchase payment divided by the appraised market value for that unit at the point of original purchase. To achieve long-term affordability, as part of the TOD overlay plan the HCDA will consider the requirement of first option to purchase at all subsequent sale of

reserved housing units. Once HCDA purchases the reserved housing units, it can re-sell the unit at reserved housing price and maintain affordability. Repeating this for each subsequent resale of reserved housing would assist in achieving long-term affordability.

Proposed Reserved Housing Program Checklist: The following summarizes HCDA's plans to provide affordable housing as part of the TOD Overlay Plan:

- Residential Projects that include residential units of 10 or more must provide at least 20% of the residential units as reserved housing units.
- Hotels and other commercial development shall have the requirement to provide reserved housing. The HCDA will develop a formula for the number of units to be provided.
- The reserved housing price shall be based on area median income of 80-120%. The HCDA shall develop a formula for what percentages of the reserved housing units are provided at what AMI level.
- As much as feasible, the HCDA will couple the reserved housing requirement with incentive-based zoning. The number of reserved housing units required for a particular project should in in line with the incentive provided for the project.
- The developer must sell the units, priced between 80-120 percent of AMI, to qualified buyers with deeded covenants in favor of HCDA that include a buy-back provision for every successive future sale of the unit, and in the event that the HCDA waves its right to buy-back, a perpetual equity sharing provision.
- The buy-back price shall be based on the original purchase price, inflated by an appropriate index plus owner-paid unit improvements; or indexed to the AMI at the time of resale, whichever is lower.
- A reserved housing buyer shall set an equity-sharing percentage at the time of the original purchase. HCDA's share of the equity upon resale will be transferred to the HCDA's Reserved Housing Sub-Account in the event that HCDA waves its right to buy back the unit.

The developer may also choose to develop rental units, in which case the reserved housing units shall be rented to tenants qualified between 80 to 100 percent of AMI. Such rental units shall remain as reserved housing for a period of 30 years. The developer will be responsible for managing such units. After the regulated period the reserved housing units may be sold with HCDA or a successor agency having the first option to purchase.

4.10.6 Health Care

4.10.6.1 Results of Analysis

Public Health – Emergency Services: The City and County of Honolulu Emergency Services Dept.[13] has two divisions –

[13] Information in this section reflects various communications with and from Director Mark Rigg, October to December 2013.

- Ocean Safety and Lifeguard Services Division. This Division is City-funded and focuses on marine emergencies. The Division is not directly affected by population or economic changes in Kakaʻako (except indirectly through harbor and beach park usage), or any other specific geographical neighborhood on land. However, the Department is in discussions with HCDA to provide land on a lease basis for a new Ocean Safety Facility at Kewalo Basin, to replace a current facility in the Waikīkī Natatorium, which is to be demolished. The Department expects to request City Council funding approval in FY2016. This activity is independent of the Proposed Action, and so no further discussion of Ocean Safety functions will be made here.

- Emergency Medical Services Division (EMSD). This Division – administered by the City but ultimately funded by the State Dept. of Health – provides emergency medical service and ambulance transportation in response to land-based crises. The EMSD will be the primary focus of this discussion.

Islandwide, there are 20 EMS units and two single-response units. These are EMS emergency response vehicles staffed with a single paramedic and treats victims on scene until a transport unit arrives. Of these, five EMS units serve the overall metropolitan area from Waikīkī to Kalihi/Iwilei. There are no specific service-area boundaries, but Kakaʻako is usually served by either (1) the Makiki and Metro One EMS units at 1426 Young St., or (2) the Baker One unit located at the Queen's Medical Center, 1301 Punchbowl St.

Given current population growth, the EMSD considers metropolitan Honolulu to be on the cusp of needing a new EMS unit. The Department is also now (late 2013) in discussions with HCDA about another 24-hour/day site in Kakaʻako (in the area where Fisherman's Wharf now stands) to meet this need. A tentative plan is to locate a trailer from which the ambulance crew could operate, as has been done in other parts of the island. Although this action, if it occurs, would also be independent of substantial future Kakaʻako population growth, it does raise the strong possibility that Kakaʻako would be effectively served long before 2035 by at least one new EMS station – although that station may also serve other nearby neighborhoods as well.

Medical Facilities: Assessment of impacts on medical facilities differs from other analyses in that service is provided by a network of providers rather than a single agency. Most are private-sector providers, and so it is generally difficult and/or inappropriate to estimate costs that would be borne by government. Medical facilities are of several types:

- Acute Care Facilities: These offer a wide range of medical, surgical, obstetric and pediatric services. These facilities primarily treat patients with conditions that require a hospital stay of fewer than 30 days.[14]

- Long-Term Care Facilities: These may be defined as institutions (such as nursing homes and skilled nursing facilities) that provide healthcare to people who are unable

[14] Blue Cross Blue Shield Blue Care Network. [December 2013]. http://www.bcbsm.com/index/health-insurance-help/glossary.html

to manage independently in the community.[15] They are either freestanding or hospital-based.

- Specialty Care Facilities: These are acute care facilities that provide specialized services and specially trained personnel to care for a specific portion of the injured population, such as pediatric, burn injury, or spinal cord injury patients.[16]

Many of these facilities are run by the private sector, though with overall supervision by the Hawai'i State Dept. of Health. Table 4-50 shows that the number of State approved medical facilities has been declining since 2000:

Table 4-50: Number of State Approved Medical Facilities 2000-2010

Number of Facilities	Acute Care(1)	Long-term Care(1)	Specialty Care	Total(2)
2000	24	45	24	**74**
2001	21	45	22	**73**
2002	20	45	23	**72**
2003	20	45	19	**68**
2004	22	47	20	**70**
2005	21	49	17	**68**
2006	19	43	13	**62**
2007	19	46	13	**63**
2008	19	46	14	**66**
2009	20	49	14	**69**
2010	20	48	15	**70**

Source: Hawai`i State Data Book-2012. Table 2.25 Number and Bed Capacity of State-Approved Facilities, By Type of Facility 2000-2010. http://dbedt.hawaii.gov/economic/databook/db2012/
Notes: Excludes Tripler Army Medical Center. Figures based on facilities that reported their activity.
(1) Acute/SNF swing beds are classified as long-term care.
(2) Institutions providing more than one kind of care are counted only once.

Present Conditions: Kaka'ako is not uniquely served by any one of the above types of health care facilities. It is part of the wider metropolitan Honolulu area currently served by numerous facilities, none of which (with the exception of a clinic associated with the John A. Burns School of Medicine) is now located in Kaka'ako itself –

15 Center for Disease Control and Prevention. [December 2013]. http://www.cdc.gov/HAI/settings/ltc_settings.html

16 National Highway Traffic Safety Administration. 1996. *EMS Agenda for the Future*. Washington, D.C. [December 2013]. http://www.nhtsa.gov/people/injury/ems/emstraumasystem03/glossary.htm

- **Acute Care Hospitals** serving Kakaʻako and other parts of urban Honolulu include the Queen's Medical Center (a private non-profit facility the largest hospital in Hawaiʻi, a trauma hospital, and a part of the Queen's Health Systems), Kuakini Medical Center (a non-profit hospital that is part of the Kuakini Health System), and the Straub Clinic and Hospital (also a non-profit hospital under the Hawaiʻi Pacific Health System).

- **Long-Term Care Hospitals** serving the wider Honolulu area (including but not limited to Kakaʻako) include (a) Lēʻahi Hospital, which is a State-run nursing facility and tuberculosis hospital; (b) Kuakini Medical Center and The Queen's Medical Center, which also offer hospital-based skilled nursing services; (c) Maluhia; (d) Hale Nani; (e) Oahu Care Facility; (f) Island Nursing and Rehab Center; and several other skilled nursing facilities.

- **Specialty Care Facilities** serving Honolulu/Kakaʻako include (a) Shriners Hospitals for Children-Honolulu, a pediatric orthopedic hospital providing care for children with bone, joint, and neuromuscular conditions; (b) Kapiʻolani Medical Center for Women & Children, the state's only specialty care facility for women and children and only pediatric intensive care unit serving all islands and the Pacific Basin; and (c) The Rehabilitation Hospital of the Pacific, which provides rehabilitation services to patients with physical and cognitive disabilities.

- **Health Care Clinics** serving the area include the Waikīkī Health and Kalihi-Pālama Health Centers, both of which are federally qualified health centers (FQHCs). FQHCs are organizations receiving grants under Section 330 of the Public Health Service Act (PHS). They receive reimbursement from Medicare and Medicaid, and supply comprehensive health services to underserved areas or populations based on a sliding fee scale.

- **Other:** Honolulu is also served by various health care providers such as home health agencies and hospices (which mostly provide care in people's homes), physician practices, urgent care clinics, and dialysis and rehabilitation centers.

The Healthcare Association of Hawaiʻi (HAH)[17] and the State Health Planning & Development Agency (SHPDA) [18] both report that the health care system throughout Hawaiʻi – in urban Honolulu and elsewhere – was stressed by various factors:

1. The shutdown in 2011 of two Oʻahu hospitals (Hawaiʻi Medical Center East in Liliha and Hawaiʻi Medical Center West in ʻEwa). The closure of these hospitals, which employed 990 workers, eliminated more than 340 hospital beds. While ERs have been operating at capacity since these closures, the opening of The Queen's Medical

17 Telephone conversation between JMK Assoc. Staff and Rachael Wong, Vice President and COO of Healthcare Association of Hawaiʻi (HAH) on Dec. 11, 2013.

18 Information received via email communications between JMK Assoc. Staff and State Health Planning & Development Agency Administrator, Sue Radcliffe in December 2013 and January 2014.

Center–West Oʻahu in May 2014 was expected to relieve some of the systemic pressure by providing health services to patients who live on the Leeward side closer to their homes. The experts consulted could not quantify the impact of its opening, but did believe it will relieve some of this stress.

2. The Great Recession, while technically ended, has left many without insurance. Because of this, emergency rooms and community health clinics feel greater pressure.

3. Changes in national healthcare system following the nation's health reform law enacted in March 2010 (i.e., the Affordable Care Act) is expected to increase patient demand for medical services. This could cause further stress on existing facilities.

None of these factors relate to population growth in any particular area, including Kakaʻako, but represent a challenge to the quality of health care both at present and also for the future growing population of Hawaiʻi in general.

4.10.6.2 Potential Impacts and Recommended Measures to Mitigate Them

Public Health – Emergency Services: The question for analysis here is what additional future needs, if any, the EMSD would face if the present Kakaʻako de facto population and jobcount were to grow by 2035 to the levels estimated in this EIS.

Future EMSD needs would of course depend on overall islandwide and metropolitan growth, as there is no official separate Kakaʻako EMSD service area. However, the EMSD estimates that growth under the Future Baseline Scenario would contribute to need for a second new EMS station. Based on the new station currently proposed for Kakaʻako, it would have annual operating costs of about $1.04 million (primarily for salaries). However, no additional service would thereafter be required for TOD Alternative A – or, logically, for the lower-density TOD Alternative B. Therefore, the impact as defined for this EIS would be $0, according to the agency.

Full build-out costs for the proposed new Kakaʻako EMS unit would be about $4 million, which provides the best estimate for construction costs for a possible second unit under the Future Baseline Scenario. However, no additional facility construction costs are envisioned for TOD Alternative A (and this in this analysis for TOD Alternative B as well).

EMSD notes that transport time to metropolitan hospitals are short from Kakaʻako. They would be mainly to Queens and Straub, and a little further to Kuakini. Kaiser Health Care plans will be transported to Moanalua Kaiser.

Medical Facilities: Whether population growth takes place in Kakaʻako or elsewhere on Oʻahu, the islandwide and statewide resilience of the health care system requires improvement. Population growth will otherwise continue to challenge the adequacy of health care throughout Hawaiʻi.

Because it cannot be currently estimated to what extent either TOD Alternative A or B will increase the population of the overall urban Honolulu on a net basis – i.e., because it

cannot be known how many people would be living in urban Honolulu outside Kakaʻako under the Future Baseline Scenario – it is difficult to estimate the impact on any current facility or on the network of facilities serving both Kakaʻako and the rest of urban Honolulu. No cost impacts can be calculated.

The redirection of some population growth into Kakaʻako is highly unlikely to result in any publicly funded facility construction costs in the area that would not occur anyway. At the moment, no such new construction is expected.

From the viewpoint of adequacy of services, the system is now stressed and has the potential to be further stressed by population growth, whether in Kakaʻako, other parts of urban Honolulu, or the rest of the island.

4.10.7 Education Facilities

4.10.7.1 Results of Analysis

The State Dept. of Education (DOE) most recent available estimates indicate there are now (Fall 2012) about 450 students with Kakaʻako addresses in various public elementary, middle, and high schools serving the area.[19] Five schools from two complexes (Kaimukī and McKinley Complexes) serve Kakaʻako and surrounding urban areas. These are Royal and Kaʻahumanu Elementary Schools, Central and Washington Middle Schools, and President William McKinley High School, with recent enrollment figures shown in Table 4-51 below. These are all public schools operated by the DOE. Voyager Public Charter School, the area's only charter school serving grades K-8, recently relocated out of the area. Although there are more than 100 private pre-schools serving the Honolulu area, only 12 public pre-schools operate in Honolulu, none of which are located in Kakaʻako. There have, however, been recent proposals to open two new (private) pre-schools in Kakaʻako, including a Seagull Schools and a Montessori School. [20]

The President William McKinley High School (aka McKinley High School) occupies 45.6 acres of land within the Thomas Square District neighborhood. The campus is significantly underdeveloped from a planning point of view and is capable of supporting a much larger educational facility. However, the potential expansion of the existing facilities is a decision that rests with the State Department of Education. Considerations include not only the potential ability of the campus to accommodate additional classrooms, e.g. an elementary school, middle school, or expanded high school, or some combination of the three, but also the future shared use of the playing fields for the benefit of the greater community.

---

19 This information and subsequent statements attributed to DOE derive from various communications (face-to-face, telephone, and written) between JMK Associates and personnel within the Planning Section, DOE Facilities Development Branch, October-November 2013.

Source: DOE Facilities Development Branch

DOE representatives have confirmed that Royal Elementary and Queen Ka'ahumanu Elementary are currently operating at near capacity and may not be able to accommodate large surges in enrollment in the future. While DOE projections anticipate negative growth for both of the elementary schools as well as for Central Middle school over the next five years (and hence increasing capacity for future growth), Royal School is expected to have the ability to provide space for fewer than 30 additional children by 2018 under present conditions. (See Table 4-52)

Table 4-52: Current and Near-Term Future Anticipated School Capacity

	School Capacity[a]	2013-2014 Residual Capacity[b]	2018-2019 Residual Capacity[c]
McKinley Complex			
Royal Elementary	368	-8	29
Ka'ahumanu Elementary	623	26	79
Central Middle	843	492	587
McKinley High	2,012	335	199
Kaimukī Complex			
Washington Middle	1,210	416	354

[a] Maximum Enrollment. Capacity assessed in 2012-2013 via DOE's "ARTS Classroom Space Survey"

[b] 2012-2013 ARTS Classroom Space Survey less actual 2013-2014 Enrollment

[c] 2012-2013 ARTS Classroom Space Survey less projected 2018 Enrollment

The official DOE policy[21] regarding enrollment guidelines for new schools lays out standard student enrollment ranges and land acreage needed to accommodate them. The DOE recommends that elementary schools (grades K-5) serve 400-750 students on 8 to 15 usable acres;[22] that middle schools (grades 6-8) serve 500-1,000 students on 15-20 usable acres; and that high schools (grades 9-12) serve 800-1,600 students on 45-55 usable acres. Future schools will likely have the maximal capacities.

With this policy in mind, the DOE uses residential unit counts, as well as current enrollment to set student generation rates for a particular area. In the urban Honolulu area including Kakaʻako, the DOE has set student generation rates at 0.082 students per multi-family dwelling unit for elementary schools; 0.033 students per multi family dwelling unit for middle schools; and 0.054 students per multi family dwelling unit for high schools.

When measuring the impact of the development of additional units in Kakaʻako over area school facilities, it cannot be assumed that all of the pressure placed on those schools will come from the Kakaʻako area alone. The five schools mentioned above serve not only Kakaʻako, but surrounding areas as well. In fact, service areas for middle and high schools in particular serve a *much* larger area than Kakaʻako alone. However, it is not possible to know for certain what the growth will be in the remainder of these various school service areas.

DOE is presently exploring the possibility that space could be made available for school facilities on the State-owned former Pohukaina School site, which has been proposed for the development of the 690 Pohukaina St. affordable housing project. The Pohukaina site is currently used for a State Library book-processing center. The library is slated to move to an ʻAiea location by the end of the 2013-2014 fiscal year. Pohukaina could be developed as a mixed-use project that includes an Elementary School.

4.10.7.2 Potential Impacts and Recommended Measures to Mitigate Them

The DOE has developed various location-specific multipliers for estimating future student counts generated by new developments, intended for use in eventual impact fee calculations. The multipliers for the urban Honolulu area including Kakaʻako are based on area-wide estimates, not current Kakaʻako student enrollments. If applied to current Kakaʻako dwelling units, they would generate an estimated student count far in excess of the actual present student count. Use of these multipliers is thus likely conservative, in that they produce estimated future enrollments more substantial than might be derived from an extrapolation of present Kakaʻako conditions.

21 State of Hawaii Board of Education. BOE Policies. 6000 Series. 6701. https://lilinote.k12.hi.us/STATE/BOE/POL1.NSF/85255a0a0010ae82852555340060479d/b31a0aa2c2ca52b10a2566a30082892f?OpenDocument

22 According to DOE, "Useable is generally defined as land free of encumbrances determined to be unnecessary by the department of education, slope of five percent or less, with no ravines or stream beds".

Based on these DOE multipliers, the number of students from Kaka'ako will increase significantly for build-out under the Future Baseline Scenario and even more for build-out under the Proposed Action (see Table 4-53).

Table 4-53: Impact on Students Served

	DOE Student Generation Rates (Per Unit)	Future Baseline Scenario[a]	TOD Alternative B[b]		TOD Alternative A[c]	
		# Students	# Students	Impact (Difference)	# Students	Impact (Difference)
Elementary	0.082	1,734	2,180	446	2,375	641
Middle	0.033	698	877	180	956	258
High	0.054	1,142	1,436	294	1,564	422
Total:		**3,574**	**4,493**	**920**	**4,896**	**1,322**

[a] Generation rate times dwelling units for build-out under Future Baseline, estimated to reach 21,146

[b] Generation rate times dwelling units for build-out under TOD Alternative B, estimated to be 26,588

[c] Generation rate times dwelling units for build-out under TOD Alternative A, estimated to be 28,968

The following operational cost estimate (Table 4-54) is based on the most recent overall DOE operating budget divided by total enrollment:

Table 4-54: Impact on Operational Costs

	Change in Students	Average Per-Student Cost[a]	Total Annual Impact
TOD Alternative B	920	$11,854	$10,903,680
TOD Alternative A	1,322	$11,854	$15,670,015

[a] State of Hawaii DOE Financial Report. Office of Fiscal Services. July 1, 2010- June 30, 2011. http://www.hawaiipublicschools.org/DOE%20Forms/State%20Reports/FinancialReport2010-2011.pdf. Updated to 2012 dollars using Honolulu CPI.

It is to be remembered that both these expenditures and the change in student counts are expected to occur elsewhere on the island in any event – the "impact" is a *shift* or concentration into Kaka'ako.

The student count figures in Table 4-54, when divided by maximum DOE school enrollments (considered appropriate by DOE Facilities Branch to use when considering future urban school sites) yield the following percentage equivalents of new schools needed at each level for various planning scenarios (see Table 4-55) – *if* school district lines were redrawn such that Kaka'ako alone were to be the primary service area for schools:

Table 4-55: Kaka'ako Schools Needed Under Various Scenarios

	Maximum Capacity for Schools	Future Baseline	TOD Alternative B		TOD Alternative A	
			Need	Impact (Difference)	Need	Impact (Difference)
Elementary	750	231%	291%	60%	317%	86%
Middle	1,000	70%	88%	18%	96%	26%
High	1,600	71%	90%	18%	98%	26%

Illustrative Explanation: Previously calculated Future Baseline student count of 1,734 elementary school students is equivalent to 2.31 times the number of students in one elementary school.

The data in the table above suggests that, under TOD Alternative A, build-out would generate enough students from Kaka'ako alone to fill more than three elementary schools and almost enough to fill one middle and one high school. Compared to build-out under the Future Baseline Condition, that is almost the equivalent of one additional one elementary school and fractions (about one-quarter each) of additional middle and high schools. For the lower-density TOD Alternative B, the impact numbers are equivalent to 60% of one elementary school and nearly one-fifth of additional middle and high schools.

However, because Kaka'ako is part of a larger DOE service area (particularly for middle and high schools), it is difficult to predict for certain at what point the need for any one particular new school would be generated – as that depends in part on growth in adjacent areas as well. That is, it is difficult to say to what extent actual DOE construction costs in future would depend just on Kaka'ako population growth.

The standard DOE approach – utilized in this analysis for costing purposes – instead uses *average* construction and land cost multipliers per dwelling unit, for various parts of the island. Table 4-56 uses DOE-supplied multipliers for urban Honolulu. It suggests that DOE would have to spend a little under $123 million more for construction and land costs under TOD Alternative B, and $176 million more under Alternative A, than under the Future Baseline Condition.

Table 4-56: Additional Kaka'ako-Specific School Facility Costs (DOE Multipliers)

FUTURE BASELINE ALTERNATIVE	Construction Cost	Land Cost	Combined Cost
Total Increase over Existing Units	*12,528*	*12,528*	*12,528*
Elementary[a]	$34,739,336	$62,312,823	**$97,052,159**

[b] Middle school construction and land multipliers: $1,397 $1,474

[c] High School construction and land multipliers: $3,592 $8,326

Source for Multipliers: Hawaii State DOE

Again, however, it should be remembered this means the DOE would need to spend this money in Kakaʻako rather than elsewhere on the island, as both alternatives are about redirecting population to Kakaʻako. Additionally, these Kakaʻako-specific facility costs, as well as all preceding Kakaʻako-specific impact numbers, are likely somewhat overstated because some of the additional units (and their student counts) estimated to be developed at build-out of each alternative and could, under the Future Baseline Condition, instead still be developed in the same DOE school service areas near to Kakaʻako. Thus**, similar DOE calculations would apply to growth wherever it occurs on Oʻahu.**

Probably the most important actual consequence of Kakaʻako population growth for school development is the need to find land for new schools. This is an issue facing DOE in all areas now being planned or considered for higher-density TOD uses along the south shore of O`ahu. DOE has yet to initiate any comprehensive analyses to identify potential sites in Kakaʻako or other TOD areas, and has not conducted any in Kakaʻako for at least the past decade. However, there are no currently known candidate sites in Kakaʻako itself. A further constraint in Kakaʻako is that the Makai area (below Ala Moana Blvd.) is ruled out for DOE use because this area is largely in the potential tsunami inundation zone.

It is no more certain that additional candidate sites could be identified close to Kakaʻako than in Kakaʻako itself. However, if such a solution were to be found feasible – i.e., continuing to send Kakaʻako students to schools bordering the area, as is now the case – this could arguably affect the sense of community within greater Kakaʻako or its constituent neighborhoods. DOE notes there are still reunions of students who attended the former Pohukaina Elementary School during the 1930s.

According to DOE:

> As late as December 2011, the DOE was operating with the understanding that space would be made available for a school facility within whatever development project took place on the former Pohukaina School site.
>
> Per HRS302A-1601 the DOE is authorized to collect land and money from developers of residential housing through the imposition of impact fees. The fee formula is set in law and is heavily weighted towards providing the land (or cost of land) needed for new schools with just a 10% contribution toward construction costs. (The legislative intent was that the balance of construction funds would come from state funds.) To date, the formula has been used principally on suburban-style projects with large undeveloped acreage.
>
> The formula has not yet been applied in high-density urban areas, where there is limited land and the cost of the land is much higher. Because of the cost of land associated with urban development, it is expected that the impact fee formula would yield a higher per unit cost in developing urban areas such as Kaka'ako.

The impact fee formula, as stated in law, assumes that a new residential project will have an impact on student enrollment at elementary, middle and high schools. In Kaka'ako, there is an unusual situation of insufficient space in the elementary schools that serve the area, but currently significant capacity in the middle schools and some limited additional space in the high school. It is unclear at this point if a legal interpretation of the impact fee law would permit application of only those portions of the formula that are needed (i.e. fees charged based on providing elementary school capacity only).

The DOE would need to determine if this exception would be possible and then what the scenario might be should future capacity be required in middle and high schools if Kaka'ako continued to develop.

As noted earlier, DOE is presently exploring the possibility that space could be made available for school facilities on the State-owned former Pohukaina School site, which has been proposed for the development of the 690 Pohukaina St. affordable housing project. Pohukaina could be developed as a mixed-use project that includes an Elementary School.

4.10.8 Public Emergencies and First Responders

4.10.8.1 Results of Analysis

Kakaʻako is currently served by the Kakaʻako Fire Station (located in the western or ʻEwa portion of Kakaʻako at 555 Queen St.) and the Pāwaʻa Fire Station (located at 1610 Makaloa St, just past the eastern or Diamond Head district boundary of the Kakaʻako Community Development District). Both stations were built more than 40 years ago, and would eventually require replacement due to age alone.

The Honolulu Police Dept. (HPD) currently has no police facility in Kakaʻako, though the island's Main Station on South Beretania St. is just above Kakaʻako's mauka boundary (S. King St.). Kakaʻako is part of HPD's District 1, Central Honolulu, which includes the downtown Honolulu area from Liliha Street to Punahou Street and from Round Top Drive to Ala Moana Beach Park, including the Aloha Tower.

4.10.8.2 Potential Impacts and Recommended Measures to Mitigate Them

Fire: The projected Kakaʻako residential population growth under the Future Baseline Scenario would, at full build-out, require an increase of ten on-duty fire-fighters (FFs) (or 30 FFs to cover all shifts), two support staff, and two fire trucks. Twice those numbers (i.e., 60 FFs, four support staff, etc.) would need to be added for TOD Alternative A, with the same needs conservatively assumed for the somewhat lower density TOD Alternative B. Thus, the Kakaʻako-specific impact of either TOD Alternative A or B would be annual operating costs associated with the difference in these numbers – which amount to 30 FFs, two support staff, and two fire trucks.

With a current average HFD staff salary a little under $82,000, the average annual personnel cost for each TOD Alternative (A and B) would be about $2.6 million (for the additional 32 positions). One-time purchase costs for fire trucks would be about $500,000 each, or $1 million total.

While the current fire stations will eventually need to be replaced even if there is zero population growth in their service areas, expanded future Kaka'ako populations (and attendant needs for more FFs and equipment) under the various scenarios would necessitate larger and thus more costly replacement structures.

HFD estimates the additional construction cost for each station – over and above replacement costs for stations of the current size – would be in the range of $8 to $10 million. One expanded station would be needed to house the additional FFs and fire trucks under the Future Baseline Condition, and a second expanded station would be needed under each of the TOD Alternatives. Thus, the one-time facility cost impact of the TOD Alternatives (either A or B) would be the $8 to $10 million construction increment for a second station, which will be conservatively operationalized as a single higher-end $9.5 million for purposes of subsequent fiscal cost-revenue analysis. (Including fire trucks, one-time costs are $10.5 million.)

In response to our inquiry, the Honolulu Fire Dept. (HFD)[23] states that HFD's "ability to provide services in Kaka'ako will also be impacted by transit-oriented development, including rail infrastructure, traffic calming, and pedestrian friendly street features, and the potential increase in vertical height of the area's buildings." HFD was, however, unable to quantify such impacts. Regarding slower response times for fires at the top of tall buildings, these would depend on various building-specific factors – such as availability to firefighters of various numbers of elevator banks or stairwells, presence of an auxiliary water supply above 400 feet, layout of floors, and other parameters. (Note that difficulties associated with the provision of water above 400 feet would be associated only with TOD Alternative A and not TOD Alternative B.)

Police: According to the HPD,[24] the projected Kaka'ako residential population growth under the Future Baseline Scenario would, at full build-out, require an increase of about 31 police officers, based on the December 2012 ratio of 8.9 police officers per 10,000 people in District 1. There would also be additional costs at the main station – e.g., equipment, supplies, vehicles, etc., though some of these would of course also be required if the projected population increase occurred elsewhere in District 1 or other places supported by the main station. While the salary range for a City and County police officer currently is between $4,439 to $6,392 per month, HPD concurred with an *augmented* average salary estimate from JMK Associates of $8,000 per month ($96,000 annually) in

---

23 Letter of Sept. 20, 2013 from HFD Chief Manuel P. Neves and various follow-up discussions with Battalion Chief Socrates Bratakos of the Fire Prevention Bureau.

24 Letter of Sept. 13, from Asst. Chief Clayton G. Kau (for Chief Louis M. Kealoha), and various follow-up communications with Research Analyst Emily Ogasawara.

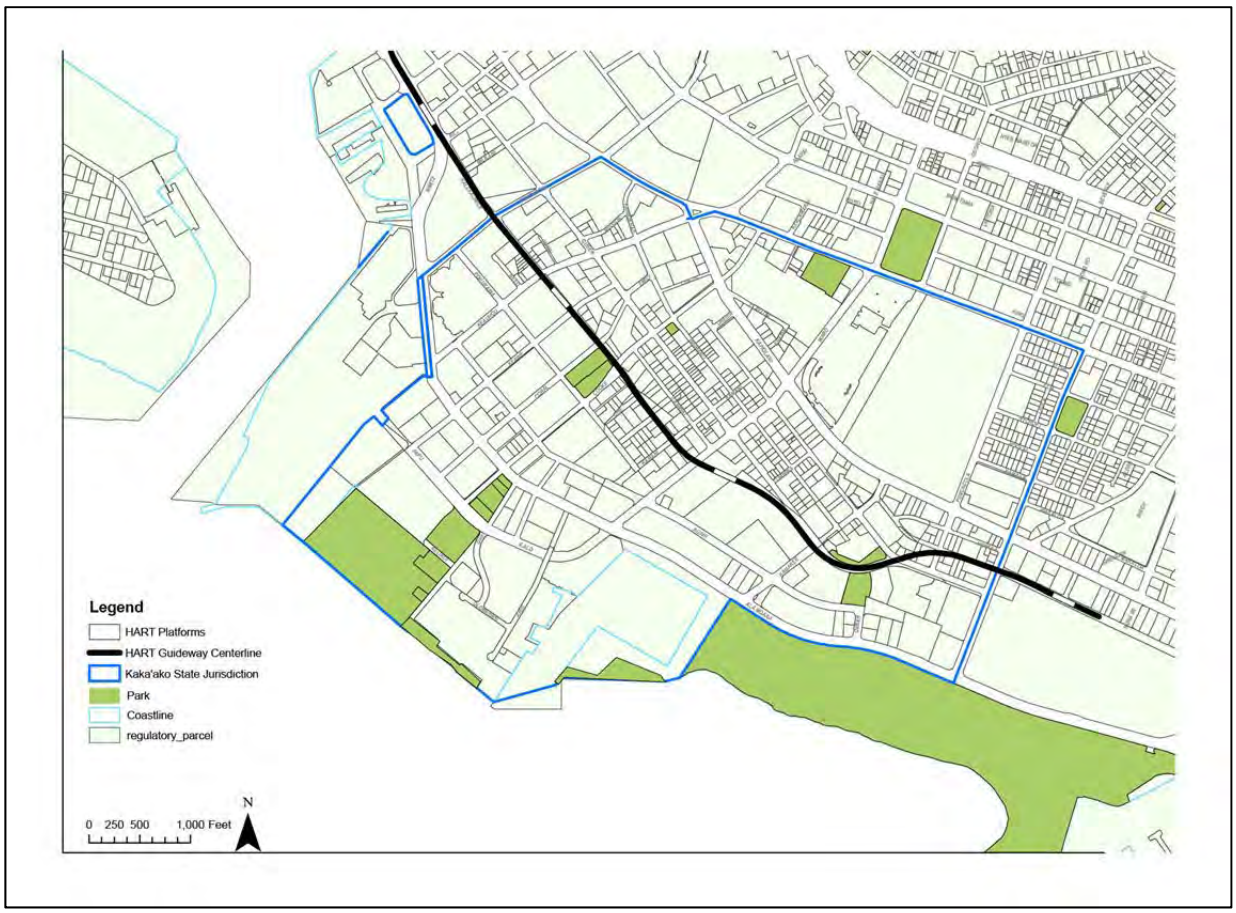
order to include appropriate portions of the supplemental costs. This results in an estimated average annual operating cost impact of $2.976 million at full build-out under the Future Baseline Scenario.

Under TOD Alternative B, the ratio of 8.9 police officers applied to the de facto population at full build-out would generate a total demand for nearly 40 police officers – and, at $96,000/year for salaries and support, a total operating cost increase of $3.8 million. The impact, or difference in figures between the two scenarios, would thus be about 9.45 more police officers and $907,500 additional personnel costs per year.

Under the higher-density TOD Alternative A, this same ratio would generate a total demand for 43 police officers – and, a total operating cost increase of $4.12 million. The impact, or difference in figures between the two scenarios, would thus be nearly 13 more police officers and $1.23 million additional operating costs per year.

Additionally, under TOD Alternative A, the HPD would need to rent space for a small field and report writing office in which officers can complete reports, miscellaneous office-type duties, and other tasks. Discussions between JMK Associates and HPD officials generated an assumed rental cost of $30,000/year ($2,500/month). The same figure may be conservatively applied to TOD Alternative B.

HPD envisioned no construction of new police facilities for TOD Alternative A. Therefore none are envisioned in this analysis for the lower-density Alternative B either.



Although the rail stations in or near Kakaʻako would be constructed with or without the Proposed Action, HPD wished to emphasize its estimate that the overall transit project, regardless of population implications, would require an additional 251 employees of various kinds, with annual cost of about $17.3 million.

4.10.9 Recreational Facilities

4.10.9.1 Results of Analysis

There are currently seven (7) public parks in Kakaʻako occupying nearly 54 acres of land (see Table 4-57). Both the Mother Waldron Neighborhood Park and the Kawaiahaʻo Street Mini Park are managed by the City and County of Honolulu's Department of Parks and Recreation (DPR), while the rest are managed by HCDA. No Kakaʻako parks are managed by the State Parks Division of the Dept. of Land and Natural Resources. Private recreational facilities associated with particular buildings provide another 16 acres in the area (see following table). In addition, DPR's Ala Moana Regional Park abuts the District on the east and serves as a regional park for greater Honolulu. Historic Thomas Square abuts the district on the north. See Figure 4-27.

Figure 4-27: Distribution of Parks, Open Space, and Greenways in the KCDD

Current HCDA rules require that 55 SF of recreational space be allocated per dwelling unit developed in Kaka‘ako. The City and County of Honolulu standards call for 110 SF of green space[25] per dwelling unit for any high-rise multi-family or town house development anywhere on the island. While under these City standards, the provision of green areas within Kaka‘ako has currently been met, it should be noted that the Mauka Area Rules (HAR Chapter 22 §15-217-8) state that “Recreational space” means an outdoors or indoors open space within a development that can be located at any level and is available for recreational use. It is hence limited not only to green space, parks, or playgrounds, but can also include parking areas. In discussions for this EIS, DPR expressed concerns regarding the current inventory of parks and adequacy of their uses in the area.[26] It said the need in Kaka‘ako is not for small private parks sprinkled throughout the region (primarily *passive* uses), but for larger regional *active* green spaces with potential to provide sports fields.

---

25 According to the City and County Land Use Ordinance (Chapter 22 §22-7.5), this requirement is to land area specifically dedicated for parks and playgrounds.

26 Information attributed to DPR is derived from various communications (telephone and written) between JMK Associates and John Reid, staff planner within the City and County of Honolulu’s Department of Parks Recreation, November-December 2013.

Table 4-57: Public and Private Recreational Facilities in Kakaʻako

Public Recreation	Agency/Mgmt.	Acres
Mother Waldron Neighborhood Park	City DPR	2.73

Total:		**16.09**

[a] Kolowalu Park (sometimes referred to as Queen Street Park) was developed by HCDA with thoughts to possibly convey it to DPR upon legislative approval. However this has been delayed because of issues with encroachment of adjacent buildings on the park site.

[b] Park-zone land, including Look Lab site

Source: HCDA. 2014. http://dbedt.hawaii.gov/hcda/files/2014/04/kcdd-park-and-private-recreation-space-032714.pdf

While Kaka‘ako Waterfront Park offers passive recreational uses (such as picnicking, strolling, and jogging), its terrain is too hilly to provide suitable outdoor space for baseball, lacrosse, and other active team sports. The limited availability of land in Kaka‘ako will not allow for another regional park to be built.

However, it is HCDA’s position that the nearby Ala Moana Regional Park is sufficient to meet the future needs of Kaka‘ako’s growing population. HCDA also recognizes that private landowners may be interested in providing active recreational space in new developments to accommodate fitness centers or health clubs to supplement existing parks. Contemporary facilities such as these do not rely upon the availability of large open grassed areas.

The privately funded Kroc Center in East Kapolei has been immensely successful and offers a good example of a non-traditional active recreational facility.
(see: http://www.kroccenterhawaii.org)

The 200,000 square foot two-story building includes the following:

- A 500-seat Performing Arts Center (also used as the Chapel);
- A multi-use indoor Gymnasium (with three basketball courts);
- A Fitness Center with several hundred exercise machines;
- A Preschool facility;
- A 7,500 square foot Conference Center with banquet capabilities;
- A 48-bed Dormitory for traveling sport teams; and
- Several Classrooms (for the Arts Center program)

4.10.9.2 Potential Impacts and Recommended Measures to Mitigate Them

Neither the HCDA (the primary provider of parks and recreational facilities in Kaka‘ako) nor the City DPR currently plans to construct additional parks in or near Kaka‘ako, suggesting that impacts on existing public facilities will be confined to those listed at the start of the above Table, and other nearby regional facilities. However, HCDA plans to develop a Parks Master Plan that would thoroughly study needs and best ways to meet them. Until such a study is completed, recreational impacts remain an “Unresolved Issue.” Nevertheless, an obvious provisional conclusion is that there is potential for congestion at area public parks and a limited supply to meet public demand within Kaka‘ako – particularly in regard to sports fields and playgrounds, a recreational need that has historically not yet been met by requirements for developer contributions.

It is also difficult under present conditions to quantify financial impacts on affected agencies for operations. Even if no new public facilities are provided, as per current plans, HCDA believes that population growth in Kaka‘ako would result in need for additional parks personnel but would little impact any other portion of the budget. Under such conditions, the need for additional maintenance personnel would likely be marginal rather than directly proportional to area population growth – i.e., even if three times as

many people live or stay in Kakaʻako in the future as do today, and no new parks are provided, that would not mean that current parks would require three times the number of maintenance workers. However, HCDA has no way to estimate the required number of additional workers, and JMK Associates could find no reasonable basis for estimates of its own.

Similarly, DPR staff had no estimates of financial impacts on future operational costs (for either the Future Baseline Scenario or the Proposed Action) for their current two small Kakaʻako parks. DPR believes that – unless the proposed Kakaʻako Parks Master Plan leads to development of more active public or private recreational facilities – the greater impact of Kakaʻako population growth on public facilities would be increased pressure on nearby Ala Moana Regional Park. Again, DPR had no estimates of cost impacts for either future growth scenario, nor could JMK Associates determine its own basis for estimating cost implications.

As previously stated, no additional public parks are planned under either the Future Baseline or either of the TOD Alternatives. Therefore, the current estimated publicly funded park facility cost impact is $0. Again, though, the social impacts of overcrowded parks and/or lack of active sports facilities could be significant.

As a result of a public-private partnership with local developer Stanford Carr Development, LLC. (SCD), improvements at the Mother Waldron Neighborhood Park were recently completed (Sept. 2014). The restoration (funded from unutilized private funds from a nearby SCD development) includes a new basketball court and playground, as well as new landscaping and trees, and the restoration of the comfort station and pavilion.

In their conceptual planning process, HCDA planners have noted that future redevelopment of the Neil S. Blaisdell Center by its owner, the City and County of Honolulu, could accommodate a sizeable open space area that could be used for park purposes.

Private recreational space, or at least open space, will be built according to HCDA's current standards of 55 SF of green space per one dwelling unit constructed. Private developers will be responsible for managing their own green space. Green space allocation per dwelling unit under these standards is presented here under the Future Baseline Scenario and will be provided within the two proposed TOD Alternatives (A and B):

- 12,528 additional units under current Rules – i.e., the Future Baseline Condition – times 55 SF equals 689,024 additional SF of green space (about 16 acres).

- Above and beyond the Future Baseline Condition, build-out of TOD Alternative B would create a further 5,513 units and demand for another 303,228 SF of green space (about 7.0 more acres). This difference is the impact for Alternative B.

- Above and beyond the Future Baseline Condition, build-out of TOD Alternative A would create a further 7,892 units and demand for another 434,084 SF of green space (about 10.0 more acres). This difference is the impact for Alternative A.

More than eight acres of public outdoor recreational space have been proposed in the already approved Howard Hughes Corp.[27] and Kamehameha Schools Master Plans[28] (Table 4-58) representing a substantial but still partial response to the total demand, according to the above standards and calculations for the total additional 16 acres under the Future Baseline Condition, 23 acres under TOD Alternative B, and 26 acres under TOD Alternative A.

Table 4- 58: Proposed Public Outdoor Recreation Space

Proposed Public Outdoor Recreation Space from Ward (Howard Hughes) and KS Master Plans	Acres
Ward Neighborhood Central Plaza	3.44
Ward Neighborhood Ewa Plaza	1.00
Ward Neighborhood Diamondhead Plaza	1.00
Park to Park Connection on Cooke Street	2.02
Auahi Street Community Gathering Place	0.57
Total:	**8.04**

4.10.10 Public Infrastructure

4.10.10.1 Kaka`ako

Public infrastructure costs for the Future Baseline Condition are found in past HCDA studies cited in Table 4-59, which also shows updated dollar values and a few adjustments explained below.

City Transportation-Related Costs: Table 4-60 presents the public infrastructure costs for the TOD Alternatives. For TOD Alternative A (subsequently attributed to Alternative B as well), the traffic study (Appendix D) estimates total transportation-related "mitigation" costs would be some $14,433,000 in 2015 dollars (roughly $13,331,000 in 2012 dollars). However, most of these consist of required pedestrian improvements that will likely be passed on to developers. The traffic study suggests that bicycle-related improvements are most likely to be funded by the City Department of Transportation Services (with no cost to the State), as well as the proposed Ala Moana Boulevard "Share Use Path" for pedestrians. Thus, the total transportation improvements are estimated to total approximately $3,178,000 in 2015 dollars (roughly $2,935,301 in 2012 dollars).

[a] Despite lack of currently identifiable costs, broad issues about adequacy of health and recreational services – at both City and State levels – were raised by some agency interviewees. Park costs considered Unresolved Issue.
[b] Though DOE cost figures here include Land Acquisition, job estimates based on Construction costs only.

Water and Sewer (Wastewater): Based on discussions with City agencies, Table 4-59 presents the adjusted Future Baseline figures. The estimated additional infrastructure costs for each of the two TOD Alternatives proved identical. These estimated costs (all adjusted to 2012 dollars) are shown in the following summary for Alternative B (Table 4-60) and Table 4-61 for Alternative A. These tables also identify direct construction job-years associated with Kakaʻako-specific facility/ infrastructure impacts.

Again, many of these costs will be incurred wherever else on Oʻahu (outside Kakaʻako) that future growth in population and/or economic activity would occur under the Future Baseline Condition. The following Section considers the net islandwide public costs attributable just to the growth-*inducing* aspects of the TOD Alternatives, as opposed to the growth-*capturing* aspects primarily analyzed here.

4.10.10.2 Islandwide Public Facility Impacts

This section begins a transition in this report to studying the *net islandwide impacts* of the TOD Alternatives (A or B). These effects are less than the Kakaʻako-specific impacts, because incremental residential population growth in Kakaʻako resulting from the TOD Alternatives would likely occur somewhere on the island under either TOD Alternative A or Alternative B.

The primary component of either TOD Alternative considered to be "net new islandwide impacts" would be the three hotels, along with the visitor population and associated islandwide employment and dependents of employees supported by visitor expenditures. Associated public costs set forth here are also islandwide impacts. As will be established in the following Section, the combined resident and visitor de facto islandwide population impact is estimated for TOD Alternative A as 7,423 average daily population (2,364 new Kakaʻako hotel guests or part-time residents, with the rest comprised of worker households distributed throughout the island). For TOD Alternative B, the comparable figures are 6,768 total (including 2,106 hotel guests or part-time residents). These are conservative numbers for establishing islandwide public service impacts, because they assume that residential workers and dependents represent entirely new or "created" population – in reality, some of the residential population might already be on-island but simply "maintained" by expanded employment opportunities.

All statements in this section flow from the same agency sources and procedures described above for Kakaʻako-specific impacts. A more concise format is possible because the Future Baseline Condition need not be addressed. It involves zero hotels and a fixed base level of part-time visitors. Impacts on public services and facilities can be directly derived from the dwelling unit or population impacts of each TOD Alternative (calculated in the following Section), and these would be dispersed islandwide.

Public Safety – Fire Department: For TOD Alternative A, according to the HFD, the additional net islandwide population would generate a need for three additional on-duty firefighters (nine total, to cover all shifts), one support staff, and probably no new equipment. At current average salaries, the annual additional personnel cost would be a

little under $820,000. The same Operational impact is conservatively assumed for TOD Alternative B

For both TOD Alternatives, no Facility Construction Impacts for the Fire Department are anticipated due to the limited operational impacts described above. It should of course be acknowledged – for all public agencies discussed in this section – that small population increases from any one project contribute over time to new facility and infrastructure needs, but it may still be correctly stated that the Proposed Action will have a negligible effect on such demand.

Public Safety – Police Department: Applying the previously described ratio of 8.9 officers per 10,000 de facto population (with average cost of $96,000 each for salaries plus support costs) to the projected de facto populations calculated in the following Section, the net islandwide Operational Impact at full build-out would be about 6.0 additional police offers and $578,000 additional personnel costs annually for TOD Alternative B. For TOD Alternative A, it would be about 6.6 additional officers and $634,000 additional personnel cost annually.

With regard to Construction Impacts for the Police Department, HPD does not project any facility construction need due to islandwide impacts of TOD Alternative A, and the slightly lower-impact TOD Alternative B would logically not create any facility construction needs either.

Public Health – Emergency Services: According to City budget documents, the total actual FY2012 EMSD budget was $24,181,985. Dividing this number by the 2012 de facto population of 1,019,156 yields a per-capita service cost of $23.73. For TOD Alternative B, that number multiplied by the de facto population increase of 6,768 produces about $161,000 in 2012 dollars. For Alternative A, $23.73 multiplied by a de facto population increase of 7,423 generates an annual Operational Impact of about $176,000 in 2012 dollars. Again, this difference in estimates is not meaningful in any practical terms.

Given the relatively small islandwide population increase, Construction Impacts for Emergency Services would be zero for either of the proposed Alternatives.

Public Health – Hospitals and Health Care Facilities: As discussed previously, the overall Hawai‘i health care system is currently stressed due to a number of factors. Any resident or visitor population growth at all will definitely add to that stress. However, the net islandwide growth attributable to either TOD Alternative A or Alternative B is unlikely to be significant, relative to overall population growth trends.

No Kaka‘ako-specific Facility Construction Impacts are anticipated, and the net islandwide de facto population growth from either alternative is not sufficient to require any specific facility construction elsewhere on the island.

Education: As with other agencies, it is assumed that the Kaka‘ako-specific Operational Impacts are *not* part of the net islandwide impacts, because the TOD Alternatives do not

cause creation of housing or population on O'ahu that would not otherwise take place – it would simply attract more of it to Kaka'ako.

For purposes of this analysis, the relevant project impacts that would affect public education would consist of an estimated 5,354 full-time residents directly or indirectly supported by jobs associated with new hotels and part-time residents in Kaka'ako under TOD Alternative A (4,934 under TOD Alternative B), and conservatively assumed not to be part of the island's population base under the Future Baseline Condition. (See calculations in subsequent Table 4-67.) These residents would be distributed throughout the island.

Given the assumed average household size of 2.95, this implies 1,816 O'ahu households would be created or maintained under TOD Alternative A, and 1,673 households under Alternative B. The procedure for estimating student counts involves application of DOE multipliers, as was done in the Kaka'ako-specific analysis. However, the multipliers used there were specifically for multi-family units in urban Honolulu, and DOE multipliers for other unit types and/or other locations tend to be higher. Because DOE has no generic islandwide average multipliers, we have (with tentative concurrence of DOE) boosted the multipliers used for Kaka`ako specific impacts by 15% to approximate an islandwide average, though we have retained the same estimated per-student cost. With these assumptions, the islandwide operational impacts equate to an additional 353 students and $4.18 million annual operational cost for TOD Alternative A and 325 students and $3.85 million for TOD Alternative B (see Table 4-62).

Table 4-62: Islandwide Operational Impacts on Schools KNOX 7.13 HERE

Islandwide Impact on Schools, by Alternative		Adjusted Student Generation Rates	Islandwide Students Generated	Average Per-Student Cost	Total Annual Impact
TOD Alternative B	Elementary	0.094	158		
	Middle	0.038	63		
	High	0.062	104		
	Total:		**325**	**$11,854**	**$3,852,016**
TOD Alternative A	Elementary	0.094	171		
	Middle	0.038	69		
	High	0.062	113		
	Total:		**353**	**$11,854**	**$4,181,465**

With regard to Facility Construction Impacts, the logic used by DOE and the logic used elsewhere in our analysis for other agencies differ. Other agencies did not assume that the relatively small net-islandwide population impacts would generate facility costs of any magnitude that could be calculated. However, the DOE (and the foregoing analysis for Kaka`ako specific impacts) uses average multipliers per dwelling unit in Kaka'ako, and so

the islandwide analysis here will follow suit. However, the multipliers for this purpose are associated just with units producing the 353 new students (TOD Alternative A) and 325 new students (Alternative B) in Table 4-62.

Exact DOE multipliers for dwelling units change according to location and unit type – both of which are unknown for the islandwide population and housing unit impacts. The DOE uses the same construction cost multipliers previously used in Table 4-56 for Kaka'ako-specific calculations, but reduces the land cost multipliers by an estimated 15% to recognize lower land costs outside the urban core. The resulting analysis suggests an islandwide facility cost impact of about $34 million for TOD Alternative B and nearly $37 million for TOD Alternative A.

Parks and Recreation: Islandwide Operational Cost Impacts for parks and recreation are borne primarily by the City DPR, but potentially also by the State Parks Division of the State DLNR. According to DPR staff, additional net islandwide population would naturally mean more people would use O'ahu parks. However, DPR was unable to determine how this increase in use would generate the need for additional personnel, increase the need for park maintenance and thus impact the overall operating cost.

To address this uncertainty, the socio-economic impact report author, John M. Knox & Associates (hereinafter, "JMK"), developed its rough assumptions for these operational cost impacts. First, JMK assumed the small magnitude of the net islandwide population increase would generate limited overall Operational Impact, primarily cost for additional personnel. JMK assumed these personnel impacts would be similar to those for the Honolulu Fire Department, an agency with roughly the same number of funded positions for Fiscal Year 2012 (**although HFD salaries are higher than those for DPR**). Note that this is a conservative assumption, because the HFD estimate of additional personnel needed for the islandwide population impact exceeded that of the much larger Honolulu Police Department.

JMK adapted the HFD's assumption of ten total additional personnel needed for the islandwide population increase under either TOD Alternative A or B. DPR's FY2012 budget [29] was then used to calculate the cost of adding these additional City workers, by dividing the amount authorized for salaries ($38,039,036) by the authorized number of positions at DPR (1,157.65). This results in a cost per worker of $32,859. The Operational Cost Impact for both TOD Alternative A and B would thus be about $328,590.

Small net islandwide operational impacts on State parks would fall to the DLNR's State Parks Division rather than HCDA, whose responsibilities are largely confined to Kaka'ako. The Director of the State Parks Division said the small estimated increase in net islandwide population is not likely to impact on State parks located on O'ahu. He noted

---

[29] City and County of Honolulu. *Departmental and Agency Reports of the City and County of Honolulu for Fiscal Year July 1, 2011 to June 30*. http://www1.honolulu.gov/csd/wholebook.pdf.

that “State Parks, unlike County Parks, aren't created based on population, rather they are natural or cultural resource based.” [30]

Islandwide Facility Construction Costs would be attributable to any additional facility costs due to net islandwide population increase. However, the net islandwide population increase is sufficiently small that these costs are likely to be zero for both Alternatives.

Islandwide Public Infrastructure: The incremental islandwide population increase related to the three hotels and additional part-time residents under either TOD Alternative A or B is not seen as likely to strain islandwide public infrastructure. While cumulative impacts of small increments of population eventually do create infrastructure needs, the population levels assessed here are sufficiently small that the cost may be appropriately equated to $0.

Summary of Islandwide Costs: Table 4-63 and Table 4-64 summarize the foregoing cost information, and also provide estimates of direct construction job-years associated with islandwide facility/infrastructure impacts.

30 Email Communication with Dan Quinn, Director, DLNR, Division of State Parks. Oct. 14, 2013.

4.10.11 Islandwide Economic Impacts

This Section provides estimates of islandwide impacts. As discussed in Section 1.6 (Methods and Assumptions) of Appendix G, islandwide impacts are actually substantially *smaller* than Kaka'ako-specific impacts, because they are based only on project elements that are assumed not to occur somewhere on the island – whether in Kaka'ako or elsewhere – if transit-oriented development is not implemented in Kaka'ako:

- Construction and operation of three hotels (illustrative hotel types including a full-service hotel for travelers desiring to stay outside Waikīkī, a business-oriented hotel; and a condo-hotel);

- Initial expenditures by an increased number of part-time residents to furnish and accessorize units, as well as large purchases by some for automobiles (these initial one-time expenditures counted along with construction impacts) and ongoing average annual expenditures by part-time residents (counted with operational impacts);

- Construction of additional government public facilities and/or infrastructure required by population growth and development associated with the above factors.

4.10.11.1 Construction: Islandwide Economic & Population Impacts

Islandwide construction impacts flow from development of three hotels and the various public facilities and infrastructure increments discussed in Section 4.10.10, along with initial expenditures by part-time residents to prepare their new homes for occupancy.

Table 4-65 and Table 4-66 show the calculation process and results. Each begins with the key inputs of dollars spent in the Hawai'i economy. Please refer to Chapter 2, Section 2.4 of Appendix G for a complete and detailed discussion of the methodology and assumptions upon which this analysis is based.

Output (Economic Activity): Due to the circulation of money through the economy (multiplier or "ripple" effects), for Alternative B, the initial direct output increment of about $235 million would result in a total $496 million in overall sales, payments, and exchanges (i.e., that much *more* under Alternative B than the Future Baseline Condition). For Alternative A, the total statewide economic impact is $474 million.

Earnings: Of this additional economic activity, for Alternative B, about $75 million would be for direct household earnings of construction workers, supporting professionals, and retailers. With the multiplier effects, the total earnings come to about $150 million. For Alternative A, comparable figures are $73 million and $144 million. Note that given the multitude of assumptions that went into this analysis, the difference between the two Alternatives is likely not significant as the outcome can change based on actual development proposals.

Table 4- 65: Islandwide Construction Impacts – TOD Alternative B

[1] Hard/soft cost distinction not applicable to initial expenditures by part-time residents, though retail multipliers shown in "Hard Cost" multiplier rows for visual convenience. [2] General Excise Tax (GET) calculated as 0.5% of direct of total County output (about 96% of Statewide). [3] Assumed average of 20% of direct construction from off-island. [4] At 1.976 population-to-worker ratio.

Jobs (Job-years): Full build-out under Alternative B would create or maintain about 960 more job-years of direct employment than would full build-out of the Future Baseline Condition – with multiplier effects, total job-years of employment reaches about 2,660. For Alternative A, comparable figures are about 1,075 and 2,680.

Population Impacts: A relatively small proportion of direct construction workers would likely come from off-island, but the on-island direct workers plus indirect/induced workers would support a total population (themselves and dependents) of about 4,935 at build-out – again, this much *more* created or maintained under TOD Alternative B than under the Future Baseline Condition. For Alternative A, the result is almost the same at nearly 5,010.

4.10.11.2 Operations: Islandwide Economic & Population Impacts

Operational impacts discussed here are on an *annual* basis, and flow entirely from new hotel guest spending and the additional annual expenditures of the incremental part-time resident population (i.e., additional numbers present under either of the TOD Alternatives, A or B, compared to the Future Baseline Condition). Please refer to Chapter 2, Section 2.7 of Appendix G for a complete and detailed discussion of the methodology and assumptions upon which this analysis is based.

Table 4-67 shows how earlier results are combined to estimate change from the Future Baseline Condition to TOD Alternative B in the key input of total annual expenditures. It indicates values of various Visitor Expenditure (VE) and Personal Consumption Expenditure (PCE) multipliers from the State's Input-Output (I-O) Model, and indicates interim results used in the following Section analysis of fiscal impacts. Table 4-68 does the same for TOD Alternative A.

Output (Economic Activity): After build-out, the project under TOD Alternative B is estimated to generate about $180 million more in direct output annually than under the Future Baseline Condition. With multiplier effects, the difference in total output would be about $324 million, mostly attributable to spending by hotel guests.

For TOD Alternative A, the direct output impact is about $197 million, and total output impact about $351 million. TOD Alternative A thus generates impacts about 8% - 10% higher than TOD Alternative B.

Earnings: Earnings flowing to households would be about $48 million more under TOD Alternative B than under the Future Baseline Condition due to direct visitor and part-time resident expenditures; about $94 million total impact with multiplier effects annually.

Results for TOD Alternative A are again about 8% greater – direct earnings of $52 million and total with multiplier effects of about $101 million annually.

Total Output	$156,649,540	$87,867,008	$47,747,958	$59,155,274	**$351,419,780**
Total Earnings	$45,308,087	$25,413,966	$13,810,246	$16,699,512	**$101,231,811**
Total Jobs	1,203	675	367	465	**2,709**
Population Impacts					
Visitor and Part-Time Resident Population	835	469	367	693	**2,364**
Total Full-Time Resident Pop. Supported by Source of Economic Activity[5]	2,377	1,333	724	919	**5,354**
DeFacto Population Impact[6]	3,082	1,728	1,052	1,561	**7,423**

[1] Avg. daily population times 365.25 days. [2] From preliminary calculations, Table 2.29 in JMK Assoc. Report. [3] Appropriate base expenditure ("adjusted average" for total expenditures, "accommodations part" for total subject to TAT) times avg. daily population times 365.25 days. [4] Effective rate of 0.459% on total hotel room bills, 0.5% on all other expenditures. The 0.5% is applied to total County output (calculated from County-level multipliers – about 95% of Statewide output). [5] At 1.976 population-to-worker ratio. [6] Visitor population plus 94.5% of resident population.

Jobs (Full- and Part-Time): Direct jobs created or maintained by new hotel guest and additional part-time resident spending would be about 1,200 more under TOD Alternative B. (Note that these direct jobs are *islandwide*, because visitor expenditures are not limited to Kakaʻako.) With multiplier effects, the total job impact is estimated as about 2,500 – again, mostly attributable to hotel guest expenditures.

For TOD Alternative A, comparable figures are a bit over 1,300 direct and 2,700 total, impact figures about 8% - 9% greater than for TOD Alternative B.

Population Impacts: Total additional employment would support a full-time resident population of about 4,930 people (workers plus dependents) more under TOD Alternative B than under the Future Baseline Condition. Subtracting average off-island resident population and adding the visitor population, the total de facto population impact would be nearly 6,760.

Results for TOD Alternative A are 9% - 10% higher – about 5,350 resident population and about 7,425 total de facto population.

All of these impact figures – output, earnings, jobs, and population – represent amounts "created *or* maintained," depending on what else is happening in the economy.

4.10.12 Fiscal Impacts

This Section provides general estimates of fiscal cost-revenue impacts for two levels of local government – the State of Hawai`i and the City and County of Honolulu. The central question for such analyses is simply whether build-out under either TOD Alternative is likely to generate more revenues than costs for each level of government, compared to the cost-revenue balance for build-out under existing HCDA Rules. The answers to this question are subject to ***important caveats discussed in the following sub-section.***

However, the Section first begins with a qualitative discussion about evidence for overall governmental cost savings for concentrated development patterns such as TOD versus dispersed development patterns, and then sets forth quantitative estimates of the impacts of the proposed Alternatives. The quantitative analyses are properly done at the *islandwide* level, and so flow primarily from the results of the previous two Sections rather than the much earlier ones on Kakaʻako-specific impacts.

4.10.12.1 General Principals of Concentrated vs. Dispersed Development

Among other things, the TOD Alternatives will result in a *population shift* of some 12,800 full-time residents (for Alternative A, or 9,100 for Alternative B) into the Kakaʻako area who would otherwise be living "somewhere else" on Oʻahu as of 2035. Though it may reasonably be assumed that many of these people would choose to live in other high-density areas, likely even in other TOD developments around future stations, there is no

way to know exactly where they would choose to live under the Future Baseline Condition. They would almost certainly not be in a single identifiable alternative location, but would be dispersed to various locations throughout the island. Therefore, it is impossible to quantify government costs – especially facility development costs – associated with accommodating this relatively small population[31] under the Future Baseline Condition.

However, both TOD Alternatives are consistent with State and City policies to concentrate much of the island's future growth in Kaka'ako or similar higher-density locations, particularly -related TOD. Those policies reflect general principles of reduced governmental costs and other economic benefits.

For governments, economic benefits associated with TOD-style concentrated development patterns include:

- Savings on city infrastructure and public facilities operations and maintenance costs;
- Increases in municipal revenues;
- Increased property values;
- Lower transportation costs;
- Promotion of local economic development; and
- Savings on health care.

Recent studies[32] have shown that "growth focused in existing urban areas takes advantage of existing infrastructure and capitalizes on the efficiencies of providing service to higher concentrations of jobs and housing."[33] The studies indicate that more dispersed development require more lengthy roads, greater sewer and water systems infrastructure, and generally incur larger operations and maintenance costs than compact development. TOD is able to maximize infrastructure capacity, and keep overall costs down.

Public facilities and services are also more efficient in TOD, where development is more compact by promoting quicker response times for such services as police and fire on a smaller footprint. School grounds in TOD are also more compact,[34] thus decreasing overall operating and maintenance costs. Denser locations (such as TOD), and close proximity to major transit systems are also reported as supporting higher property

---

31 The Hawai'i State DBEDT Long-Range Forecasts a 2035 O'ahu population of 1,071,221. The population shift would thus involve roughly 1% of the island's total number of full-time residents.

32 Examples include (a) The Pacific Resource Partnership (PRP) and Calthorpe Associates (2013). *Honolulu Transit Oriented Development Study Scenarios.* http://www.calthorpe.com/files/Honolulu%20TOD%20Scenarios%20Report.pdf;(b) Center for Transit Oriented Development (2011). *Rails to Real Estate Development Patterns along Three New Transit Lines.* http://ctod.org/pdfs/2011R2R.pdf; and c) Goetz, E.G. et al. 34 Some urban schools now share athletic fields at sites remote from each location.

values. Because of this, compact development typically generates higher local revenues than more dispersed development.

Compact development can help generate revenue for the private sector as well. It is reported that, "Projects near transit are viewed as having the potential to achieve faster absorption rates, higher occupancy rates, and in some cases higher sales prices or rents".[35] Because TOD supports greater proximity to transit, work, shopping and recreational uses, TOD residents also enjoy lower transportation costs, which results in greater overall affordability for households. Additionally, TOD projects have the potential to generate enhanced economic activity related to new construction, neighborhood urban revitalization; thus promoting local economic development. Finally, TOD can help reduce the cost of medical care and impact on local medical facilities, by promoting healthier lifestyles, encouraging walking and biking, and allowing residents enjoy the health benefits associated with reduced energy consumption, which reduce greenhouse gas emissions and air pollution.

4.10.12.2 Methods and Caveats for Quantitative Analysis

It is important to reiterate that results of this analysis focus on the net new *islandwide* components largely common to each TOD Alternative – i.e., three new hotels and an increment in the part-time resident population – plus construction of public facilities and infrastructure (whether in Kakaʻako or elsewhere on island) assumed to occur only due to the TOD Alternatives. There will be many public expenditures required, and revenues raised, in Kakaʻako as a result of the TOD Alternatives that will also be generated no matter where on Oʻahu that new residential and commercial demand is accommodated.

Because the methods underlying this analysis yield results that appear very precise, it is also useful to remind the reader that all the input to this analysis stem from assumed "scenarios" of possible ways that Kakaʻako might build out under existing Rules (Future Baseline Condition) and or proposed TOD Alternatives (A or B). Like every other analysis in this study, the following fiscal cost-revenue calculations are actually *illustrative and indicative* of potential outcomes – not calculations of specific known proposals that developers/landowners have stated firm intentions to carry out.

Furthermore, the ***islandwide inputs to the analysis are very similar, meaning the results will be very similar.*** This Section will present separate results for each Alternative, but will also point out their practical equivalence.

Beyond this general sense of testing the changes in two *very* hypothetical long-term realities, this cost-revenue analysis is constrained by key uncertainties related both to assumed costs and assumed revenues.

---

[35] Center for Transit Oriented Development (2011), *op. cit.*, p. 2.

Government Cost Uncertainties: The analysis of "Public Services and Facilities," pointed out several concerns about costing future facility construction and operations for Kakaʻako and urban Honolulu in general –

- While no new publicly funded Kakaʻako park or recreational facilities are proposed in this EIS, the additional population expected under *either* scenario will greatly impact existing/nearby facilities. HCDA is planning a study of likely recreational needs and solutions that *might* result in more taxpayer-funded facilities. Whether such taxpayer-supported facilities will actually be developed, and whether or to what extent costs would be higher due to either of the TOD Alternatives, remains an Unresolved Issue at the time of the preparation of this EIS. It is probably the most critical of the issues noted in this short series of bullet points.

- Similarly, Hawaiʻi in general faces challenges to provision of enough public health facilities – private or public – as the population grows. While either one of the TOD Alternatives is highly unlikely to determine the nature of the final response to these challenges, it should be remembered that some additional public expenditures are likely to be needed under any of the scenarios, including the Future Baseline.

Furthermore, as discussed in Chapter Two, Section 2.8 of Appendix G, government costs and revenues – for both services and for capital expenditures – generally balance out for residential population increases, and so this analysis estimates service costs only for transient populations and includes no averaged capital costs. However, as a strongly conservative step, islandwide service and facility costs (particularly DOE facility costs) are included if they were attributed by the agencies to Kaka`ako. It is not clear that this is appropriate, since it could be viewed as double-counting, but these costs *will* be included, albeit subject to comment about their overall effect on results.

Government Revenue Uncertainties: All revenues cited in this analysis come from standard tax sources typically associated with the sorts of costs that have been listed. However, the HCDA is an atypical agency – it is a *development authority* with the powers to impose public facilities dedication as a condition for developing real property within the community development district. That means it is possible that some currently unknown amount of revenues will come not from overall taxpayers, but initially from developers and ultimately from residential or commercial purchasers/lessees.

Beyond the foregoing caveats and uncertainties … the full methodology, including explanation of assumed multipliers, is to be found in Chapter 2, Section 2.8 of Appendix G. As noted there, analysis for each level of government must be divided into:

1. The Construction phase, which for this analysis involves the *cumulative* effects of all construction over time; and
2. The Operational phase, which is properly assessed at a representative point-in-time *annual* basis.

In a standard fiscal cost-revenue analysis, results of both phases would be presented together in a single table for each TOD Alternative by year, with cumulative figures indicating points in time when any negative balance for Construction might be eventually offset by potential positive balances for Operations. That is not possible for this sort of hypothetical analysis with unclear timeframes, but the textual interpretation of the tables will note when and if such offsetting results are found.

As with other islandwide analyses, this analysis reflects inputs that are already "impacts" (i.e., differences between each of the TOD Alternatives and the Future Baseline Condition), and then calculates results from those. This generates results identical to those that would flow from the more cumbersome procedure of separately calculating Future Baseline Condition and TOD Alternative results, and then subtracting.

4.10.12.3 Construction Phase

State: The upper parts of Table 4-69 and Table 4-70 indicate that construction elements, in and of themselves, would result in about a $2.3 million net revenue *loss* for the State for TOD Alternative B and a larger $6.5 loss for Alternative A. The private-sector portions of the equation (hotels and part-time residential population) generate overwhelmingly positive returns. However, these are substantially, though not entirely, offset by the very conservative inclusion of DOE public school costs for land acquisition and construction.

In an analysis of this nature, these apparent net losses are actually relatively small and fairly similar. Perhaps more importantly, **they would be offset by considerably larger annual Operational phase positive balances** (see following Operational Phase Sub-Section) at build-out. As will be seen, just one year's net Operational positive balance for State government would wipe away the calculated loss from the Construction phase under either TOD Alternative A or B.

City and County of Honolulu: The lower parts of Table 4-69 and Table 4-70 show modest positive balances of a little over $2 million each for the City and County of Honolulu related to TOD Alternatives B and A, respectively. This is in part because of the assumption that County revenues are limited to a modest share of the General Excise Tax (GET) derived from construction activity.

It also reflects the very small County costs *or* revenues that can be directly associated with this very marginal addition to a much larger directed growth strategy. In the "bigger picture," as per studies discussed at the outset of this Section, concentrated development on average is more cost-effective for municipal governments than is dispersed development.

Table 4-69: State and County Fiscal Cost-Revenue Impacts – Construction Phase – TOD Alternative B

[3] Previously calculated in Table 4-68.

4.10.12.4 Operational Phase

State: The upper parts of Tables 4-71 and 4-72 indicate the State would receive considerably more revenues than costs (about $14.1 million each year for TOD Alternative B and a roughly equal $14.8 million for Alternative A) due to operations of the net new islandwide components. This is because service costs associated with new transient hotel and part-time resident populations – as well as service costs for residents conservatively assumed to be on-island only because of these economic activities – are greatly outweighed by State tax revenues.

City and County of Honolulu: The lower parts of Tables 4-71 and 4-72 have two "bottom lines." As explained in Chapter 2, Section 2.8.2 of Appendix G, county government portions of the Transient Accommodations Tax (TAT, the "hotel room tax") have recently been capped by the State Legislature, such that additions to the lodging inventory under present law would not add to county coffers on any island. But for the long range, it seems reasonable to project the results if the cap is removed and additional TAT money again flows to counties under the previous formula.

If municipal revenues are limited to the GET and increased property tax values for the three hotel sites, the differences between the City and County's revenues and costs – a positive $0.08 million and negative $0.41 million for Alternative B – are essentially zero, considering all the uncertainties in this analysis.

If the TAT is restored, the analysis suggests the TOD Alternative A would generate a small positive annual balance for the County of about $1.2 million per year, and an essentially similar $0.7 million for Alternative B. Even these greater positive figures are quite small in light of the uncertainties underlying this analysis, although they are achieved in the face of various conservative assumptions. The real conclusion to be drawn from the County portions of Table 4-71 and Table 4-72 is that the project is unlikely to have any real perceptible impact at all on annual County operating budgets.

Table 4-71: State and County Fiscal Cost-Revenue Impacts – Operational Phase – TOD Alternative B

[1] As noted in Section 2.6 of Appendix G, services costs are appropriately limited mostly to transient populations (hotel guests and incremental part-time resident populations), but any increases in operational spending for selected agencies are conservatively included as well. Transient population service costs again estimated as $1,406.02 for State and $968.50 for County.

[2] Previously calculated in Table 8.4. [3] Construction value times rate of $12.40 per $1,000.

4.10.13 Summary of Social Impacts

Honolulu and urban O`ahu are regarded as places of great natural beauty with a unique quality of life. However, O`ahu faces a number of challenges including high housing costs, high energy prices, high levels of traffic congestion and automotive vehicle dependence, increasing obesity rates, urban design that restricts or limits walking and healthy activities, and a high level of dependence on imported oil for energy and mobility. The Proposed Action can help to address each of these challenges, particularly in urban areas where good bus service and pedestrian infrastructure is already in place, amenities and services are abundant, and major job centers are in close proximity. The implementation of the Proposed Action in the KCCD represents the region's best opportunity to create a thriving urban neighborhood that reduces per capita demands on energy, land, and other valuable resources; creates affordable housing opportunities; and reduces the overall cost and impact of living, while simultaneously building a culturally rich and vital urban neighborhood in the heart of urban Honolulu.

In addition, there is a direct correlation between infill redevelopment supporting housing and employment within central urbanized Honolulu, and reducing development pressure in outlying regions. The Proposed Action embraces TOD strategies as a positive tool for land use planning. The State Office of Planning's report, *Leveraging State Agency Involvement in Transit Oriented Development to Strengthen Hawaii's Economy* (DBED&T, December 12, 2012), defines TOD as follows:

> "TOD is an implementation tool for achieving "smart growth," defined as compact, mixed-use, transit-linked, and walkable communities. Its primary goal is to reduce consumption of undeveloped land by concentrating development, rather than allowing low-density suburban sprawl to consume a larger land area."

In Kaka`ako, the Proposed Action will allow for a development density increase, shifting from a baseline average of 5.0 FAR (accounting for parking structures within a development, or 3.5 FAR with no parking structures) to between 8.5 and 10 FAR, and with up to 12 FAR in exceptional circumstances (a total of 3 *Iconic* towers). Finally, the Proposed Action proposes no new development in the Makai District related to the proposed transit stations, allowing this area's growth and primary uses to remain in the public domain.

The following outlines some of the fundamental benefits resulting from the implementation of the Proposed Action.

4.10.13.1 Improved Public Health

Studies show significant linkages between transportation and public health. Transit rich environments, such as Kaka`ako, will benefit not only from important statistical

reductions in traffic injuries or fatalities[36], but also reduced air pollution and increased levels of daily physical exercise[37]. This has broad implications for public health, and reduced medical costs. Studies show that obesity rates tend to fall sharply with increased walking, cycling and transit use. [38]

To encourage these positive effects, the Proposed Action applies the research. The Mobility and Access and Urban Design chapters of the TOD Plan (Appendix A) propose characteristics of the circulation network – such as the frequency of street connections, type of street design and street level uses – that are shown to influence a person's choice to drive, walk, bike, or take transit. [39] For example, an easy to navigate street grid with many intersections typically yields lower levels of auto travel, and a higher likelihood of travel by more sustainable modes.[40] [41]

The in-depth analysis of future transportation mode share and intersection function (even with substantial population growth) presented in the Kaka`ako TOD Plan (Appendix A) provides a transformational break with business-as-usual traffic planning and engineering. It introduces a vision for safe, and broadly accessible cycle routes, new pedestrian connections, and safer streets, and emphasizes walking.

4.10.13.2 Alternative Travel Options: Right to Mobility

Not all of us drive. In fact about one third of the US population is typically without access to a vehicle due to age or circumstance. However, in compact, mixed transit oriented neighborhoods such as what is envisioned under the Proposed Action for Kaka`ako, as a community we are better able to address this phenomenon by allowing individuals and families to reduce their reliance on autos, and in so doing, provide better mobility for non-driving populations.[42] [43] People who live or work in accessible, multimodal communities, with a mixture of services and within convenient walking distance of

transit, tend to drive 20-40% less, and use alternative modes such as transit, walking and biking more than residents of conventional, automobile-oriented communities.[44]

The Proposed Action not only provides better future access to the rapid transit project to improve regional mobility to non-drivers via the two major stations within the District, but it also further builds upon the current Ward Neighborhood and Kamehameha Schools Master Plans. Both of these Plans are dedicated to introducing more street level activity and have been engaged by HCDA to allocate space for new local circulation options for both vehicles and pedestrians.

The Proposed Action integrates this vision into the District as a whole, highlighting approximately 11 new potential street segments. It also outlines a series of street design improvements – from Primary Pedestrian streets – to connect key destinations to low speed streets and greenways. The Proposed Action directly seeks to:

- use safety as the primary design standard in street design, and prioritizes improvements to street connectivity within ½ mile of planned stations;
- provide more pedestrian street crossings at closer distances, even across the high speed and fast moving Ala Moana Boulevard;
- allow for slower Traffic Speeds and auto-free zones;
- achieve gracious sidewalks throughout the district;
- introduce innovative transportation projects – such as bike share stations and a Halekauwila Cycle track to support the mode shift from autos to bicycles;
- provide fixes for priority, high collision intersections;
- enables HCDA to plan and implement fun, temporary uses and programmed streets, such as streets activated with markets or the Eat the Street festival;
- highlight the potential for a downtown/Kaka`ako/Ala Moana Circulator (trolley);
- guide the placement of future local service for TheBus as well as integrate policy for bus stop design; and
- improve transportation efficiency and network capacity by moving more people in the same amount of space. The Proposed Action, for example, seeks to balance modes and use underutilized streets like Queen Street, Cooke and Ward Avenue.

4.10.13.3 Social Equity

The Proposed Action benefits social equity in three ways

1. Improved access to housing

The primary goal of the Proposed Action is to encourage more housing in an accessible location proximate to existing job centers. The historical trend of high demand for residential housing on O`ahu coupled with strong economic conditions could conceivably result in housing development meeting expectations in the 2035 timeframe, especially if

[44] Litman, T. 2011. "Land Use Impacts on Travel Behavior, How Land Use Factors Affect Travel Behavior," Victoria Transportation Policy Institute.

infrastructure investments identified in the Proposed Action are prioritized to support these intensive levels of development.

Within the District, proposals for more intensive land uses with taller buildings will provide a greater number of total units than what is allowable under the Future Baseline Condition. Under the current HCDA Reserved Housing Policy, 20% of all new units will be built as reserved housing. In order for landowners and/or developers to achieve density incentives, reserved housing may even take on greater percentages in some areas.

The Proposed Action also continues the strategy developed in the Mauka Area Plan (2011) to preserve characteristics of neighborhoods with existing resident populations or historic and institutional uses, particularly in the Sheridan and Civic Center neighborhoods (neither of these neighborhoods are eligible for participation in the TOD Overlay Plan's supplementary height and density programs).

While the potential redevelopment of some existing residential and commercial properties is possible, resulting in the displacement of some occupants and/or businesses, the addition of new housing opportunities and new commercial activities in the KCDD, both under the Proposed Action and the Future Baseline Condition, will provide new housing and commercial opportunities which could enable displaced residents and/or businesses to relocate elsewhere in the District, thereby mitigating to some degree the impact of displacement.

2. Provision of additional community amenity

Taller, more intensive building uses are not allowed "as of right" but become incentive based, tied to the provision of infrastructure improvements or community amenities. This is in addition to policies within the Mauka Area Rules that emphasize the livability of new buildings, with limitations on bulk and attention to design quality, as well as provisions to encourage green roofs and landscaping treatments.

As part of the implementation process, HCDA commits to developing a system that will tether the allocation of more built capacity to pay for needed community amenities. This enables HCDA to have a conversation with the community about what is needed in the District, and represents a tool to make Kaka`ako a livable, urban place. Amenities identified in the Proposed Action include pedestrian facilities, pocket parks and open space, and particularly desired uses – such as art and educational facilities.

3. Right to mobility

There is also a clear household and community wide cost-savings attributed to transit use. Families that are able to own less vehicles per household can spend those dollars elsewhere. Furthermore, walking and cycling are the most sustainable transport modes, and are affordable by virtually everyone.

4.10.13.4 An Intelligent Approach to Parking

As areas urbanize, with more people and uses competing for access to the same destinations, parking becomes highly contested. The availability and supply of parking is one of the strongest indicators of a population's likely transit mode share, with free and readily available parking strongly correlated with reduced transit ridership.[45] Applying measures to manage parking efficiently achieves the broader planning objectives of supporting more compact development, encouraging transit use, and increasing development affordability.

The Proposed Action studies where and how to manage parking as a public resource, with a particular emphasis on both long-term "park once" systems (residential or employee parking) and short-term (visitors and shopping) parking needs. When implemented, the Proposed Action will offer a menu of different types of on-street parking treatments, provide a basis for market-based pricing of parking, explore context-sensitive parking requirements for new land uses, and provide progressive measures to introduce options for shared parking resources between uses. The Proposed Action also incorporates policies to encourage long term parking management strategies at the District scale to provide more efficient utilization.

4.10.13.5 Reserved Housing

High-rise development provides a better opportunity for the provision of reserved housing than single-family unit residential development because the land and infrastructure costs for high-rise development are distributed among a greater number of units. In addition, the sale of high-priced units in a building can help offset (subsidize) the cost of the units reserved for lower income families. The cost of developing single-family units makes it difficult to achieve affordability without government subsidy. While there are successful government programs, it is clear that they alone cannot meet the demand.

The Proposed Action is intended to increase the number of reserved housing units in three fundamental ways. First, as discussed above, by adhering to the HCDA 20% Rule (20% percent of all new units constructed must be reserved for families/individuals who qualify under federal affordability guidelines), the increase in density envisioned in the Proposed Action will result in a greater number of units coming to market, and a proportionate increase in the number of those that reserved.

Second, the Proposed Action includes height and density bonuses that are intended to encourage developers to participate in the provision of reserved units. Simply put, a developer could be allowed to increase the density of a structure in exchange for what are described as "exemplary public benefits". The result is an incentive based process whereby the HCDA can achieve increased provision of reserved housing.

---

45 Litman, T. 2011. "Land Use Impacts on Travel Behavior, How Land Use Factors Affect Travel Behavior," Victoria Transportation Policy Institute.

Third, by relaxing the parking standards per dwelling unit, by untethering parking from residential units in deference to the District's proximity to rail and employment centers, and by increasing building heights (in the case of TOD Alternative A), the HCDA is attempting to bring down the development cost of units, which would result in their increased affordability. If it is possible to include more units in a building because fewer floors must be dedicated to onsite parking and more floors are allowed, then arguably the cost of constructing the building can be distributed among a greater number of units, thereby lowering the cost of each.

4.10.13.6 Displacement of Existing Residents/Tenants/Businesses

The potential transformation of the Mauka Area under either the Future Baseline Condition or the Proposed Action could result in the displacement of some existing residents and/or businesses, as the result of property redevelopment or because increasing property values may result in higher real property taxes which certain businesses may not be able to afford. This is a natural consequence of a community based redevelopment initiative. However, as discussed briefly above, the provision of new residential and commercial opportunities within the very same community will help, to some degree, to offset the negative impacts of displacement. Properties within the Sheridan Neighborhood portion of the KCDD and the Central Kaka`ako Neighborhood are particularly susceptible to this potential outcome. It may become necessary for HCDA to consider adopting measures that could aid property owners and/or tenants affected by displacement.

4.11 Infrastructure

4.11.1 Potable Water

4.11.1.1 Affected Environment

The public water system, including fire hydrants, on the island of O`ahu is owned and operated by the Honolulu Board of Water Supply (BWS). Groundwater is pumped from aquifers, treated to become potable, and stored in reservoirs located at various locations and elevations throughout the island. Transmission pipelines deliver the water from the well pumps to the reservoirs; and distribution pipelines deliver the potable water to the individual property lots/blocks.

The distribution lines within the KCDD vary in size from a minimum of 6-inch diameter to a maximum of 20-inch diameter. Further descriptions of the existing water system can be found in the Kaka'ako Community Development District "Makai Area Plan", dated October 2005 and "Final Supplemental Environmental Impact Statement, Mauka Area Plan", dated May 2009, Volume III, Appendix E - Mauka Area Infrastructure Plan (MAIP). It is noted that the extent of the water distribution system within both the Makai and Mauka Areas is quite good, with pipelines within most streets.

The Makai Area Plan and MAIP are the base documents on which the Proposed Action will be applied. As the Proposed Action affects only properties within the Mauka Area Plan, the majority of this section will focus on the Mauka Area Plan; however, Aloha Tower Special District will also reviewed.

The MAIP described the criteria and assumptions used for calculating water consumption and distribution line sizing. It provided water system performance requirements and calculated water demand. Specifically, the Year 2030 projected average daily flow was calculated as 7.15 million gallons per day (mgd).

System improvements proposed in the MAIP to address the Future Baseline Condition include:

- Replacing approximately 900 lineal feet (LF) of 12-inch diameter water main with 18-inch diameter water main from the Punchbowl 180 Reservoir to South King Street; this proposed improvement is outside of the Mauka Area.
- Replacing the existing 16-, 12-, and 8-inch diameter transmission lines from the Makiki 180 Reservoir to South King Street with approximately 6,600 LF of 18-inch diameter water main; this proposed improvement is also outside of the Mauka Area.
- Replacing approximately 1,400 LF of 12-inch diameter water main along Kapiolani Boulevard with 18-inch diameter water main.
- Replacing approximately 2,900 LF of 8-inch diameter water main along South Street with 18-inch diameter water main.
- Replacing approximately 1,000 LF of 12-inch diameter water main along Cooke Street with 18-inch diameter water main.
- Replacing approximately 1,800 LF of 12-inch diameter water main along Kamakee Street with 18-inch diameter water main.
- Replacing approximately 2,700 LF of 12-inch diameter water main along Ala Moana Boulevard with 18-inch diameter water main.

A map from the MAIP (MAIP Figure 15) depicts these improvements proposed in 2009 (see Figure 4-28). These improvements represent the Future Baseline Condition. HCDA has no schedule for the design or construction of the above-proposed improvements.

The MAIP specified that each development/redevelopment applicant must address fire flow for fire protection of the premises. It discussed water allocation and system facilities charges, specifically that projects within State lands will require a water allocation from BWS and will be required to pay Water Facility Charges for Resource Development, Transmission and Daily Storage. In addition, each applicant will be required to provide BWS with development specific water demands and associated infrastructure to address the proposed demands. BWS will determine water availability on a case-by-case basis during City Building Department permit application review. The MAIP noted that for park

redevelopment BWS suggested that the applicant investigate the availability and use of non-potable water and to provide a report of the investigations findings.

The MAIP provided a condition assessment of the existing water system and a review of water main breaks as of October 2008. The assessment suggested that portions of the following streets might need replacement based on the break location and replacement history:

- Ala Moana Boulevard, 300 LF of 12-inch diameter main between Ward Avenue and Kamakee Street.
- Cooke Street, 400 LF of 8-inch diameter main between Kapiolani Boulevard and South King Street
- Kapiolani Boulevard, 1,400 LF of 12-inch diameter main between Ward Avenue and Kamakee Street
- Keawe Street, 560 LF of 6-inch diameter pipe between Auahi and Pohukaina Streets.
- Ward Avenue, 200 LF of 12-inch diameter pipe between Kapiolani Boulevard and South King Street.

The MAIP included BWS correspondence requesting that HCDA submit a revised water master plan to BWS.

Figure 4-28: Future Baseline Condition Water System Improvements

Since October 2008, BWS has completed the Ward Avenue 12-Inch and 8-Inch Mains project. This project installed approximately 2,400 LF of 12-inch diameter and 8-inch diameter mains and appurtenances along Ward Avenue, from Kinau Street to Kapiolani Boulevard. This was a replacement project; therefore, the abandoned water pipes remain in the road.

BWS is currently constructing the Kona Street Water System Improvements project. This project will install approximately 2,450 LF of 8-inch diameter main and appurtenances along Kona Street, from Kona Iki Street to Atkinson Drive. The estimated completion date for this project is December 2014. This is a replacement project; therefore, the abandoned water pipes are to remain in the road.

The majority of other water system improvement projects involved the installation of new meters or fire hydrants, which were done for private parcel development. Additionally, as part of the City's sewer force main project, a portion of the 12-inch diameter main within Ilalao Street (Makai Area) was relocated in year 2012.

There have been 35 water main breaks between October 2008 and April 2013. Table 4-73 summarizes the break information where there have been two or more breaks within a block. Although the cluster and number of breaks may not suggest that additional water mains require replacement, it was noted that 10 of the 35 breaks were on 6-inch and 8-inch diameter mains that were installed prior to 1960.

Table 4-73: Summary of Water Main Breaks in the KCDD from October 2008 to April 2013

Street	Crossing Streets	Remarks
Forrest Avenue	Ala Moana Boulevard and Papu Street – Makai Area	Breaks occurred on 1/9/2011 and 2/26/2011; 22 LF of 8-inch diameter (8") pipe and 8 LF of 12" pipe were replaced.
Keawe Street	Auahi and Pohukaina Streets – Mauka Area. DMAP proposed replacing this water line.	Breaks occurred on 12/19/2009 and 8/3/2010 (2 breaks); 12 LF of 6" pipe was replaced in total.
Keawe Street	Ala Moana Boulevard and Ilalao Street – Makai Area	Breaks occurred on 2/5/2010 and 9/13/2010; 14 LF of 8" pipe was replaced in total.
Koula Street	Ala Moana Boulevard and Ilalo Street – Makai Area	Breaks occurred on 1/27/2009 and 6/24/2012; 19LF of 6" pipe was replaced in total.
Auahi Street	Cooke Street and Ohe Street – Mauka Area	Breaks occurred on 11/16/2011 and 3/18/2013; repaired with clamps.
Queen Street	Ward Avenue and Cummins Street – Mauka Area	Breaks occurred on 12/28/2010 and 3/20/2012; 20 LF of 6" pipe was replaced in total.
Kona Street	Pensacola Street and Kamakee Street – Mauka Area	Breaks occurred on 7/13/2009, 12/26/2009, 10/15/2012; 23LF of 6" pipe was replaced in total.

Future planned BWS projects within the mauka area include:

- Pensacola Street Water System Improvements. This project will install: approximately 2,300 LF of 12-inch diameter main and appurtenances along Pensacola Street, from Kapiʻolani Boulevard to Young Street; and approximately 750 LF of 8-inch diameter main and appurtenances along Pensacola Street from Young Street to Kīnaʻu Street. The design is ongoing; and construction is tentatively scheduled for fiscal year 2015. This will be a replacement project; therefore, the abandoned water pipes will remain in the road.
- Ala Moana Boulevard 24-Inch Main. This project will install approximately 6,200 LF of 24-inch diameter main and appurtenances along Ala Moana Boulevard, from Ward Avenue to Atkinson Drive. Design is tentatively scheduled for fiscal year 2016; and construction is tentatively scheduled for fiscal year 2018. This will be a replacement project; therefore, the abandoned water pipes will remain in the road.
- Ala Moana Water System Improvements, Part II. This project will install:
  - Approximately 2,500 LF of 24-inch mains and appurtenances along Aloha Tower Drive, from Richards Street to S. Nimitz Highway and along Ala Moana Boulevard from S. Nimitz Highway to Keawe Street.
  - Approximately 810 LF of 8-inch diameter main and appurtenances along Keawe Street and Koula Street, from Ala Moana Boulevard to Ilalo Street. Design is tentatively scheduled for fiscal year 2016; and construction is tentatively scheduled for fiscal year 2018. This will be a replacement project; therefore, the abandoned water pipes will remain in the road.
- Honolulu District 42-Inch Mains - Liliha to Moiliili (Phase I). This project will install approximately 11,000 LF of 42-inch diameter main: along Beretania Street, from Liliha Street to Richard Street; along Richard Street, from Beretania Street to King Street; along King Street, from Richard Street to Victoria Street; and along Victoria Street, from King Street to Kīnaʻu Street. Design is tentatively scheduled for fiscal year 2017; however, there is no construction schedule. This will be a new main project; therefore, any existing water pipes within the road will remain in service.
- Honolulu District 42-Inch Mains - Liliha to Moiliili (Phase II). This project will install approximately 9,000 LF of 42-inch diameter main along King Street, from Victoria Street to Isenberg Street. Design is tentatively scheduled for fiscal year 2018; however, there is no construction schedule. This will be a new main project; therefore, any existing water pipes within the road will remain in service.

In addition, the BWS is proposing to install approximately 1,040 LF of 20-inch diameter main along Cooke Street from Ala Moana Boulevard to the intersection with Kapiolani Boulevard as part of a future BWS project (Honolulu Water System Improvements) that will require an Environmental Assessment.

4.11.1.2 Potential Impacts and Recommended Measures to Mitigate Them

As part of planning for the Proposed Action, the water master plan was updated for the Kakaʻako Mauka Area and Aloha Tower Special District (see Appendix J). A summary of the Water Master Plan Update is provided below.

At the request of BWS, a study was undertaken to review consumption rates based on recent water meter billing records, which resulted in the proposed consumption rates in Table 4-74, below.

Table 4-74: Estimated KCDD Water Consumption Rates Under the Proposed Action

Land Use	Current Average Daily Consumption Rate	Proposed Average Daily Consumption Rate
Single Family Residential	500 gallons/unit	500 gallons/unit
Multifamily Residential	400 gallons/unit	200 gallons/unit
Civic / Office	n/a	120 gallons/1,000 square feet (sf)
Commercial/Restaurant	69 gallons/1000 sf (3,000 gallons/acre)	300 gallons/1000 sf (13,100 gallons/acre)
General/Light Industry	92 gallons/1000 sf (4,000 gallons/acre)	92 gallons/1000 sf (4,000 gallons/acre)
School	60 gallons/student	60 gallons / student

Applying these consumption rates and planned Howard Hughes Group (HHG) developments as provided by Wilson Okamoto Corporation (see Appendix J) resulted in the following estimated average daily consumption rates:

Future Baseline condition: 6.74 million gallons per day (MGD)
TOD Alternative A: 7.85 MGD
TOD Alternative B: 7.54 MGD

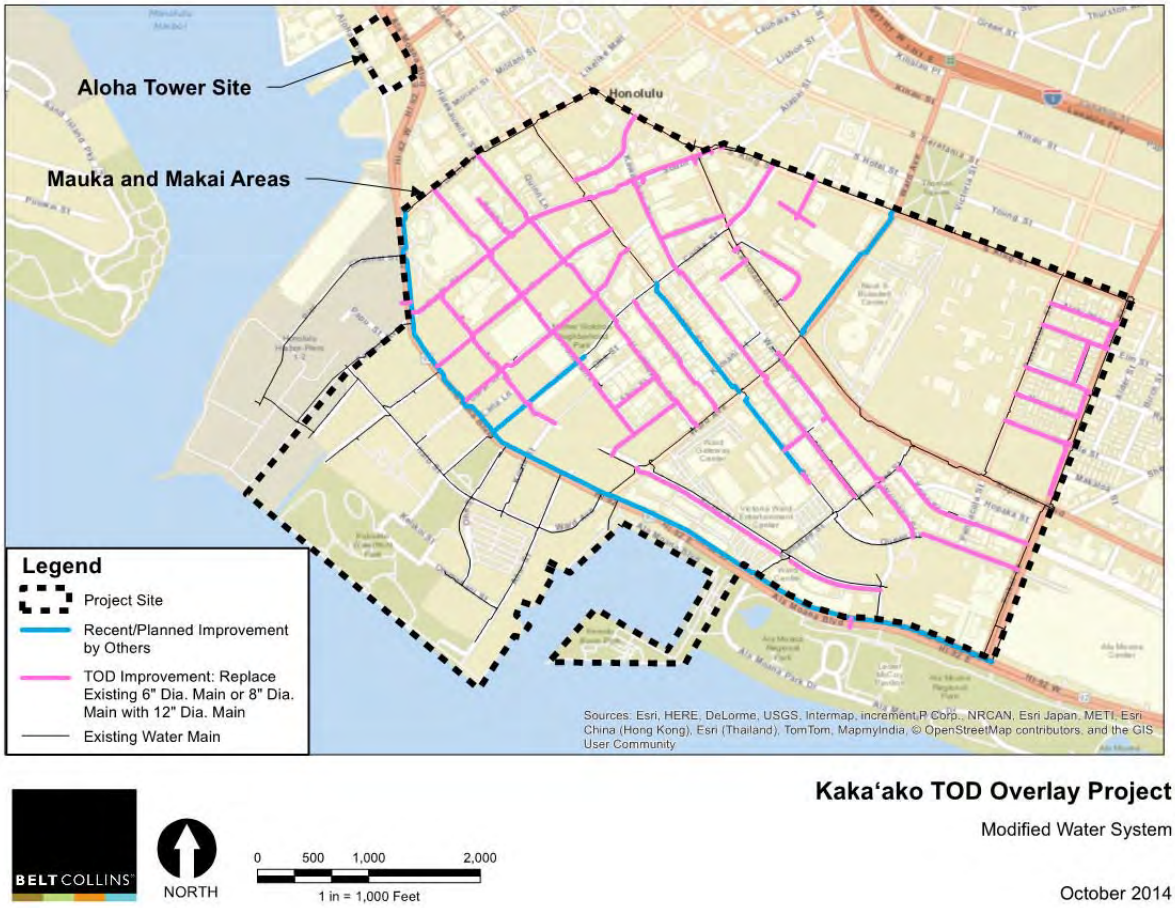
The existing water distribution system was modeled; however, the following improvements were included when evaluating future development scenarios:

- Ward Avenue – BWS completed replacement of an existing 12-inch diameter main with a new 12-inch diameter main and a new 8-inch diameter main from Kapiʻolani Boulevard to Kīnaʻu Street.
- Ala Moana Boulevard – BWS planned replacement of the existing 12-inch diameter main with a new 24-inch diameter main from Aloha Tower Drive to Kalākaua Avenue.
- Cooke Street – BWS planned replacement of the existing 12-inch diameter main with a new 20-inch diameter main from Ala Moana Boulevard to Pohukaina Street.
- Queen Street – HHG planned replacement of the existing 6-inch diameter main with a new 12-inch diameter main from Cooke Street to the existing 12-inch diameter main located between Cummings Street and Kamakee Street.

An analysis of the water distribution system was conducted using the following planning criteria from the *Water System Standards:*

- Pipelines shall be sized to accommodate maximum daily flow plus fire flow with a minimum residual pressure of 20 pounds per square inch (psi) at fire hydrants;
- Fire flow for the entire KCDD shall be 4,000 gallons per minute (gpm); as the KCDD is envisioned to be a densely developed area similar to Waikīkī or downtown Honolulu;
- Pipelines shall be sized to accommodate peak hour flow with a minimum residual pressure of 40 psi; and
- The maximum velocity in distribution mains without fire flow shall be 6 feet per second.

The analysis results were as follows:



- The modeled water distribution system is adequate to meet the peak hour domestic demands for all scenarios.
- The modeled water distribution system is inadequate to meet the fire flow requirement. Specifically, fire hydrants along existing 6-inch diameter water mains do not have adequate residual pressure to support a 4,000 gpm fire flow; and the flow velocities in the 6-inch and 8-inch diameter water mains were well above the generally accepted maximum velocity of 10 feet per second. By replacing all 6- and 8-inch diameter water mains with 12-inch diameter mains, the resulting analysis showed that the modified water system is adequate to meet the fire flow requirements. The modified water system is shown on the following page.

Since the replacement of all 6-inch and 8-inch diameter water mains with 12-inch diameter mains is not a BWS or HHG planned improvements, the cost of the approximately 37,600 linear feet replacement needs to be borne by the developments within the KCDD. The estimated cost of this replacement is $41,900,000.

The existing KCDD Mauka Area water system as modified by planned BWS and HHG system improvements and the suggested replacement of approximately 37,600 linear feet of existing 6- and 8-inch diameter mains with new 12-inch diameter mains will be capable of meeting both peak hour domestic consumption demand requirement and 4,000-gpm fire flow requirement. (see Figure 4-29)

No additional “regional” water system improvements are required specifically to support the system. However, all developments need to pay their fair share portion of the 6-inch and 8-inch to 12-inch diameter water main replacement cost.

Figure 4-29: Water System Modifications Required by Proposed Action

4.11.2 Wastewater Collection and Disposal

4.11.2.1 Affected Environment

Wastewater is collected by a system that consists of gravity mains, wastewater pump stations (WWPS) and sewer force mains. Wastewater from the KCDD area is conveyed to the Ala Moana WWPS, located on Keawe Street; a 60-inch diameter and a 78-inch diameter force main then conveys the wastewater to the Sand Island Wastewater Treatment Plant (WWTP), located on Sand Island, between the Honolulu International Airport and downtown Honolulu, for treatment and disposal. The City Department of Environmental Services (City ENV) maintains the sewer system; and the City Department of Planning and Permitting Wastewater Branch (City DPP-WB) is responsible for planning and design of the sewer system. It also manages sewer connection requests.

The sewer system within the KCDD consists of a combination of: local collection mains, from 6-inch up to 14-inch diameter pipe, and regional trunk/relief sewers, from 18-inch

to 78-inch diameter pipe. Further descriptions of the existing sewer system can be found in the KCDD Makai Area Plan and Mauka Area Infrastructure Plan (MAIP). It is noted that the extent of the sewer system within both the Makai and Mauka Areas is quite good, with sewer lines within most streets.

The Makai Area Plan and MAIP are the base documents on which Proposed Action will be applied. As the Proposed Action affects only properties within the Mauka Area Plan, the majority of this section will focus on the Mauka Area Plan; however, Aloha Tower Special District was also reviewed.

The MAIP described the criteria for calculating wastewater flow and calculated wastewater demand. Specifically, the base year 2030 used in the MAIP projected flows were calculated as:

- 28.7 million gallons per day (MGD) average wastewater (sewage) flow
- 172 MGD design peak flow

System improvements proposed in the MAIP to address the Future Baseline Condition include:

- Replacing the existing 34- to 36-inch diameter pipes along Ala Moana Boulevard:
  - From Punchbowl Street to Ward Avenue with 150 LF of 36-inch diameter pipe and 1,200 LF of 48-inch diameter pipe.
  - From Ward Avenue to Keawe Street with 1,900 LF of 48-inch diameter pipe.
- Replacing the existing 16- to 18-inch diameter pipes along South King Street from Cooke Street to Piikoi Street with 2,300 LF of 21-inch diameter pipe and 1,100 LF of 24-inch diameter pipe.
- Replacing the existing 18- to 24-inch diameter pipes along Cooke Street from South King Street to Auahi Street with 1,200 LF of 24-inch diameter pipe, 250 LF of 27-inch diameter pipe, and 1,600 LF of 30-inch diameter pipe.
- Replacing approximately 83% of the existing 60-inch diameter pipes along Ward Avenue between Auahi Street to South King Street with 2,600 LF of 66-inch diameter pipe.
- Replacing the existing 36-inch diameter pipes along Kapiolani Boulevard from Piikoi Street to Kamakee Street and along Kamakee Street to Auahi Street with 330 LF of 48-inch diameter pipe and 2,440 LF of 42-inch diameter pipe.
- Replacing the existing 78-inch diameter pipe along Auahi Street from Ward Avenue to Keawe Street and down Keawe Street to Ala Moana Boulevard with 1,200 LF of 84-inch diameter pipe and 1,200 LF of 90-inch diameter pipe.

A map from the MAIP (MAIP Figure 14) depicts the sanitary sewer system improvements proposed in 2009 (see Figure 4-30). These improvements represent the Future Baseline Condition. HCDA has no current schedule for the design or construction of any of the proposed improvements.

Figure 4-30: Future Baseline Condition Sewer System Improvements

The MAIP discussed the City ENV regulation of industrial wastewater discharges pursuant to the Revised Ordinances of Honolulu (ROH) Chapter 11, which requires that all wastewater plans be submitted to the State Department of Health for approval. It requires all new or renovated development applicants of the requirement to submit a "Site Development Division Master Application Form", with at least the sewer connection permit checked. Other possible permit requirements and the sewer system design standards were also discussed.

The MAIP provided a condition assessment of the existing sewer systems.

- Based on the results of the City's 2009 closed-circuit television (CCTV) inspection videos, it was concluded that no sewer line segments required rehabilitation or replacement based solely on condition.
- The accumulation of fats, oils and grease (FOG) was identified as a major concern as the buildup of FOG within sewer pipes would reduce the pipe's available cross-sectional area and subsequently reduce the amount of flow that could pass through the pipe. Coordination with the City to mitigate FOG buildup was suggested.

The MAIP included City DPP correspondence stating that a wastewater master plan is required and that the submittal and review of the wastewater master plan could be separate from the EIS review process.

With regard to future projects, upon receipt of the "Site Development Master Application for Sewer Connection", the City DPP-WB will determine if adequate sewer capacity is available for the proposed improvements. Permission to connect to the City's sewer system will either be granted unconditionally, or if a deficiency exists, granted on the condition that the developer makes certain off-site improvements.

All new connections to the City's sewer system will incur a Wastewater System Facility Charge (WSFC) in accordance with the Revised Ordinances of Honolulu, Chapter 14, Article 10. The WSFC is a function of the number of units for a residential development and the size of the potable water meter for non-residential units. An equivalent single-family dwelling unit count (ESDU) is computed for the proposed development. Each ESDU carries a dollar amount, varying with the type of development and the year assessed. The construction cost of an off-site improvement may be credited against the WSFC provided the improvement will be a benefit to the general population, not just the individual development.

Since preparation of the MAIP (January 2009), system conditions have been evaluated. The Ala Moana WWPS presently has the following operating characteristics:

- Peak design flow: 142.85 million gallons per day (MGD)[46]

[46] Peak design flow and average design flow reference: metro: http://www1.honolulu.gov/env/wwm/plants/sandisland.pdf

- Average design flow: 65.71 MGD
- Maximum daily flow (between August 2, 2011 and July 21, 2013): 98.3 MGD, March 6, 2012[47]
- Minimum daily flow (between August 2, 2011 and July 21, 2013): 33.5 MGD, October 17, 2011
- Peak flow during December 2010 rain events: 106.5 MGD, December 19, 2010[48]

The City ENV had no reported sewage spills within the January 2011 to November 2012 timeframe.

A current project by the City ENV project to CCTV inspect sewer lines within the Kaka`ako Area is nearing completion. The City ENV is currently reviewing the "Gravity Sewer Assessment Program Draft Preliminary Sewer Assessment Report for the Kakaako Area" dated June 29, 2012. The Report's Table 9 identified sewer lines recommended for replacement/upsizing within the following KCDD streets: Punchbowl Street (1 area); Auahi Street (2 areas); Kapiolani Boulevard (3 areas); Ward Avenue (2 areas); Halekauwila (1 area); South King Street (1 area); and Piikoi Street (3 areas). Of all the above noted recommendations, only 235 linear feet of 6-inch diameter main within Halekauwila Street was recommended to be upsized to a minimum 8-inch diameter main.

The City ENV's six-year capital improvement projects and budget for fiscal year 2013 to 2018 include the following projects within the KCDD:

- Kapiolani Area Revised Sewer System. The existing 36-inch diameter line along Kapiolani Boulevard from Kalakaua Avenue to Kamakee Street was rehabilitated; work was completed in October 2009.
- Ala Moana and Kapiolani Trunk Sewer Replacement/Rehabilitation.
    - The existing 69-inch diameter line along Ala Moana Boulevard from Ward Avenue to Keawe Street was rehabilitated; work was completed in April 2012.
    - A second project to rehabilitate the existing 69-inch diameter line along Ala Moana Boulevard from Ala Moana Beach Park to Ward Avenue is scheduled to be completed in December 2014.
- Ala Moana Boulevard/Auahi Street Sewer Rehabilitation.
    - The existing 6-feet by 6-feet box line rehabilitation along Auahi Street from Ward Avenue to Keawe Street is scheduled to be completed in December 2014. NOTE: the MAIP proposed upsizing this line to an 84-inch or 90-inch diameter line.
    - The existing 6-feet by 6-feet box line rehabilitation along Keawe Street from Auahi to Ala Moana Boulevard is currently under construction, no completion date is available. NOTE: the MAIP proposed upsizing this line to a 90-inch diameter line.

---

47 Maximum and minimum daily flow data obtained from City ENV on July 22, 2013.

48 Hourly flow data for the month of December 2010 obtained from City ENV on July 22, 2013.

    - The existing 14-inch diameter line along Ward Avenue from Auahi to Ala Moana Boulevard was rehabilitated; work was completed in August 2011.
    - The existing 36-inch diameter line along Ala Moana Boulevard from Ahui Street to Keawe Street was rehabilitated; work was completed in April 2012. NOTE: the MAIP proposed upsizing this line to a 48-inch diameter line.
- Ala Moana Wastewater Pump Station Force main No. 2 Rehabilitation. Spot repairs were performed on the existing force main; substantial completion was issued on August 2012.
- Ala Moana Wastewater Pump Station Force Mains No. 3 and 4. New force mains will be installed from the Ala Moana WWPS to the Sand Island WWTP to provide back-up capacity and convey projected peak wet weather flows. The project is scheduled to be completed in May 2015.
- Ala Moana Park Wastewater Pump Station and Alternatives. A proposed new WWPS near the Diamond Head entrance to Ala Moana Park, or alternative site along the route from Ala Moana Park to Kaka'ako will be evaluated. This project is still in the planning phase; the planning phase is scheduled to end in January 2014.
- Ala Moana Wastewater Pump Station Upgrade. Upgrade the WWPS capacity from 167 MGD to the projected peak flow, is still under evaluation. The project's planning phase is scheduled to begin January 2013 and end January 2016.

It is noted that of the above listed capital improvement projects only the Ala Moana Wastewater Pump Station Force Mains No. 3 and 4 project increased the City's sewer capacity.

The City ENV prepared the "Sand Island Wastewater Treatment Plant & Sewer Basin Facilities, Phase 1 Area, Oahu, Hawaii Final Environmental Assessment/Environmental Impact Statement Preparation Notice" (Sand Island WWTP EISPN) dated January 2010[49]. The Sand Island East Sewer Tunnel is one of four gravity sewer tunnel (GST) alignments being considered in the Sand Island WWTP EIS PN. The GST would extend from the Sand Island WWTP to Moana Park pump station (located at the east end of Ala Moana Beach Park) along one of three routes; all routes would traverse through the Kaka`ako Makai Area. The Sand Island WWTP EIS PN does not mention any projects within the Kaka`ako Mauka Area.

Per HCDA's June 18, 2013 meeting with City ENV and City Department of Design and Construction, Wastewater Division (City DDC-WD), additional information regarding the City's wastewater plans and operations were provided. Specifically:

[49] The Sand Island WWTP EIS-PN evaluated alternatives for upgrading and improving the major conveyance infrastructure in the Sand Island WWTP service area and the hydraulic capacity at the Sand Island WWTP to meet the service demands to year 2030 and beyond.

- City ENV, City DDC-WD and City DPP-WB has been collaborating to address future wastewater needs and plans for subsequent wastewater improvements for TOD projects.
- City ENV will be replacing its current "static" wastewater flow calculation model (INFIX) with a "dynamic" model produced by InfoWorks®. The new dynamic model will incorporate rainfall radar imagery and address rainfall runoff attenuation/lag.
- A preliminary alignment of the Makai Relief Sewer Corridor (mentioned in the Sand Island WWTP EIS PN as the Sand Island East Sewer Tunnel) and a Mauka Relief Sewer Corridor was provided to HCDA. The Mauka Relief Sewer Corridor is being proposed to accommodate additional sewer flows generated within the Mo`ili`ili area should the Rail project extend beyond Ala Moana. Completion of the Mauka Relief Sewer Corridor is required by year 2020 as an alternative to the Amended Consent Decree requirement to upgrade the Fort DeRussy WWPS or implement an alternative project.
- The City ENV is currently refining the proposed alternatives information, including alignment/location, for inclusion in the subsequent Sand Island WWTP Environmental Impact Statement.
- The following sewer system constraints were noted:
    - Sand Island Wastewater Treatment Plant (WWTP)[50].
        - Currently there is only one digester at the Sand Island WWTP; therefore, the system has a solids processing constraint.
        - As City ENV and City DDC-WD have only recently received the 2009 Kaka`ako MAIP, the City ENV has neither reviewed the Plan improvements nor has the City ENV included the 2009 MAIP's projected increased sewer flow into their Sand Island WWTP capacity projections.
    - No outfall issues were noted. City ENV stated that it does annual condition assessments of the outfalls.
- Other sewer system notes:
    - City ENV will investigate whether Ala Moana WWPS capacity upgrades are necessary to accommodate the additional development being proposed by both the Ala Moana and Kaka'ako TOD Overly projects.

When the City relined the 69-inch diameter main within Ala Moana Boulevard, it noticed that the 36-inch diameter main within Ala Moana Boulevard had minimal flow; as such the City abandoned the 36-inch diameter main within Ala Moana Boulevard.

4.11.2.2 Potential Impacts and Recommended Measures to Mitigate Them

As part of the Proposed Action, the sewer master plan was updated for the Kaka'ako Mauka Area and Aloha Tower Special District (see Appendix K). A summary of the Sewer Master Plan Update is provided below.

50 The Sand Island WWTP service area encompasses the area from Salt Lake to Niu Valley.

The land use categories and corresponding average daily flow used to generate wastewater flow are provided in Table 4-75, below.

Table 4-75: Methodology for Sewage Flow Rates

Use	Unit Capita	Unit	Average daily flow rate (gpd)
SF Residential	4 residents	Dwelling	80
MF Residential	2.8 residents	Dwelling	80
Civic / Office	300 employees	Acre	25
Retail	140 employees	Acre	25
General/Light Industry	100 employees	Acre	25
Parking Structure	1 employee	Each	25
School	1 student	Per 80 sf	25
Restaurant	1 cover	Per 25 sf	5 gal/cover @ 6 services per day
Cinema	Metered water consumption rates used in lieu of population estimates based on patronage.		

Applying these rates resulted in the following average daily flow rates:

Future Baseline condition: 5.3 MGD
TOD Alternative A: 6.5 MGD
TOD Alternative B: 6.2 MGD

The existing sewer system was modeled; however, for the Future Baseline and TOD Alternative A scenarios[51], the following Howard Hughes Group (HHG) proposed improvements were also included:

- Install a 24" relief sewer in Ward Avenue between Ilaniwai and Auahi Streets;
- Reroute the 48" trunk sewer from under the Ross Dress for Less and Sports Authority stores into Ward Avenue;
- Replace the 6" sewers in Pohukaina Street between Koula and Ward Avenue with 12" sewers;
- Install a 36" sewer in Auahi Street between Kamakee Street and Ward Avenue; and
- Replace the 8" sewer in Auahi Street between Kamakee Street and Queen Lane with a 12" sewer.

[51] As TOD Alternative B resulted in a marginal decrease in flow from the TOD Alternative A, TOD Alternative B was not analyzed separately; any TOD Alternative B improvements would also be required for TOD Alternative A.

As the analysis resulted in surcharged sewers in the Existing, Future Baseline Condition, and TOD Alternative A scenarios, the following mitigative measures were included in the sewer system model:

Future Baseline Condition:

- Replace 480 LF of 10" sewer on Pohukaina Street between South and Keawe Streets with a 12" sewer; and
- Upsize 305 LF of HHG's planned sewer in Pohukaina Street between Ahui Street and Ward Avenue from 12" to 18" diameter.
- City's proposed diversion of sewage flows from the 60" Ward Avenue trunk sewer; a minimum of 27 MGD was used in the analysis.

See Future Baseline Sewer System Figure 4-31.

TOD Alternative A:

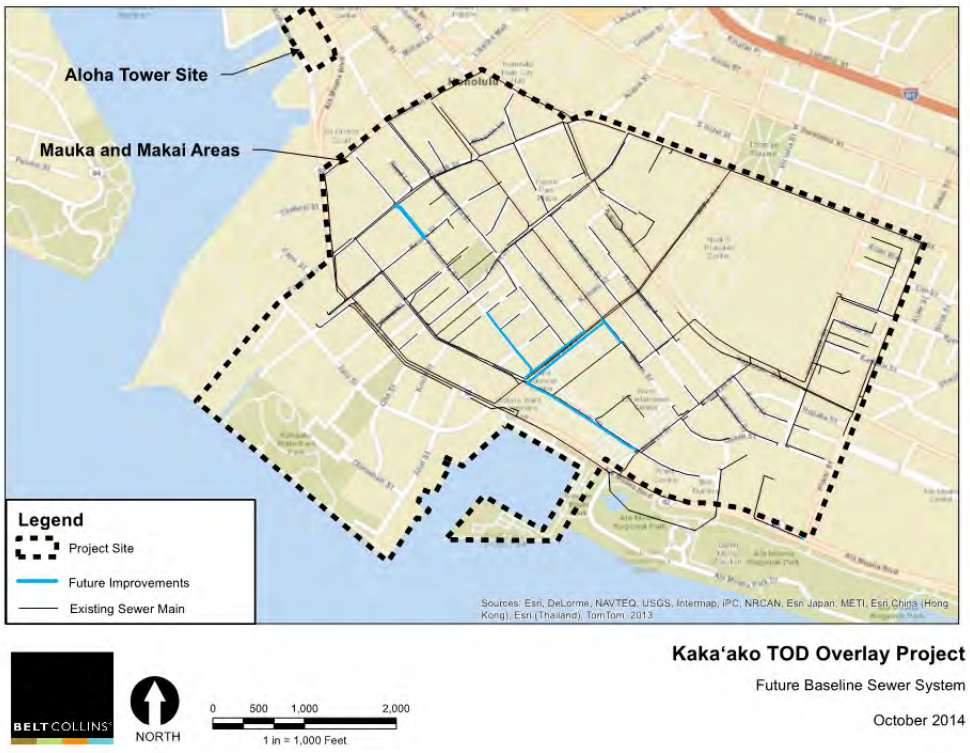
- Replace 480 LF of 10" sewer on Halekauwila Street between South and Keawe Streets with a 12" sewer;
- Replace 310 LF of 8" sewer on Keawe Street makai of Halekauwila Street with a 12" sewer;
- Replace 250 LF of 6" sewer on Ilaniwai between Kamani Street and Ward Avenue with an 8" sewer; and
- Upsize 305 LF of HHG's planned sewer in Pohukaina Street between Ahui Street and Ward Avenue from 12" to 18" diameter to 24" sewer in Ward Avenue. Sewer demands from Blocks 48N and 55 (KS D) are redirected to this line as the adjacent 6" and 8" sewers are inadequate.

See TOD Alternative A Sewer System Figure 4-32.

The analysis results indicated that, even with the proposed diversion and sewer system improvements in place, a number of existing branching sewer mains would remain surcharged. (Under ideal conditions the top of a branching sewer is typically set at an elevation equal to the top of the trunk sewer to minimize surcharging of the branching sewer.) The branch sewer profiles suggest external factors such as a conflicting utility precluded a higher invert connection or larger pipe diameter; therefore, surcharging of the branching sewers is practically unavoidable. The following branching sewers will remain surcharged as a result of connecting to the trunk sewer at or near the trunk sewer invert:

- The 8" sewer, ID 4065997, at the intersection of Auahi and Coral Streets;
- The 24" sewer, ID 3014925, at the intersection of Cooke and Auahi Streets;
- The 30" sewer, IDs 685449, 685488, and 3010720, on Auahi Street between South and Keawe Streets;

Figure 4-31: Future Baseline Condition Sewer System



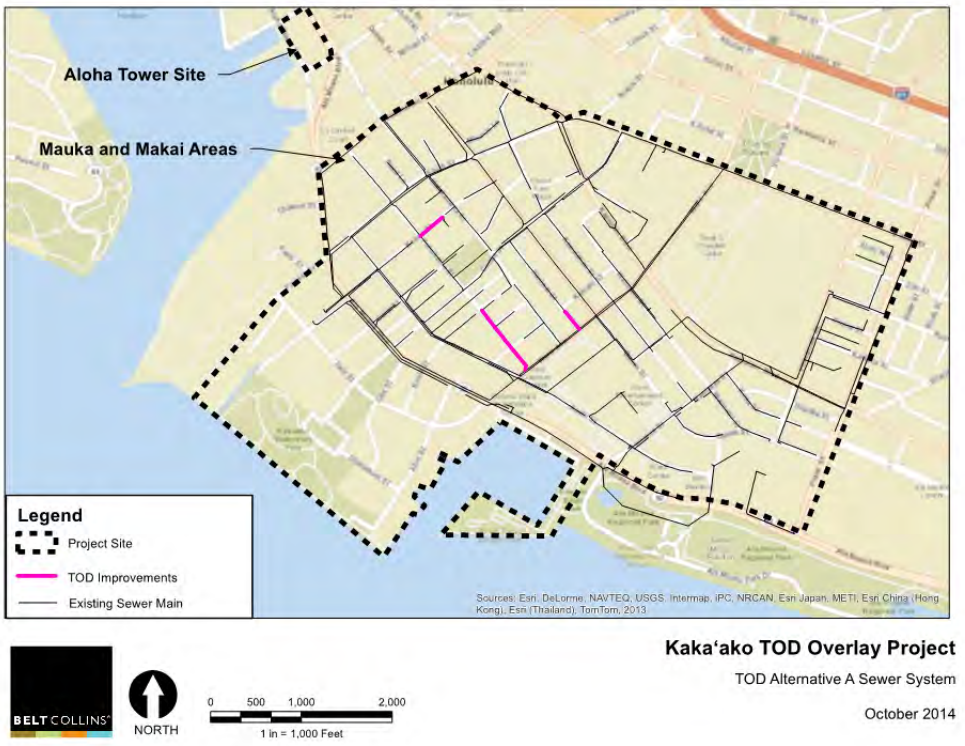


Figure 4-32: TOD Alternative A Sewer System

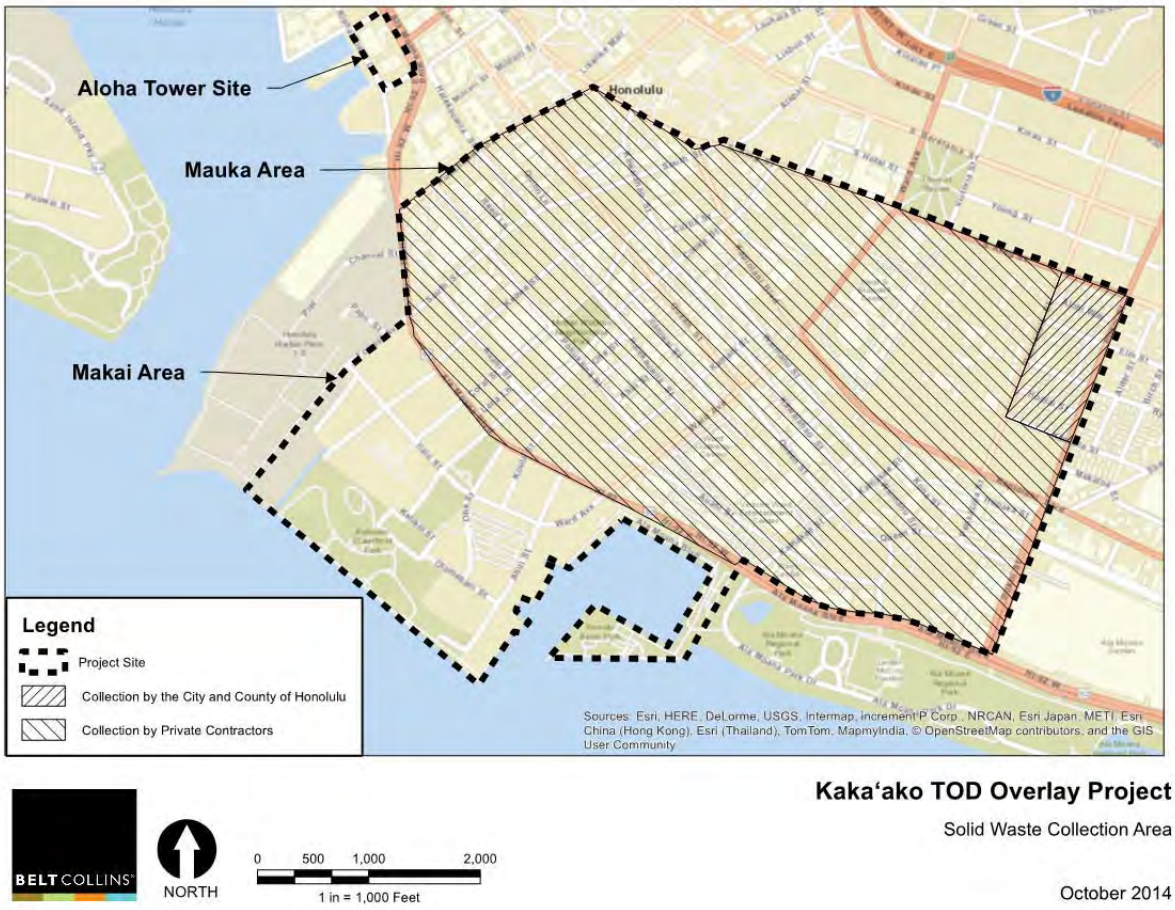
- The 10" sewer, ID 4026585, at the intersection of Halekauwila and Cooke Streets;
- The 6" sewer, ID 344232, at the intersection of Archer Lane and South Beretania Street;
- The triple barrel 12" sewers, ID 3015527, at the intersection of Kapiʻolani Boulevard and Pensacola Street;
- The 21" sewer, ID 380522, on Kapiʻolani Boulevard, just west of Pensacola Street; and
- The 8" sewer, ID 4047070, 12" sewer, ID 4046376, and 18" sewer, ID 2023300 connecting to the 36" Kamakeʻe Street sewer.

The costs for the non-City or HHG proposed improvements are:

- Future Baseline improvements: $3,400,000
- TOD Alternative A improvements: $1,100,000
- Total sewer improvement cost: $4,500,000

The existing KCDD Mauka Area sewer system as modified by planned HHG system improvements and Future Baseline Condition and TOD Alternative proposed improvements will be capable of meeting peak hour flow requirements. Surcharged conditions will, however, continue to be experienced in branch sewers, but given the sewer line depths, spills will not occur.

The previously noted City's Mauka Relief Sewer Corridor project will significantly impact the Mauka Area's wastewater master plan. Per discussion with City ENV, the City does not have a schedule for completing the Mauka Relief Sewer Corridor. ENV acknowledged that the project is behind schedule and that they will need to complete the improvements by year 2020, implement an alternative project, or request to extend the completion date.



A sewer connection application was submitted for the Aloha Tower Special District (ATS), and on October 12, 2013 the application was approved by DPP-WB. Therefore no additional sewer improvements are required for this property.

4.11.3 Solid Waste Collection and Disposal

4.11.3.1 Affected Environment

Solid waste is trash/rubbish generated by residences and businesses. The City Department of Environmental Services Refuse Division (City ENV-RD) manages the collection, disposal and recycling operations for the majority of residences in the Mauka Area. The City ENV-RD does not collect solid waste generated by businesses or commercial developments; private contractors service them. Figure 4-33 depicts the solid waste collection areas serviced by City ENV-RD and by private contractors.

Figure 4-33: Solid Waste Collection Area

The City ENV-RD collects solid waste twice a week, on Tuesday and Friday. Private contractors that currently collect solid waste from the Mauka Area for disposal include Rolloffs Hawaii and Honolulu Disposal Service.

The City ENV-RD does not collect industrial or hazardous waste; such as hazardous chemicals, paint, used oil, propane tanks, batteries, etc. Information on what can be recycled and disposal instructions is available in the City's website: http://www.opala.org/solid_waste/what_goes_where_table.html#electronic Generators of waste that cannot be taken to a City facility need to contract with appropriately licensed contractors to dispose of industrial or hazardous waste.

There are no existing or proposed solid waste disposal facilities located within the Mauka Area. All collected solid waste is disposed of outside of the Mauka Area; at refuse transfer stations, recycling centers, composting/mulch sites, the Waimānalo Gulch Sanitary Landfill, the H-POWER plant in Campbell Industrial Park, other State Department of Health permitted facility, such as the PVT Landfill in Nanakuli.

4.11.3.2 Potential Impacts and Recommended Measures to Mitigate Them

No modifications to the solid waste disposal program within the Mauka Area are proposed. Expansion of private contractor provided collection services might be required to meet future increased demands.

4.11.4 Drainage

4.11.4.1 Affected Environment

Storm water runoff is collected by a drainage system that consists of catch basins, drain inlets, and road curb inlets, discharging to open drainage channels or underground conduits that outlet to the ocean. The City Department of Facilities Maintenance (City DFM) maintains the storm drain system; and the City Department of Planning and Permitting Civil Engineering Branch (City DPP-CEB) is responsible for planning and design of the storm drain system and manages storm drain connection requests.

The underground storm drain conduits within the Kaka`ako Community Development District (KCDD) road rights-of-way are a combination of circular pipes ranging from 18-inch to 72-inch diameter and box culverts ranging from 2.5-feet by 1.25-feet to 16-feet by 9-feet. Further descriptions of the existing storm drain system can be found in the KCDD Makai Area Plan dated October 2005 (Makai Area Plan) and Final Supplemental Environmental Impact Statement for the Revisions to the Kaka'ako Community Development District, Mauka Area dated May 2009, Volume III, Appendix E - Mauka Area Infrastructure Plan (MAIP). It is noted that within both the Makai and Mauka Areas storm drain lines are within most streets.

4.11.4.2 Potential Impacts and Recommended Measures to Mitigate Them

The Makai Area Plan and MAIP are the base documents utilized to determine impacts and measures that may be necessary to mitigate them. The MAIP describes the criteria to calculate rainfall runoff and states that the existing major trunk drain lines would discharge an estimated 2,500 cubic feet per second of rainfall runoff to the ocean.

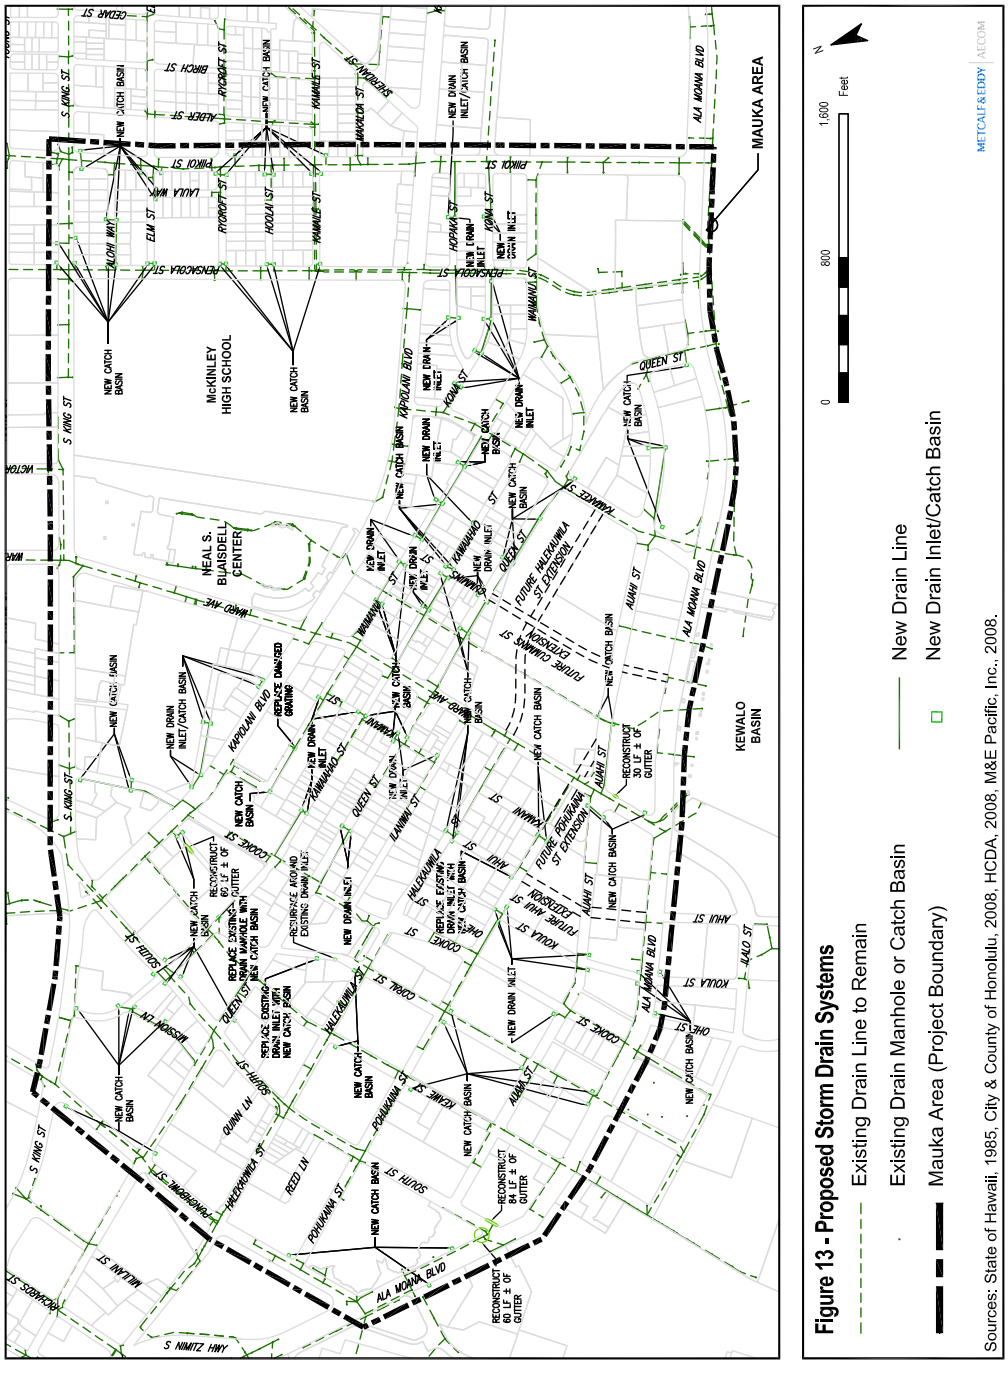
System improvements proposed in the MAIP to address the Future Baseline Condition include:

- Locations recommended to receive pavement resurfacing to relieve identified substantial ponding concerns; specific locations listed were:
  - Waimanu Street between Ward Avenue and Kamakee Street
  - Cummins Street between Waimanu Street and Queen Street
  - Hopaka Street between Kona Street and Pensacola Street
  - Kona Street between Kamakee Street and Piikoi Street
- Locations recommended to receive drain inlets and/or catch basins to relieve more frequent, day-to-day, rainfall events; specific locations listed were:
  - Waimalu Street between Drier Street and Kamakee Street

- Kawaiahao Street between Cooke Street and Kamakee Street
- Queen Street between Cooke Street and Kamakee Street
- Ilaniwai Street between Cooke Street and Ward Avenue
- Halekauwila Street between Cooke Street and Ward Avenue
- Koula Street between Halekauwila Street and Pohukaina Street
- Ahui Street between Halekauwila Street and Pohukaina Street
- Kamani Street between Halekauwila Street and Pohukaina Street
- Kona Street between Kamakee Street and Pensacola Street
- Hopaka Street between Kona Street and Pensacola Street
- Cooke Street between Kapiolani Boulevard and South King Street.
- Mission Lane between Queen Street and Kawaiahao Street.

A map from the MAIP (MAIP Figure 13) depicts these storm drainage improvements proposed in 2009 (see Figure 4-34). These improvements represent the Future Baseline Condition. HCDA has no current schedule for the design or construction of any of the proposed improvements.

The MAIP concludes that the existing drainage system is inadequate to accommodate and dispose of design storm rainfall runoff quantities in both the existing and future conditions. However, it is noted that since most of the future improvements were anticipated to be vertical development, additional rainfall runoff, due to development, was anticipated to be negligible; and as such, surface water ponding concerns and existing drainage system inadequacies would not be exacerbated. In other words, while the existing drainage system has deficiencies, the Proposed Action will not exacerbate them. The actions identified above are intended to relieve the existing system deficiencies.



The MAIP also notes that future runoff quantities can be reduced through the implementation of:

- The capture and reuse of rainwater, specifically capture, store and use runoff as a non-potable water source for the building and irrigation.
- Reduction of impermeable surfaces, specifically, the installation more landscaping.
- The optimization of impermeable surfaces; specifically the construction of smaller, multi-level parking structures.
- The use of more evapotranspiration; specifically install more landscaping.

The MAIP identifies Federal, State and City regulations requiring storm water quality treatment and lists the following possible license/permit requirements for new projects:

- Drainage Connection License, if connecting to the City's storm drain system.
- Trenching permit for work within the City's rights-of-way.
- Dewatering permit for discharging dewatering effluent into the City's municipal separate storm sewer system (MS4).

Figure 4-34: Proposed Storm Drain System Improvements (Future Baseline Condition)

The MAIP includes the following project requirements:

- Wastewater plans meeting the State Department of Health (DOH), Hawaii Administrative Rules (HAR) Chapter 11-62 "Wastewater Systems".
- Comply with the Anti-degradation policy outlined in HAR, Section 11-54-1.1.
- Conform to designated uses as outlined in HAR, Section 11-54.3;
- Conform to water quality criteria outlined in HAR, Sections 11-54.4 through 11-54-8.
- Obtain National Pollutant Discharge Elimination System (NPDES) general permit, if required.

The MAIP provides a condition assessment of the existing storm drain systems. The MAIP concluded that the existing major drainage structures are satisfactory. However, the MAIP noted that, during a field inspection, a significant amount of debris and litter was observed in the storm drain along Keawe Street, between Auahi Street and Ala Moana Boulevard; and stressed that the City schedule on-going periodic maintenance to remove the debris/litter from major drainage structures to mitigate runoff from backing up into the street and sidewalks, which could become a hazard to motorists and pedestrians.

It is noted that there are several items that are not addressed in the MAIP due to its 2009 publication date. Specifically, the City has revised several design requirements that include the following:

- The City DPP-CEB reviews proposed development construction plans to ensure that: neighboring properties are not adversely impacted by runoff generated from the proposed development; and impacts to the environment from storm water borne pollutants are minimized. The basis for this review is the *Rules Relating to Storm Drainage Standards*, January 2000; the current amendment became effective on June 1, 2013.
- Proposed developments must demonstrate that the proposed improvements will not discharge runoff to the municipal system in excess of the current condition, commonly referred to as a "no net increase" in runoff. Any increase in storm water runoff in excess of the existing condition is typically retained or disposed of on-site.
- A related component of storm water runoff managed by the CEB is storm water quality, under the City's MS4 NPDES Permit. The purpose is to minimize the quantity of pollutants entering the municipal drain system and ultimately the ocean through the use of Best Management Practices, or BMPs. The treatment criteria and means to provide treatment vary depending on the type and size of development. BMP measures could include vegetated swales or structural BMPs such as a hydrodynamic separator, targeting solid pollutants including dirt, road dust, litter, and vegetative debris.
- Effective June 2013, the City implemented a more rigorous storm drainage standard that included standards for storm water quality program, which included

Low Impact Development (LID) principles specific to storm water runoff. Targeted pollutants will now include liquid contaminants such as petroleum/hydrocarbon by-products. Developments will be required to retain storm water runoff on-site through the use of infiltration or rain harvesting methods, or may be allowed to discharge runoff through an appropriate bio filter such as a rain garden, green roof, or tree box filters.

4.11.5 Electrical Utilities

4.11.5.1 Affected Environment

Hawaiian Electric Co.'s (HECO) existing generation system, on the Island of Oahu, is currently capable of providing approximately 1,321 Megawatts (Mw) of power with independent power producers capable of providing an additional 456 Mw of power for a total generating capacity of 1,778 Mw (based on 11 April 2014 Availability of Supply letter). Current peak demand on the Island of Oahu, as of December 2013, was 1,175 Mw.

Four existing HECO substations presently serve the Mauka Area: Kewalo Substation, located on Kona Street between Kamakee and Piikoi Streets; Kaka'ako Substation, located on Ilaniwai Street between Cooke Street and Ward Avenue; Honolulu Power Plant substation, located on the Honolulu Power Plant site along Nimitz Highway; and Iwilei Substation, located near the corner of Dillingham Boulevard and Ka'a'ahi Street. Based on discussions with HECO, the capacity of each of the substations is 70 Mw, 45 Mw, 20 Mw and 110 Mw, respectively. The current peak demand experienced at each of these substations is 25 Mw, 30 Mw, 13 Mw and 50 Mw, respectively.

The HECO primary distribution systems (11.5 kilo-volt (kV), 12.47 kV and 25 kV) within the Mauka Area currently consist of a blend of overhead and underground lines. In addition to these lines, HECO also has 46 kV and 138 kV transmission lines routed through the Mauka Area. The 46 kV transmission lines are used to energize the primary (higher voltage) side of HECO's substations; and at the substations the 46kV transmission voltage is stepped-down to 12.47 kV or 11.5 kV distribution voltages. Similarly, the 138 kV transmission lines energize the primary side of HECO's transmission substations; and, at the substations, the 138 kV transmission voltage is then stepped-down to the 46 kV transmission voltage or is used to energize the primary side of HECO's 138-25 kV substations, where the 138 kV transmission voltage is stepped-down to the 25 kV distribution voltage. Table 4-76 below provides the voltage information for each of the four HECO substations within the Mauka Area.

Pole-top and ground-mounted HECO owned transformers further step-down the distribution voltage to secondary voltages that are then useable by HECO's customers.

HECO's 138 kV transmission line within the Mauka Area has been installed completely underground and extends from HECO's Archer Substation, located just off Kapiolani Boulevard, along Kapiolani Boulevard down Kamakee Street onto Kona Street and into the Kewalo Substation. From the Kewalo Substation the underground 138 kV line

continues on Kona Street, past the Ala Moana Center, back onto Kapiolani Boulevard to HECO's Kamoku Substation located at the corner of Kamoku Street/Date Street/Kapiolani Boulevard.

Table 4-76: HECO Voltage Within the Mauka Area

HECO Substation	In-Coming Transmission Voltage	Out-Going Distribution Voltage
Kewalo Substation	138 kV and 46 kV	25 kV and 12.47 kV
Kaka'ako Substation	46 kV	11.5 kV
Honolulu Power Plant Substa.	46 kV	11.5 kV
Iwilei Substation	138 kV and 46 kV	25 kV and 12.47 kV

HECO 46 kV transmission lines within the TOD eligible areas, are installed both underground and overhead. The underground 46 kV transmission lines are located along Cooke Street, Halekauwila Street and Kona Street. The overhead 46 kV lines are located along Pensacola Street, Kona Street (west of Pensacola Street) and Waimanu Street.

Based on the estimated Future Baseline Condition build-out figures, the anticipated increased electrical demand will be 89 Mega Volt-Amperes or 89 MVA, tabulated as follows: increased residential loading of 57 MVA or 64% of total load growth; increased commercial loading, of 19 MVA or 21% of total load growth; increased retail loading of 10.5 MVA or 12% of total load growth; increased industrial loading of 1 MVA or 1% of total load growth; and increased parking structure loading of 2 MVA or 2% of total load growth. Averaging the build-out over the 21-year period (2014-2035), the average annual load growth will be approximately 4 MVA per year.

4.11.5.2 Potential Impacts and Recommended Measures to Mitigate Them

Based on the estimated TOD Alternative A build-out figures, the anticipated increased electrical demand, over and above the Future Base estimated demand, will be 30 MVA, tabulated as follows: increased residential loading of 36 MVA or 120% of total load growth; a decreased commercial loading, of -6 MVA or -20% of total load growth. Averaging the build-out over the same 21-year period, the average annual load growth with TOD Alternate A will be approximately 5.2 MVA per year.

Based on the estimated TOD Alternative B build-out figures, the anticipated increased electrical demand, over and above the Future Base estimated demand, will be 14 MVA, tabulated as follows: increased residential loading of 26 MVA or 185% of total load growth; decreased commercial loading, of -10 MVA or -72% of total load growth; and decreased industrial loading of -1.8 MVA or -13% of total load growth. Averaging the build-out over the same 21 year-period, the average annual load growth with TOD Alternate B will be approximately 4.4 MVA per year.

During the initial years of development, the spare capacity in and an expansion of the existing Kewalo Substation and the existing spare capacity at the Iwilei Substation will be adequate to serve the annualized load growth. The Honolulu Power Plant Substation and the Kaka`ako Substation appear to be at their capacity, both in terms of useable land area as well as substation transformer capacity.

Using the Future Baseline Condition projection of 4 MVA increase per year, it appears that within 12 years, HECO would apparently either need to serve the additional loads from the Iwilei and Kewalo Substations, by adding another substation transformer in both substations or need to construct and energize its proposed Cooke Street Substation site or both. Beyond 12 years of development, HECO would likely need to secure an additional substation site. The need for this site would be evaluated by HECO based on actual load growth experienced.

Using the TOD Alternative A projection of 5.2 MVA growth per year, it appears that within 9 years, HECO would apparently either need to serve the additional loads from the Iwilei and Kewalo Substations, by adding another substation transformer in both substations or need to construct and energize its proposed Cooke Street Substation site or both. Beyond 9 years of development, HECO would likely need to secure an additional substation site. Similar to the load growth under the Future Baseline Condition, the need for this site would be evaluated by HECO based on actual load growth experienced during the 21-year build-out.

As interim measures, HECO could also consider adding fan cooling to their existing transformers that would increase their capacity by 25% or HECO could shift load away from the existing substations presently serving this area onto its Makaloa and Piikoi Substations, which are the closest substations to the Mauka Area, thereby creating additional capacity within substations serving the Mauka Area.

In early 2014, the existing electric generating units at the Honolulu Power Plant, which were previously operating as on-line spinning reserve, were de-activated. In the near term, HECO's Power Plant property is not planned to be re-developed and the existing Honolulu Power Plant Substation will remain in service. It is noted that, although the existing generators are de-activated, HECO may re-start these generators at any time if required for additional reserve power.

Subsequent to the issuance of the Final Draft Mauka Area Plan (DMAP) supplemental environmental impact statement in 2009, HECO, under HDOT's Nimitz Highway and Ala Moana Boulevard Rehabilitation project, is completing the construction of a duct line that will extend 25 kV circuits from the Iwilei Substation along Ala Moana Boulevard to the Queen Street intersection. The initial facility that will be connected to this duct line is the Hawaii Sea Water Air Conditioning (HSWAC) system plant located on Keawe Street. The infrastructure supports 25kV circuits and consists of 2-4" and 4-6" conduits. Additional development in both the Mauka and Makai areas of Kaka'ako District could be fed from this line by extending 2-4" and 4-6" conduits along the perpendicular side streets off Ala Moana Boulevard. By connecting the new developments to the 25 kV system, additional

capacity would be created in the existing 12.47 kV infrastructure, which consists of 2-4" and 3 or 4-5" conduits.

In areas presently served by existing overhead facilities, consideration should be given to constructing underground duct systems and relocating the existing overhead conductors. This would have aesthetic benefits as well as continuing the streetscape improvements begun under the HCDA Improvement District projects. The proposed duct system for most areas presently served by overhead systems would consist of a minimum of 3-5" conduits and 2-4" conduits and 6' x 11' manholes. The 5" and 4" conduits would accommodate the 1000 kcmil, unfused feeders and #4/0 fused feeders of HECO's 12.47 kV distribution system. HECO would require larger developments such as the Moana Vista and Ward Entertainment Center to provide dedicated sectionalizing switchgear sites and would be connected to HECO's unfused feeder system. Smaller developments, such as the Public Storage Building and Pier 1, would be connected to HECO's fused feeder system.

It appears that, in general, the existing underground duct systems within the Mauka Area have sufficient space to accommodate the proposed load growth with the caveat that, in some areas, new infrastructure would need to be constructed to extend the 25 kV distribution system. Additionally, development in areas served by existing overhead lines may be limited until an underground duct system is installed in these areas.

4.11.6 Synthetic Natural Gas System

4.11.6.1 Affected Environment

Hawai'i Gas (previously known as The Gas Company) is a public utility providing gas service within the State of Hawaii. Gas lines are located within most streets in the Mauka Area, with line sizes ranging from 1- to 4-inches in diameter.

4.11.6.2 Potential Impacts and Recommended Measures to Mitigate Them

Currently, Hawai'i Gas has no major upgrades or line installations planned in the Mauka Area. However, Hawai'i Gas has indicated that they can expand or upgrade their network to accommodate any required coverage expansion or increased demand. Additional gas service needs will be accomplished through installation of: larger or new lines, service laterals and meters, or by providing on-site containerized gas. Installation of new gas lines will result in short-term construction activity within street rights-of-way. Installation of new laterals will result in short-term construction impacts to some streets and sidewalks. Best management practices for construction within streets or sidewalk areas will be employed to mitigate short-term impacts.

4.11.7 Telecommunication Utilities

4.11.7.1 Affected Environment

Hawaiian Telcom (HTCo.) presently serves the Mauka Area from its Alakea and Kaka'ako Central Offices. The Alakea Central Office is located within the HTCo. headquarters building on Alakea Street. HTCo.'s Kaka'ako Central Office is located on Kawaiahao Street near its intersection with Kamakee Street. The HTCo. distribution system within the Mauka Area currently consists of a blend of overhead and underground lines. Existing HTCo. facilities include both fiber optic cables for trunking, cable television and high-bandwidth uses and copper twisted pair cables which carry voice grade and medium bandwidth signals.

Based on the estimated Future Baseline Condition build-out figures, the anticipated increased telephone line requirements will be: residential – 19,000 lines; commercial – 3,000 lines; retail – 2,000 lines; and industrial – 330 lines. It should be noted that in lieu of deploying conventional copper twisted-pair lines for new or renovated facilities, HTCo., in many cases, is providing fiber optic service instead.

With regard to cable television, Oceanic Time Warner Cable (OTWC) presently serves the Island of Oahu from its head-end facility located in Mililani Technology Park. The OTWC trunking system consists of fiber optic cables that are connected to regional hubs at various locations throughout Oahu. From each hub, fiber optic cables are extended to nodes that service neighborhoods. From these nodes a blend of coaxial cables and fiber optic cables distributes OTWC's signal to end-users. Typically, power supplies are deployed on an "as-needed" basis to provide adequate signal strength throughout OTWC's system.

Due to the nature of Time Warner Oceanic Cable's (OTWC) system, it is not apparent that the increase in residential, commercial and industrial space estimated for the Future Baseline Condition or would necessitate expansion of their existing off-site cable infrastructure except where reinforcement would be needed to provide service enhancements and where additional nodes and power supplies may be required to maintain signal strength. OTWC will be responsible to maintain the bandwidth and transmission speed of their broadband service.

4.11.7.2 Potential Impacts and Recommended Measures to Mitigate Them

Based on the estimated TOD Alternative A build-out figures, increased telephone line requirements will be: residential – 30,000 lines; commercial – 2,000 lines; and retail – 1,800 lines. It should be noted that these anticipated telephone line requirements reflect the in-building requirements and do not, necessarily, represent the actual quantity of lines that HTCo. will be installing. Further, it should be noted that in lieu of deploying conventional copper twisted-pair lines for new or renovated facilities, HTCo., in many cases, is proving fiber optic service instead.

Based on the estimated TOD Alternative B build-out figures, increased telephone line requirements will be: residential – 27,000 lines; commercial – 1,600 lines; and retail – 1,800 lines. It should be noted that these anticipated telephone line requirements reflect the in-building requirements and do not, necessarily, represent the actual quantity of lines that HTCo. will be installing. Further, it should be noted that in lieu of deploying conventional copper twisted-pair lines for new or renovated facilities, HTCo., in many cases, is proving fiber optic service instead.

HTCo.'s existing Alakea and Kaka'ako Central Office facilities appear adequate to accommodate the projected residential, commercial and industrial developments without expansion. However, HTCo. may request easements within the Mauka Area or from building developers to allow multiplexing "pair-gain" units to be deployed. These "pair-gain" units allow HTCo. to concentrate numerous customer lines onto high bandwidth, high capacity trunk lines. For example, a typical "pair-gain" unit module would concentrate approximately 100 customer lines onto 1 HTCo. trunk line. This line concentration would, in turn, lessen the quantity of cables HTCo. is required to install in their underground duct system or onto the joint utility pole system.

Similar to the electrical system, areas presently served by existing overhead facilities, consideration should be given to constructing underground duct systems and relocating the existing overhead conductors. This would have aesthetic benefits as well as continuing the streetscape improvements begun under the HCDA Improvement District projects. The proposed duct system for most areas presently served by overhead systems would consist of a minimum of 4-4" conduits and 5' x 10.5' manholes. Provision of separate underground facilities would lessen the possible congestion of HTCo. facilities by routing Oceanic Time Warner Cable owned-cables separately from HTCo. cables. HTCo. would install a combination of fiber optic and copper cables. In most cases, HTCo would use the fiber optic lines. as trunk facilities, while the copper cables provide telephone service to the buildings located along the route of the telephone duct lines. As mentioned in the previous section, HTCo. would place dedicated "pair-gain" units to serve large developments or would request easements on the large developments so that the "pair-gain" unit(s) could provide service to the large development as well as neighboring developments.

Based on available existing plans of the Mauka Area telephone infrastructure, HTCo. appears to have sufficient conduits to extend additional service from their Alakea and Kaka'ako Central Offices to the Mauka Area. HTCo. may also accommodate development in areas served by overhead lines by adding cables onto the existing poles or through replacement of existing cables with larger capacity cables. In addition, HTCO's initiative to utilize fiber optic lines to service new development in lieu of copper cable technology would create greater capacity within the existing infrastructure.

With regard to cable television service, as additional development occurs, OTWC may determine that reinforcement of their existing cable infrastructure may be needed, both to support the increase service demand and to provide enhanced capabilities. In the Mauka Area where the various HCDA Improvement District projects constructed

undergrounded duct facilities, it appears that no provisions were made for OTWC facilities. In order to initially provide service to these areas, OTWC negotiated with HTCo. for use of space with the HTCo. duct facilities. Similarly, in areas served by overhead facilities, OTWC is not a member of the Joint Pole Committee, whose members include HECo., HTCo. the City and the State, and, therefore, cannot install cables onto existing overhead poles. However, OTWC negotiated with HTCo. to lease space on the joint poles from HTCo. Existing OTWC cable facilities would either be added or upgraded to accommodate the additional development.

Similar to the electrical and telephone systems, areas presently served by existing overhead facilities, consideration should be given to constructing underground duct systems and relocating the existing overhead conductors. This would have aesthetic benefits as well as continuing the streetscape improvements begun under the HCDA Improvement District projects. The proposed duct system for most areas presently served by overhead systems would consist of a minimum of 2-4" conduits and 3' x 5' or 2' x 6' hand holes. OTWC would install a combination of fiber optic and coaxial cables. The fiber optic lines, in most cases, would be used by OTWC as trunk facilities, while the coaxial cables provide service to the buildings located along the route of the duct lines.

After the construction of the OTWC duct line along Ala Moana Boulevard, OTWC may be able to reconfigure its system to lessen the impact on the existing telephone duct lines constructed under the HCDA Kaka'ako Improvement District Nos. 1, 2 and 3. This may require developers to provide additional infrastructure within the road right-of-way from the OTWC designated service connection point to the development.

4.12 Aesthetic Environment

4.12.1 Affected Environment

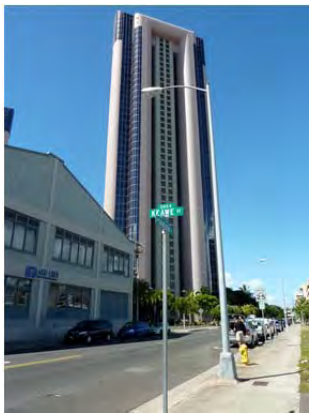
Defined as a redevelopment area in 1976, the Kaka`ako District consists of an entirely urbanized area which has undergone many transitions over the past one hundred and fifty years[52]. Since the Mauka Area rezoning in 1982, this area's low-scale, circa mid-20th century commercial and warehouse buildings are beginning to be incrementally replaced with high-rise residential buildings. By the mid 1990's, commercial offices along the Kapiolani corridor and "big box" retail near to Ala Moana Boulevard and Ward Center began to proliferate in Kaka`ako's Mauka Area.[53] In response to growing development pressure, the Mauka Area Plan (2011) was adopted to provide strategies to preserve the Mauka Area's mixed industrial character, respect its existing assets, and better provide for tools to create livable neighborhoods. These tools, including a "form-based code" (Chapter 15-217 Subchapter 2, HAR) differentiate the KKCD Mauka Area into a set of

52 A Century of Change, Kaka`ako. HCDA, 1991. web. 25 Aug. 2013.

53 Gomes, Andrew. "Retail infiltration leaving little room for industrial space in Kakaako." Pacific Business News [Honolulu], 4 Oct. 1998, web. 25 Aug 2013; http://www.bizjournals.com/pacific/stories/1998/10/05/focus1.html?page=all

neighborhoods with unique characteristics. Under the 2011 Mauka Area Plan, urban design priorities relate to local context, development opportunity and future vision. Each of Mauka neighborhoods' characteristics are described in Chapter 2, Section 2.3.1.

The Proposed Action project area is contained entirely within a portion of the Mauka Area, specifically portions of the Thomas Square District, Auahi, Kapiolani, Pauahi, and the Central Kaka`ako neighborhoods, which together comprises an eclectic mix of buildings with varied types, scales and relationships to the street. As part of HCDA's Mauka Area rezoning process and development and adoption of the Form Based Code in 2011, the agency completed an extensive survey documenting the built form context and representative building types for each neighborhood.[54] Following are descriptions of the key building types found within the project area.



High-Rise Residential Buildings: High-rise residential buildings scattered through the Mauka Area are generally between 100'- 400' in height. A majority of high-rise residential buildings extant in 2013 were entitled under the Mauka Area Rules adopted previously, in 2005 or 1982. The older structures can consist of a higher ratio of wall to window, be up to 200' long and 400' high with a parking podium of 1-6 stories. Many are residential "slab" buildings, a form that maximizes the number of residential units with views to the shoreline. They can have minimal modulations and tend to be a "tower in the park" extending straight up from the ground plane. An extended "super block" of high-rise towers is located at the corner of Pi`ikoi Street and Ala Moana Blvd. These buildings were entitled under the 2005 Mauka Area Rules.

Both Howard Hughes Corporation for the Ward Neighborhood Master Plan and Kamehameha Schools have recently submitted plans for the modified tower-podium form, designed to better provide for street level continuity, eyes on the street, and design quality for high rise buildings (see Photo Plate 4-1).

[54] "Synoptic Survey" Prepared as part of the Mauka Area Rules and Form Based Code, HCDA 4- Apr. 2010.

Photo Plate 4-1: Character of High-Rise Buildings in Kaka`ako

Warehouse/Light Industrial: One to three-story commercial buildings dominate the Pauahi and Auahi neighborhoods as well as Central Kaka`ako. With low overhead costs, these simple structures house local service businesses such as repair shops, automobile service, and personal services, as well as warehouses and industrial shops. Some of these buildings directly front the street (often without a sidewalk) with a clear entry and high street activation with garage or roll up doors. Others are simple steel siding, with entrances away from the street at an abutting parking lot. Some of older warehouses have been adapted to new uses, such as a warehouse that is reused as an auto dealership.[55] (See Photo Plate 4-2.)

Photo Plate 4-2: Character of Low-Rise Buildings in Kaka`ako

Thomas Square/Blaisdell Center: The Neal S. Blaisdell Center (originally named the Honolulu International Center or "HIC") has been in operation since 1964. It is a city owned and city-operated center used for conventions and concerts, with a multi-purpose arena and neighboring performing arts center (the Concert Hall). The facility includes an associated multi-level parking garage (2,000 stalls). Situated on the makai side of King Street, across the street from historic Thomas Square, the center is located in the KCDD's Thomas Square District neighborhood that also includes the McKinley High School campus. (See Photo Plate 4-3 below.)

Photo Plate 4-3: Neal S. Blaisdell Arena

55 Kamehameha Schools, owner of nine contiguous blocks in the community references this type of street environment in plans for the recently released catalyst SALT project (bordered by Ala Moana Blvd., Coral, Keawe and Auahi Streets) which proposes a conversion of an industrial complex into a mix of retail and residential tenancies.

Commercial and Retail Uses Ward Center: TJ Maxx, Sports Authority, and other single use retail buildings are located along Auahi Street and Ward Avenue near to Ala Moana Boulevard with either surface parking lots, or associated multi-story garages. Ward Village shops, now under construction will house major national chain retail. The Kapiolani corridor also contains mid-rise office buildings from 4-12 stories. These buildings have separate parking garages. (See Photo Plate 4-4 below.)

Photo Plate 4-4: Commercial Buildings on Ward & Kapiolani

Parking Lots and Temporary Uses: Portions of the Pauahi and Auahi areas are presently occupied by surface parking areas. In these locations, programmed festivals such as "Eat the Street" festival (555 South), the Honolulu Night Market, and most recently the American Circus, bring temporary activation onto parking areas. Additionally, temporary themed "pop-up shops" have begun to appear in the district that

take advantage of the lower rents and high accessibility of the District. (See Photo Plate 4-5 below.)

Photo Plate 4-5: Temporary Use of Parking Lot in Kaka`ako

Open Space and Public Realm: As discussed above in Section 4.10.9.1, there are presently seven public parks in the entire KCDD. Although some of the following information repeats what was previously presented, it focuses on urban design and aesthetics.

The Mauka Area contains two public parks.

- Mother Waldron Park Neighborhood Park is registered on both the Hawaii register of Historic Places (HRHP) and the National Register of Historic Places (NRHP) because of its distinct art deco features. While central to the project area, the park lacks updated amenity spaces, and is underutilized. The rapid transit alignment will abut the park's boundary on Halekauwila Street. Several adjacent parcels are already developed as high-rise towers, i.e. the Waterfront Towers, and Pohulani residential tower. The Halekauwila Place project, a 19 story tower, 204 unit affordable housing project, has been completed on the property directly abutting the 'Ewa – mauka corner of the park.
- Kolowalu Park is a two-acre passive park on either side of Queen Street between Waimanu Street and Kamakee Streets.

There are also two public parks, located at the corner of Cooke Streets and Kawaiahao Street and along Ala Moana Boulevard as part of the waterfront plaza project. In total, since 1982, the HCDA has introduced 16 acres of privately dedicated recreation area into the KKCD, consisting of landscaped setbacks, and small, dedicated park areas. HCDA is also working with McKinley High School to make the school's planned new track and field

facility available for public use during evenings and weekends. The Mauka Area is also directly across South King Street from the Thomas Square Historic Park.

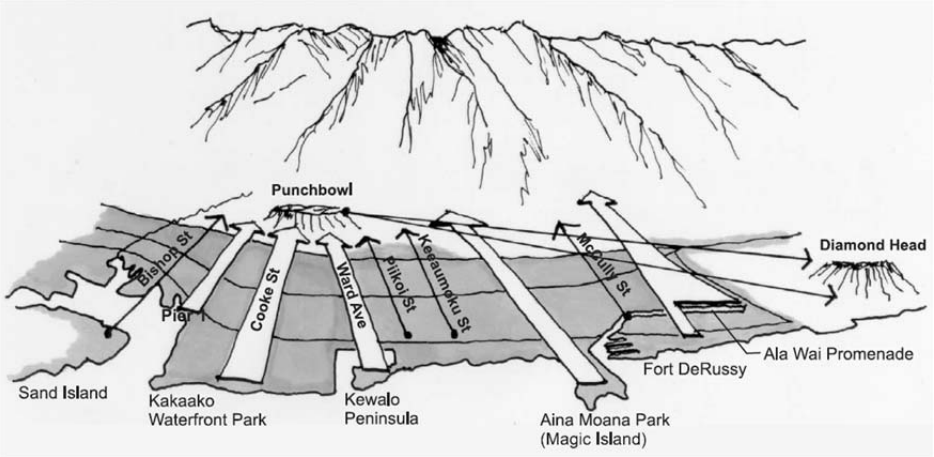
The Makai Area contains the Kaka`ako Waterfront Park, and the Makai Gateway Park, Kewalo Basin Park and is directly adjacent to Ala Moana Beach Regional Park. Outside of traditional parks, the quality of the existing public realm is diverse, and transitioning. While Kapiolani Boulevard and Punchbowl Streets are notable green corridors with mature street trees, large portions of the project area's local streets lack pedestrian facilities, particularly in Pauahi, Auahi and Central Kaka`ako neighborhoods. These local streets do not have street trees, landscape strips or buffers, and in the case of portions of Queen Street, sidewalks, curbs and gutters. Ala Moana Boulevard, as an important regional route has a landscaped property line setback, but lacks either on-street parking or landscape strips to buffer pedestrians from street traffic. It also generally does not have ground-level walk-in uses that contribute to a comfortable pedestrian environment and can be accessed directly from the Boulevard. Electric power lines are under ground on most major streets in the district.

Planned public park facilities are associated with Kamehameha Schools Master Plan and Ward Neighborhood Master Plan. Each master plan has a 3% public facilities dedication requirement for new commercial uses and 4% public facilities dedication residential uses. Additionally 10% of the total land area covered by each master plan is required to be provided as open space. Both master plans are moving forward with their Phase One implementation. The KS Master Plan consists of an estimated total of 126,000 SF for new open space. Proposed enhancements include:

- Implementation of green street design between Makai Gateway Park and Mother Waldron Neighborhood Park on Cooke Street. This linear park is also coordinated in the Mauka Area Plan.
- A community gathering place at the intersection of Cooke and Auahi Streets with indoor/outdoor space and a large public plaza, now in design stages.
- Kamehameha Schools addresses the potential for associated improvements to Makai Gateway Park and Mother Waldron Neighborhood Park.
- The potential for associated improvements to Makai Gateway Park and Mother Waldron Neighborhood Park.
- Activated green open space on the podium levels constitutes embedded open spaces available to tenants and building users.

In the Ward Neighborhood Master Plan, open space is currently estimated at 260,000 SF. In addition, nearly 250,000 SF of recreational space will be provided for neighborhood use. The Ward Center Master Plan proposes a major linear greenway or Central Plaza as the community's "outdoor living room." The 3.25-acre Central Plaza extends across the length of Ward Center to Ala Moana Boulevard. Additional active spaces are designated at `Ewa Plaza and Diamond Head Plaza.

4.12.2 Visual Resources and Context



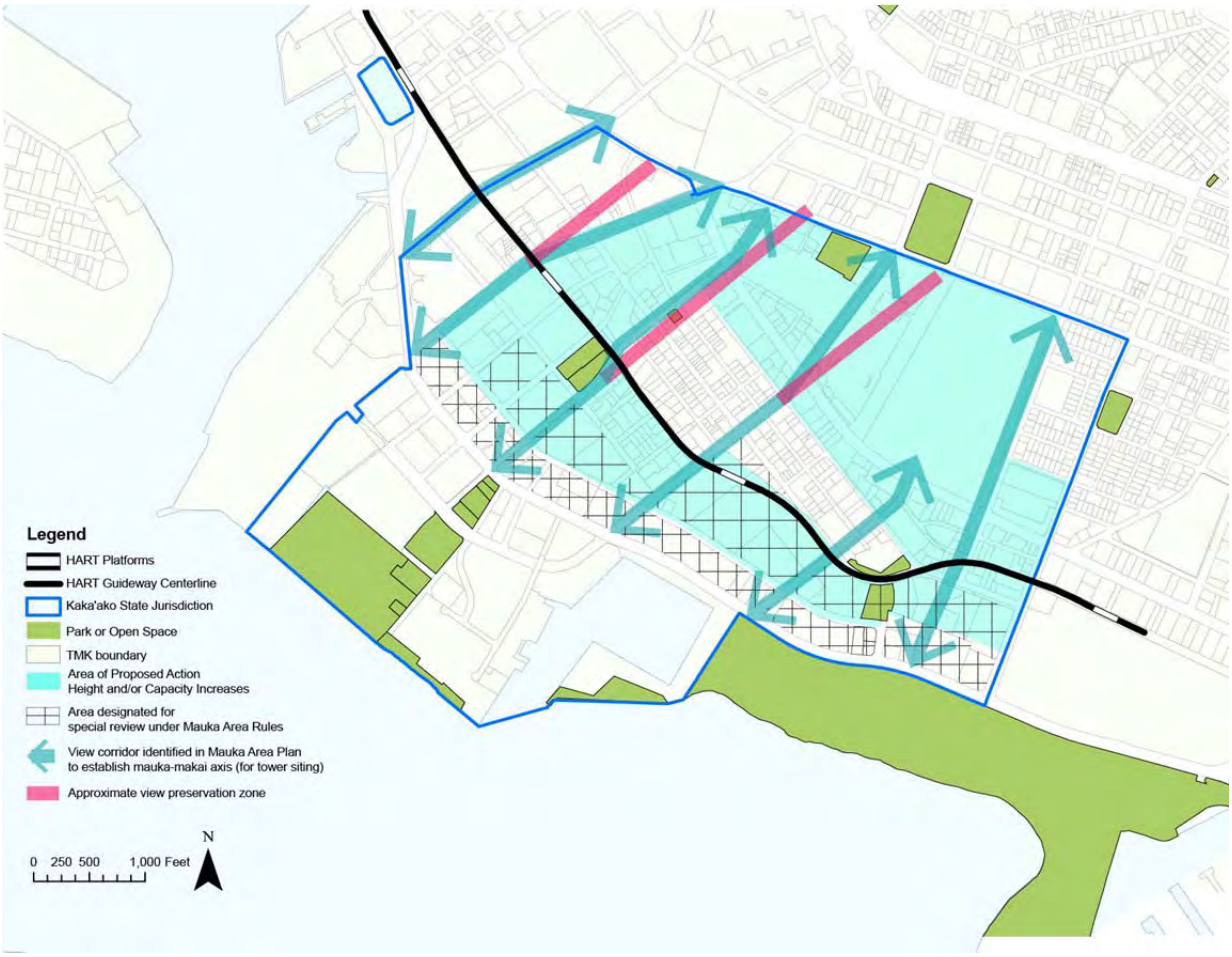
The City's Primary Urban Center Development Plan identifies significant broad, public vistas in the Kaka`ako area (PUC DP, page 3-3). See Figure 4-35. According to the Plan, these vistas have been selected not only to promote local way finding, but also contribute to the overall "sense of place" for urban Honolulu. Panoramic views identified in the PUC DP within the Kaka`ako District are:

- Views of the Ko`olau and Waianae Mountain Ranges and their foothills
- Views to the Pacific Ocean and Kewalo Basin
- Views of the Puowaina (Punchbowl) crater

While the PUC DP identifies these vistas as desirable, it also notes that "there are public places along the shoreline – such as Ala Moana Beach Park, Kaka`ako Waterfront Park and Kewalo Basin" where these panoramic mauka views are gradually diminishing as high-rise buildings are developed.[56]

The Mauka Area Rules established and the Proposed Action also maintains a set of mauka-makai view corridors. See Figure 4-36. These corridors align with the width of the street, combined with building setbacks (and/or building placement guidelines). Street end views to the Ko`olau range are available from the public right of way, except in those instances where a street includes a turning point.

Figure 4-35: View Corridors Identified in the Primary Urban Center Development Plan



To further this policy of view protection, The Mauka Area Plan designates a corridor fronting Ala Moana Boulevard as the Ala Moana Special Review District in response to the public desire to have a higher quality design treatment along Ala Moana Boulevard and to ensure views to the Ko`olau range would be preserved and avoid a monolithic "wall of

56 City and County of Honolulu, Primary Urban Center Development Plan, Department of Planning and Permitting, 2004 p3-3

towers." The Ala Moana Special Review District constitutes much of the area currently in the Kamehameha Schools and Ward Neighborhood Master Plan and relies upon a discretionary review process by HCDA for the number and placement of towers, with maximum heights of 400'. Project Review criteria include: visual access to the ocean, encouraging and preserving pedestrian access to the Makai Area, and creating nodes of activities at street corners.

Figure 4-36: Established Mauka-Makai View Corridors in Kaka`ako

Existing conditions for the PUC DP associated vantage points are described as follows:

**Vantage Point 1: Kaka'ako Waterfront Park to Ko`olau Ridgeline:** The Kaka'ako Waterfront Park is located in the Makai neighborhood. A view corridor extends from this park over Kaka'ako Makai Gateway Park, allowing for mauka views with partial views to the Ko`olau Mountain range and Punchbowl (Photo Plate 4-6). The current placement of high-rise towers in the distance allows for a good sense of the scale and proximity of the mountain range. Those areas of the Kaka'ako Waterfront Park makai of the (4 story) John A. Burns School of Medicine have obstructed views.

Allowable building heights of 200 feet within the Makai neighborhood – particularly on development parcels adjacent to Ala Moana Boulevard will further obscure views into the distance except in those areas where development is not allowed, i.e. identified park and open space areas, and the historic pump station, and street right of ways.

Photo Plate 4-6: View from Waterfront Park Looking Mauka

Vantage Point 2: Kewalo Basin looking Mauka: The Kewalo Basin is an area identified for water-related uses, with low-rise structures for water-related commercial enterprise at its hardened shoreline. Kewalo Basin also includes a public promenade that affords panoramic views of the Makai neighborhood and the Auahi and Pauahi Districts, as well as through the Ala Moana Special Review District (Photo Plate 4-7).

Photo Plate 4-7: View from Kewalo Basin Looking Mauka

Vantage Point 3: Ala Moana Beach Park Kamakee Street: Makai of Ala Moana Boulevard, the Ala Moana Beach park offers recreational opportunities and shoreline access. Vantage points within the park afford views mauka in the Auahi District, and the Ward Center Master Plan area. Single story buildings and trees within the park obscure panoramic views to the Ko`olau ridgeline (Photo Plate 4-8). Consequently, views to the Ko`olau range are best observed at existing street corridors such as Kamakee Street, but skyline views of high rise buildings, and some narrower views may be accessed from through-out the park.

Photo Plate 4-8: View from Ala Moana Beach Park Looking Mauka to Kamakee Street

In addition to the views identified in the PUC DP, the following five vantage points have been identified for the purposes of this EIS, and consist of views from selected public sites in the project location: McKinley High School, Thomas Square, Punchbowl, from Makai Coral Street and Ilalo Street looking towards Mother Waldron Park, and from the entrance to the National Memorial Cemetery looking makai.

Vantage Point 4: McKinley High School Makai: McKinley High School constitutes a publicly owned shared open area within the District. Views `*Ewa*, diamond head, mauka and makai give a sense of the changes occurring in the distance, particularly in a cluster of new towers along Kapiolani, at the Honolulu Design Center, and along South Street. The existing view from the playing field at McKinley High School looking makai shows lower rise public storage building on Kapiolani, and towers in the distance in the high rise

super block bounded by Queen, Waimanu and Piikoi Streets, and Ala Moana Boulevard. (see Photo Plate 4-9)

Vantage Point 5: McKinley High School ʻEwa: The view *`Ewa* from McKinley takes in high-rise construction along Kapiolani Boulevard, as well as the parking garage associated with the Blaisdell Center. (see Photo Plate 4-10)

Vantage Point 6: Thomas Square, Makai: Located makai of the trees surrounding the fountain, Thomas Square has a view into the Kaka`ako District at the Neil S. Blaisdell performing arts center. Any changes proposed there would be visible from Thomas Square. (see Photo Plate 4-11)

Photo Plate 4-9: View from McKinley High School Sports Field Looking Makai

Photo Plate 4-10: View from McKinley High School Sports Field Looking Ewa

Photo Plate 4-11: View from Thomas Square Looking Makai

Vantage Point 7: Coral Street and Ilalo Street, Mauka: There is no required view corridor on Coral Street. Rather, Coral Street ends at the makai end of Mother Waldron Neighborhood Park, begins again on the mauka side of the park and extends mauka to Queen Street where it terminates. It angles to the Diamond Head direction just mauka of Mother Waldron Neighborhood Park, effectively terminating the view corridor up the street from Ala Moana Boulevard. This vantage point is chosen to showcase the redevelopment around the Civic Center Station and adjacent to Mother Waldron Neighborhood Park. Currently much of Coral Street corridor mauka of Ala Moana Boulevard is low scale, with single story buildings. (see Photo Plate 4-12)

Photo Plate 4-12: View from Coral Street at Llalo Street Looking Mauka

Vantage Point 8: Punchbowl at the Entrance to the National Memorial Cemetery: This vantage point is located at the entrance to the National Memorial Cemetery at Puowaina Drive. Urbanized Kaka`ako can be seen in the distance. However, it should be noted that pedestrians do not frequent this vantage point because there is no public parking adjacent to it, and pedestrian activity is oriented to the cemetery. (see Photo Plate 4-13)

Photo Plate 4-13: View from Punchbowl Looking Makai

4.12.3 Honolulu International Airport Safety Concerns

A majority of the Mauka Area is located in the Precision Instrument Approach Zone between a 15,000 and 20,000-foot radius of the Honolulu International Airport runway. (Attached as Appendix H is the 19-12-14 Department of Transportation, Airports Division, Federal Airports Administration Airport Zoning Map.) This is an area where the Federal Aviation Administration (FAA) uses precision equipment to monitor approaches, and its air traffic controllers issue guidance instructions to pilots based on the aircraft's position in relation to the approach course. Under FAA rule 77.9, projects within the Mauka must submit FAA Form 7460-1 Notice of Proposed Construction or Alteration if the project exceeds an imaginary surface extending outward and upward at the following defined slope:

- Taller than 200'.
- 100:1 for a horizontal distance of 20,000 ft from the nearest point of the Honolulu International Airport runway.

These requirements are intended to ensure that the FAA is kept informed of new development and is provided an opportunity to comment on its potential impact upon airport flight operations.

4.12.4 Shadows, Light and Glare

Current lighting conditions within the KCDD are typical of an urban environment. When viewed from surrounding areas, Kaka`ako is similar to other urbanized locations, particularly Ala Moana, Waikiki and Downtown Honolulu. At night, existing buildings in the District and vehicles traveling on roads within the District currently generate limited ambient light. During the day, glare is created by some building surfaces (windows and building materials) reflecting sunlight. In the area surrounding the District, the primary sources of ambient nighttime light and daytime glare are buildings (including glare from windows and building materials), and at night by automobiles on area roadways. Because of the high concentration of buildings and automobile traffic in both the Central Business District (downtown) and Waikiki and the major roadways leading to them, these areas outside the District currently contribute a proportionally larger amount of daytime glare and nighttime ambient light in the general urban area than the District itself.

4.12.5 Potential Impacts

This section describes changes to the aesthetic character of the built environment that could occur under the Proposed Action and the Future Baseline Condition. As the Proposed Action assumes an increase in both capacity (building density) and height, it would result in a greater potential for visual impacts. However, due to the fact that the specific lay-out of uses, including building heights and scale, cannot be specifically defined at this point in time because they are ultimately dependent upon specific development plans for individual properties that are not yet known, this EIS employs a "worst-case" analysis regarding the potential level of redevelopment, location of buildings and building heights that could occur during the build-out period (see Appendix I for the methodology used in this analysis). Actual uses, building footprints, designs, heights etc. will ultimately be determined by future market conditions and the specific agreements and applicable development regulations and standards that govern long term site redevelopment. Changes to the project are also assumed to be incremental over the approximately 20-year build-out period.

4.12.5.1 Urban Design

Future Baseline Condition: Under the Future Baseline Condition, new mixed-use developments assumed for the KCDD would be consistent with the current Mauka Area Plan, development agreements and rules. Development would occur on a project-by-project basis. Current developments may achieve building heights up to 400 feet, as specified by the Mauka Area Rules in identified neighborhood areas. The existing process for design review and building permitting would continue. Some neighborhoods could

have a discontinuous visual appearance where redevelopment occurs on a lot-by-lot basis. Visual contrasts between older and newer buildings could increase and there is a potential for incompatibility, and/or abrupt transitions between older and new buildings. This is particularly true where properties are privately owned, and development proposals (or decisions not to develop) will largely remain with many individual parties.

However, this is a condition that is common to any metropolitan area that undergoes redevelopment.

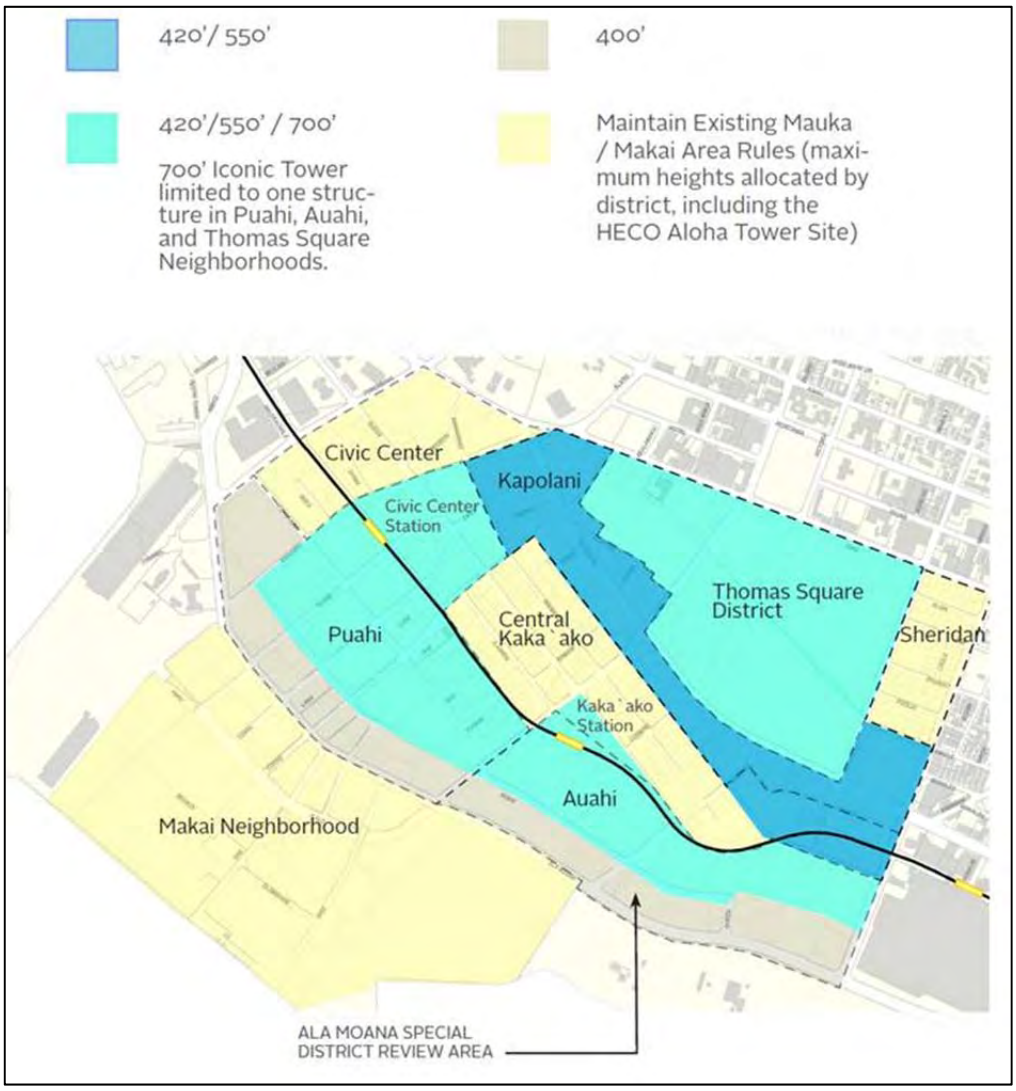
Proposed Action: Both TOD Alternative A and TOD Alternative B propose to switch to a different way to quantify and regulate development capacity. Both rely on a minimum lot size of 40,000 sq. ft. to take advantage of the incentive based development rules for TOD.

Floor Area Ratio

FAR capacity begins at 5.0 FAR (but is inclusive of areas devoted to parking). While causing complexity in analysis, the inclusion of parking requires developers to consider their choice of building parking as a land use. Development incentive is assumed beyond the 5.0 FAR such that amenities are allocated upon provision of those features that improve associated infrastructure.

Overall FAR capacity is held relatively constant between the two alternatives, bulk and scale change when associated with height allowances. FAR is used as one tool, in coordination with Floor plates, tower spacing and form-based standards in the Regulating Plan to be prepared by HCDA.

At full build-out, TOD Alternative A would change the character of the overall Mauka Area, and sites entitled under the Plan would develop to a greater intensity and scale. Transit integration resulting from the transit-oriented development would likely result in more intensity of use, including street-level uses located near to the Civic Center Station, Kaka`ako Station and Downtown Honolulu Station. TOD Alternative A demonstrates the potential for a greater frequency of towers, including some buildings that are taller than those in Downtown Honolulu or previously constructed in the District.[57]



When applying proposed building types and maximizing all density allowances, an eligible parcel could result in up to two towers per development site (provided it meets lot size thresholds). For example, Neighborhoods presenting a FAR maximum of 8.5 would likely allow for one taller structure (>400') to be paired with a lower structure (240'), and podium structure, or some variation thereof. Those areas with a greater development capacity (10 FAR) could effectively increase building heights on the high-rise structure to accommodate greater capacities, adding additional units. While maximum building heights would vary throughout the district; TOD Alternative A anticipates only one tall 700' tower in each of the Pauahi, Auahi and Thomas Square neighborhoods (see Figure 4-37). Buildings in each of the Alternatives have maximum height limitation directly restricting both floorplate size and heights. These attributes are maintained and refine in parallel with density increases.

---

[57] The current tallest building on O`ahu is the First Hawaiian Bank, at a height of 438 feet. Buildings in adjacent Waikiki are allowed up to 350 feet. By comparison, the summit of Diamond Head is 761 feet. Mountain peaks comprising the Ko'olau mountain range average about 2,500 feet.

TOD Alternative B would have a similar aesthetic impact to the District as TOD Alternative A, only the building heights would be restricted to a maximum height of 418 feet.

Figure 4-37: Height Limits Recommended in TOD Alternative A

Street Elements

The term "Street Element" is defined in the Mauka Area Rules as the element that creates a consistent street wall and that area of a building that defines the public space at ground level. In a High-Rise building, the "Street Element" is the lower portion of the building fronting the street, as opposed to the tower element – which is setback, and constrained by maximum footprint controls. The scale and size of a Street Element is generally determined by the necessity to accommodate all required off-street parking for that

development within the development lot. As a result, the amount, treatment and design of parking ultimately influence a building's street characteristics and the quality of pedestrian experience due to access or design treatments.

In a High-Rise building, the range of height allowable under the Future Baseline Condition for a Street Element (before a required setback) is a minimum height of 4 stories or 40' and a maximum height of 15' - 65' (depending on location and context). In the two adopted Master Plans (KS and Ward), the Street Element may achieve a maximum of 75' heights. Under the Proposed Action, while overall height of the towers may increase, the general characteristics of the "Street-Element" and the pedestrian experience at street level would maintain a similar scale as the Future Baseline Condition.

Under the Proposed Action (both Alternatives A and B), a Street Element height of 75' in most locations would accommodate usable area to be placed in the podium and at the street-level such as retail, restaurants, offices or residential units (instead of exposed parking garages). This 75-foot Street Element height limit also allows for garages to be fully buffered from view for aesthetic purposes. Additionally, the Proposed Action encourages residential projects to use the top level of a parking podium as an activated green space with an option to include townhouses that open directly onto these areas.

Parking

Under the Proposed Action (both Alternatives A and B), the portion of a new building allocated to parking (i.e. much of the internal, lower stories located behind the Street Element facade) may ultimately be reduced relative to overall building height and capacity as compared to the Future Baseline Condition. This is due to an emphasis on programs leading to the efficient management of parking as a common resource. Both Alternatives include strategies (commonly known as "transportation demand management) that jointly help to reduce the necessity for a private developer to supply individual, reserved parking spaces specific to each use at the levels currently sustained today. Furthermore, one of the most important shifts assumed under the Proposed Action that will affect the demand for auto use is access to high capacity transit. Strategies considered that affect the design of parking in TOD sites include:

- Counting of square feet associated with the parking in overall density limitations;
- More efficient use of reserved parking spaces with the broad application of Transportation Demand Management strategies and the on-going transition to more shared and joint use parking scenarios;
- Concurrent investment in new and/or improved public infrastructure and associated identified street enhancements that may encourage residents to utilize public transit, walk, or cycle such as bicycle lanes, and access to bike share, new internal streets, or traffic calming;
- Improved access to local transit service, and high capacity transit stations, and
- Potentially unbundling the selling of individual parking spaces from the unit price.

Older buildings and those buildings that no longer produce positive net value compared to rising land values, or shifting economic needs may eventually be demolished or remodeled by landowners in favor of newer structures that meet the HCDA's current design standards. Additionally, land consolidation may occur associated with this redevelopment process.

4.12.5.2 Visual Resources and Views

Impacts Common to Either Alternative: As projects in the Mauka Area develop according to existing zoning, views of, and within the KCDD are expected to change significantly. The greatest impacts will be seen with the higher intensity growth in number and frequency of high-rise buildings under the TOD Alternative A. TOD Alternative B would result in impacts greater than the Future Baseline Condition, but less than the TOD Alternative A. Under either Alternative, panoramic views from identified viewpoints, and existing high-rise or low-rise buildings will be curtailed, but existing view corridors along major mauka-makai streets will be preserved. Buildings fronting Ala Moana Boulevard and situated in the Makai Area will have reduced views of the Ko`olau Range, while buildings along Kapiolani and in the Thomas Square Neighborhood will have reduced views of the ocean. This is typical of an urban environment where external views of landscapes are slowly exchanged for framed views and new architectural features.

Although some existing residents of the District actively oppose any new development that might impact their views, it is possible that the new development occurring in the Kaka`ako District could also be an attractive addition to the views and visual character of the existing community, helping to create new community identity or enhancing the existing sense of place. With all due respect to the passion of those opposed to new development because of reduced views from the balconies of their individual units, the Proposed Action must balance the desires of the few with the needs of the many. The long envisioned redevelopment of Kaka`ako to address the provision of affordable housing and the reduction of development pressures on O`ahu's rural areas, clearly outweighs the complaints of those who purchased high-rise units in a district slated for redevelopment. As demonstrated above, the Proposed Action is consistent with the preservation of view corridors required by the City's Primary Urban Development Plan. Beyond that, it is a matter of urban design. How best can the new development be constructed to create a new and attractive cityscape and skyline for Kaka`ako?

Towers under both the Mauka Area Rules and the two Alternatives must orient towards the closest designated mauka-makai corridor, and include tower separations of a minimum of 80' (for portions of the building above 100') as well as meet other existing and identified view preservation policies. Due to the distance between the Kaka`ako Mauka Area and the identified vistas, and its minimal topography, external views from the ground plane to the Ko`olau Range, Puowaina (Punchbowl Crater) or the shoreline would be obstructed by even low-rise existing development. Additionally, while Makai Area Rules allow for 200' buildings to line the Makai side of Ala Moana, there are currently few restrictions on floor plates, massing or bulk which may result in view obstruction to the Ko`olau ridgeline from the Kaka`ako Waterfront Park.

View Comparisons: As part of the visual analysis for this EIS, eight viewpoint locations were selected as representative views (see Photo Plates 4-6 to 4-13). Based on these viewpoints, visual simulations of site redevelopment under each EIS Alternative were prepared based on massing concepts that assume a level of redevelopment and building heights consistent with the Alternatives. The conceptual buildings representing the extent of potential building massing visible from the respective viewpoint are consistent with the assumed total building square footage and the assumed maximum heights for the Alternatives.

In this analysis, new construction under TOD Alternative A is depicted in blue, while new development under TOD Alternative B is depicted in purple. Under TOD Alternative B, the analysis assumes that existing buildings less than 418 feet in height will eventually be replaced by buildings constructed to the maximum allowable height.

Vantage Point 1: Kaka`ako Waterfront Park

The panoramic view to the Ko`olau Ridge from the Waterfront Park (Photo Plate 4-14) would be obstructed by the continued development of high-rise towers in the Mauka Area, as well as allowable office and commercial development in Makai under existing rules (Future Baseline Condition).

Photo Plate 4-14: Visual Impact of Future Baseline Condition from Waterfront Park

Under the TOD Alternatives, the Ala Moana Special District review area is maintained with no height changes proposed one block mauka of Ala Moana. However, for those

eligible areas in Pauahi and Auahi, height limits are raised to a base of 420'. This increased height limit, together with potential taller structures at 550' and possibly 700' will shift the skyline to create a hierarchy of scale (see Photo Plates 4-15 and 4-16). These additional buildings may increase in height to just below the Ko`olau ridgeline when viewed from the Makai Area. The combination of future potential developments in Makai as well as Mauka will result in reduced visibility except in mandated view corridors. In this instance the view corridor above the Makai Gateway Park, and extending out to Cooke Street may provide the best opportunity to preserve uninterrupted views of the Ko`olau ridgeline. Please note that in this analysis, TOD Alternative A assumes that the property at 690 Pohukaina Street will be built out with either one or two towers (Photo Plates 4-15 and 4-16 respectively).

The view impacts of the TOD-B Alternative are generally similar to those associated with the TOD-A Alternative (see Photo Plate 4-17). Impacts to mountain views are generally comparable, however, from this particular viewpoint, portions of the mountain view over the Ward area are lost. Because the maximum tower height is 418 feet for the TOD-B Alternative, the analysis assumes that most towers are built to that height, creating a more monolithic skyline with less hierarchy of scale, compared to the TOD-A Alternative. An increase in overall development capacity increases the frequency of towers, but the existing view corridors are marginally maintained.

Photo Plate 4-15: Visual Impact of TOD Alternative A from Waterfront Park (with one tower at 690 Pohukaina Street)

Photo Plate 4-16: Visual Impact of TOD Alternative A from Waterfront Park (with two towers at 690 Pohukaina Street)

Photo Plate 4-17: Visual Impact of TOD Alternative B from Waterfront Park (with two towers at 690 Pohukaina Street)

Vantage Point 2: Kewalo Basin looking Mauka

Under both the Future Baseline Condition and the two Alternatives, it is likely that continued construction within the Mauka Area will obstruct views to the Ko`olau Range from the Kewalo Basin public promenade. The Ala Moana Special Review District maintains height and capacity limitations on buildings to 400' one block mauka of Ala Moana Boulevard in both alternatives. Photo Plate 4-18 depicts the anticipated visual impact of the Future Baseline Condition.

Under TOD Alternative A, taller and more frequent towers will place more importance on the street level views at Ward Ave, from the proposed Ward Center plaza open space, and from Kamakee Streets. In these locations views may be obtained up past Kapiolani Boulevard towards the relative open space of McKinley High School grounds. These street corridors will become important wayfinding locations for orientation towards or away from the Ko`olau Range at ground level. (see Photo Plates 4-19 and 4-20)

Photo Plate 4-18: Visual Impact of Future Baseline Condition from Kewalo Basin

Photo Plate 4-19: Visual Impact of TOD Alternative A from Kewalo Basin (with one tower at 690 Pohukaina Street)

Photo Plate 4-20: Visual Impact of TOD Alternative A from Kewalo Basin (with two towers at 690 Pohukaina Street)

The impacts of the TOD Alternative B are generally similar to those associated with the TOD Alternative A. But TOD Alternative B uses lower scaled buildings to achieve capacity increases. This Alternative results in more obscured views to the mountains, compared to the No Action Alternative.

Photo Plate 4-21: Visual Impact of TOD Alternative B from Kewalo Basin (with one tower at 690 Pohukaina Street)

Because the maximum tower height is 400 feet for the TOD Alternative B, most towers are built to that height, creating a more monolithic skyline with less hierarchy of scale, compared to the TOD Alternative A.

Vantage Point 3: Ala Moana Beach Park looking Mauka at Kamakee Street

The mauka-makai view corridor maintains distance views from this public intersection under both the Future Baseline Condition (Photo Plate 22) and the Proposed Action (Photo Plates 4-23 and 4-24).

This viewpoint also illustrates the general quality of street level views at Ala Moana Boulevard. In both Alternatives, the Kamakee mauka-makai view corridor requires towers to be stepped back a minimum of 50' from the Street Element. In this location, Ward Master Plan allows for a maximum of 75' Street Elements. In all Alternatives, building siting and placement is determined by "Build-to lines" designated in the Mauka Area Plan, (figure NZ.1-7 of that plan) which designates the distance between the lot line and the building edge. On Ward Avenue there is a 15' distance from the lot line. While not shown, it should be assumed that generous landscaping and sidewalk treatments would improve the Ward Ave street context.

Photo Plate 4-22: Visual Impact of Future Baseline Condition from Ala Moana Beach Park at Kamakee Street

Photo Plate 4-23: Visual Impact of TOD Alternative A from Ala Moana Beach Park at Kamakee Street

Photo Plate 4-24: Visual Impact of TOD Alternative B from Ala Moana Beach Park at Kamakee Street

The impacts of the TOD Alternative B are nearly identical to those associated with TOD Alternative A. Views to the mountains would be identical for both Alternatives. TOD Alternative B would have slightly less impact on views to the sky because the tower on the west side of Kamakee would be limited in height to 418 feet, as opposed to the 550 feet envisioned in the TOD Alternative A.

Vantage Point 4: McKinley High School Looking Makai

This viewpoint shows the condition of development along the Kapiolani Boulevard. The photograph has been taken approximately at the 50-yard line at the McKinley High School football field.

The Future Baseline Condition (Photo Plate 4-25) illustrates the potential for commercial/residential towers of up to 400' to be constructed on consolidated land parcels along Kapiolani Boulevard.

Photo Plate 4-25: Visual Impact of Future Baseline Condition at McKinley High Sports Field School Looking Makai

TOD Alternative A increases the number and frequency of these towers (see Photo Plate 4-26). Height limitations for buildings are raised to 420' and in limited circumstances, up to 550'. In the Illustrated view point, additional high rise buildings can be seen adjacent to the rapid transit alignment, as well as beyond in the Auahi District as part of the Ward Centers master planned area.

The impacts of the TOD Alternative B are nearly identical to those associated with the TOD Alternative A (see Photo Plate 4-27). TOD Alternative B would have slightly less impacts on views of the sky because of the height limitation to 418 feet for towers on Kamakee Ave.

Photo Plate 4-26: Visual Impact of TOD Alternative A at McKinley High School Sports Field Looking Makai

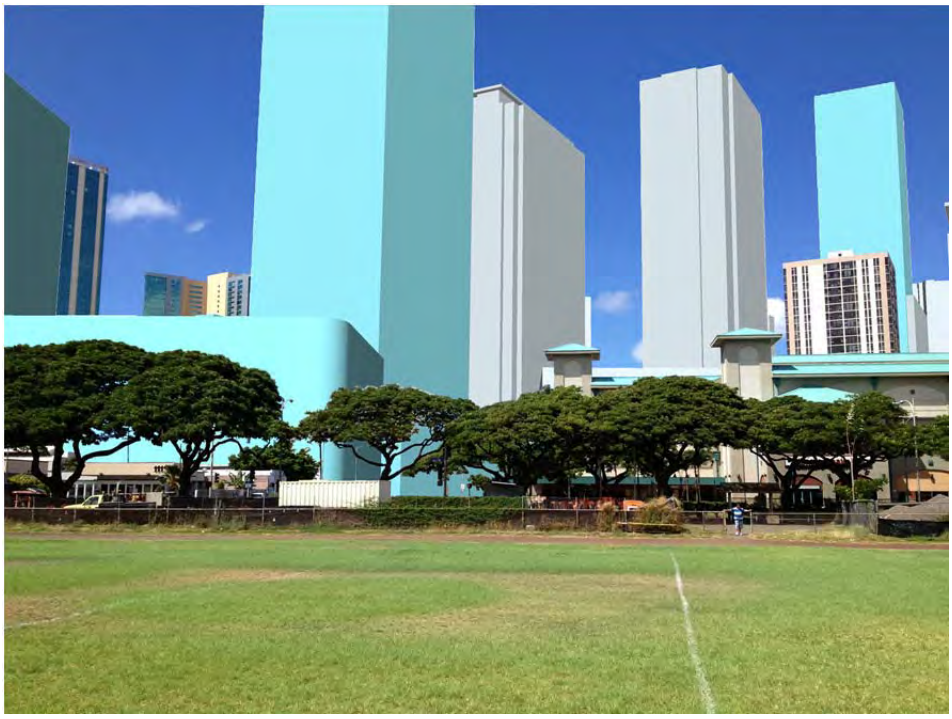


Photo Plate 4-27: Visual Impact of TOD Alternative B at McKinley High School Sports Field Looking Makai

Vantage Point 5: McKinley High School Looking Ewa (Blaisdell Center Site)

The Future Baseline Condition illustrates a possible redevelopment scenario for the Blaisdell Site with a series of high-rise structures (see Photo Plate 4-28). The total number of structures shown on the site meets existing capacity limitations of 3.5 FAR. There would be other potential scenarios for Blaisdell redevelopments, including maintaining existing structures. This illustration reflects a portion of nearby 400' high-rise, with its Street Element located on S. King Street. The Symphony Project now permitted on the corner of Ward and Kapiolani would also affect views from the McKinley High School looking `Ewa.

Photo Plate 4-28: Visual Impact of Future Baseline Condition at McKinley High School Sports Field Looking Ewa

In both the TOD Alternatives A and B, the Blaisdell Center was identified as an opportunity for a joint development between the HCDA and the City/County, and a potential location for residential, hotel and affordable housing development, in addition to a redeveloped arena, performing arts center and a new public green. Here, an additional full street improvement is proposed directly `Ewa of the site.

In the TOD Alternative A (Photo Plate 4-29), visible from the McKinley High School is a redeveloped Blaisdell Center, including an optional 700' tall tower. The total capacity assumed for the site is comparable to that allowed under the Future Baseline Condition; approximately 3.5 FAR. However, permitting a taller structure would accommodate a more consolidated footprint. In particular, the placement of a 700' tall structure somewhere on the Blaisdell site (with market or luxury residential units or a hotel) may

also lead to higher revenues permitting the funding of additional public amenity, such as the public open space seen in Vantage Point 6. Furthermore (not shown in the illustration) additional reserved housing could also be accommodated on the site.

Photo Plate 4-29: Visual Impact of TOD Alternative A at McKinley High School Sports Field Looking Ewa (with one tower at 690 Pohukaina Street)

Photo Plate 4-30: Visual Impact of TOD Alternative A at McKinley High School Sports Field Looking Ewa (with two towers at 690 Pohukaina Street)

In TOD Alternative B, the development capacity on the Blaisdell Center site is the same as for the TOD Alternative A, but the capacity is spread between a greater number of smaller floorplates and shorter towers due to the 418 foot height limit (see Photo Plate 4-31). This results in reduced view blockage from Vantage Point 5. However the illustrations are

only general estimates of the mass and scale of potential developments and should be in no way confused with actual design proposals.

Photo Plate 4-31: Visual Impact of TOD Alternative B at McKinley High School Sports Field Looking Ewa (with two towers at 690 Pohukaina Street)

Vantage Point 6: Thomas Square Historic Park, looking Makai:

The view from Thomas Square Historic Park will be changed depending on the future redevelopment of the Blaisdell site. The Future Baseline Condition (Photo Plate 4-32) shows what could be built with the full redevelopment of the site at maximum allowable capacity (3.5 FAR), with a series of high-rise structures, without the additional amenity options.

As noted in Vantage Point 5, both the TOD Alternatives A and B explore an option to allocate a consolidated area of green, recreation space to extend the public use of Historic Thomas Square Park into the Kaka`ako district, and include additional street connections. The public ownership of the Blaisdell site would allow for potential park allocations, as well as a site that includes additional public amenity, provided that enough revenue generating uses (market residential units or a hotel/hotels) can help to pay for public amenities.

Photo Plate 4-32: Visual Impact of Future Baseline Condition from Thomas Square Looking Makai

Photo Plate 4-33: Visual Impact of TOD Alternative A from Thomas Square Looking Makai

Photo Plate 4-34: Visual Impact of TOD Alternative B from Thomas Square Looking Makai

Both Alternatives would result in reduced visual impact compared to the Future Baseline Condition, because the new buildings are set back further from the street. TOD Alternative A (Photo Plate 4-33) has a bigger visual impact than does the Alternative B (Photo Plate 4-34) because the main tower in the Blaisdell site is 700 feet tall, as opposed to 418 feet tall. Design and placement of buildings would change depending on specific development proposals.

Vantage Point 7: Coral Street and Ilalo Street, Mauka

The Future Baseline Condition depicts proposed development associated with the Kamehameha Schools Master Plan on Ala Moana Boulevard and an individual parcel (see Photo Plate 4-35). These buildings generally constitute only one tower per site, with no new street access points. Allowable building heights and basic massing are included for parcels makai of the Ala Moana Boulevard. This street is not identified within the Mauka Area Rules as a "view corridor street". This street leads into Mother Waldron Neighborhood Park, with a development site located directly mauka of the park.

Photo Plate 4-35: Visual Impact of Future Baseline Condition from Coral Street at Ilalo Street Looking Mauka

TOD Alternative A allows for significant development in this area adjacent to Civic Center Station. This vantage point presents two options for the 690 Pohukaina project – the provision of a single 650' tall tower that would met the proposed criteria for an exceptional circumstance and an "Iconic Tower" (see Photo Plate 4-36), and two 400' towers that would require no changes to existing development standards (see Photo Plate 4-37). Developments are also depicted diamond head to Mother Waldron Neighborhood Park, and on an identified TOD site makai of the rapid transit alignment.

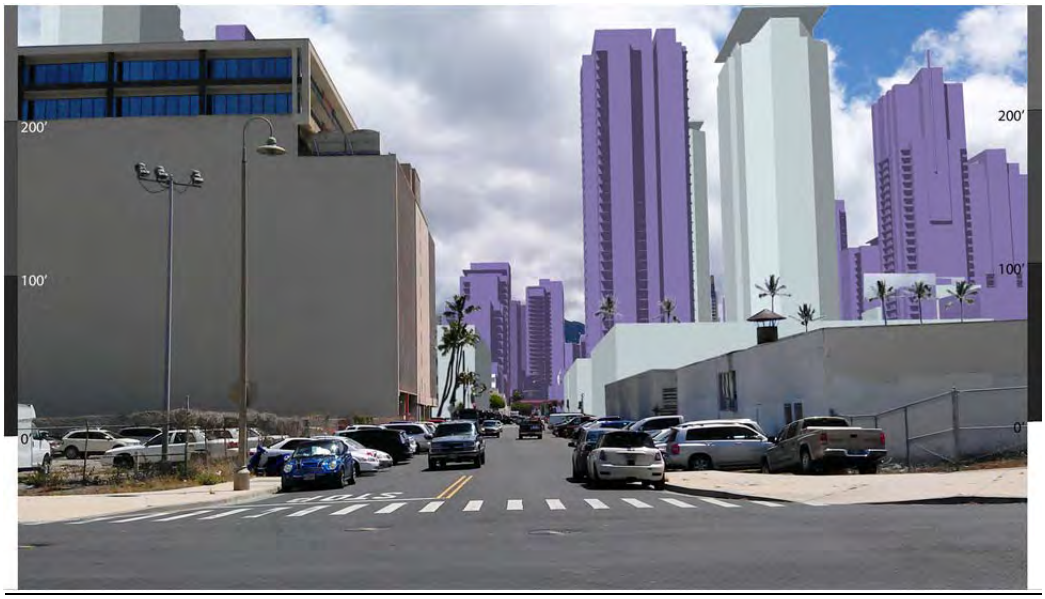

Photo Plate 4-36: Visual Impact of TOD Alternative A from Coral Street at Ilalo Street Looking Mauka (with one tower at 690 Pohukaina Street)

Photo Plate 4-37: Visual Impact of TOD Alternative A from Coral Street at Ilalo Street Looking Mauka (with two towers at 690 Pohukaina Street)

Photo Plate 4- 38: Visual Impact of TOD Alternative B from Coral Street at Ilalo Street Looking Mauka

Compared to the TOD Alternative A, the TOD Alternative B has significantly reduced impacts on views to the sky down the Coral Ave corridor, but views of the mountains are increasingly obstructed (Photo Plate 4-38).

Vantage Point 8: View from the entrance of the National Cemetery, 2195 Puowaina Drive

There is an extensive view towards the southern shoreline from Punchbowl. Both Alternatives show the proliferation of new high-rise structures. Those structures in the Future Baseline Condition are the same height as the existing buildings in Kaka`ako (Photo Plate 4-39).

Photo Plate 4-39: Visual Impact of Future Baseline Condition from Punchbowl

TOD Alternative A provides the potential for taller structures, with a 700' tall tower on Blaisdell Center meeting the criteria for an "iconic tower" (Photo Plate 4-40). Three towers extend above the existing buildings in the view shed, and create a small additional amount of view blockage of the ocean.

For the TOD Alternative B, new buildings do not extend beyond the height of existing buildings in the view shed, and only create a very slight additional view blockage of the ocean (Photo Plate 4-41).

Photo Plate 4-40: Visual Impact of TOD Alternative A from Punchbowl

Photo Plate 4-41: Visual Impact of TOD Alternative B from Punchbowl

Shade and Shadows: Development of taller buildings results in increased shading throughout the area, which could periodically affect street environments, smaller buildings, and open spaces, particularly if these areas are located to the north of new development. Shadow impacts are temporary and are influenced by the height, building location etc.

Computer modeling was conducted utilizing the position of the sun at the Spring Equinox (the day when the sun crosses the equator and the length of day and night are equal) and Summer Solstice (the day when the sun is at its farthest point north of the equator, traditionally marking the first day of summer in the northern hemisphere).

A comparison between the existing 400' High Rise Building Type allowed in the Mauka Area Plan and the TOD Alternatives' tower typologies explores the extent of shadowing impact on key public spaces within the Mauka Area, Mother Waldron Neighborhood Park, Kawaiaha`o Church, the planned Cooke Street linear park and Historic Thomas Square Park. Illustrations that follow compare the existing tower typology under the Future Baseline Condition, TOD Alternative B, TOD Alternative A (with a single iconic tower at 690 Pohukaina Street), and TOD Alternative B (with two 418-foot towers at 690 Pohukaina Street). The floor plate controls maintain a slender profile – so that shadows move quickly across a path. Higher buildings generally result in longer shadows.

Figure 4-38: Shadow Impacts of Future Baseline Condition at Equinox (10am)

Figure 4-39: Shadow Impacts of Future Baseline Condition at Solstice (10am)

Figure 4-52: Shadow Impacts of TOD Alternative A (with two towers at 690 Pohukaina) at Equinox (4pm)

Figure 4-53: Shadow Impacts of TOD Alternative A (with two towers at 690 Pohukaina) at Solstice (4pm)

Light and Glare: Alteration of natural light will continue with the on-going urbanization of the Kaka`ako District. The light and glare impact that could occur is generally consistent in both alternatives. Views in and out of buildings are desirable for public safety and pedestrian comfort. Chapter 217-22-55 (k.2), HAR, requires that visible light transmission level of windows on the ground floor shall be 50% or greater.

New and renovated structures would provide additional light sources at night within the Mauka and Makai Areas, including interior and exterior building lighting and security lighting, which would be noticeable from adjacent neighborhoods on Punchbowl. With the Proposed Action, additional vehicular traffic is anticipated within the area, which would result in additional light from vehicles entering and leaving the area. Additional light resulting from any one of the development alternatives, however, is not anticipated to result in any significant impacts. Cumulatively, the construction of new towers envisioned under the Proposed Action (either Alternative) would represent an increase in ambient nighttime light over the Future Baseline Condition.

The primary sources of glare from development would be direct nighttime glare from lighting sources, (e.g., building and security lighting, vehicle headlights) and reflective daytime solar glare from specular surfaces (e.g., glazing, luminaire housing, reflective surfaces on building facades and vehicles). New sources of light and glare would be similar to those that current exist in the Mauka Area and could be perceived as a

continuation of existing light and glare from Downtown Honolulu or Waikiki. As with shadows, reflected solar glare impacts are also influenced by climatic conditions. No significant glare related impacts are anticipated. Chapter 217-22- 55 (k), HAR, mitigates adverse light and glare impacts by prohibiting highly reflective, mirrored and opaque window glazing.

Open Space and Public Realm: Ongoing redevelopment of the Kaka`ako District under the Proposed Action (either TOD Alternative), Mauka Area Rules and Makai Conceptual Master Plan will result in a large population of both full-time and employee residents in a more intensive land use pattern. In the Mauka Area, it is unlikely that the HCDA will be able to purchase a new major property to be allocated for parkland.

Recognizing that land in the KCDD is primarily developed by the private sector, both the Future Baseline Condition, and Proposed Action (either TOD Alternative) seek to leverage private investments by requiring developers to provide active public recreational spaces either on or off-site that are accessible to residents and local users. The Alternatives include an allocation of 7% of net sq. ft as recreation area for building users that is comparable to the Future Baseline Condition requirement of 55 sq. ft of space per unit, but does not penalize small units. Rather, this means that both smaller and larger units would result in an amount of recreation area that is proportional to the size of the unit. For example, a 1,500 sq. ft unit (a typical 2 or 3 bedroom) would allocate 105 sq. ft of space, while a smaller studio apartment at 650 sq. ft would be required to allocate 42 sq. ft. Both the Alternatives and Future Baseline Condition maintain a minimum of 15% of lot area as public active space. This required public active space could be allowed on above-grade on podiums or addressed through an in-lieu program.

Mother Waldron Neighborhood Park is adjacent to the proposed ~~HART~~ ***light metro rail*** alignment (along Halekauwila), the 690 Pohukaina property, and new Halekauwila Place – a 19 story affordable housing project. The park is also surrounded by potential sites eligible for participation in the TOD Overlay Plan, and to the south, the Kamehameha Schools Master Plan. As a result, the future context of Mother Waldron Neighborhood Park may be oriented towards, a more activated park space with public improvements that animate and improve the existing park.

4.12.6 Recommended Measures to Mitigate Impacts

4.12.6.1 Urban Design

The following mitigation measures apply to the Proposed Action, and are based on existing HCDA policy[58], as well as new policy proposed in the draft TOD Overlay Plan

[58] Chapter 15-217, HAR, establishes Development and Design Standards for the KCDD Mauka Area. Sub Chapter 2 "Regulating Plan and Neighborhood Zones" establishes the Regulating Plan, Neighborhoods Zones, Building Types, Frontage Types, and the Open Space Plan. Sub Chapter 3 establishes Area Wide Standards including Building Placement, Building Form, Architectural Design, Landscape and Recreation Space, Adequate Infrastructure, Large Lots, Green Building, Encroaching Elements, Historic and Cultural Sites, Parking and Loading and Conditional Use of vacant land.

document. These mitigation measures are proposed in the TOD Overlay Draft Plan, and together with more specific measures developed in implementing rules, can help to mitigate impacts described in Section 4.12.5 of this EIS.

Table 4-77: Urban Design Mitigation Measures

TOD Overlay Plan Strategy	Intent	Alternative
Strategy LU 6 MA 3	This strategy seeks to improve the quality of urban experience related to the minimization of the automobile's impact on streets and land uses. This may have an impact on a reduction of the scale of parking structures in the Kaka`ako District and will improve the comfort of the street environment. This strategy is to be applied concurrently with measures to support street-level building activation and adequate provision of transportation alternatives.	A and B
New tools for Vibrant Neighborhoods	In both Alternatives, the capacity increase is an opt-in program provided land areas meet minimum thresholds. Additional capacity achieved under the program is not given "as of right," but is allocated upon the contractual obligation for the timely receipt of identified public goals, including affordable housing, and new public amenity – such as park space, civic programs, street grid enhancements, new pedestrian links or vehicular connections. To guide this process, HCDA should devise an appropriate "needs assessment" and make available an inventory of desired, and priority amenities, and their relative costs. HCDA should evaluate the value of these amenities and tie their provision using a point system or other basis to the delivery of added capacity.	A and B
Strategy UDI	This strategy directs the HCDA to adopt a revised set of form-based, transit-friendly building types that will allow for increased capacity, while avoiding monolithic, overly uniform buildings or inward facing buildings. High Rise Building types are generally outlined in Chapter four of the Draft TOD Overlay Plan. HCDA should codify these proposed building types to coordinate with and ensure compatibility with existing design and development standards in Chapter 15-217. HCDA to consider: • Definitions and standards for proposed TOD Overlay Building Types; • Refinements to site design for pedestrian and vehicular access, parking and loading as needed; • Standards, design guidelines and review criteria specific to TOD Overlay High Rise structures; (see also guidelines for Family Housing and Design Review) • Guidelines or standards to improve transitions between large buildings and small-scale development. • Provisions for modification of standards by HCDA's Executive Director	A and B

Strategy UD 4	This strategy directs HCDA to expand the existing Design Review process to cover all projects that meet or exceed identified minimum size thresholds. It also directs the agency to engage a Design Review Panel, establish design guidelines and principles to guide the TOD Overlay development process, and provide adequate opportunity for public review and community input for new projects.	
Strategy MA1	Tied to the urban design quality of the buildings, this strategy is focused on the scale of the development site. In reference to Chapter 15-217-58 Large Lots, this strategy directs HCDA to develop tools to implement a fine-grained street network within TOD Overlay redevelopment areas that promote walkability and pedestrian orientation of TOD Developments. In particular this Strategy directs HCDA to consider requiring through-block pedestrian connections where an adequate lot size allows for two projects on a block, or where projects are mostly commercial. This strategy also directs HCDA to consider requiring the Master Plans in its Plan area to meet a minimum intersection density requirement.	A and B
Strategy MA 3	Building upon the existing Mauka Area Rules, this strategy will improve pedestrian orientation and comfort by providing an array of strategies that will reduce vehicle and pedestrian conflicts at the street level. Specifically in terms of building design, this strategy also encourages HCDA to limit driveway access on identified streets to better promote pedestrian and non-motorized movement.	A and B
Strategy SA1 SA 7 SA 9	This strategy seeks to improve street connectivity in the ½ mile around the HART ~~rapid transit~~ ***light metro rail*** stations, and prioritizes pedestrian crossings and pedestrian facility improvements. This strategy directs HCDA to improve the areas around the station, including streets, paths, signage and connections to feeder transit. This strategy also directs HCDA to advocate for, and ensure that on developments located close to new rapid transit stations, designs are vetted to ensure both pedestrian safety and comfort.	A and B
Strategy SA 10	This strategy directs the HCDA to partner with and other relevant agencies to coordinate proposed rapid transit station design with future TOD redevelopment, and circulation plans to achieve desired transit friendly land uses and design strategies. Station and alignment integration opportunities for Kaka`ako, Civic Center and aloha Tower District are identified in the plan. (Draft TOD Overlay Plan Figures: 7-12, 7-13, 7-14, 7-15.)	
Strategy PT 1	This strategy alters capacity regulations in the TOD Overlay to include square footage of building area devoted to parking as part of the calculated Floor Area. This is intended to encourage more efficient use of space, and reduce the likelihood of over-building of parking areas. Support and outreach to the development community on planning and opportunities for more efficient parking utilization may be required.	A and B
Strategy PT 4	This strategy establishes a shared parking district to reduce vehicle trips and share between uses, and create a more welcoming environment. Improve urban design by reducing the amount of area dedicated to parking spaces.	A and B

Strategy PT 9 and 10	This strategy requires Transportation Demand Management for new residential developments to reduce overall auto dependence, and help to reduce the need for multiple cars. See TOD TDM Strategies Menu, 8-16.	A and B
	Family Compatible Housing: a major requirement for the TOD Overlay plan is provide a range of housing types and market places, including unit diversity. The HCDA should provide an analysis of the types of housing opportunities in the Mauka Area under the TOD Plan and provide guidance for successful family housing. Guidelines should be applicable to BOTH affordable and market rate projects and encourage the integration of residents at various income levels and tenants with and without children into projects. For example the City of Vancouver "High Density Housing for Families with Children Guidelines."	A and B

4.12.6.2 Views

The ocean or mountain views experienced by existing high-rise dwellers are not protected under City or State regulations. However, a method for considering the significance attributed to both distant and near-by views will help to maintain the KCDD's long-term residential desirability. This can be accomplished by providing guidelines that ensure that building placement is neighborly, and a balanced distance between towers and housing complexes is maintained. Partial or framed views can also be preserved through the appropriate siting of towers, staggering building placement, and enforcing required spacing.

The existing Mauka Area Rules include policies for View Preservation. Ch 12-217-53 Architectural Design regulates the placement of new buildings in relationship to the Mauka-Makai view corridors. Both TOD Alternatives propose to

- Maintain the 80' high-rise tower separation rules.
- Maintain tower floor plate maximums. These maximums are designated by building type, and when combined with maximum tower dimensions ensure a more slender building profile. This will reduce the effect of a monolithic wall of development, and impact on the mauka-makai view shed.
- Maintain maximum dimension in mauka-makai axis, and maximum tower dimension.

HCDA may consider adjustments to the view preservation rules as discussed in the following sections.

4.12.6.3 Tower Siting and Design

Develop a guideline that addresses issues identified in the TOD Draft Plan (Appendix A, table 4-2 – Building Siting and View Preservation), applicable to either TOD Alternative. Guidelines should at minimum address the following:

- Show prototypical development lots, with preferred site design for staggered or offset towers;
- Encourage staggered heights (tower configurations should provide skyline diversity; and
- Examples for appropriate building tops.

4.12.6.4 Street Level Setbacks

Revise Rules for either TOD Alternative that are in conflict with TOD Overlay Plan objectives. For example:

- Revise standard (ch 15-217-55 (4) for view corridor streets in the TOD Overlay Area to regularize the setback allowed in the Master Plan areas, at 75' above the Street Element. This will meet the TOD Objective of increased capacity, and improved pedestrian environment.
- Revise rule 15-217-54 (c) that requires an increased setback by three feet for every ten feet of building height. These rules are in conflict with building types as proposed and would negate the ability for large parcels to place multiple buildings on a development parcel by reducing flexibility and pushing development to one side of the development parcel.
- Revise Mauka Area Rule designating 25% of tower "void" space to be located at the street frontage.
- Revise Mauka Area Rule designating 65% of tower to be located on street frontage.

4.12.6.5 Incorporate Green Landscaped Podiums

As the number and frequency of towers increases, HCDA may encourage developments to better address and consider internal views. HCDA will require a portion of rooftops to include aesthetic treatments, as well as meet open space objectives. To encourage green roofs as a best practice within Kaka`ako, HCDA will create a green roof policy and provide technical support appropriate to the Hawaiian climate, with resources and guides for developers. HCDA will consider appropriate incentive mechanisms as necessary.

4.12.6.6 Provide Public Access

For Iconic Towers in TOD Alternative A, include a provision for the public to access the view, by providing for a public lobby, restaurant, or other public space on top floors.

4.12.6.7 Flight Path (Honolulu International Airport)

In order to ensure that buildings do not obstruct the flight path and airspace established in consultation with the FAA, maximum building heights in this area of KCDD will be adjusted to ensure that buildings do not penetrate the airspace.

- A vertical safety buffer below the approach surface will be considered to ensure adequate separation between the airspace and building rooftops.
- Consideration will be given to limiting the height of rooftop appurtenances (e.g., antennae, flag poles, etc.) proximate to the flight path that could penetrate the airspace or the associated safety buffer.
- Consideration will also be given as part of the HCDA's design review process to limiting rooftop specular surfaces that can act as a distraction for pilots.
- Proximate to the flight path, consideration will be given to limiting electrical interference on frequencies used by aircraft.

4.12.6.8 Light and Glare

Strategy UD 3 in the Draft TOD Overlay Plan builds upon Chapter 15-217-55 Architectural Design and further directs the HCDA to consider the impact of shadowing on the public realm to reduce shading on public spaces and parks. This is applicable to either TOD Alternative. Other strategies appropriate to an urban environment such as Kaka`ako are the limiting the area and intensity of illumination;

- limiting the location or angle of illumination;
- limiting the hours of illumination; and
- providing landscaping at the street level that will absorb light.

Other measures that may be also employed include:

- installation of screening, overhangs, or shielding to minimize spillover lighting impacts – particularly near sensitive residential receivers;
- shielding exterior lighting fixtures and directing site security lighting away from nearby residential uses;
- including pedestrian-scaled and pedestrian-oriented lighting for safety along sidewalks, parking areas, street crossings and building access points;
- employing timers or motion sensors for lighting to reduce spillover lighting and generally reduce ambient light levels;
- avoiding large expanses of smooth, uniform, reflective building surfaces;
- incorporating architectural relief and detail, such as exterior sun shades, deep spandrels, mullions or other features of façade articulation, that reduce reflectivity; and
- as necessary, undertaking project-specific solar impact analysis studies to determine the extent of light and/or glare impacts and to identify specific mitigation measures.

4.12.6.9 Open Space and Public Realm

The Mauka Area Rules identify a variety of strategies to secure needed open, active public space to ensure that the growing neighborhood contains adequate resources. In addition to the recreational requirement, under the existing Mauka Area Rules, developers are

required to dedicate public facilities in the amount of three percent of the total commercial floor area of the development (exclusive of nursing facilities and assisted living facilities). Additionally, developers are required to dedicate four percent of the total residential floor area, exclusive of floor area devoted to reserved housing unit. If it is determined that dedicating land is not in the best interest of the public, the developer shall pay instead a fee in the sum equal to the fair market value of the land area required. HCDA may expend the moneys for the purchase, creation, expansion, or improvement of public facilities, including parks and recreational facilities.

Other measures that may be employed include:

- Construction of improved pedestrian connections to nearby public parks (Kewalo Basin, Kaka`ako Waterfront Park, Ala Moana Beachfront Park, Thomas Square Historic Park).
- Explicit shared use of existing public recreation facilities: McKinley High School campus contains the most significant publically owned recreation facilities including softball courts, baseball field, tennis courts, basketball and volley ball courts and a football/soccer field surrounded by a track. As noted in the 2009 Mauka Area Plan FEIS, a more formal school/community use arrangement, combined with the improvement of the adjoining three and a half acre site, is a practical option for making a wide range of active outdoor recreation facilities available to the public.
- Improving connecting links and access within the District. Greenways identified in the Mauka Area Rules are Cooke Street, Pohukaina Street, Kamakee Street, and Piikoi Street.

The Proposed Action will apply these strategies for either TOD Alternative. HCDA will also explore opportunities for quasi-public parcels at the Blaisdell Center and the HECO facility (between Cooke St, Ward Ave, S. King Street and Kapiolani) for larger, consolidated park spaces for use by the Kaka`ako community. Either TOD Alternative would include the creation of two small plazas located at both Civic Center Station, and Kaka`ako Stations associated with the ~~HART rapid transit~~ ***light metro rail*** system.

Further strategies for park and Public realm enhancements follow:

Table 4-78: Park and Public Realm Strategies

TOD Overlay Plan Strategy	Intent	Alternative
New Tools for Vibrant Neighborhoods	This strategy directs HCDA to develop a needs assessment process to work with the KCDD community to understand and prioritize a set of public amenities to be tied to the provision of new density. This process should be revised with enough frequency to capture demographic shifts in the area, be coordinated with the City and County of Honolulu such as those amenities that address the needs of diverse populations, such as senior populations, youth	A and B

	populations or day-time employees.	
Strategy LU4 Strategy MA8	This strategy encourages the HCDA to allow for temporary uses, repurposing spaces such as parking lots, low traffic streets, and into a resource that can be used to provide communities activities.	A and B
Strategy MA 9	This strategy directs the HCDA to transform existing and proposed corridors into greenways as identified in the Draft TOD Overly Plan: Cummins Street, connecting the Blaisdell Center to Ala Moana Beach Park; Auahi Street connecting between the Auahi and Pauahi neighborhoods; Punchbowl Street, and Ilalo street within Makai. The Plan also recommends green treatments for Aloha Tower Drive. (Figure 5-10 TOD Overlay Plan)	A and B
Guidelines Public Parks P4-23	HCDA will introduce new types of spaces in the Mauka Area, and activate existing green spaces. Guidelines identify a variety of public realm options as identified including “promenades,” “community gardens,” and “public squares and plazas.” This is especially appropriate for new internal pedestrian passageways in new private development sites.	A and B
Strategy MA 7	Directs HCDA to complete a set of Complete Streets Design Standards for gracious sidewalks that invite pedestrian travel.	A and B

5.0 Relationship to Land Use Plans, Policies, and Controls

5.1 Federal Policies and Controls

This chapter discusses the relationship of the Proposed Action to applicable plans, policies, and controls of the federal government, State of Hawai`i, and the City and County of Honolulu.

5.1.1 Coastal Zone Management

Section 307 of the National Coastal Zone Management (CZM) Act of 1972 provides for State review of federal actions or permits affecting the coastal zone of states with an approved CZM program. Unlike other states, the entire land mass of the State of Hawai`i is considered to be part of the Coastal Zone. Any federal action conducted in Hawai`i therefore requires a Certificate of Consistency to ensure that it complies with the requirements of the CZM Act.

Hawai`i's CZM program was established pursuant to Chapter 205A, HRS, and is administered by the State Office of Planning. The program provides for the beneficial use, protection, and development of the State's coastal zone. Under the State program, a coastal zone has been delineated along the coast of each island and designated the Special Management Area (SMA). Any activity defined as development by Chapter 205A, HRS, requires that an application for a SMA Use Permit be filed with the regulating County agency, or in the instance of the KCDD, with the State Office of Planning. Further discussion of the SMA requirements is provided in Section 5.3.3 below.

5.1.2 FEMA National Flood Insurance Program

The National Flood Insurance Act of 1968 established a nationwide program to delineate flood-prone areas and provide insurance opportunities to property owners in those designated areas. The Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Maps (FIRM) are utilized by building departments and development agencies throughout the country to establish flood control policies and building code requirements in designated flood zones. All development must comply with flood zone regulations.

5.1.3 National Historic Preservation Act of 1966

The 1966 National Historic Preservation Act established a mechanism for protecting and preserving valued historic and archaeological resources, including architectural resources. In Hawai`i, the provisions of the federal law are implemented and

enforced by the State Historic Preservation Division of the Department of Land and Natural Resources, pursuant to Chapter 6E, Hawaii Revised Statutes, as amended. In instances where archaeological and/or cultural artifacts such as burials are discovered during excavation of property in Kaka`ako, the work crew is required to stop work and to contact the State Historic Preservation Officer at DLNR to determine whether the provisions of Chapter 6E are applicable and how to proceed.

5.2 State Plans, Policies, and Controls

Numerous state plans, polices, programs and controls provide goals, objectives, and priority actions to provide guidelines for development within the State of Hawai`i. Following is a review of those that are most applicable to the KCDD.

5.2.1 Hawaii State Land Use Law (Chapter 205, HRS)

Under this law, all lands in the State of Hawai`i are classified as one of four categories: Urban, Conservation, Agricultural, or Rural. The KCDD is designated as Urban. Jurisdiction over Urban lands rests with the County in which the lands are located.

5.2.2 Hawaii State Plan (Chapter 226)

In 1978, the Department of Planning and Economic Development (now known as the Department of Business, Economic Development and Tourism, or "DBEDT") completed the Hawai'i State Plan to: (1) improve the planning process; (2) increase the effectiveness of government and private actions; (3) improve coordination among agencies and levels of government; (4) provide for the wise use of Hawai'i's resources; and (5) guide the future development of the State. (State of Hawai'i, Department of Planning and Economic Development, 1978, Revised 1989, 1991.)

The State Legislature subsequently adopted 1978 the Hawai'i State Planning Act (Planning Act), as HRS Chapter 226. The Planning Act consists of a series of broad goals, objectives and policies that serve as guidelines for future long-term growth and development. It further (1) provides a basis for determining priorities and allocating limited resources; (2) seeks to improve coordination of Federal, State, and County plans, policies, programs, projects, and regulatory activities; and (3) establishes a system for plan formulation and program coordination to provide for an integration of all major State and County activities.

The Planning Act is divided into three sections: Part I - Overall Theme, Goals, Objectives and Policies; Part II - Planning Coordination and Implementation; and Part III - Priority Guidelines. Part I of the Planning Act consists of three overall themes: (1) individual and family self-sufficiency; (2) social and economic mobility; and (3) community or social well-being. These themes are considered "basic functions of society" and goals toward which government must strive (HRS §226-3).

Part II of the Planning Act primarily addresses internal government policies to help streamline, coordinate, and implement various plans and processes between governmental agencies. It seeks to eliminate or consolidate burdensome or duplicative governmental requirements imposed on business, where public health, safety, and welfare would not be adversely affected. Part III of the Planning Act establishes overall priority guidelines to address areas of statewide concern (HRS §226-101). The overall direction and focus are on improving the quality of life for Hawai'i's present and future population through the pursuit of desirable courses of action (HRS §226-102). Following is a discussion of how the Proposed Action relates to these to Chapter 226.

Table 5-1: Compliance with Hawai`i State Planning Act – Part 1

SECTION	CHAPTER 226 - PART I. OVERALL THEME, GOALS, OBJECTIVES AND POLICIES	RATING
A = actively supportive C= conforms I = goal is inconsistent with applicant's objectives NA = goal is not applicable		
226-1	Findings and purpose.	
226-2	Definitions.	
226-3	Overall Theme	
226-4	State Goals. In order to guarantee, for present and future generations, those elements of choice and mobility that insure that individuals and groups may approach their desired levels of self-reliance and self-determination, it shall be the goal of the State to achieve:	
(1)	A strong, viable economy, characterized by stability, diversity, and growth, that enables the fulfillment of the needs and expectations of Hawai'i's present and future generations.	**A**
(2)	A desired physical environment, characterized by beauty, cleanliness, quiet, stable natural systems, and uniqueness, that enhances the mental and physical well being of the people.	**A**
(3)	Physical, social, and economic well being, for individuals and families in Hawai'i, that nourishes a sense of community responsibility, of caring, and of participation in community life.	**A**
COMMENTARY: As a matter of State and County land use policy, the KCDD has been created to provide new residential opportunities. The Proposed Action is consistent with those policies. Implementation of Transit-Oriented Development contributes to the continued strengthening of the island economy. As the TOD Overlay is an incentive based program, Kaka`ako will continue to provide new residential opportunities with or without the Proposed Action. However, with the Proposed Action new residential opportunities are expected to increase.		
226-5	OBJECTIVE AND POLICIES FOR POPULATION	
(a)	It shall be the objective in planning for the State's population to guide population growth to be consistent with the achievement of physical, economic, and social objectives contained in this chapter;	**A**
(b)	To achieve the population objective, it shall be the policy of this State to:	
(1)	Manage population growth statewide in a manner that provides	**A**

	increased opportunities for Hawai'i's people to pursue their physical, social, and economic aspirations while recognizing the unique needs of each county.	
(2)	Encourage an increase in economic activities and employment opportunities on the neighbor islands consistent with community needs and desires.	**NA**
(3)	Promote increased opportunities for Hawai'i's people to pursue their socio-economic aspirations throughout the islands.	**C**
(4)	Encourage research activities and public awareness programs to foster an understanding of Hawai'i's limited capacity to accommodate population needs and to address concerns resulting from an increase in Hawai'i's population.	**C**
(5)	Encourage federal actions and coordination among major governmental agencies to promote a more balanced distribution of immigrants among the states, provided that such actions do not prevent the reunion of immediate family members.	**NA**
(6)	Pursue an increase in federal assistance for states with a greater proportion of foreign immigrants relative to their state's population.	**NA**
(7)	Plan the development and availability of land and water resources in a coordinated manner so as to provide for the desired levels of growth in each geographic area.	**A**
COMMENTARY: The Proposed Action is consistent with the CC&H's population distribution policies. As the TOD Overlay is an incentive based program, Kaka`ako will continue to accommodate population growth with or without the Proposed Action. However, with the Proposed Action the population of the district will increase over what is anticipated under current rules.		
226-6	OBJECTIVES AND POLICIES FOR THE ECONOMY - IN GENERAL.	
(a)	Planning for the State's economy in general shall be directed toward achievement of the following objectives:	
(1)	Increased and diversified employment opportunities to achieve full employment, increased income and job choice, and improved living standards for Hawai'i's people.	**A**
(2)	A steadily growing and diversified economic base that is not overly dependent on a few industries, and includes the development and expansion of industries on the neighbor islands.	**C**
(b)	To achieve the general economic objectives, it shall be the policy of this State to:	
(1)	Expand Hawai'i's national and international marketing, communication, and organizational ties, to increase the State's capacity to adjust to and capitalize upon economic changes and opportunities occurring outside the State.	**NA**
(2)	Promote Hawai'i as an attractive market for environmentally and socially sound investment activities that benefit Hawai'i's people.	**C**
(3)	Seek broader outlets for new or expanded Hawai'i business	**C**

	investments.	
(4)	Expand existing markets and penetrate new markets for Hawai'i's products and services.	**C**
(5)	Assure that the basic economic needs of Hawai'i's people are maintained in the event of disruptions in overseas transportation.	**C**
(6)	Strive to achieve a level of construction activity responsive to, and consistent with, state growth objectives.	**C**
(7)	Encourage the formation of cooperatives and other favorable marketing arrangements at the local or regional level to assist Hawai'i's small-scale producers, manufacturers, and distributors.	**NA**
(8)	Encourage labor-intensive activities that are economically satisfying and which offer opportunities for upward mobility.	**C**
(9)	Foster greater cooperation and coordination between the government and private sectors in developing Hawai'i's employment and economic growth opportunities.	**C**
(10)	Stimulate the development and expansion of economic activities which will benefit areas with substantial or expected employment problems.	**C**
(11)	Maintain acceptable working conditions and standards for Hawai'i's workers.	**C**
(13)	Provide equal employment opportunities for all segments of Hawai'i's population through affirmative action and nondiscrimination measures.	**C**
(14)	Encourage businesses that have favorable financial multiplier effects within Hawai'i's economy.	**C**
(15)	Promote and protect intangible resources in Hawai'i, such as scenic beauty and the aloha spirit, which are vital to a healthy economy.	**C**
(16)	Increase effective communication between the educational community and the private sector to develop relevant curricula and training programs to meet future employment needs in general, and requirements of new, potential growth industries in particular.	**C**
(17)	Foster a business climate in Hawai'i - including attitudes, tax and regulatory policies, and financial and technical assistance programs - that is conducive to the expansion of existing enterprises and the creation and attraction of new business and industry.	**C**
COMMENTARY: While the Proposed Action focuses on residential development, the provision of new office space, commercial, and industrial land use opportunities are supportive of the State's objectives.		
226-7	OBJECTIVES AND POLICIES FOR THE ECONOMY - AGRICULTURE	
(a)	Planning for the State's economy with regard to agriculture shall be directed towards achievement of the following objectives:	
(1)	Viability of Hawai'i's sugar and pineapple industries.	**NA**
(2)	Growth and development of diversified agriculture throughout the State.	**C**
(3)	An agriculture industry that continues to constitute a dynamic and essential component of Hawai'i's strategic, economic, and social well-	**C**

	being.	
(b)	To achieve the agriculture objectives, it shall be the policy of this State to:	
(1)	Establish a clear direction for Hawai'i's agriculture through stakeholder commitment and advocacy.	**NA**
(2)	Encourage agriculture by making best use of natural resources.	**C**
(3)	Provide the governor and the legislature with information and options needed for prudent decision making for the development of agriculture.	**NA**
(4)	Establish strong relationships between the agricultural and visitor industries for mutual marketing benefits.	**NA**
(5)	Foster increased public awareness and understanding of the contributions and benefits of agriculture as a major sector of Hawai'i's economy.	**NA**
(6)	Seek the enactment and retention of federal and state legislation that benefits Hawai'i's agricultural industries.	**NA**
(7)	Strengthen diversified agriculture by developing an effective promotion, marketing, and distribution system between Hawai'i's producers and consumer markets locally, on the continental United States, and internationally.	**NA**
(8)	Support research and development activities that provide greater efficiency and economic productivity in agriculture.	**NA**
(9)	Enhance agricultural growth by providing public incentives and encouraging private initiatives.	**NA**
(10)	Assure the availability of agriculturally suitable lands with adequate water to accommodate present and future needs.	**NA**
(11)	Increase the attractiveness and opportunities for an agricultural education and livelihood.	**NA**
(12)	Expand Hawai'i's agricultural base by promoting growth and development of flowers, tropical fruits and plants, livestock, feed grains, forestry, food crops, aquaculture, and other potential enterprises.	**NA**
(13)	Promote economically competitive activities that increase Hawai'i's agricultural self-sufficiency.	**NA**
(14)	Promote and assist in the establishment of sound financial programs for diversified agriculture.	**NA**
(15)	Institute and support programs and activities to assist the entry of displaced agricultural workers into alternative agricultural or other employment.	**NA**
(16)	Facilitate the transition of agricultural lands in economically nonfeasible agricultural production to economically viable agricultural uses.	**NA**
COMMENTARY: Because the Proposed Action is situated in the Urban district, it has no direct relationship to agricultural activities. However, continued development in the KCDD will help to reduce development pressures on rural and agricultural lands by		

redirecting growth to an existing urban growth center.		
226-8	OBJECTIVE AND POLICIES FOR THE ECONOMY - VISITOR INDUSTRY.	
(a)	Planning for the State's economy with regard to the visitor industry shall be directed towards the achievement of the objective of a visitor industry that constitutes a major component of steady growth for Hawai'i's economy.	
(b)	To achieve the visitor industry objective, it shall be the policy of this State to:	
(1)	Support and assist in the promotion of Hawai'i's visitor attractions and facilities.	**C**
(2)	Insure that visitor industry activities are in keeping with the social, economic, and physical needs and aspirations of Hawai'i's people.	**C**
(3)	Improve the quality of existing visitor destination areas.	**NA**
(4)	Encourage cooperation and coordination between the government and private sectors in developing and maintaining well-designed, adequately serviced visitor industry and related developments which are sensitive to neighboring communities and activities.	**A**
(5)	Develop the industry in a manner that will continue to provide new job opportunities and steady employment for Hawai'i's people.	**C**
(6)	Provide opportunities for Hawai'i's people to obtain job training and education that will allow for upward mobility within the visitor industry.	**C**
(7)	Foster a recognition of the contribution of the visitor industry to Hawai'i's economy and the need to perpetuate the aloha spirit.	**C**
(8)	Foster an understanding by visitors of the aloha spirit and of the unique and sensitive character of Hawai'i's cultures and values.	**C**
COMMENTARY: Although the Proposed Action is focused on residential development, the inclusion of limited hotel development is supportive of the State's policies related to the visitor industry.		
226-9	OBJECTIVE AND POLICIES FOR THE ECONOMY – FEDERAL EXPENDITURES.	
(a)	Planning for the State's economy with regard to federal expenditures shall be directed towards achievement of the objective of a stable federal investment base as an integral component of Hawai'i's economy;	
(b)	To achieve the federal expenditures objective, it shall be the policy of this State to:	
(1)	Encourage the sustained flow of federal expenditures in Hawai'i that generates long-term government civilian employment.	**NA**
(2)	Promote Hawai'i's supportive role in national defense.	**NA**
(3)	Promote the development of federally supported activities in Hawai'i that respect state-wide economic concerns, are sensitive to community needs, and minimize adverse impacts on Hawai'i's environment.	**NA**
(4)	Increase opportunities for entry and advancement of Hawai'i's people	**NA**

	into federal government service.	
(5)	Promote federal use of local commodities, services, and facilities available in Hawai‘i.	**NA**
(6)	Strengthen federal-state-county communication and coordination in all federal activities that affect Hawai‘i.	**NA**
(7)	Pursue the return of federally controlled lands in Hawai‘i that are not required for either the defense of the nation or for other purposes of national importance, and promote the mutually beneficial exchanges of land between federal agencies, the State, and the counties.	**NA**
COMMENTARY: As the Proposed Action involves no federal programs, objectives and policies pertaining to federal expenditures are not applicable.		
226-10	OBJECTIVE AND POLICIES FOR THE ECONOMY – POTENTIAL GROWTH ACTIVITIES.	
(a)	Planning for the State’s economy with regard to potential growth activities shall be directed towards achievement of the objective of development and expansion of potential growth activities that serve to increase and diversify Hawai‘i’s economic base.	
(b)	To achieve the potential growth activity objective, it shall be the policy of this State to:	
(1)	Facilitate investment and employment in economic activities that have the potential for growth such as diversified agriculture, aquaculture, apparel and textile manufacturing, film and television production, and energy and marine-related industries.	**NA**
(2)	Expand Hawai‘i’s capacity to attract and service international programs and activities that generate employment for Hawai‘i’s people.	**NA**
(3)	Enhance and promote Hawai‘i’s role as a center for international relations, trade, finance, services, technology, education, culture, and the arts.	**NA**
(4)	Accelerate research and development of new energy- related industries based on wind, solar, ocean, and underground resources and solid waste.	**NA**
(5)	Promote Hawai‘i’s geographic, environmental, social, and technological advantages to attract new economic activities into the State.	**NA**
(6)	Provide public incentives and encourage private initiative to attract new industries that best support Hawai‘i’s social, economic, physical, and environmental objectives.	**NA**
(7)	Increase research and the development of ocean-related economic activities such as mining, food production, and scientific research.	**NA**
(8)	Develop, promote, and support research and educational and training programs that will enhance Hawai‘i’s ability to attract and develop economic activities of benefit to Hawai‘i.	**NA**
(9)	Foster a broader public recognition and understanding of the potential benefits of new, growth-oriented industry in Hawai‘i.	**NA**
(10)	Encourage the development and implementation of joint federal and	**NA**

	state initiatives to attract federal programs and projects that will support Hawai'i's social, economic, physical, and environmental objectives.	
(11)	Increase research and development of businesses and services in the telecommunications and information industries.	**NA**
COMMENTARY: As the development of new residential opportunities in the KCDD is largely intended to help redistribute the existing population by making Kaka`ako a more attractive place to live, the Proposed Action will not attract new economic development to the State.		
226-10.5	OBJECTIVES AND POLICIES FOR THE ECONOMY – INFORMATION INDUSTRY.	
(a)	Planning for the State's economy with regard to the information industry shall be directed toward the achievement of the objective of positioning Hawai'i as the leading dealer in information businesses and services in the Pacific Rim;	
(b)	To achieve the information industry objective, it shall be the policy of this State to:	
(1)	Encourage the continued development and expansion of the telecommunications infrastructure serving Hawai'i to accommodate future growth in the information industry;	**C**
(2)	Facilitate the development of new business and service ventures in the information industry which will provide employment opportunities for the people of Hawai'i;	**C**
(3)	Encourage greater cooperation between the public and private sectors in developing and maintaining a well-designed information industry;	**C**
(4)	Ensure that the development of new businesses and services in the industry are in keeping with the social, economic, and physical needs and aspirations of Hawai'i's people;	**C**
(5)	Provide opportunities for Hawai'i's people to obtain job training and education that will allow for upward mobility within the information industry;	**NA**
(6)	Foster a recognition of the contribution of the information industry to Hawai'i's economy; and	**C**
(7)	Assist in the promotion of Hawai'i as a broker, creator, and processor of information in the Pacific.	**NA**
COMMENTARY: The redevelopment of the KCDD relative to the Proposed Action will provide new opportunities for improving broadband infrastructure in Urban Honolulu, thereby facilitating positive growth in the telecommunications industry.		
226-11	OBJECTIVES AND POLICIES FOR THE PHYSICAL ENVIRONMENT – LANDBASED, SHORELINE, AND MARINE RESOURCES.	
(a)	Planning for the State's physical environment with regard to land-based, shoreline, and marine resources shall be directed towards achievement of the following objectives:	
(1)	Prudent use of Hawai'i's land-based, shoreline, and marine resources.	**A**

(2)	Effective protection of Hawai'i's unique and fragile environmental resources.	**A**
(b)	To achieve the land-based, shoreline, and marine resources objectives, it shall be the policy of this State to:	
(1)	Exercise an overall conservation ethic in the use of Hawai'i's natural resources.	**A**
(2)	Ensure compatibility between land-based and water-based activities and natural resources and ecological systems.	**A**
(3)	Take into account the physical attributes of areas when planning and designing activities and facilities.	**A**
(4)	Manage natural resources and environs to encourage their beneficial and multiple use without generating costly or irreparable environmental damage.	**A**
(5)	Consider multiple uses in watershed areas, provided such uses do not detrimentally affect water quality and recharge functions.	**A**
(6)	Encourage the protection of rare or endangered plant and animal species and habitats native to Hawai'i.	**A**
(7)	Provide public incentives that encourage private actions to protect significant natural resources from degradation or unnecessary depletion.	**A**
(8)	Pursue compatible relationships among activities, facilities, and natural resources.	**A**
(9)	Promote increased accessibility and prudent use of inland and shoreline areas for public recreational, educational, and scientific purposes.	**A**
COMMENTARY: The Proposed Action actively promotes protection of natural resources and environmentally sensitive areas by promoting population growth in an existing urban area, thereby reducing development pressures on rural areas.		
226-12	OBJECTIVE AND POLICIES FOR THE PHYSICAL ENVIRONMENT – SCENIC, NATURAL BEAUTY, AND HISTORIC RESOURCES.	
(a)	Planning for the State's physical environment shall be directed towards achievement of the objective of enhancement of Hawai'i's scenic assets, natural beauty, and multi-cultural/historical resources.	
(b)	To achieve the scenic, natural beauty, and historic resources objective, it shall be the policy of this State to:	
(1)	Promote the preservation and restoration of significant natural and historic resources.	**A**
(2)	Provide incentives to maintain and enhance historic, cultural, and scenic amenities.	**C**
(3)	Promote the preservation of views and vistas to enhance the visual and aesthetic enjoyment of mountains, ocean, scenic landscapes, and other natural features.	**C**
(4)	Protect those special areas, structures, and elements that are an integral and functional part of Hawai'i's ethnic and cultural heritage.	**C**

(5)	Encourage the design of developments and activities that complement the natural beauty of the islands.	**C**
COMMENTARY: As discussed in Chapter 4, historic and cultural resources in the District have been identified. HCDA is committed to ensuring the historic resources are protected and preserved.		
226-13	OBJECTIVES AND POLICIES FOR THE PHYSICAL ENVIRONMENT – LAND, AIR, AND WATER QUALITY.	
(a)	Planning for the State's physical environment with regard to land, air, and water quality shall be directed towards achievement of the following objectives:	
(1)	Maintenance and pursuit of improved quality in Hawai'i's land, air, and water resources.	**A**
(2)	Greater public awareness and appreciation of Hawai'i's environmental resources.	**A**
(b)	To achieve the land, air, and water quality objectives, it shall be the policy of this State to:	
(1)	Foster educational activities that promote a better understanding of Hawai'i's limited environmental resources.	**C**
(2)	Promote the proper management of Hawai'i's land and water resources.	**C**
(3)	Promote effective measures to achieve desired quality in Hawai'i's surface, ground, and coastal waters.	**C**
(4)	Encourage actions to maintain or improve aural and air quality levels to enhance the health and well-being of Hawai'i's people.	**C**
(5)	Reduce the threat to life and property from erosion, flooding, tsunamis, hurricanes, earthquakes, volcanic eruptions, and other natural or man-induced hazards and disasters.	**C**
(6)	Encourage design and construction practices that enhance the physical qualities of Hawai'i's communities.	**A**
(7)	Encourage urban developments in close proximity to existing services and facilities.	**A**
(8)	Foster recognition of the importance and value of the land, air, and water resources to Hawai'i's people, their cultures and visitors.	**C**
COMMENTARY: The Proposed Action concentrates new urban density in an existing urban area, thereby making the best use of existing services and facilities. By redirecting population growth to the Primary Urban Center, development pressures on rural and urban-fringe areas will be reduced.		
226-14	OBJECTIVE AND POLICIES FOR FACILITY SYSTEMS – IN GENERAL.	
(a)	Planning for the State's facility systems in general shall be directed towards achievement of the objective of water, transportation, waste disposal, and energy and telecommunication systems that support statewide social, economic, and physical objectives.	
(b)	To achieve the general facility systems objective, it shall be the policy of this State to:	

(1)	Accommodate the needs of Hawai'i's people through coordination of facility systems and capital improvement priorities in consonance with state and county plans.	**A**
(2)	Encourage flexibility in the design and development of facility systems to promote prudent use of resources and accommodate changing public demands and priorities.	**A**
(3)	Ensure that required facility systems can be supported within resource capacities and at reasonable cost to the user.	**A**
(4)	Pursue alternative methods of financing programs and projects and cost-saving techniques in the planning, construction, and maintenance of facility systems.	**C**
COMMENTARY: As a mature urban area, the KCDD's ancillary infrastructure has been designed to accommodate urban growth.		
226-15	OBJECTIVE AND POLICIES FOR FACILITY SYSTEMS -- IN GENERAL.	
(a)	Planning for the State's facility systems with regard to solid and liquid wastes shall be directed towards the achievement of the following objectives:	
(1)	Maintenance of basic public health and sanitation standards relating to treatment and disposal of solid and liquid wastes.	**C**
(2)	Provision of adequate sewerage facilities for physical and economic activities that alleviate problems in housing, employment, mobility, and other areas.	**C**
(b)	To achieve solid and liquid waste objectives, it shall be the policy of this State to:	
(1)	Encourage the adequate development of sewerage facilities that complement planned growth.	**C**
(2)	Promote re-use and recycling to reduce solid and liquid wastes and employ a conservation ethic.	**C**
(3)	Promote research to develop more efficient and economical treatment and disposal of solid and liquid wastes.	**C**
COMMENTARY: The Proposed Action is in a location designated for urban growth. Additional infrastructure that may be necessary to support the Proposed Action will be provided as needed.		
226-16	OBJECTIVE AND POLICIES FOR FACILITY SYSTEMS – WATER.	
(a)	Planning for the State's facility systems with regard to water shall be directed towards achievement of the objective of the provision of water to adequately accommodate domestic, agricultural, commercial, industrial, recreational, and other needs within resource capacities.	
(b)	To achieve the facility systems water objective, it shall be the policy of this State to:	
(1)	Coordinate development of land use activities with existing and potential water supply.	**C**
(2)	Support research and development of alternative methods to meet future water requirements well in advance of anticipated needs.	**C**

(3)	Reclaim and encourage the productive use of runoff water and wastewater discharges.	**C**
(4)	Assist in improving the quality, efficiency, service, and storage capabilities of water systems for domestic and agricultural use.	**C**
(5)	Support water supply services to areas experiencing critical water problems.	**C**
(6)	Promote water conservation programs and practices in government, private industry, and the general public to help ensure adequate water to meet long-term needs.	**C**
COMMENTARY: Adequate water resources exist to support development under the Baseline Condition. Additional demands on the water system posed by the Proposed Action will be addressed as needed.		
226-17	OBJECTIVES AND POLICIES FOR FACILITY SYSTEMS – TRANSPORTATION	
(a)	Planning for the State's facility systems with regard to transportation shall be directed towards the achievement of the following objectives:	
(1)	An integrated multi-modal transportation system that services statewide needs and promotes the efficient, economical, safe, and convenient movement of people and goods.	**A**
(2)	A statewide transportation system that is consistent with and will accommodate planned growth objectives throughout the State.	**A**
(b)	To achieve the transportation objectives, it shall be the policy of this State to:	
(1)	Design, program, and develop a multi-modal system in conformance with desired growth and physical development as stated in this chapter;	**A**
(2)	Coordinate state, county, federal, and private transportation activities and programs toward the achievement of statewide objectives;	**A**
(3)	Encourage a reasonable distribution of financial responsibilities for transportation among participating governmental and private parties;	**A**
(4)	Provide for improved accessibility to shipping, docking, and storage facilities;	**C**
(5)	Promote a reasonable level and variety of mass transportation services that adequately meet statewide and community needs;	**A**
(6)	Encourage transportation systems that serve to accommodate present and future development needs of communities;	**A**
(7)	Encourage a variety of carriers to offer increased opportunities and advantages to interisland movement of people and goods;	**NA**
(8)	Increase the capacities of airport and harbor systems and support facilities to effectively accommodate transshipment and storage needs;	**NA**
(9)	Encourage the development of transportation systems and programs which would assist statewide economic growth and diversification;	**A**
(10)	Encourage the design and development of transportation systems sensitive to the needs of affected communities and the quality of	**A**

	Hawai'i's natural environment;	
(11)	Encourage safe and convenient use of low-cost, energy-efficient, non-polluting means of transportation;	**A**
(12)	Coordinate intergovernmental land use and transportation planning activities to ensure the timely delivery of supporting transportation infrastructure in order to accommodate planned growth objectives; and	**A**
(13)	Encourage diversification of transportation modes and infrastructure to promote alternate fuels and energy efficiency.	**A**
COMMENTARY: The Proposed Action is specifically intended to take advantage of the development opportunities presented by the introduction of the HART *light metro rail* system in the KCDD. The presence of the light rail system will provide new transportation alternatives for the District's current and future residents. The Proposed Action is focused on making the KCDD a more walkable and bike-able community.		
226-18	OBJECTIVES AND POLICIES FOR FACILITY SYSTEMS – ENERGY	
(a)	Planning for the State's facility systems with regard to energy shall be directed toward the achievement of the following objectives, giving due consideration to all	
(1)	Dependable, efficient, and economical statewide energy systems capable of supporting the needs of the people;	**C**
(2)	Increased energy self-sufficiency where the ratio of indigenous to imported energy use is increased;	**C**
(3)	Greater energy security in the face of threats to Hawai'i's energy supplies and systems; and	**NA**
(4)	Reduction, avoidance, or sequestration of greenhouse gas emissions from energy supply and use.	**C**
(b)	To achieve the energy objectives, it shall be the policy of this State to ensure the provision of adequate, reasonably priced, and dependable energy services to accommodate demand.	
(c)	To further achieve the energy objectives, it shall be the policy of this State to:	
(1)	Support research and development as well as promote the use of renewable energy sources;	**C**
(2)	Ensure that the combination of energy supplies and energy-saving systems is sufficient to support the demands of growth;	**C**
(3)	Base decisions of least-cost supply-side and demand-side energy resource options on a comparison of their total costs and benefits when a least-cost is determined by a reasonably comprehensive, quantitative, and qualitative accounting of their long-term, direct and indirect economic, environmental, social, cultural, and public health costs and benefits;	**C**
(4)	Promote all cost-effective conservation of power and fuel supplies through measures including: (A) Development of cost-effective demand-side management programs; (B) Education; and (C) Adoption	**C**

	of energy-efficient practices and technologies;	
(5)	Ensure to the extent that new supply-side resources are needed, the development or expansion of energy systems utilizes the least-cost energy supply option and maximizes efficient technologies;	**NA**
(6)	Support research, development, and demonstration of energy efficiency, load management, and other demand-side management programs, practices, and technologies;	**NA**
(7)	Promote alternate fuels and energy efficiency by encouraging diversification of transportation modes and infrastructure;	**C**
(8)	Support actions that reduce, avoid, or sequester greenhouse gases in utility, transportation, and industrial sector applications; and	**C**
(9)	Support actions that reduce, avoid, or sequester Hawai'i's greenhouse gas emissions through agriculture and forestry initiatives.	**C**
COMMENTARY: Redevelopment of the KCDD affords landowners and developers opportunities to implement new energy saving technologies, which in turn, will help lower energy demand.		
226-18.5	OBJECTIVES AND POLICIES FOR FACILITY SYSTEMS – TELECOMMUNICATIONS.	
(a)	Planning for the State's telecommunications facility systems shall be directed towards the achievement of dependable, efficient, and economical statewide telecommunications systems capable of supporting the needs of the people.	
(b)	To achieve the telecommunications objective, it shall be the policy of this State to ensure the provision of adequate, reasonably priced, and dependable telecommunications services to accommodate demand.	
(c)	To further achieve the telecommunications objective, it shall be the policy of this State to:	
(1)	Facilitate research and development of telecommunications systems and resources;	**C**
(2)	Encourage public and private sector efforts to develop means for adequate, ongoing telecommunications planning;	**C**
(3)	Promote efficient management and use of existing telecommunications systems and services; and	**C**
(4)	Facilitate the development of education and training of telecommunications personnel.	**NA**
COMMENTARY: The Proposed Action will require the expansion of the existing telecommunications systems to service the proposed project, including new opportunities for improvements to broadband service.		
226-19	OBJECTIVES AND POLICIES FOR SOCIO – CULTURAL ADVANCEMENT – HOUSING	
(a)	Planning for the State's socio-cultural advancement with regard to housing shall be directed toward the achievement of the following objectives:	
(1)	Greater opportunities for Hawai'i's people to secure reasonably priced,	**A**

	safe, sanitary, and livable homes, located in suitable environments that satisfactorily accommodate the needs and desires of families and individuals, through collaboration and cooperation between government and nonprofit and for-profit developers to ensure that more affordable housing is made available to very low, low- and moderate-income segments of Hawai'i's population.	
(2)	The orderly development of residential areas sensitive to community needs and other land uses.	**A**
(3)	The development and provision of affordable rental housing by the State to meet the housing needs of Hawai'i's people.	**A**
(b)	To achieve the housing objectives, it shall be the policy of this State to:	
(1)	Effectively accommodate the housing needs of Hawai'i's people.	**A**
(2)	Stimulate and promote feasible approaches that increase housing choices for low-income, moderate-income, and gap-group households.	**A**
(3)	Increase homeownership and rental opportunities and choices in terms of quality, location, cost, densities, style, and size of housing.	**A**
(4)	Promote appropriate improvement, rehabilitation, and maintenance of existing housing units and residential areas.	**NA**
(5)	Promote design and location of housing developments taking into account the physical setting, accessibility to public facilities and services, and other concerns of existing communities and surrounding areas.	**A**
(6)	Facilitate the use of available vacant, developable, and underutilized urban lands for housing.	**A**
(7)	Foster a variety of lifestyles traditional to Hawai'i through the design and maintenance of neighborhoods that reflect the culture and values of the community.	**A**
(8)	Promote research and development of methods to reduce the cost of housing construction in Hawai'i.	**C**
COMMENTARY: The provision of new affordable housing opportunities is a key component of the Proposed Action.		
226-20	OBJECTIVES AND POLICIES FOR SOCIO – CULTURAL ADVANCEMENT – HEALTH.	
(a)	Planning for the State's socio-cultural advancement with regard to health shall be directed towards achievement of the following objectives:	
(1)	Fulfillment of basic individual health needs of the general public.	**C**
(2)	Maintenance of sanitary and environmentally healthful conditions in Hawai'i's communities.	**C**
(b)	To achieve the health objectives, it shall be the policy of this State to:	
(1)	Provide adequate and accessible services and facilities for prevention and treatment of physical and mental health problems, including substance abuse.	**NA**
(2)	Encourage improved cooperation among public and private sectors in	**NA**

	the provision of health care to accommodate the total health needs of individuals throughout the State.	
(3)	Encourage public and private efforts to develop and promote statewide and local strategies to reduce health care and related insurance costs.	**NA**
(4)	Foster an awareness of the need for personal health maintenance and preventive health care through education and other measures.	**NA**
(5)	Provide programs, services, and activities that ensure environmentally healthful and sanitary conditions.	**C**
(6)	Improve the State's capabilities in preventing contamination by pesticides and other potentially hazardous substances through increased coordination, education, monitoring, and enforcement.	**NA**
COMMENTARY: The Proposed Action will connect to regional infrastructure systems. On-site infrastructure improvements will be constructed to comply with relevant DOH and County standards. Collectively, the on-site and off-site systems will ensure that sanitary and healthful conditions are maintained for the benefit of the area's residents and visitors.		
226-21	OBJECTIVE AND POLICIES FOR SOCIO – CULTURAL ADVANCEMENT – EDUCATION	
(a)	Planning for the State's socio-cultural advancement with regard to education shall be directed towards achievement of the objective of the provision of a variety of educational opportunities to enable individuals to fulfill their needs, responsibilities, and aspirations.	**NA**
(b)	To achieve the education objective, it shall be the policy of this State to:	
(1)	Support educational programs and activities that enhance personal development, physical fitness, recreation, and cultural pursuits of all groups.	**C**
(2)	Ensure the provision of adequate and accessible educational services and facilities that are designed to meet individual and community needs.	**C**
(3)	Provide appropriate educational opportunities for groups with special needs.	**C**
(4)	Promote educational programs which enhance understanding of Hawai'i's cultural heritage.	**C**
(5)	Provide higher educational opportunities that enable Hawai'i's people to adapt to changing employment demands.	**C**
(6)	Assist individuals, especially those experiencing critical employment problems or barriers, or undergoing employment transitions, by providing appropriate employment training programs and other related educational opportunities.	**C**
(7)	Promote programs and activities that facilitate the acquisition of basic skills, such as reading, writing, computing, listening, speaking, and reasoning.	**C**
(8)	Emphasize quality educational programs in Hawai'i's institutions to promote academic excellence.	**C**

(9)	Support research programs and activities that enhance the education programs of the State.	**C**
COMMENTARY: The HCDA is committed to working with the Department of Education to ensure that adequate educational opportunities will exist for all residents of the KCDD.		
226-22	OBJECTIVE AND POLICIES FOR SOCIO-CULTURAL ADVANCEMENT – LEISURE.	
(a)	Planning for the State's socio-cultural advancement with regard to social services shall be directed towards the achievement of the objective of improved public and private social services and activities that enable individuals, families, and groups to become more self-reliant and confident to improve their well-being.	**NA**
(b)	To achieve the social service objective, it shall be the policy of the State to:	**NA**
(1)	Assist individuals, especially those in need of attaining a minimally adequate standard of living and those confronted by social and economic hardship conditions, through social services and activities within the State's fiscal capacities.	**NA**
(2)	Promote coordination and integrative approaches among public and private agencies and programs to jointly address social problems that will enable individuals, families, and groups to deal effectively with social problems and to enhance their participation in society.	**NA**
(3)	Facilitate the adjustment of new residents, especially recently arrived immigrants, into Hawaii's communities.	**NA**
(4)	Promote alternatives to institutional care in the provision of long-term care for elder and disabled populations.	**NA**
(5)	Support public and private efforts to prevent domestic abuse and child molestation, and assist victims of abuse and neglect.	**NA**
(6)	Promote programs which assist people in need of family planning services to enable them to meet their needs.	**NA**
COMMENTARY: This objective and its policies are directed towards governmental responsibilities of social service agencies and are, therefore, beyond the scope of the Proposed Action.		
226-23	OBJECTIVE AND POLICIES FOR SOCIO-CULTURAL ADVANCEMENT – LEISURE.	
(a)	Planning for the State's socio-cultural advancement with regard to leisure shall be directed towards the achievement of the objective of the adequate provision of resources to accommodate diverse cultural, artistic, and recreational needs for present and future generations.	
(b)	To achieve the leisure objective, it shall be the policy of this State to:	
(1)	Foster and preserve Hawai'i's multi-cultural heritage through supportive cultural, artistic, recreational, and humanities-oriented programs and activities.	**C**
(2)	Provide a wide range of activities and facilities to fulfill the cultural,	**C**

	artistic, and recreational needs of all diverse and special groups effectively and efficiently.	
(3)	Enhance the enjoyment of recreational experiences through safety and security measures, educational opportunities, and improved facility design and maintenance.	**C**
(4)	Promote the recreational and educational potential of natural resources having scenic, open space, cultural, historical, geological, or biological values while ensuring that their inherent values are preserved.	**C**
(5)	Ensure opportunities for everyone to use and enjoy Hawai‘i’s recreational resources.	**C**
(6)	Assure the availability of sufficient resources to provide for future cultural, artistic, and recreational needs.	**C**
(7)	Provide adequate and accessible physical fitness programs to promote physical and mental well-being of Hawai‘i’s people.	**C**
(8)	Increase opportunities for appreciation and participation in the creative arts, including the literary, theatrical, visual, musical, folk, and traditional art forms.	**C**
(9)	Encourage the development of creative expression in the artistic disciplines to enable all segments of Hawai‘i's population to participate in the creative arts.	**C**
(10)	Assure adequate access to significant natural and cultural resources in public ownership.	**C**
COMMENTARY: As discussed in Chapter 4, a variety of new contemporary cultural activities have emerged in the KCDD and are anticipated to continue with implementation of the Proposed Action.		
226-24	OBJECTIVE AND POLICIES FOR SOCIO-CULTURAL ADVANCEMENT--INDIVIDUAL RIGHTS AND PERSONAL WELL-BEING.	
(a)	Planning for the State’s socio-cultural advancement with regard to individual rights and personal well-being shall be directed towards achievement of the objective of increased opportunities and protection of individual rights to enable individuals to fulfill their socio-economic needs and aspirations.	
(b)	To achieve the individual rights and personal well- being objective, it shall be the policy of this State to:	
(1)	Provide effective services and activities that protect individuals from criminal acts and unfair practices and that alleviate the consequences of criminal acts in order to foster a safe and secure environment.	**C**
(2)	Uphold and protect the national and state constitutional rights of every individual.	**C**
(3)	Assure access to, and availability of, legal assistance, consumer protection, and other public services which strive to attain social justice.	**NA**
(4)	Ensure equal opportunities for individual participation in society.	**NA**

	COMMENTARY: The provision of a safe, livable community is a central component of the Proposed Action.	
226-25	OBJECTIVE AND POLICIES FOR SOCIO – CULTURAL ADVANCEMENT – CULTURE.	
(a)	Planning for the State's socio-cultural advancement with regard to culture shall be directed toward the achievement of the objective of enhancement of cultural identities, traditions, values, customs, and arts of Hawai'i's people.	
(b)	To achieve the culture objective, it shall be the policy of this State to:	
(1)	Foster increased knowledge and understanding of Hawai'i's ethnic and cultural heritages and the history of Hawai'i.	**C**
(2)	Support activities and conditions that promote cultural values, customs, and arts that enrich the lifestyles of Hawai'i's people and which are sensitive and responsive to family and community needs.	**C**
(3)	Encourage increased awareness of the effects of proposed public and private actions on the integrity and quality of cultural and community lifestyles in Hawai'i.	**C**
(4)	Encourage the essence of the aloha spirit in people's daily activities to promote harmonious relationships among Hawai'i's people and visitors.	**C**
COMMENTARY: The provision of a safe, livable community is a central component of the Proposed Action.		
226-26	SECTION 226-26 OBJECTIVES AND POLICIES FOR SOCIO – CULTURAL ADVANCEMENT – PUBLIC SAFETY.	
(a)	Planning for the State's socio-cultural advancement with regard to public safety shall be directed towards the achievement of the following objectives:	
(1)	Assurance of public safety and adequate protection of life and property for all people.	**C**
(2)	Optimum organizational readiness and capability in all phases of emergency management to maintain the strength, resources, and social and economic well-being of the community in the event of civil disruptions, wars, natural disasters, and other major disturbances.	**C**
(3)	Promotion of a sense of community responsibility for the welfare and safety of Hawai'i's people.	**C**
(b)	To achieve the public safety objectives, it shall be the policy of this State to:	
(1)	Ensure that public safety programs are effective and responsive to community needs.	**C**
(2)	Encourage increased community awareness and participation in public safety programs.	**C**
(c)	To further achieve public safety objectives related to criminal justice, it shall be the policy of this State to:	
(1)	Support criminal justice programs aimed at preventing and curtailing	**NA**

	criminal activities.	
(2)	Develop a coordinated, systematic approach to criminal justice administration among all criminal justice agencies.	**NA**
(3)	Provide a range of correctional resources which may include facilities and alternatives to traditional incarceration in order to address the varied security needs of the community and successfully reintegrate offenders into the community.	**NA**
(d)	To further achieve public safety objectives related to emergency management, it shall be the policy of this State to:	**NA**
(1)	Ensure that responsible organizations are in a proper state of readiness to respond to major war-related, natural, or technological disasters and civil disturbances at all times.	**NA**
(2)	Enhance the coordination between emergency management programs throughout the State.	**NA**
COMMENTARY: The provision of a safe, livable community is a central component of the Proposed Action.		
226-27	OBJECTIVES AND POLICIES FOR SOCIO-CULTURAL ADVANCEMENT – GOVERNMENT	
(a)	Planning the State's socio-cultural advancement with regard to government shall be directed towards the achievement of the following objectives:	
(1)	Efficient, effective, and responsive government services at all levels in the State.	**C**
(2)	Fiscal integrity, responsibility, and efficiency in the state government and county governments.	**C**
(b)	To achieve the government objectives, it shall be the policy of this State to:	
(1)	Provide for necessary public goods and services not assumed by the private sector.	**C**
(2)	Pursue an openness and responsiveness in government that permits the flow of public information, interaction, and response.	**C**
(3)	Minimize the size of government to that necessary to be effective.	**C**
(4)	Stimulate the responsibility in citizens to productively participate in government for a better Hawai'i.	**C**
(5)	Assure that government attitudes, actions, and services are sensitive to community needs and concerns.	**C**
(6)	Provide for a balanced fiscal budget.	**C**
(7)	Improve the fiscal budgeting and management system of the State.	**C**
(8)	Promote the consolidation of state and county governmental functions to increase the effective and efficient delivery of government programs and services and to eliminate duplicative services wherever feasible.	**C**
COMMENTARY: As a public agency, the HCDA is committed to complying with these goals, objectives and policies.		

Table 5-2: Compliance with Hawai`i State Planning Act – Part III

SECTION	CHAPTER 226 - PART III. PRIORITY GUIDELINES	RATING
A = actively supportive C = conforms I = goal is inconsistent with applicant's objectives NA = goal is not applicable		
226-101	Establishes overall priority guidelines to address areas of statewide concern.	
226-102	Overall direction. The State shall strive to improve the quality of life for Hawai'i's present and future population through the pursuit of desirable courses of action in five major areas of statewide concern which merit priority attention: economic development, population growth and land resource management, affordable housing, crime and criminal justice, and quality education.	
226-103	ECONOMIC PRIORITY GUIDELINES.	
(a)	Priority guidelines to stimulate economic growth and encourage business expansion and development to provide needed jobs for Hawai'i's people and achieve a stable and diversified economy:	
(1)	Seek a variety of means to increase the availability of investment capital for new and expanding enterprises.	NA
(A)	Encourage investments which:	
(i)	Reflect long term commitments to the State;	A
(ii)	Rely on economic linkages within the local economy;	A
(iii)	Diversify the economy;	A
(iv)	Reinvest in the local economy;	A
(v)	Are sensitive to community needs and priorities, and	A
(vi)	Demonstrate a commitment to provide management opportunities to Hawai'i residents.	A
(2)	Encourage the expansion of technological research to assist industry development and support the development and commercialization of technological advancements.	NA
(3)	Improve the quality, accessibility, and range of services provided by government to business, including data and reference services and assistance in complying with governmental regulations.	NA
(4)	Seek to ensure that state business tax and labor laws and administrative policies are equitable, rational, and predictable.	NA
(5)	Streamline the building and development permit and review process, and eliminate or consolidate other burdensome or duplicative governmental requirements imposed on business, where public health, safety and welfare would not be adversely affected.	C
(6)	Encourage the formation of cooperatives and other favorable	NA

	marketing or distribution arrangements at the regional or local level to assist Hawai‘i’s small-scale producers, manufacturers, and distributors.	
(7)	Continue to seek legislation to protect Hawai‘i from transportation interruptions between Hawai‘i and the continental United States.	NA
(8)	Provide public incentives and encourage private initiative to develop and attract industries which promise long-term growth potentials and which have the following characteristics:	NA
(A)	An industry that can take advantage of Hawai‘i’s unique location and available physical and human resources.	NA
(B)	A clean industry that would have minimal adverse effects on Hawai‘i’s environment.	NA
(C)	An industry that is willing to hire and train Hawai‘i’s people to meet the industry's labor needs at all levels of employment.	NA
(D)	An industry that would provide reasonable income and steady employment.	NA
(9)	Support and encourage, through educational and technical assistance programs and other means, expanded opportunities for employee ownership and participation in Hawai‘i business.	NA
(10)	Enhance the quality of Hawai‘i’s labor force and develop and maintain career opportunities for Hawai‘i’s people through the following actions:	NA
(A)	Expand vocational training in diversified agriculture, aquaculture, information industry, and other areas where growth is desired and feasible.	NA
(B)	Encourage more effective career counseling and guidance in high schools and post-secondary institutions to inform students of present and future career opportunities.	NA
(C)	Allocate educational resources to career areas where high employment is expected and where growth of new industries is desired.	NA
(D)	Promote career opportunities in all industries for Hawai‘i’s people by encouraging firms doing business in the State to hire residents.	NA
(E)	Promote greater public and private sector cooperation in determining industrial training needs and in developing relevant curricula and on-the-job training opportunities.	NA
(F)	Provide retraining programs and other support services to assist entry of displaced workers into alternative employment.	NA
(b)	Priority guidelines to promote the economic health and quality of the visitor industry:	
(1)	Promote visitor satisfaction by fostering an environment which enhances the aloha spirit and minimizes inconveniences to	C

	Hawai‘i’s residents and visitors.	
(2)	Encourage the development and maintenance of well-designed, adequately serviced hotels and resort destination areas which are sensitive to neighboring communities and activities and which provide for adequate shoreline setbacks and beach access.	A
(3)	Support appropriate capital improvements to enhance the quality of existing resort destination areas and provide incentives to encourage investment in upgrading, repair, and maintenance of visitor facilities.	NA
(4)	Encourage visitor industry practices and activities which respect, preserve, and enhance Hawai‘i’s significant natural, scenic, historic, and cultural resources.	NA
(5)	Develop and maintain career opportunities in the visitor industry for Hawai‘i’s people, with emphasis on managerial positions.	C
(6)	Support and coordinate tourism promotion abroad to enhance Hawai‘i’s share of existing and potential visitor markets.	NA
(7)	Maintain and encourage a more favorable resort investment climate consistent with the objectives of this chapter.	NA
(8)	Support law enforcement activities that provide a safer environment for both visitors and residents alike.	C
(9)	Coordinate visitor industry activities and promotions to business visitors through the state network of advanced data communication techniques.	NA
(c)	Priority guidelines to promote the continued viability of the sugar and pineapple industries:	
(1)	Provide adequate agricultural lands to support the economic viability of the sugar and pineapple industries.	C
(2)	Continue efforts to maintain federal support to provide stable sugar prices high enough to allow profitable operations in Hawai‘i.	NA
(3)	Support research and development, as appropriate, to improve the quality and production of sugar and pineapple crops.	NA
(d)	Priority guidelines to promote the growth and development of diversified agriculture and aquaculture:	
(1)	Identify, conserve, and protect agricultural and aquacultural lands of importance and initiate affirmative and comprehensive programs to promote economically productive agricultural and aquacultural uses of such lands.	C
(2)	Assist in providing adequate, reasonably priced water for agricultural activities.	NA
(3)	Encourage public and private investment to increase water supply and to improve transmission, storage, and irrigation facilities in support of diversified agriculture and aquaculture.	NA

(4)	Assist in the formation and operation of production and marketing associations and cooperatives to reduce production and marketing costs.	NA
(5)	Encourage and assist with the development of a waterborne and airborne freight and cargo system capable of meeting the needs of Hawai‘i’s agricultural community.	NA
(6)	Seek favorable freight rates for Hawai‘i’s agricultural products from interisland and overseas transportation operators.	NA
(7)	Encourage the development and expansion of agricultural and aquacultural activities which offer long-term economic growth potential and employment opportunities.	NA
(8)	Continue the development of agricultural parks and other programs to assist small independent farmers in securing agricultural lands and loans.	NA
(9)	Require agricultural uses in agricultural subdivisions and closely monitor the uses in these subdivisions.	NA
(10)	Support the continuation of land currently in use for diversified agriculture.	A
(e)	Priority guidelines for water use and development:	
(1)	Maintain and improve water conservation programs to reduce the overall water consumption rate.	A
(2)	Encourage the improvement of irrigation technology and promote the use of nonpotable water for agricultural and landscaping purposes.	NA
(3)	Increase the support for research and development of economically feasible alternative water sources.	NA
(4)	Explore alternative funding sources and approaches to support future water development programs and water system improvements.	NA
(f)	Priority guidelines for energy use and development:	
(1)	Encourage the development, demonstration, and commercialization of renewable energy sources.	C
(2)	Initiate, maintain, and improve energy conservation programs aimed at reducing energy waste and increasing public awareness of the need to conserve energy.	C
(3)	Provide incentives to encourage the use of energy conserving technology in residential, industrial, and other buildings.	C
(4)	Encourage the development and use of energy conserving and cost-efficient transportation systems.	C
(g)	Priority guidelines to promote the development of the information industry:	
(1)	Establish an information network that will serve as the catalyst for establishing a viable information industry in Hawai‘i.	C
(2)	Encourage the development of services such as financial data processing, products and services exchange, foreign language	NA

	translations, telemarketing, teleconferencing, a twenty-four-hour international stock exchange, international banking, and a Pacific Rim management center.	
(3)	Encourage the development of small businesses in the information field such as software development, the development of new information systems and peripherals, data conversion and data entry services, and home or cottage services such as computer programming, secretarial, and accounting services.	NA
(4)	Encourage the development or expansion of educational and training opportunities for residents in the information and telecommunications fields.	NA
(5)	Encourage research activities, including legal research in the information and telecommunications fields.	NA
(6)	Support promotional activities to market Hawai‘i’s information industry services.	NA
226-104	POPULATION GROWTH AND LAND RESOURCES PRIORITY GUIDELINES.	
(a)	Priority guidelines to effect desired statewide growth and distribution:	
(1)	Encourage planning and resource management to insure that population growth rates throughout the State are consistent with available and planned resource capacities and reflect the needs and desires of Hawai‘i’s people.	A
(2)	Manage a growth rate for Hawai‘i’s economy that will parallel future employment needs for Hawai‘i’s people.	A
(3)	Ensure that adequate support services and facilities are provided to accommodate the desired distribution of future growth throughout the State.	A
(4)	Encourage major state and federal investments and services to promote economic development and private investment to the neighbor islands, as appropriate.	NA
(5)	Explore the possibility of making available urban land, low-interest loans, and housing subsidies to encourage the provision of housing to support selective economic and population growth on the neighbor islands.	NA
(6)	Seek federal funds and other funding sources outside the State for research, program development, and training to provide future employment opportunities on the neighbor islands.	NA
(7)	Support the development of high technology parks on the neighbor islands.	NA
(b)	Priority guidelines for regional growth distribution and land resource utilization:	
(1)	Encourage urban growth primarily to existing urban areas where adequate public facilities are already available or can be	A

	provided with reasonable public expenditures, and away from areas where other important benefits are present, such as protection of important agricultural land or preservation of lifestyles.	
(2)	Make available marginal or nonessential agricultural lands for appropriate urban uses while maintaining agricultural lands of importance in the agricultural district.	NA
(3)	Restrict development when drafting of water would result in exceeding the sustainable yield or in significantly diminishing the recharge capacity of any groundwater area.	NA
(4)	Encourage restriction of new urban development in areas where water is insufficient from any source for both agricultural and domestic use.	C
(5)	In order to preserve green belts, give priority to state capital-improvement funds which encourage location of urban development within existing urban areas except where compelling public interest dictates development of a noncontiguous new urban core.	A
(6)	Seek participation from the private sector for the cost of building infrastructure and utilities, and maintaining open spaces.	A
(7)	Pursue rehabilitation of appropriate urban areas.	A
(8)	Support the redevelopment of Kakaako into a viable residential, industrial, and commercial community.	A
(9)	Direct future urban development away from critical environmental areas or impose mitigating measures so that negative impacts on the environment would be minimized.	A
(10)	Identify critical environmental areas in Hawai‘i to include but not be limited to the following: watershed and recharge areas; wildlife habitats (on land and in the ocean); areas with endangered species of plants and wildlife; natural streams and water bodies; scenic and recreational shoreline resources; open space and natural areas; historic and cultural sites; areas particularly sensitive to reduction in water and air quality; and scenic resources.	C
(11)	Identify all areas where priority should be given to preserving rural character and lifestyle.	NA
(12)	Utilize Hawai‘i’s limited land resources wisely, providing adequate land to accommodate projected population and economic growth needs while ensuring the protection of the environment and the availability of the shoreline, conservation lands, and other limited resources for future generations.	A
(13)	Protect and enhance Hawai‘i’s shoreline, open spaces, and scenic resources.	A
226-	CRIME AND CRIMINAL JUSTICE. PRIORITY GUIDELINES IN	

105	THE AREA OF CRIME AND CRIMINAL JUSTICE:	
(1)	Support law enforcement activities and other criminal justice efforts that are directed to provide a safer environment.	NA
(2)	Target state and local resources on efforts to reduce the incidence of violent crime and on programs relating to the apprehension and prosecution of repeat offenders.	NA
(3)	Support community and neighborhood program initiatives that enable residents to assist law enforcement agencies in preventing criminal activities.	NA
(4)	Reduce overcrowding or substandard conditions in correctional facilities through a comprehensive approach among all criminal justice agencies which may include sentencing law revisions and use of alternative sanctions other than incarceration for persons who pose no danger to their community.	NA
(5)	Provide a range of appropriate sanctions for juvenile offenders, including community-based programs and other alternative sanctions.	NA
(6)	Increase public and private efforts to assist witnesses and victims of crimes and to minimize the costs of victimization.	NA
226-106	AFFORDABLE HOUSING. PRIORITY GUIDELINES FOR THE PROVISION OF AFFORDABLE HOUSING:	
(1)	Seek to use marginal or nonessential agricultural land and public land to meet housing needs of low-and moderate-income and gap-group households.	A
(2)	Encourage the use of alternative construction and development methods as a means of reducing production costs.	A
(3)	Improve information and analysis relative to land availability and suitability for housing.	A
(4)	Create incentives for development which would increase home ownership and rental opportunities for Hawai‘i’s low- and moderate-income households, gap-group households, and residents with special needs.	A
(5)	Encourage continued support for government or private housing programs that provide low interest mortgages to Hawai‘i’s people for the purchase of initial owner-occupied housing.	A
(6)	Encourage public and private sector cooperation in the development of rental housing alternatives.	A
(7)	Encourage improved coordination between various agencies and levels of government to deal with housing policies and regulations.	A
(8)	Give higher priority to the provision of quality housing that is affordable for Hawai‘i’s residents and less priority to	A

	development of housing intended primarily for individuals outside of Hawai‘i.	
226-107	QUALITY EDUCATION. PRIORITY GUIDELINES TO PROMOTE QUALITY EDUCATION:	
(1)	Pursue effective programs which reflect the varied district, school, and student needs to strengthen basic skills achievement;	NA
(2)	Continue emphasis on general education “core” requirements to provide common background to students and essential support to other university programs;	NA
(3)	Initiate efforts to improve the quality of education by improving the capabilities of the education work force;	NA
(4)	Promote increased opportunities for greater autonomy and flexibility of educational institutions in their decision-making responsibilities;	C
(5)	Increase and improve the use of information technology in education by the availability of telecommunications equipment for:	NA
(A)	The electronic exchange of information;	NA
(B)	Statewide electronic mail; and	NA
(C)	Access to the Internet.	NA
(6)	Encourage programs that increase the public's awareness and understanding of the impact of information technologies on our lives;	NA
(7)	Pursue the establishment of Hawai‘i’s public and private universities and colleges as research and training centers of the Pacific;	NA
(8)	Develop resources and programs for early childhood education;	NA
(9)	Explore alternatives for funding and delivery of educational services to improve the overall quality of education; and	NA
(10)	Strengthen and expand educational programs and services for students with special needs.	NA

Sustainability: In 2011, the Governor signed into law Act 181 amending Chapter 226 to add a new definition (Sustainability) and new priority guidelines and principles to promote sustainability. Following is a discussion of how the Proposed Action fulfills the intent of these amendments.

As set forth in Act 181, “Sustainability means achieving the following:

1. Respect of the culture, character, beauty, and history of the State’s island communities;
2. Striking a balance between economic, social, community, and environmental priorities; and

3. Meeting the needs of the present without compromising the ability of future generations to meet their own needs.

New Priority Guidelines:

(1) Encouraging balanced economic, social, community, and environmental priorities;
(2) Encouraging planning that respects and promotes living within the natural resources and limits of the State;
(3) Promoting a diversified and dynamic economy;
(4) Encouraging respect for the host culture;
(5) Promoting decisions based on meeting the needs of the present without compromising the needs of future generations;
(6) Considering the principles of the ahupua`a system; and
(7) Emphasizing that everyone, including individuals, families, communities, businesses, and government, has the responsibility for achieving a sustainable Hawaii.

Discussion: The Proposed Action is consistent with the intent of these new priority guidelines. By focusing development in an existing urban area and by redirecting population growth to an area specifically designated for that purpose, the HCDA is contributing to the overall sustainability of Hawaii's economy.

Climate Change Adaptation: In 2009, Act 20 created a Climate Change Task Force that was to identify adaptation actions for Hawaii. The Task Force was never funded or convened. It ceased to exist in 2011. Nevertheless, a series of stakeholder-driven workshops were held in conjunction with the *Ocean Resource Management Plan*, with funding support from the Army Corps of Engineers and the National Oceanic Atmospheric Administration, which resulted in *A Framework for Climate Change Adaptation in Hawaii* (ORMP, 2009). The framework suggests to:

1) Build a Climate Change Adaptation Team;

2) Develop and Adopt a Long-Term Vision;

3) Identify Planning Areas and Opportunities Relevant to Climate Change;

4) Scope Climate Change Impacts to Major Sectors;

5) Conduct a Vulnerability Assessment;

6) Conduct a Risk Assessment;

7) Prioritize Areas for Adaptation Planning;

8) Set Preparedness Goals;

9) Develop, Select, and Prioritize Preparedness Actions;

10) Implement Preparedness Plan; and

11) Monitor Progress and Update Plan as Appropriate (ORMP, 2009).

This provides the groundwork in determining key components of Hawaii's future climate change adaptation plan.

As a next step in creating overarching guidelines for adaptation in Hawaii, Act 286 was passed in the 2012 legislative session (Office of Planning, 2013). Act 286 aims to prioritize guidelines to prepare the State to address impacts of climate change. Act 286 is now codified as Section 226-109, HRS. Following are the guidelines and a discussion of how they relate to the Proposed Action.

1) Ensure that Hawaii's people are educated, informed, and aware of the impacts climate change may have on their communities;

2) Encourage community stewardship groups and local stakeholders to participate in planning and implementation of climate change policies;

3) Invest in continued monitoring and research of Hawaii's climate and the impacts of climate change on the State;

4) Consider native Hawaiian traditional knowledge and practices in planning for the impacts of climate change;

5) Encourage the preservation and restoration of natural landscape features, such as coral reefs, beaches and dunes, forests, streams, floodplains, and wetlands, that have the inherent capacity to avoid, minimize, or mitigate the impacts of climate change;

6) Explore adaptation strategies that moderate harm or exploit beneficial opportunities in response to actual or expected climate change impacts to the natural and built environments;

7) Promote sector resilience in areas such as water, roads, airports, and public health, by encouraging the identification of climate change threats, assessment of potential consequences, and evaluation of adaptation options;

8) Foster cross-jurisdictional collaboration between county, state, and federal agencies and partnerships between government and private entities and other non-governmental entities, including nonprofit entities;

9) Use management and implementation approaches that encourage the continual collection, evaluation, and integration of new information and strategies into new and existing practices, policies, and plans; and

10) Encourage planning and management of the natural and built environments that effectively integrate climate change policy (HRS 226-109).

These priority guidelines are now "part of the statewide planning system, which coordinate and guides all major state and county activities and implements Chapter 226. As a priority guideline, climate change must now be considered in state and county budgetary, land use and other decision-making processes" (ICAP, 2012). However, actions may differ from the adaptation guidelines, in some circumstances, without penalty (ICAP, 2012). In addition, because the guidelines are at a relatively high-level, there is broad space for interpretation of what constitutes, for example, "encourag[ing] planning and management of the natural and built environments that effectively integrate climate change policy." The word "encourage" is non-binding while reference to effectively integrating climate change policy is vague, given there is currently little actual policy other than the guidelines themselves. These guidelines nonetheless serve as a foundational framework for prioritizing adaptation planning activities in Hawaii as well as for incorporating future climate change policies. The Office of Planning is "currently working with various stakeholders, primarily through the *Ocean Resource Management Plan* program, to implement this policy" (Office of Planning, 2013).

5.2.3 Hawaii State Functional Plans

The Planning Act called for the creation of functional plans to set specific objectives, establish policies, and implement actions for a particular field of activity. These functional plans further identified those organizations responsible in carrying out the actions, the implementing timeframe, and the proposed budgets.

The following section describe the Proposed Action's relationship and compatibility to applicable State Functional Plans.

5.2.3.1 State Educational Functional Plan (1989)

Goals of the Plan: The State Educational Functional Plan reflects the State Department of Education's (DOE) strategy to address the goals, policies, and priority guidelines of the Planning Act and the goals of the Board of Education (BOE). The plan outlines actions to be taken by the DOE to improve the public school system and to attend to various societal needs and trends.

Conformance with the Goals of the Plan: The HCDA will work closely with the DOE to ensure that demand for additional classrooms generated by the Proposed Action will be addressed.

5.2.3.2 State Energy Functional Plan (1991)

Goals of the Plan: The State Energy Functional Plan sought to (1) support the commercialization of Hawai'i's alternative energy resources, (2) implement a wide range of energy conservation and efficiency technologies; (3) prepare for disruptions in the energy supply; and (4) reduce the State's dependence on imported fossil fuels, such as oil, for 90 percent of its total energy needs as opposed to 42 percent nationally.

The plan called for objectives and courses of action to lessen Hawai'i's dependence on imported fossil fuels. The objectives were to: (1) moderate the growth in energy demand through conservation and energy efficiency; (2) displace oil and fossil fuels through alternate and renewable energy sources; (3) promote energy education and legislation; (4) support and develop an integrated approach to energy development and management; (5) ensure the State's abilities to implement energy emergency actions immediately in the event of fuel supply disruptions, and ensure essential public services are maintained and provisions are made to alleviate economic and personal hardships that may arise.

Conformance with the Goals of the Plan: The Proposed Action will facilitate energy conservation efforts by providing residential opportunities near the region's largest employment centers (Downtown, Ala Moana Center, and Waikiki). The Proposed Action's emphasis on pedestrian, bike, and transit options will assist the effort to use a non-motorized vehicle alternative and reduce overall fossil fuel consumption. The use of energy efficient equipment in buildings will also contribute towards the effort as well. HCDA will comply with sustainability guidelines adopted by the State. The intent of these guidelines is to respond to Hawai'i's complex growth challenges by promoting sustainable practices, high performance energy efficient buildings, economically viable and environmentally mindful development, and by encouraging best practices in new development today.

The Proposed Action will perpetuate the policies already established in the Mauka Area Rules that projects will incorporate energy efficient design principles where feasible. Design elements may include the use of individual meters for the residential and commercial/retail uses to provide incentives for energy conservation, high efficiency motors, chillers, energy efficient ballasts for all fluorescent lamps, building design that maximizes indoor light without increasing indoor heat, use of insulation and double glazed windows and doors, and energy efficient metal halide lights for outdoor lighting. The highly respected and established programs like the US Green Building Council's LEED (Leadership in Energy and Environmental Design) Green Building Rating System and other similar industry standard best practice rating and measurements systems are also available as tools for implementing designs with minimal impact to the environment.

5.2.3.3 State Historic Preservation Functional Plan (1991)

Goals of the Plan: The State Historic Functional Plan identifies issues, policies, and implementing actions that seek to preserve and protect the unsurpassable beauty, history, and culture of the Hawaiian Islands. Hawai'i's natural scenic beauty, clean environment, and rich multi-cultural heritage (including historic/cultural sites) are reasons why so many people have made Hawai'i their home, and why so many visit the State.

Conformance with the Goals of the Plan: The Proposed Action is supportive of the Historic Preservation Functional Plan. At the time of redevelopment, individual property owners will be expected to conduct a supplemental archaeological inventory survey for the expressed purpose of identifying archaeological and cultural resources so that they can be avoided. The preparation of the Cultural Impact Assessment included in this EIS furthers the understanding of the region's valued cultural resources.

5.2.3.4 State Housing Functional Plan (1990)

Goals of the Plan: The 1990 State Housing Functional Plan identified a need to develop affordable housing throughout the State, and found that the housing needs of lower income households would not be adequately met in future residential developments. Obstacles identified to the development of affordable housing include (1) the lack of infrastructure, particularly on the neighbor islands; (2) the high cost of zoned land, high development costs, and the regulatory system particularly on O`ahu; (3) government policies that have created a shortage of urban land zoned for housing; (4) lack of government funds to develop rental housing; (5) building codes and subdivision standards that constrain innovative, cost-saving technologies; and (6) current labor wages. The Plan recommended increased densities in residential developments where feasible, smaller and basic units, funding for rental developments, and state subsidies.

Conformance with the Goals of the Plan: The Proposed Action will comply with the Reserved Housing plan already incorporated as part of the Mauka Area Plan and Rules. The design incentives included in the Proposed Action (density bonuses, increased building height, and reduced parking standards) are all intended to encourage the development of affordable housing by helping to lower building costs. Please refer to Chapter Four, Section 4.10.5 for a detailed discussion of HCDA's intentions regarding its Reserved Housing plan.

5.2.3.5 State Recreation Functional Plan (1991)

Goals of the Plan: The 1991 State Recreation Functional Plan focused on six issue areas: (1) ocean and shoreline recreation; (2) *mauka*, urban, and other recreation; (3) public access to the shoreline and upland recreation areas; (4) resource conservation and management, (5) management of recreation programs and facilities; and (6) wetlands protection and management.

Conformance with the Goals of the Plan: The Makai Area supplements the existing recreational facilities present in the Mauka Area with the Kaka`ako Waterfront Park, Kaka`ako Gateway Park, Kewalo Basin Park, and Ala Moana Beach Park. HCDA will be preparing a new recreation plan for the KCDD to ensure that the provisions of the State Recreational Functional Plan are implemented.

5.2.3.6 State Transportation Functional Plan (1991)

Goals of the Plan: The 1991 State Transportation Functional Plan sought to (1) construct facility and infrastructure improvements in support of Hawai'i's thriving economy and growing population base; (2) develop a transportation system balanced with an array of new alternatives; (3) implement Transportation Systems Management to maximize the use of existing facilities and systems; (4) foster innovation and use of new technology in transportation; (5) maximize joint efforts with the private sector; (6) pursue land use initiatives which help reduce travel demand; (7) encourage resident quality-of-life improvements through improved mobility opportunities and travel reduction.

Conformance with the Goals of the Plan: The goal of the Proposed Action to promote transportation alternatives in the District, including access to transit and improved pedestrian and bicycle access will contribute to a community where people can live, work, and play in close proximity to their residences, thereby reducing their dependence upon automobile travel. The mixed-use character of the Proposed Action in a high density setting allows complimentary land uses to be clustered together, further reducing the need for automotive travel. Implementation of a Complete Streets program in the District will greatly improve pedestrian activities and bicycling. The implementation of three fixed rail transit stations in the District will not only compliment existing bus service, but help to further reduce dependency upon the automobile.

5.2.4 State Ocean Resources Management Plan

The State Ocean Resources Management Plan (ORMP) was adopted by the State Department of Land and Natural Resources in 2006 to establish management goals and strategic actions pertaining to three broad areas of concern. Following is a review of how the Proposed Action relates to the ORMP.

Table 5-3: Compliance with the State Ocean Resources Management Plan

Management Goals and Strategic Actions	Supports	Conforms	Inconsistent	Not Applicable

Improve coastal water quality by reducing land-based sources of pollution.	**S**	**C**	**I**	**NA**
Reduce soil erosion from upland forest ecosystems and conservation lands.				x

Reduce pollutant loads from residential, agricultural, and commercial uses in priority watersheds.				x

Discussion: The KCDD is an urban area that includes no forest ecosystems, conservation lands, or priority watersheds.

Protect beaches, wetlands, and coastal communities from shoreline erosion and other coastal hazards.	**S**	**C**	**I**	**NA**
Develop and implement a comprehensive and integrated shoreline policy that addresses the impacts of chronic and episodic coastal hazards.		x		
Develop a Hawai`i beach and shoreline management plan with specific management measures to address coastal erosion and other hazards in priority coastal areas.				x
Encourage appropriate coastal-dependent development that reduces risks from coastal hazards and protects coastal and cultural resources.		x		

Discussion: The Proposed Action incorporates development restrictions imposed by the Federal Emergency Management Agency through its Flood Insurance Rate Map (FIRM) program. As the District's coastline is a hardened seawall with no beach resources present, no beach and shoreline management plan is required.

Management Goals and Strategic Actions	**Supports**	**Conforms**	**Inconsistent**	**Not Applicable**

Improve and ensure maintenance and appropriate use of environmental infrastructure.	**S**	**C**	**I**	**NA**
Repair leaking sewers in priority watersheds.				x
Reduce the number of individual wastewater disposal systems in the coastal environment.				x
Reduce unpermitted storm-water discharges to the sewers in priority watersheds.				x
Provide appropriate waste management infrastructure to support commercial and recreational marine facilities.	x			

Discussion: The District's existing wastewater collection system will be expanded if needed to accommodate increased density under the Proposed Action.

Improve coastal water quality by reducing marine sources of pollution.	**S**	**C**	**I**	**NA**
Minimize the introduction and spread of marine alien and invasive species into and throughout archipelagic waters.				x
Establish wastewater-discharge restricted zones and conditions for commercial vessels in archipelagic waters.				x

Discussion: As part of the KCDD, Kewalo Basin is an important asset to the community. The authority for vessel-related activities there rests with the Harbors Division of the State DOT.

Improve the health of coral reef resources for sustainable traditional, subsistence, recreational, and commercial uses.	**S**	**C**	**I**	**NA**
Strengthen and expand marine protected area management.				x
Develop ecosystem-based approaches for near-shore fisheries management.				x
Establish and institutionalize approaches for restoring, operating, and preserving ancient Hawaiian coastal fishponds for the benefit of coastal communities around the State.				x
Improve enforcement capacity and voluntary compliance with existing rules and regulations for ocean resource protection.				x

Discussion: Management of coastal resources makai of the Kaka`ako Waterfront Park seawall rests with the Aquatics Division of DLNR and the Harbor Division of DOT.

Management Goals and Strategic Actions	**Supports**	**Conforms**	**Inconsistent**	**Not Applicable**

Enhance public access and appropriate coastal-dependent uses of the shoreline.	**S**	**C**	**I**	**NA**
Enhance and restore existing public shoreline areas and scenic vistas.	x			
Establish new shoreline areas public and appropriate coastal-dependent uses.	x			

Discussion: The Proposed Action's emphasis on improving pedestrian and biking activities within the District will help to enhance public access to the shoreline.

Promote appropriate and responsible ocean recreation and tourism that provide culturally informed and environmentally sustainable uses for visitors and residents.	**S**	**C**	**I**	**NA**
Develop community-based frameworks and practices for identifying and mitigating ocean recreational use conflicts.				x
Develop responsible and sustainable ocean-based tourism.				x

Discussion: Achievement of this goal is beyond the scope of the Proposed Action.

Encourage cutting edge and appropriate ocean science and technology with safeguards for ocean resource protection.	**S**	**C**	**I**	**NA**
Promote alternative ocean energy sources.				x
Plan and develop sustainable commercial aquaculture in coastal				x

areas and ocean waters to diversify and expand Hawai`i's economy and provide locally produced sources of seafood.				
Expand ocean science and technology.				x

Discussion: Achievement of this goal is beyond the scope of the Proposed Action.

Apply integrated and place-based approaches to the management of natural and cultural resources.	**S**	**C**	**I**	**NA**
Develop integrated natural and cultural resources planning process and standardized tools.		x		
Build capacity for community participation in natural and cultural resources management.		x		

Discussion: HCDA is committed to the protection and preservation of archaeological and cultural resources in the District.

Management Goals and Strategic Actions	**Supports**	**Conforms**	**Inconsistent**	**Not Applicable**

Improve the existing legal, regulatory, and institutional framework for integrated natural resources management based on scientific data, traditional knowledge, and field experience.	**S**	**C**	**I**	**NA**
Establish a legislative and administrative reform agenda to improve management of natural resources.				x
Develop integrated information management systems for priority watersheds and coastal areas.				x
Document and share experiences and lessons learned in Hawai`i and globally to promote natural and cultural resource policy reforms and adoption.				x
Monitor and evaluate ORMP implementation.				x

Discussion: The implementation of this goal and its accompanying strategic actions lies with the State Department of Land and Natural Resources.

5.2.5 State of Hawaii Historic Preservation Act (Chapter 6E, HRS)

As set forth in Section 1 of Chapter 6E, HRS, "The Constitution of the State of Hawaii recognizes the value of conserving and developing the historic and cultural property within the State for the public good. The legislature declares that the historic and cultural heritage of the State is among its important assets and that the rapid social and economic developments of contemporary society threaten to destroy the remaining vestiges of this heritage. The legislature further declares that it is in the public interest to engage in a comprehensive program of historic preservation at all levels of government to promote the use and conservation of such property for the education, inspiration, pleasure, and enrichment of its citizens. The legislature

further declares that it shall be the public policy of this State to provide leadership in preserving, restoring, and maintaining historic and cultural property, to ensure the administration of such historic and cultural property in a spirit of stewardship and trusteeship for future generations, and to conduct activities, plans, and programs in a manner consistent with the preservation and enhancement of historic and cultural property."

The District includes several properties and/or land registered as a State or National historic site. Burials that have been previously identified and inadvertently discovered in the District have been respectfully cared for and disposition (preservation in place of relocation) has followed the Hawai'i State Burial Laws as contained in chapter 6E. A CIA was prepared pursuant to Act 50, 2000 Hawai'i Session Laws, as part of the current EIS process. The CIA and the community consultation process identified cultural resources within the District and the potential impacts of the Proposed Action on these valuable cultural and historic resources is disclosed in Chapter 4.

5.2.6 State of Hawaii Environmental Protection Act (Chapter 343 & 344, HRS)

Hawai`i's Environmental Protection Act establishes procedures by which environmental impacts resulting from a proposed action are disclosed. The rules governing the implementation of Chapter 343 are found in Section 11-200, HAR. HAR Section 11-200-12 establishes thirteen (13) significance criteria which agencies use in evaluating an action's impacts. Following is a discussion of how the Proposed Action relates to applicable significance criteria:

Pursuant to subparagraph 12, ...an action shall be determined to have a significant effect on the environment if it:

(1) Involves an irrevocable commitment to loss or destruction of any natural or cultural resource;

Discussion: The Proposed Action will impact cultural resources in the region. However, these impacts will be mitigated through continued compliance with policies and procedures established pursuant to Chapter 6E, HRS, and implemented under the auspices of the SHPO and the O`ahu Burial Council. ***(see discussion in Chapter Four, Section 4.6)***

(2) Curtails the range of beneficial uses of the environment:

Discussion: The range of beneficial uses of the District's environment is guided by the HCDA, as implemented by the State Legislature which designated the District as a redevelopment area. The Proposed Action is consistent with the planned beneficial use of the area. The Proposed Action increases the range of beneficial uses for the environment by providing additional residential units in the District, with an emphasis on affordable units, and increased connectivity with surrounding

roads, infrastructure, services, and public facilities. ***(see discussion in Chapter Two)***

(3) Conflicts with the state's long-term environmental policies or goals and guidelines as expressed in chapter 344, HRS, and any revisions thereof and amendments thereto, court decisions, or executive orders;

Discussion: The stated purpose of Chapter 344 is to establish a state policy which will encourage productive and enjoyable harmony between people and their environment, promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of humanity, and enrich the understanding of the ecological systems and natural resources important to the people of Hawai'i. The Proposed Action complies with the policies, goals and guidelines of Chapter 344. The project proposes to improve the integration of the District with the regional transportation network (including the fixed rail system) and infrastructure systems, and improve the quality of life for residents by providing affordable housing near employment centers.

(4) Substantially affects the economic or social welfare of the community or State;

Discussion: The Proposed Action will have a beneficial impact upon the economic and social welfare of surrounding communities, the region and the State. It will provide new residential opportunities and the provision of housing that is affordable to the community; both of which will directly benefit the residents of the region. ***(see discussion in Chapter Four, Section 4.10.13)***

(5) Substantially affects public health;

Discussion: The Proposed Action is anticipated to have negligible impact on public health. Infrastructure systems will be constructed to comply with applicable State, DOH, and County standards and regulations. ***(see discussion in Chapter Four, Sections 4.8 and 4.9)***

(6) Involves substantial secondary impacts such as population changes or effects on public facilities;

Discussion: The Proposed Action will have a significant impact on population, which, in turn, will have an impact upon public facilities. While it will necessitate an increase in some services, e.g. enrollment in public schools for the children of new residents and increased demand for recreational facilities, these increases are offset by the increased economic benefits that the Proposed Action will bring to the region in terms of new tax revenues. ***(see discussion in Chapter Four, Sections 4.10.2 and 4.10.12)***

(7) Involves a substantial degradation of environmental quality

Discussion: The Proposed Action will not result in a substantial degradation of environmental quality in the District or the region. It will result in a substantial increase in the quality of life for existing and future District residents through the provision of pedestrian and bicycle friendly streets and a decreased emphasis on automobile travel. ***(see discussion in Chapter Four, Section 4.7.10)***

(8) Is individually limited but cumulatively has considerable effect upon the environment or involves a commitment for larger actions;

Discussion: The Proposed Action will involve a commitment for larger actions by the State DOE and the City and County of Honolulu's Fire Department and Police Department in terms of providing new personnel and/or facilities to support the anticipated development. It will result in a beneficial cumulative effect in the form of increased tax revenues in the region to help offset this demand. The project's environmental impacts are mostly related to short-term construction impacts that can be mitigated through the implementation of Best Management Practices.

(9) Substantially affects a rare, threatened, or endangered species, or its habitat;

Discussion: No rare, threatened, or endangered plants or terrestrials animals or birds have been identified in the District. ***(see discussion in Chapter Four, Section 4.3)***

(10) Detrimentally affects air or water quality or ambient noise levels;

Discussion: As discussed in Chapter 4, ***Sections 4.2 and 4.9.***, the Proposed Action will have no significant adverse impact upon water or air quality.

(11) Affects or is likely to suffer damage by being located in an environmentally sensitive area such as a flood plain, tsunami zone, beach, erosion-prone area, geologically hazardous land, estuary, fresh water, or coastal waters;

Discussion: The Proposed Action will be implemented in a manner that conforms to prevailing flood control regulations and requirements. While portions of the District are situated within a tsunami evacuation zone, emergency evacuations plans already in place will help to ensure that the community can respond appropriately in during emergencies. ***(see discussion in Chapter Four, Section 4.1.4)***

(12) Substantially affects scenic vistas and viewplanes identified in county or state plans or studies,

Discussion: The Proposed Action will affect scenic vistas and viewplanes between the mountains and the ocean through the provision of new towers built up to or exceeding the prevailing height limit. However, it will not impact identified view corridors. ***(see discussion in Chapter Four, Sections 4.12.2 and 4.12.6.2)***

(13) Requires substantial energy consumption.

Discussion: Energy consumption will be increased in relation to the Proposed Action. However, new development will employ energy saving strategies. ***(see discussion in Chapter Four, Section 4.11.15)***

5.3 County Plans, Policies, and Controls

5.3.1 Oahu General Plan

The General Plan for the City and County of Honolulu (referred to herein as the "O`ahu General Plan"), first enacted in 1977 and amended in 2002, is a statement of the long-range social, economic, environmental, and design objectives for the general welfare and prosperity of the people of O`ahu and a statement of broad policies that facilitate the attainment of those objectives. The General Plan identifies eleven areas of concern. Following is a discussion of those objectives and policies that are directly relevant to the Proposed Action.

Table 5-4: Objectives and Policies of the O`ahu General Plan

Housing Objective	Policy	
A		To provide decent housing for all the people of Oahu at prices they can afford.
	1	Develop programs and controls which will provide decent homes at the least possible cost.
	3	Encourage innovative residential development which will result in lower costs, added convenience and privacy, and the more efficient use of streets and utilities.
	5	Make full use of State and Federal programs that provide financial assistance for low- and moderate-income homebuyers.
	8	Encourage and participate in joint public- private development of low- and moderate- income housing.
	10	Promote the construction of affordable dwellings which take advantage of Oahu's year-round moderate climate.
	12	Encourage the production and maintenance of affordable rental housing.
	13	Encourage the provision of affordable housing designed for the elderly and the handicapped.
	14	Encourage equitable relationships between landowners and leaseholders, between landlords and tenants, and between condominium developers and owners.

Discussion: The Proposed Action represents the latest initiative by the HCDA to fulfill its mission to provide new affordable housing opportunities for the residents of O`ahu.

Housing Objective	Policy	
C		To provide the people of Oahu with a choice of living environments which are reasonably close to employment, recreation, and commercial centers and which are adequately served by public utilities.
	1	Encourage residential developments that offer a variety of homes to people of different income levels and to families of various sizes.
	2	Encourage the fair distribution of low- and moderate-income housing throughout the Island.
	3	Encourage residential development near employment centers.

Discussion: The Proposed Action will provide new residential opportunities, including affordable housing, in close proximity to major employment areas. The provision of transit-oriented development is consistent with the City and County of Honolulu's intent to improve the quality of life of its residents through the introduction of a fixed rail system.

Transportation & Utilities Objective	Policy	
A		To create a transportation system which will enable people and goods to move safely, efficiently, and at a reasonable cost; serve all people, including the poor, the elderly, and the physically handicapped; and offer a variety of attractive and convenient modes of travel.
	5	Improve roads in existing communities to reduce congestion and eliminate unsafe conditions.
	9	Promote programs to reduce dependence on the use of automobiles.
	10	Discourage the inefficient use of the private automobile, especially in congested corridors and during peak-hours.
	11	Make public, and encourage private, improvements to major walkway systems.

Discussion: The Proposed Action specifically focuses on new urban design attributes that will help to reduce dependency upon automotive travel and enhance

the use of the fixed rail system and bus service in the District. Implementation of a Complete Streets program in the District will improve pedestrian and bicycle use and access.

Energy Objective	Policy	
C		To fully utilize proven alternative sources of energy.
	1	Encourage the use of commercially available solar energy systems in public facilities, institutions, residences, and business developments.
E		To establish a continuing energy information program.
	2	Foster the development of an energy conservation ethic among Oahu residents.

Discussion: It will be the ultimate decision of the future developer(s) of individual properties to determine the extent of energy saving initiatives that will be implemented during redevelopment of their property. However, HCDA is committed to requiring that all major development structures meet the LEED certification standards for new structures on all individual site development.

Physical Development & Urban Design Objective	Policy	
A		To coordinate changes in the physical environment of Oahu to ensure that all new developments are timely, well-designed, and appropriate for the areas in which they will be located.
	2	Coordinate the location and timing of new development with the availability of adequate water supply, sewage treatment, drainage, transportation, and public safety facilities.
	3	Phase the construction of new developments so that they do not require more regional supporting services than are available.
	4	Require new developments to provide or pay the cost of all essential community services, including roads, utilities, schools, parks, and emergency facilities that are intended to directly serve the development.
	5	Provide for more compact development and intensive use of urban lands where compatible with the physical and social character of existing communities.
	6	Encourage the clustering of developments to reduce the cost of providing utilities and other public services.

Discussion: The HCDA is committed to ensuring that new development will not proceed unless supported by adequate infrastructure. New development proposals in the District are reviewed on a case-by-case basis to ensure that adequate infrastructure capacity exists before a project is permitted to proceed.

Physical Development & Urban Design Objective	Policy	
D		To maintain those development characteristics in the urban-fringe and rural areas which make them desirable places to live.
	4	Maintain rural areas as areas which are intended to provide environments supportive of lifestyle choices which are dependent on the availability of land suitable for small to moderate size agricultural pursuits, a relatively open and scenic setting, and/or a small town, country atmosphere consisting of communities which are small in size, very low density and low rise in character, and may contain a mixture of uses.

Discussion: The Proposed Action is specifically intended to help reduce development pressures on rural and urban fringe areas by increasing density in the Primary Urban Center, and specifically in the District that was intended for redevelopment over 30 years ago.

Physical Development & Urban Design Objective	Policy	
E		To create and maintain attractive, meaningful, and stimulating environments throughout Oahu.
	3	Encourage distinctive community identities for both new and existing districts and neighborhoods.
	4	Require the consideration of urban-design principles in all development projects.
	5	Require new developments in stable, established communities and rural areas to be compatible with the existing communities and areas.

	8	Preserve and maintain beneficial open space in urbanized areas.
	9	Design public structures to meet high aesthetic and functional standards and to complement the physical character of the communities they will serve.

Discussion: The existing neighborhoods of the KCDD will be improved and enhanced through the implementation of the Proposed Action.

Culture & Recreation Objective	Policy	
B		To protect Oahu's cultural, historic, architectural, and archaeological resources.
	2	Identify, and to the extent possible, preserve and restore buildings, sites, and areas of social, cultural, historic, architectural, and archaeological significance.
	3	Cooperate with the State and Federal governments in developing and implementing a comprehensive preservation program for social, cultural, historic, architectural, and archaeological resources.
	4	Promote the interpretive and educational use of cultural, historic, architectural, and archaeological sites, buildings, and artifacts.

Discussion: The HCDA's is committed to preserving and protecting historic and cultural resources.

Culture & Recreation Objective	Policy	
D		To provide a wide range of recreational facilities and services that are readily available to all residents of Oahu.
	1	Develop and maintain community-based parks to meet the needs of the different communities on Oahu.
	6	Provide convenient access to all beaches and inland recreation areas.
	9	Require all new developments to provide their residents with adequate recreation space.
	10	Encourage the private provision of recreation and leisure-time facilities and services.
	13	Encourage the safe use of Oahu's ocean environments.

Discussion: Implementation of the Proposed Action will result in improved access to the regional's recreational amenities.

5.3.2 General Plan Update Program

In 2011, the DPP initiated a General Plan Update program to solicit public input on possible revisions to the O`ahu General Plan. In 2012, the DPP released a public review draft of the proposed General Plan Update. Public review meetings continued into 2013.

Following is a summary of the Proposed Action's compliance with applicable revisions being proposed to the O`ahu General Plan as discussed in the 2012 General Plan Update - Public Review Draft (GPUPRD).

The GPUPRD adds new language promoting sustainability. The Proposed Action is consistent with and supportive of these amendments.

The GPUPRD emphasizes the need for economic diversification. The Proposed Action is consistent with and supportive of these amendments. While a major focus of the Proposed Action is to help provide new residential opportunities in the Primary Urban Center, the indirect and induced job growth resulting from the Proposed Action will contribute to growth in other sectors of the O`ahu economy

The GPUPRD recognizes expanded options for visitor accommodations, including community hotels and alternative lodging. The Proposed Action is consistent with and supportive of this provision. The Proposed Action includes provisions for a limited number of hotels in the District.

The GPUPRD updates policies on affordable housing. The Proposed Action is consistent with and supportive of this policy. HCDA is committed to the provision of new housing opportunities that will be affordable to residents of O`ahu.

The GPUPRD promotes mixed use and higher density development. The Proposed Action is supportive of this policy. By focusing increased density in Kaka`ako, development pressures will be relieved in rural and urban-fringe areas of O`ahu.

The GPUPRD emphasizes the creation of a multi-modal transportation system and improvements to existing transportation and utility systems. The Proposed Action is consistent with and supportive of these policies. The TOD orientation of the Proposed Action is the result of the fixed rail system providing three new stations in the District. The Proposed Action also includes a strong emphasis on improving pedestrian activity and bicycle use in the District.

5.3.3 Primary Urban Center Development Plan

Adopted in 2004, the Primary Urban Center Development Plan is one of eight development plans created to implement the goals and policies of the O`ahu General Plan. Its policies are used to shape the growth and development of the primary urban core of Honolulu, which includes Kaka`ako. Kaka`ako will absorb about 30 percent of the PUC's future residential and commercial growth. Although conformance with the PUCDP is not required, the Proposed Action and the Baseline Condition (pursuant to the Mauka Area Plan) are generally consistent with the vision of the PUCDP. Policy 3.1.2 of the PUCDP pertains to open space network and calls for the preservation of panoramic views of natural landmarks and the urban skyline. The full buildout of Kaka`ako under the Baseline Condition and the Proposed Action would result in the near obliteration of the Mauka view of the Ko`olau mountain range referred to by the PUCDP. The Proposed Action lessens this impact my introducing provisions to reduce the bulk and mass of tower structures and encouraging orientation of the longer face of buildings to a Mauka-Makai orientation. It also encourages the continued preservation of view corridors along major Mauka-Makai oriented streets.

5.3.4 Special Management Area

Enforcement of the federal Coastal Zone Management Act (CZM) of 1972 has been delegated to the State and enacted as HRS Chapter 205A, HRS. The CZM area encompasses the entire State including all marine waters seaward to the extent of the State's police power and management authority, including the 12-mile U.S. territorial sea and all archipelagic waters. A CZM Certificate of Consistency is required for federal applicants, federal permits, or federal activities.

5.3.4.1 Coastal Zone Management

The CZM Act is comprised of a number of objectives primarily related to (1) protecting and preserving the coastal zone; (2) improving the quality of coastal scenic and open space resources and ensuring that coastal dependent development such as harbors and ports, and coastal-related development such as visitor industry facilities and energy generating facilities, are located, designed, and constructed to minimize adverse social, visual, and environmental impacts in the coastal zone management area; and (3) encouraging research and development of new, innovative technologies for exploring, using, or protecting marine and coastal resources.

Following is a summary of the project's conformance with the ten objectives of the coastal zone management program.

1A Provide coastal recreation opportunities accessible to the public.

Discussion: The Proposed Action is consistent with and supportive of the existing Mauka Area Plan's initiatives to increase public access to nearby coastal recreational areas of Kewalo Basin Park, Kaka`ako Waterfront Park, and Ala Moana Beach Park by improving pedestrian connections between the Mauka Area and these parks. By promoting the District wide implementation of a Complete Streets program, the existing and future residents of the District will enjoy improved access to coastal recreational opportunities.

2A Protect, preserve, and where desirable, restore those natural and manmade historic and prehistoric resources in the coastal zone management area that are significant in Hawaiian and American history and culture.

Discussion: This objective will be satisfied by the Proposed Action which will continue the protection of identified historic resources in the District, through preservation, rehabilitation, and restoration as applicable. Moreover, no action to alter or demolish these protected properties shall occur without prior approval by the DLNR for state resources and the National Park Service for national resources.

3A Protect, preserve, and, where desirable, restore or improve the quality of coastal scenic and open space resources.

Discussion: The Proposed Action focuses development on specific properties within the Mauka Area, thereby preserving the open space character and scenic attributes of the Makai Area. Existing open spaces in the Mauka Area, such as the Mother Waldron Neighborhood Park, will be preserved and new open space areas will be created as part of the Ward Master Plan and the Kamehameha Schools Master Plan for respective properties in the District.

4A Protect valuable coastal ecosystems, including reefs, from disruption and minimize adverse impacts on all coastal ecosystems.

Discussion: As a mature urban area, the District's existing storm water drainage system is designed to protect nearshore areas from excessive storm water runoff and environmental degradation.

5A Provide public or private facilities and improvements important to the State's economy in suitable locations.

Discussion: Because the Proposed Action responds in part to the planned development of three new rail stations in the District, it is specifically intended to focus new development in proximity to the rail system, to the benefit of all residents of O`ahu.

6A Reduce hazard to life and property from tsunami, storm waves, stream flooding, erosion, subsidence, and pollution.

Discussion: The Proposed Action is focused on the Mauka Area, which is situated outside of the tsunami inundation zone. In the event of a disaster, the NBC and McKinley High School have been designated as disaster relief sites. Both sites are located outside the floodplain and can accommodate a large number of persons as needed. In addition, new residential towers built to comply with contemporary building codes improve opportunities for vertical evacuations during public emergencies.

7 Improve the development review process, communication, and public participation in the management of coastal resources and hazards.

Discussion: The development process will utilize and implement existing laws and applications will be reviewed in a timely manner. All proposed developments will be subject to the HCDA review and approval process. Developers shall also obtain applicable permits and planning approvals required by other local, state, and in some instances, federal agencies.

8 Stimulate public awareness, education, and participation in coastal management.

Discussion: Through the preparation of the EIS, the HCDA hopes to stimulate public awareness about coastal management issues relevant to the District.

9 Protect beaches for public use and recreation.

Discussion: The Proposed Action concentrates new development in the Mauka Area, thereby protecting regional beaches for public use and recreation.

10 Promote the protection, use, and development of marine and coastal resources to assure their sustainability.

Discussion: The Proposed Action includes actions that will likely increase the use of marine and coastal resources, due to its associated population increases. The HCDA is committed to working with its sister agencies to ensure that the public is educated to the sensitivity of our valued coastal resources.

5.3.4.2 Special Management Area

The State CZM review authority has been, in turn, delegated to the counties through the Special Management Area (SMA) controls for development along the shoreline. In the late 1970s, each county delineated the SMA around its coastline, varying in interior depth from a few hundred feet to several miles inland from the coastline. Within the District, the SMA extends from the shoreline to Ala Moana Boulevard and is administered by the State Office of Planning. Following is a discussion of the relationship of the Proposed Action to the guidelines presented in Chapter 205A-26.

(*1) All development in the special management area shall be subject to reasonable terms and conditions set by the authority in order to ensure:*

(A) Adequate access, by dedication or other means, to publicly owned or used beaches, recreation areas, and natural reserves is provided to the extent consistent with sound conservation principles;

Discussion: The Proposed Action focuses development in the Mauka Area and facilitates improved pedestrian access to the Makai Area which includes the Kaka`ako Waterfront Park.

(B) Adequate and properly located public recreation areas and wildlife preserves are reserved;

Discussion: The Proposed Action is consistent with and supportive of the existing Mauka Area Plan's initiatives to increase public access to nearby coastal recreational areas of Kewalo Basin Park, Kaka`ako Waterfront Park, and Ala Moana Beach Park by improving pedestrian connections between the Mauka Area and these parks. By promoting the District wide implementation of a Complete Streets program, the existing and future residents of the District will enjoy improved access to coastal recreational opportunities.

(C) Provisions are made for solid and liquid waste treatment, disposition, and management which will minimize adverse effects upon special management area resources; and

Discussion: The District is served by an existing municipal wastewater collection and treatment system. Solid waste collection is conducted by the City and County of Honolulu. All new development will be reviewed prior to approval to determine the adequacy of the wastewater collection and treatment system.

(D) Alterations to existing land forms and vegetation, except crops, and construction of structures shall cause minimum adverse effect to water resources and scenic and recreational amenities and minimum danger of floods, wind damage, storm surge, landslides, erosion, siltation, or failure in the event of earthquake.

Discussion: Given the flat character of the existing topography, the Proposed Project will require no significant alteration to existing land forms. The proposed development will be constructed in compliance with all applicable building and developed regulations to minimize danger from floods, wind damage, storm surge, erosion, siltation, or failure from earthquakes. Given the existing topography, the potential for landslides on the property does not exist.

(2) No development shall be approved unless the authority has first found:

(A) That the development will not have any substantial adverse environmental or ecological effect, except as such adverse effect is minimized to the extent practicable and clearly outweighed by public health, safety, or compelling public interests. Such adverse effects shall include, but not be limited to, the potential cumulative impact of individual developments, each one of which taken in itself might not have a substantial adverse effect, and the elimination of planning options;

Discussion: Based upon the findings of the EIS, the proposed project will not result in a substantial adverse environmental or ecological effect over the long term. While the Proposed Action will result in ecological impacts, these are not anticipated to be long-term significant adverse impacts because they are short-term impacts related to construction. Anticipated beneficial impacts include the provision of new affordable housing opportunities.

(B) That the development is consistent with the objectives, policies, and special management area guidelines of this chapter and any guidelines enacted by the legislature; and

Discussion: Based upon the findings of the EIS, the proposed project has been found to be consistent with the objectives, policies, and special management area guidelines.

(C) That the development is consistent with the county general plan and zoning. Such a finding of consistency does not preclude concurrent processing where a general plan or zoning amendment may also be required.

Discussion: The proposed project is consistent with the O`ahu General Plan, and the Primary Urban Center Development Plan. As a redevelopment district established by the State, Kaka`ako is exempt from the City's zoning requirements. The HCDA has established its own zoning classifications pursuant to the Mauka and Makai Area Plans.

(3) The authority shall seek to minimize, where reasonable:

(A) Dredging, filling or otherwise altering any bay, estuary, salt marsh, river mouth, slough or lagoon;

Discussion: No such activities are contemplated as part of the Proposed Action.

(B) Any development which would reduce the size of any beach or other area usable for public recreation;

Discussion: No such activities are contemplated as part of the Proposed Action.

(C) Any development which would reduce or impose restrictions upon public access to tidal and submerged lands, beaches, portions of rivers and streams within the special management areas and the mean high tide line where there is no beach;

Discussion: The Proposed Action will not impose any restriction upon public access to tidal and submerged lands, beaches, portions of rivers, or the mean high tide line.

(D) Any development which would substantially interfere with or detract from the line of sight toward the sea from the state highway nearest the coast; and

Discussion: The Proposed Action is not anticipated to substantively interfere or detract from the line of sight toward the sea from the Ala Moana Boulevard. The Proposed Action focuses development activity in the Mauka Area, which is mauka of Ala Moana Boulevard.

(E) Any development which would adversely affect water quality, existing areas of open water free of visible structures, existing and potential fisheries and fishing grounds, wildlife habitats, or potential or existing agricultural uses of land.

Discussion: No such activities are contemplated as part of the Proposed Action.

5.3.5 Complete Streets

In 2012, the City and County of Honolulu adopted Bill 26 (2012), adopting a Complete Streets policy to guide and direct more comprehensive and balanced planning, design, and construction of City transportation systems. As set forth in the ordinance, the City now encourages the development of transportation facilities or projects that are planned, designed, operated, and maintained to provide safe mobility for all users. The ordinance identifies the following objectives:

(1) Improve safety;
(2) Apply a context sensitive solution process that integrates community context and the surrounding environment, including land use;
(3) Protect and promote accessibility and mobility for all;
(4) Balance the needs an comfort of all modes and users;
(5) Encourage consistent use of national industry best practice guidelines to select complete street design elements;
(6) Improve energy efficiency in travel and mitigate vehicle emissions by providing non-motorized transportation options;
(7) Encourage opportunities for physical activity and recognize the health benefits of an active lifestyle;
(8) Recognize complete streets as a long term investment that can save money over time;

(9) Build partnerships with stakeholders and organizations statewide; and
(10) Incorporate trees and landscaping as integral components of complete streets.

The Proposed Action is supportive of the Complete Streets initiative. The HCDA intends to implement Complete Streets throughout the District.

Chapter Six:
Contextual Issues

6.3.4 Loss and/or Destruction of Natural and Cultural Resources 7
6.3.5 Addressing the Irretrievable and Irreversible Loss of Resources 7
6.4 Government Policies that Offset Identified Adverse Impacts 8
6.5 Secondary and Cumulative Impacts 8
6.6 Unresolved Issues 9

6.0 Contextual Issues

6.1 Contributing to the Regional and Island Economy

Assuming full build-out, each of the TOD Alternatives generates more population, fewer operational jobs (in the form of office jobs), but more cumulative construction employment in Kakaʻako than does the Future Baseline Condition.

TOD Alternative B is forecast to generate $496 million in overall sales, payments, and exchanges than build-out under the Future Baseline Condition. For TOD Alternative A, the total statewide economic impact is slightly less: $474 million. (Each alternative assumes up to three hotels, but Alternative B assumes a higher density hotel because of the height limit imposed by Act 61).

Full build-out under Alternative B would create or maintain about 960 more job-years of direct employment than would full build-out of the Future Baseline Condition – with multiplier effects, total job-years of employment reaches about 2,660. For Alternative A, comparable figures are about 1,075 and 2,680.

TOD Alternative B is forecast to generate over $21 million annually in State taxes and about $1.5 million annually in County General Excise Taxes. Tourist Accommodation Taxes would exceed $67 million annually.

TOD Alternative A is forecast to generate over $22 million annually in State taxes and about $1.6 million annually in County General Excise Taxes. Tourist Accommodation Taxes would exceed $66 million annually.

Analysis of government costs and revenues is complicated by various uncertainties (such as whether public funds will be needed for parks, or whether new impact fees or other mechanisms to capture revenue from developers/consumers will be developed). However, the analysis suggests the State will see a significant annual positive balance from operational elements of each TOD Alternative, A or B. Given some conservative assumptions, the State's balance from facility and infrastructure construction costs alone could be negative, but the positive operational balance and tax revenues from build-out would be enough to offset this loss in a single year.

The City and County situation is more neutral – figures mostly hovering a little above zero for both construction costs and operational revenues, though a little negative for operations under TOD Alternative A only. That apparent negative balance is very small, and would be turned to a small positive balance if the State decides to restore more Transient Accommodations Tax funds to counties in the future. It would seem logical to assume that new development in Kaka`ako would result in a noticeable increase in property tax revenues. However, as discussed in Appendix G (the socio-economic impact analysis), real property tax revenues were

calculated on an islandwide basis, and it is assumed that growth in Kaka`ako represents captured growth that would otherwise occur elsewhere. Thus, net growth is nearly neutral.

Implementing TOD Alternative B would result in a Total Facilities Cost of approximately $1.88 million, while implementing TOD Alternative A would result in a modestly higher cost: approximately $1.96 million.

6.2 Relationship to Short-Term Uses and Long-Term Productivity

6.2.1 Trade Offs: Short-Term and Long-Term Gains and Losses

From an over-arching perspective, the benefits of providing more residential units, including Reserved Housing units, in the District generally outweigh the short-term impacts related to the construction of individual projects. The public investment in facilities and services that may be needed to support private sector development is greatly offset by increased tax revenues generated from completed projects.

As an incentive based plan, implementation of the TOD Overlay will depend upon voluntary actions and commitments by public agencies as well as private landowners. From the government perspective, the implementation of rules to guide transit-oriented development will have generally few, if any, short-term impacts; landowners need only comply if they seek the advantages offered in the form of incentives. The long-term impacts of implementing TOD will include increased density in the form of more residential units than allowed under the existing rules, and increased building heights for a limited number of towers (under Alternative A), which will result in a change to the skyline when viewed from afar.

Implementation of TOD will also result in the creation of a comprehensive Complete Streets program in Kaka`ako that will result in long-term benefits with very few short-term impacts. While a limited amount of construction is necessary over the short term, in the form of changes to sidewalks and street widths, and the re-striping of traffic lanes to accommodate increased bicycle usage, the long-term benefits are anticipated to include a shift away from reliance upon automobiles by residents of the District and an increase in alternative forms of transportation.

Implementation of HCDA's vision for Transit Oriented Development in Kaka`ako will result in some short-term impacts in the form of the construction impacts of infrastructure projects. However, as discussed in Chapter Four, the implementation of regional plans by the City's Board of Water Supply and the Department of Environmental Services are independent of any actions by HCDA and may or may not proceed depending upon the respective agencies ultimate course of action.

From the perspective of private landowners, implementation of TOD will result in the same general short-term construction impacts, on a project-by-project basis, as would development of their property pursuant to the existing rules.

6.2.2 Extent to Which the Proposed Action Forecloses Future Options

Because TOD is an incentive based program, in and of itself it does not foreclose upon other development options; it is an overlay that is "added on" to existing rules that guide development in the District.

6.2.3 How the Proposed Action Narrows the Range of Beneficial Uses

Since the KCDD has been targeted for redevelopment for several decades, beneficial uses are defined as the desired outcome of implementing HCDA's policies and plans. Those beneficial uses focus on the provision of new residential opportunities in the District, including units that affordable as defined by federal guidelines. Rather than narrow the range of those beneficial uses, the Proposed Action increases them by offering the opportunity for high density for residential development. It does, however, reduce to a small degree, commercial land uses in the District, compared to what is allowable under the current rules. However, that loss is considered to be negligible.

6.2.4 Long Term Risks to Health and Safety

Since there are no significant adverse impacts associated with noise or air quality, and because the Proposed Action focuses on increasing transportation options for District residents, there are generally no long-term risks to health and safety associated with the Proposed Action. While increases in vehicular traffic are anticipated to result from implementing TOD, resulting in impacts to regional traffic patterns and volumes, the presence of the HART ***light metro rail*** system in Kaka`ako, together with implementation of a Complete Streets program, are intended to mitigate those impacts, primarily by offering area residents opportunities to increase their bicycling and pedestrian activities, which in turn, can lead to a healthier lifestyle.

6.2.5 Culturally Significant Consequences

As discussed in Chapter Four, implementation of the Proposed Action will result in potentially significant archaeological and cultural impacts whenever inadvertent find of human remains occurs. It will also potentially impact contemporary cultural activities that may be threatened with displacement as the result of redevelopment.

6.2.6 Environmentally Significant Consequences

As the KCDD is a mature urban area with no identified flora or faunal habitat of significance, its redevelopment under the Proposed Action will result in impacts no different than those anticipated with full build-out under the existing rules (the Future Baseline Condition). Infrastructure in the District has been constructed over the past several decades to accommodate redevelopment envisioned by the HCDA and the State Legislature. Although implementation of the TOD overlay plan may necessitate some additional infrastructure projects, they are not anticipated to result in significant adverse environmental consequences.

6.2.7 Potential Harm to the Environment

Assuming that Best Management Plans and Practices are followed and all permit-induced protocol are adhered to, no primary, secondary, or cumulative impacts to the natural environment are anticipated.

6.2.8 Promoting Sustainability

HCDA is committed to promoting sustainable practices in both construction activities and operational activities that would implement the Proposed Action. The Proposed Action will facilitate energy conservation efforts by providing residential opportunities near the region's largest employment centers (Downtown, Ala Moana Center, and Waikiki). The Proposed Action's emphasis on pedestrian, bike, and transit options will assist the effort to use a non-motorized transportation alternative and reduce overall fossil fuel consumption. The use of energy efficient equipment in buildings will also contribute towards the effort as well. HCDA will comply with sustainability guidelines adopted by the State. The intent of these guidelines is to respond to Hawai'i's complex growth challenges by promoting sustainable practices, high performance energy efficient buildings, economically viable and environmentally mindful development, and by encouraging best practices in new development today.

The Proposed Action will perpetuate the policies already established in the Mauka Area Rules that projects will incorporate energy efficient design principles where feasible. Design elements may include the use of individual meters for the residential and commercial/retail uses to provide incentives for energy conservation, high efficiency motors, chillers, energy efficient ballasts for all fluorescent lamps, building design that maximizes indoor light without increasing indoor heat, use of insulation and double glazed windows and doors, and energy efficient metal halide lights for outdoor lighting. The highly respected and established programs like the US Green Building Council's LEED (Leadership in Energy and Environmental Design) Green Building Rating System and other similar industry standard best practice rating and measurements systems are also available as tools for implementing designs with minimal impact to the environment.

6.3 Irreversible and Irretrievable Commitments of Resources

6.3.1 Unavoidable Impacts and Probable Adverse Effects

Implementation of the Proposed Action (either TOD Alternative) will impact the general character of the overall district by increasing urban density, increasing the resident population, and increasing vehicular and non-vehicular traffic in and outside of the District. ***Increases in vehicular traffic will result in slower vehicular travel times, especially during peak hour travel periods. Intersections operating at Level of Service F will impede the movement of vehicles, including the transport of goods and the provision of some vehicular-oriented services.*** Either Alternative will impact scenic vistas: the skyline of Kaka`ako will change with the addition of new residential towers. Implementation of TOD Alternative A would increase those visual impacts due to the presence of a maximum of three iconic towers that may approach 700 feet in height (although the final determination as to the height of any structures on the three designated properties will be the result of negotiations between the landowner and HCDA). Building heights will be limited to 418 feet TOD Alternative B, thus the visual impact of height would not be any different than what is allowed under the current Mauka Area Rules, except that there may be additional numbers of towers constructed under TOD Alternative B.

Under the Future Baseline Condition, the construction of a new mixed-use high-rise developments throughout the Mauka Area will degrade the existing Mauka view of the Ko`olau mountain range as seen from the Makai Area, as disclosed in the 2009 Supplemental EIS. Implementation of either TOD Alternative may result in additional high-rise towers being constructed, which would further degrade the view. In addition, new development will change the visual character of the streetscape at the eye-level of the pedestrian, both through changes in building mass and replacement of existing single story buildings with multi-story buildings.

Whether these impacts are deemed to be adverse is somewhat subjective. Those attracted to the urban environment and the benefits it has to offer in terms of convenience and lifestyle, may not consider increased building density to be an adverse effect. However, those who may be opposed to the general concept of population growth, might consider any density increase in Kaka`ako to result in an adverse effect. For the residents already living in the District, implementation of the Proposed Action might be considered to be adverse if they purchased their unit or property based upon an assumption that the urban design character of the District would never change. However, for those residents who purchased their unit or property under the assumption that redevelopment of the District would occur in a timely manner, the effects resulting from implementation of the Proposed Action may be viewed as beneficial rather than adverse.

While all public services and facilities will be impacted by population growth throughout urban Honolulu, responses from affected agencies suggest that impacts

of both TOD Alternatives A and B on Kaka'ako-area schools and recreational facilities could be significant. (Park/recreational impacts are considered an "Unresolved Issue" until HCDA completes a study of needs and master plan for the area.) An additional fire station is likely also needed under both Alternative A and Alternative B.

6.3.2 Use of Non-Renewable Resources

Implementation of the Proposed Action would result in the irreversible and irretrievable commitment of certain natural and fiscal resources. Major non-renewable resource commitments include individual project sites, the capital financing of the project, construction materials, labor, and energy required for the construction and long-term operation of projects. Impacts represented by the commitment of these resources must be weighed against the positive social-economic benefits that could be derived from any particular development project (or the Proposed Action as a whole at build-out), versus the consequences of either taking no action or pursuing another less beneficial use of the area.

When fully built out pursuant to the Proposed Action (either Alternative), the area will transform to a higher density mixed-use environment than that envisioned under the current Mauka Area Rules (the Future Baseline Condition). More residents, more pedestrians, more bicycles, and more vehicles on the road can all be expected.

As with any construction activity, non-renewable resources such as fossil fuel and construction materials will be irrevocably committed. Labor will be required for planning, engineering, and construction. New residential, commercial, and light-industrial uses will generate increases in demand for water, electricity, and sewer services, and the provision of these services will create additional demand for the consumption of non-renewable resources. Similar types of development proposed elsewhere in Honolulu will generate the same or similar demand for these resources.

Providing potable water for consumption and irrigation would commit additional groundwater resources. However, it is repeated here that the population increase associated with the Proposed Action is anticipated to represent the relocation of existing population from elsewhere on the island. Thus, the anticipated increase in demand for non-renewable resources such as water in Kaka`ako also represents the relocation or redistribution of demand rather than the creation of substantive new demand.

The introduction of light rail to the District, together with the implementation of a Complete Streets program, will result in increased opportunities for existing and future residents to engage in transportation methods that are less reliant upon fossil fuels than internal combustion engine powered vehicles. In this regard, the Proposed Action will likely result in the decreased use of non-renewable resources.

However, because Kaka`ako is dependent upon the provision of electrical energy from a publicly regulated utility that presently relies upon non-renewable resources as the primary fuel source for its power plants, the District, together with its residents and the remaining population of the City and County of Honolulu, will continue to rely upon the use of non-renewable resources until such time that alternative energy sources are implemented by the utility. While that conversion is happening, progress has been slow.

6.3.3 Possibility of Environmental Accidents

Activities in the District pursuant to the Proposed Action will be limited to residential, commercial (including hotel and office), and light-industrial land uses. The possibility of significant environmental accidents emanating from residential and/or commercial land uses is quite remote, and is generally limited to the accidental spillage of small quantities of household chemicals or pesticides associated with landscape maintenance. Environmental accidents associated with light-industrial land uses are greater, due to the character of the land use, but are generally limited to similar small-scale accidental releases.

6.3.4 Loss and/or Destruction of Natural and Cultural Resources

Redevelopment of individual properties in Kaka`ako will result in the temporary loss of limited areas of existing vegetation and the faunal habitat associated with them. However, redevelopment also provides the opportunity for replacement of existing vegetation with new landscaping and vegetation. Provisions for the creation of new open space areas may result in a net gain of vegetated areas. Urban fauna displaced by development is considered to be resilient and will not likely be permanently lost. Implementation of the Proposed Action will result in potentially significant archaeological and cultural impacts whenever inadvertent find of human remains occurs. It will also potentially impact contemporary cultural activities that may be threatened with displacement as the result of redevelopment. However, it is not anticipated that these resources will be permanently lost or destroyed. Archaeological or historical cultural resources may be preserved in place or relocated, depending upon the nature of the resource, and decision-making by regulating agencies such as the State Historic Preservation Division of DLNR, which has strict regulations and protocol in place. Contemporary cultural activities may be displaced, but will likely not be destroyed as the result of redevelopment. Like any business, contemporary cultural activities respond to consumer demand, and if displaced, will likely relocate elsewhere in response to that demand.

6.3.5 Addressing the Irretrievable and Irreversible Loss of Resources

The irretrievable and irreversible loss of the resources discussed above is offset by the beneficial impacts associated with providing transit-oriented development in an existing urban area already targeted for redevelopment. Increasing urban density in a portion of the Primary Urban Center as a means of redirecting population growth

and expansion away from rural areas more than offsets the losses described. They would be far greater if the scale of population growth envision under the Proposed Action were to occur in a rural area.

6.4 Government Policies that Offset Identified Adverse Impacts

The following positive benefits included in the current TOD planning effort will help to offset the adverse impacts identified above by:

- increasing opportunities for the provision of Reserved Housing;
- increasing open space through urban design requirements focused on improving the streetscape and the pedestrian experience;
- improving pedestrian and bicycle access through the implementation of a Complete Streets program;
- reducing reliance upon internal combustion engine powered vehicles;
- increasing employment opportunities, including new service, retain, office and construction jobs;
- reducing urban pressure on rural areas elsewhere on O`ahu; and
- improving quality of living, working, and playing in urban Honolulu.

6.5 Secondary and Cumulative Impacts

Introducing transit-oriented development as an overlay to the redevelopment of Kaka`ako already anticipated under the current Mauka Area rules (the Future Baseline Condition), is likely to affect the residents and visitors to nearby areas such as downtown Honolulu, the Ala Moana/Sheridan district, Waikiki, and other areas of the City and County of Honolulu. Implementation of TOD, when added to other adopted and proposed projects of a similar nature (such as other TOD projects envisioned by the City along the transit line corridor), may have a significant ~~affect~~ ***effect*** on a regional scale, and at an islandwide scale.

Long-term direct effects will likely include increases in population-related activities including the increased presence of people, both residents and visitors, and improved economic conditions resulting of their demand for goods and services. Long-term indirect effects can extend to the redistribution of goods and services to accommodate the redistribution of population anticipated by TOD.

Kaka`ako is situated in the Primary Urban Center, which has been designated to accommodate a substantial portion of O`ahu's population growth over the next 25 to 30 years. The Proposed Action will have long-term effects on the decisions by O`ahu residents about where to live, work, and play, which will, in turn lead to a redistribution of population.

Implementation of the Proposed Action will also provide new employment, residential, commercial, and light-industrial opportunities that together sustain the redevelopment activity that was initiated by the implementation of the Mauka Area Plan in 2011.

6.6 Unresolved Issues

Regional Infrastructure: The construction of a region-serving sewer line to relieve wastewater demands in Waikiki and elsewhere in Honolulu is presently being evaluated by the City's Environmental Services Department. The decision to construct the line, and if so where, will impact wastewater collection line capacities in Kaka`ako. Some existing sewer lines in Kaka`ako are surcharged by wastewater generated elsewhere. Construction of the relief sewer line would resolve capacity issues and might preclude the need for additional smaller-scale sewer improvements in the District. The relief sewer line project has been under consideration for several years and the outcome of decision-making is beyond the control of HCDA. The matter will remain unresolved until the City completes its planning efforts, and the timing of that effort remains unknown.

City's 2040 Population Projections: The City and County of Honolulu's Department of Planning and Permitting periodically forecasts population on the island of O`ahu for purposes of long-range planning. For the past several years, DPP has utilized population projections with a planning horizon of 2035. The Proposed Action assumes the same planning horizon as its hypothetical build-out date. In 2013, the City advised HCDA that it would soon begin updating its current population forecast to 2040. As recently as October, 2014, in a follow-up inquiry to the City as to the status of its efforts, we were advised that the City has developed *interim* projections to 2040 that have been used by the City for some planning purposes. However, we were also advised that *official* projections are still on hold due to technical issues that must be resolved. The City is targeting June 2015 as a possible release date for the *official* projections. The matter will remain unresolved until such time that the DPP officially releases the 2040 forecast.

The Ultimate Timing and Extent of Community Amenities: As the majority of property in the KCDD is privately owned, individual properties will undergo redevelopment based on the preferences and needs of the respective property owners. The existing Mauka Area Rules define the maximum allowable scope of redevelopment of any particular property. While the TOD Overlay Plan, when implemented, will change that scope, it is an incentive based program and it will remain up to the property owner to determine how much density to pursue should they determine that redevelopment is in their interest. Thus, the scope of potential community amenities are tethered to the land use capacity of a particular property, as defined by the property owner in a redevelopment proposal. For example,

Kamehameha Schools has elected to focus the redevelopment of some of its properties at a density (including building height) that is less than what is allowed under existing rules. The ultimate timing of redevelopment of any given property is therefore unknown to the HCDA until the property owner presents specific plans to the agency for approval. Additionally, the extent of community amenities that may arise from the redevelopment of any particular property will ultimately be negotiated between the property owner and the agency and will be directly proportional to the density of the redevelopment proposed: the pursuit of maximum allowable density by a property owner will likely result in greater public amenities than a more modest development proposal. Thus, the ultimate provision of community amenities is unknown until such time that a property's redevelopment plan is formulated, presented to HCDA for review and approval, and the nature and extent of community amenities are successfully negotiated.

Office of Hawaiian Affairs (OHA) Master Plan: In 2014, OHA announced that it would prepare a master plan to determine the future uses and development timing for its property holdings in the Makai Area. The outcome of its master planning efforts will have broad implications on matters concerning general urban density, infrastructure capacity, and views. The scope and timing of the OHA master plan will remain unresolved until such time that the agency establishes a deadline for the planning effort and its decision-making.

Completion of HCDA Parks Master Plan: HCDA has determined the need to prepare a master plan for the provision of public and private parklands and recreational and/or passive open space in the KCDD. The timing for the preparation, review, and approval of the plan is presently unresolved. The outcome of this process cannot be known until the effort is funded by HCDA, a consultant is selected, and a deadline for completion is established.

Implementation of the Proposed Action: The Proposed Action is described throughout this document as being "incentive based", meaning that to achieve the HCDA's desired outcome of more affordable housing, pedestrian-friendlier streets, and less emphasis on the automobile, developers will be offered an incentive of greater density and/or relaxed parking standards, etc. How this incentive based program will be implemented is unresolved at this point in time. The process for implementing TOD requires the publication of a Draft TOD Overlay Plan, which was done in May 2013, followed by the preparation of an EIS to evaluate its impacts (which is now underway). Once the EIS effort is concluded, the Draft TOD Overlay Plan must be finalized and then approved by the HCDA. After that occurs, final rules for implementing TOD must be prepared by the HCDA and presented to the public for comment, before being reviewed by the HCDA for final approval. The rules are the mechanism by which the incentive based program will be implemented. The exact form and content of those rules cannot be finalized at this point in time, which leaves the matter unresolved. The matter will be resolved once the rules are finalized, presented to the public for comment, and ultimately reviewed by the HCDA for approval. However, Appendix B of the Draft TOD Overlay Plan (presented

in the EIS as Appendix A) presents a preliminary idea of the scope and content of the proposed rules for TOD.

Chapter Eight:
Document Preparation and References

Table of Contents

8.1 EIS Preparation Notice Publication, Comments, and Responses 1
8.2 Community Outreach 1
8.3 Draft EIS Distribution, Comments, and Responses 9

8.0 Public Outreach

8.1 EIS Preparation Notice Publication, Comments, and Responses

An Environmental Impact Statement Preparation Notice was published in the December 23, 2012 edition of the Office of Environmental Quality Control's *Environmental Notice* announcing the intent of the HCDA to prepare an EIS for the Proposed Action. Written comments were received from the following:

- Outdoor Circle
- University of Hawaii's Water Resources Research Center and Environmental Center
- Kamehameha Schools[1]
- The Pacific Resource Partnership

The Draft TOD Overlay Pan was published on May 20, 2013. Comments on the Plan were received from the following:

- Servco Pacific Inc.
- CCH Department of Planning and Permitting

The comment letters on the EISPN, together with HCDA's responses, are presented following Section 8.3. The two letters commenting on the Draft TOD Overlay Plan follow the EISPN comments and responses.

8.2 Community Outreach

Since the inception of the TOD Overlay Plan project, the HCDA has sought to engage public agencies, elected officials, community members, organizations, and decision-makers in the discussion of the future of Kaka`ako as it relates to transit-oriented development. This process involved meetings with the following:

<u>City and County of Honolulu</u>

Board of Water Supply
Department of Design and Construction
Department of Emergency Services, Emergency Medical Services Division
Department of Environmental Services
Department of Planning and Permitting
Department of Transportation Services

[1] Two comment letters were received from Kamehameha Schools; dated 1-17-13 and 1-22-13.

Department of Parks and Recreation
Honolulu Administration for Rapid Transit
Honolulu Fire Department
Honolulu Police Department

State of Hawai`i

Department of Business, Economic Development & Tourism
Department of Education
Department of Land & Natural Resources, Division of State Parks
Department of Transportation
State Health Planning & Development Agency
State Historic Preservation Division
University of Hawai'i, John A. Burns School of Medicine

Federal Government

Federal Aviation Administration

Community Organizations

Hawai'i Hotel & Lodging Association
The Healthcare Association of Hawai'i (HAH)
Honolulu Board of Realtors
Kaka`ako Small Business Association

In addition, the HCDA conducted a series of four public informational Open House meetings at its office to present the Draft TOD Plan to the general public (May 23, 24, 25, and 30, 2013). Notice of the meetings dates and times were published in the Honolulu Star Advertiser the week prior to the meetings. Over 230 persons attended the meetings and were invited to provide comments on the Plan and the process.

The following persons attended the meetings (based on sign-up sheets posted at the meetings[2]). Handwritten comments received at the meetings have been transcribed and appear immediately following the list of attendees.

[2] All sign up sheets were handwritten and therefore the spelling of some names may be erroneous because the entry was difficult to read. We apologize for any errors.

May 2013 Open House Meeting Attendees:

May 23, 2013	May 23, 2013	May 24, 2013	May 25, 2013
Vince Vanderstroop	John G.	Roger Apana	Wayne Yoshioka
Mider Holloway	Paula Tadaki	Sumi Rilsaver	Pui Rhody

	Malynne Simeon	Richard Regels	Virginia Low
	Bob Crone	Jeff Sandborn	Trina Dang
		Sidney Fukuyama	Mark Garrity
		Anthony Aballo	

The following comments (unedited and unabridged) were transcribed from public comments written on the display boards of the TOD Overlay Plan visual materials during HCDA's Open House conducted during May 23, 24, 25, 30, 2013. (Please note that persons commenting were not asked or required to provide their name.)

"Preserve views from Punchbowl to Magic Island and Ala Moana Park unobstructed."

"Schools – elementary/middle/high to keep residents within Kakaako."

"I like townhomes at ground level."

"Where are sports fields? Civic amenities?"

"Provide expansive plaza at stations with active uses adjacent to…"

"Improvements to H-1 (on/off ramps) – impact of roads beyond (Ward/Punchbowl) immediate/adjacent streets of high rises."
"Voyager its moved! To Reed Lane…"

"A park in a city can be a green desert. Where is the city square that will give a heart and life to this neighborhood?"

"To create pedestrian friendly district HCDA needs control of streets and areas currently controlled by City's right-of-way"

"If Blaisdell is removed, its replacement must include and enhance current available venues for the arts and entertainment. Kakaako cannot be turned into a cultural desert."

"Mature street trees."

"Urban programmed park space (basketball, tennis..) and community center."

"Where is the central square with stores and cafes and restaurants at street level…"

"Where are the new schools to support the new residential uses. What will they look like ie. A dense multi-story school or a typical 8 acre plan?"

"Why don't these illustrations show us what the Kamehameha Schools and Howard Hughes projects will do? How do they integrate with HCDA plans?"

"If this neighborhood is really for families and not a ghost town for offshore investors, where is the elementary school going to be? Why is the only existing school (DOE) property (former Pohukaina school site) being used for a state sponsored 670 foot tower rather than for a school for which it is ideally located?"

"How do small landowners (not KS/HH) redevelop? Cost of construction and design plans and TOD framework is impossible."

"What does Kakaako mean? Names have meanings, and can have an effect on the person, or the place."

"Public safety ie. A police sub-station should be a priority."

"This area has a long and varied history. A museum would show what this place was like, as a basis for its ongoing present and future."

"Why Turtle Bay and envision Laie if this is PUC plan!"

"The local taxpayers will support this with GET for rail, sewer assessments that are going out of sight as well as water fees."

"We better get almost all affordable rentals and not subsidize rich guys from outside Hawaii and big time developers!"

"Diamond Head is 400 feet – that's our iconic landmark that should set the city's…the 700 foot height limit damages the whole scale and quality of Kakaako's mauka makai special experience. It is the height and visual beauty of the Koolaus as seen from Honolulu's Kakaako core area that makes this on of the world's most exceptionally beautiful, desireable and livable places. It helps drive the visitor industry and make visitors want to buy in. As we accommodate more and more 'affordable housing' in this area with out-of-scale towers we promote population growth and simultaneously kill the sense of this place, the unique quality of the place and kill the goose. Don't destroy mauka/makai views!"

"I totally oppose proposed exemptions to heights allowed for new condos. I believe the density can be accomplished without higher buildings and creating concrete jungle. Don't make this another Waikiki with all its concrete."

"Why have height limitations if every time a developer wants to build a taller building he is granted a variance? I vote a big no on anymore buildings taller than the 400 foot limitation!"

"All views should be identified by street, neighborhood and city." (note: this comment was written in reference to photos displayed during HCDA's open house)

"Towering highrises will put many of these charming streets in shade."

"How do we keep open public spaces clean and free from homeless?"

"To achieve family friendly space Kakaako Makai must stay open space."

"Open space important but if there are no other uses that create presence, only open will not be as safe or secure as people may want." (note: this is in reference to the comment directly preceding)

"Without real and sufficient grocery and other retail you will only increase traffic."

"Times market or Whole Food?? Nearest is Foodland Ala Moana, would you carry y our groceries? Must not create food deserts."

"All of these desirable life issues are important and need to be accommodated."

"Be sure to do bike/car road education!"

"Where is the school?"

"Make sure there are benches and shade trees for the surfers, walkers, and families!"

"Great idea!" (note: comment in response to photo of community gardens below the rail guideway)

"Excellent!" (note: comment in response to suggestion that rail alignments can be activated with bicycle paths as done in Vancouver, BC)

"Why aren't the densities increased closer to the stops and then taper out?"

"The frameworks needs to truly consider the education assets (existing) potential…and lets not forget about employment (jobs!) impacts."

"We don't want this great opportunity to mix TOD with the need for rental housing people can afford – TOD should not be just for those who can afford affordable units. People with below median incomes need truly economical rental housing, and other locales are creatively building economy rentals that fill this need. Kakaako should make sure to do it also, since one-half of Hawaii's people have below median incomes."

"Rules need a specific provision requiring mandatory area for bike parking! Why doesn't HCDA have a rack in front of your office?"

"Don't forget bike garages at train stations."

"Will be interested to see a path analysis in the EIS analyzing walking routes between the transit stations and the major visit destinations. This will facilitate pedestrian protection measures and interfaces with vehicle ways."

"About 16 years ago I recall Mitch D'Olier (sp?) then head of Victoria Ward proposed closing Auahi Street at Ward Avenue to create a kind of mall at that intersection a parking structure was to be built. Is there a possibility that Auahi Street could still be closed to automobile traffic. Originally Victoria Ward owned Auahi Street."

"You should have those streets where everyone crosses at once like in Waikiki."

"TOD rules seem to trump the existing mauka area rules by allowing towers of 700 feet in height? If that is the case it is a bad precedent to set."
"How many degrees will the temperature rise? Will there be many reflective buildings? 10% temperature rise."

"Small footprint is a good idea but no variance on height."

"Keep FAR to city limits – 3.0 FAR max."

"How does parking structure in the center support 'transit-oriented' development?"

"Once rail is on-line parking structure should be designed so it can be replaced with living space."

"How have you solved the complexities involved with owning/developing shared parking structures?"

"Are you reducing code requirements for parking and unbundling the parking?"

"Consider low-rise density condos, such as Vanguard Lofts."

"Please limit building heights and protect views!"

"Make sure that infrastructure can support this density – streets, water, sewer, power. How will you manage the traffic?"

"Height limits please – this is Honolulu not Manhattan."

"Protect views of Diamond Head from the Ewa direction."

"Will there be any way to guarantee that increases in height for buildings in the urban core will mean no urban sprawl into ag lands elsewhere on Oahu? If not, there needs to be."

"Urban heat island studies?"

"How about more trees to climatize pedestrian areas?"

"How will the buildings affect the wind patterns?"

"Infrastructure – water, sewers – who builds it, who manages it, who pays for it."

"Public elementary and middle schools – where will they be and who will build them."
"Please retain the historic stone curbs that are along many Kakaako streets. When new developments come in do not allow them to replace the stone curbs with new concrete curbs. Also please do not widen streets. Keep the historic dimensions of Kakaako's streets. At the corner of Halekauwila and Keawe Streets the stone curbs have been removed and the street has been widened – this should no have happened."

"Kakaako – do it right plan wisely!"

"Please review and visit crystal city in Arlington. This sounds like their original vision which hasn't been as successful."

"Is it possible to stop even considering raising the height limits to 700 feet and keeping the limits as is. Kakaako already has an extra 50 feet in height, it shouldn't ask for more."

"Housing for families making $120,000 a year is hardly affordable half of us make under $90,000 total family income."

8.3 Draft EIS Distribution, Comments, and Responses

Copies of the Draft EIS ~~are being~~ ***were*** submitted to the following agencies, organizations for review, as required by the OEQC. ***Parties that responded are identified by an asterisk (*) following their name.*** The DEIS ~~will be~~ ***was*** provided in digital format (on a CD). The HCDA promotes a policy of reduced use of paper the HCDA and encourages the use of digital files. However, a limited number of printed copies ~~are~~ ***were*** available.

SUBJECT: **Request by Kamehameha Schools to be a Consulted Party in the Preparation of the Environmental Impact Statement for the Transit-Oriented Development Overlay (the "Proposed Action")**

Dear Ms. Mutart:

Pursuant to the enclosed environmental notice for the Proposed Action and Hawaii Administrative Rules §§11-200-9 and -15, Kamehameha Schools requests to be a consulted party in the preparation of the Environmental Impact Statement for the Proposed Action. We understand that the Proposed Action is as set forth in the *"Kakaako-TOD Overlay and Complete Streets Plan"* attached hereto. Prior to January 22, 2013, Kamehameha Schools may provide comments to the Proposed Action.

Please advise me if any additional information is required to recognize Kamehameha School as a consulted party under the applicable agency rules. Thank you.

Sincerely,
Kamehameha Schools

RE: Comments on Transit-Oriented Development Overlay for the Kakaako Community Development District Environmental Impact Statement Preparation Notice

Dear Ms. Mutart:

The Pacific Resource Partnership (PRP), a labor-management consortium representing over 280 signatory contractors and the Hawaii Regional Council of Carpenters, offers the following comments related to the Transit-Oriented Development (TOD) Overlay – Kakaako Community Development District Environmental Impact Statement Preparation Notice.

Using current City and County projections for population and job growth through the next several decades, we anticipate the need for about 104,500 additional homes to accommodate the city's resident population. PRP strongly favors exploring the impacts that focusing much of this projected development within Honolulu's urban corridor, specifically along the rail transit alignment, will have. We believe there will be substantial benefits to a well-managed growth strategy.

We would like the Environmental Impact Statement (EIS) to focus on the impacts of well-managed growth that is more walkable, less automobile-dependent, and more closely coordinated with transit investments. This could include TOD's effect on the following measurable factors:

- Green House Gas (CO2e) emissions from cars and buildings
- Air pollution and public health impacts
- Fuel use and cost
- Building energy and water use, and cost
- Land consumption
- Fiscal impacts: capital infrastructure costs, operations and maintenance costs, and local revenues

December 16, 2014

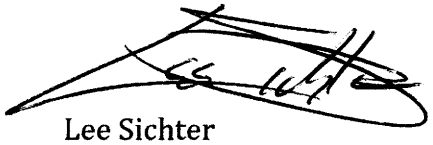
Mr. John White, Executive Director
The Pacific Resource Partnership
1100 Alakea Street, 4th Floor
Honolulu, Hawai`i 96813

Dear Mr. White:

Response to Comments on Kaka`ako TOD Overlay Plan
Environmental Impact Statement Preparation Notice

Mahalo for your letter of January 21, 2013 providing comments on the EISPN for the TOD Overlay Plan. Following are our responses in the order your comments were presented in your letter.

1. We appreciate your statement of support for exploring the impacts of projected development within Honolulu's urban corridor. We agree that there will be substantial benefits to a well-managed growth strategy.



2. The Draft EIS will include an air quality impact analysis that will address the anticipated impacts from the TOD development within the Kaka`ako Community Development District (KCDD). It will also include a traffic study to determine what impacts the TOD development may have upon traffic in the KCDD, which in turn affects fuel use and emissions. The Draft EIS will also include an infrastructure analysis to determine energy demand, water demand, and wastewater treatment demand.

3. As the study is limited to the KCDD, it will focus on development within the district. Therefore, the issue of land consumption will also be limited to that area.

4. An economic analysis will also be conducted to determine the TOD project's fiscal impacts.

We appreciate your interest in the project and your participation in the Chapter 343 environmental review process. You will be provided a copy of the Draft EIS when it becomes available for your review and comment. We anticipate publication of the Notice of Availability of the Draft EIS in January 2015.

Very truly yours,
LEE SICHTER LLC

SUBJECT: **Comments by Kamehameha Schools to the Transit-Oriented Development Overlay (the "Proposed Action")**

Dear Ms. Mutart:

Kamehameha Schools ("KS") is generally supportive of the concepts described in the Proposed Action, including the concept of "complete streets." KS, however, wishes to ensure that the Proposed Action is consistent with, and promotes development pursuant to, master plan permit "PL MASP 13.2.8." issued by the Authority to KS on September 2, 2009. We also want to ensure that the Proposed Action will recognize and preserve the vested rights of KS under Hawai'i Administrative Rules chapter 15-22 then in effect (the "Applicable Mauka Area Rules").

In preparation of the environmental impact statement ("EIS"), both the development approved by the master plan permit and the Applicable Mauka Area Rules must be the starting point by which impacts from the Proposed Action are evaluated. It is our understanding that the Proposed Action will be an "overlay" to existing rules. Under this approach, KS should be able to adopt those new rules that are consistent with or enhance the quality of the development envisioned under the master plan permit and the Applicable Mauka Area Rules and not adopt those rules that are inconsistent with or impose additional requirements or constraints on such development.

Further, the EIS should address whether private developers or the Authority will be required to make certain improvements to the public rights of way as part of the "complete streets" program. Where it is contemplated by the Authority that such improvements will be made by private developers, the Authority should ensure that the EIS is sufficiently comprehensive so that such improvements do not require any further environmental assessments under Hawaii Revised Statutes chapter 343 or the rules promulgated thereunder.

It should be recognized that KS and other owners (including apartment owners) are paying real property taxes to the City to design, construct, repair, and maintain roadways and related infrastructure in Kaka'ako, including liability for the same. Such costs of, and liability for, such the improvements made to public property pursuant to the Proposed Action should rest with the City or the Authority and not shifted to private owners. Thus, the EIS should address these impacts on the City, the Authority, or both.

Finally, to implement the Proposed Action, the Authority, by agreement or otherwise, should either require the City to accept, without qualification, the dedication of the improvements on the City's property that are constructed in accordance with the complete street rules or assume responsibility for such property, including roadways. Absent the Authority or the City maintaining responsibility, the cost of liability could be shifted onto private developments and represent an undue burden.

Please advise me if you have any questions on these comments to the Proposed Action. Thank you for the opportunity to provide comment.

Sincerely,
Kamehameha Schools

Paul A. Quintiliani
Senior Director, Commercial Real Estate Division

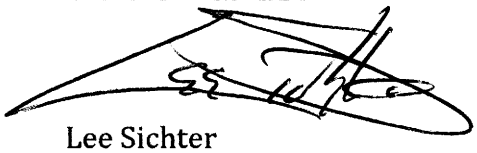
Dear Mr. Quintillani:

Response to Comments on Kaka`ako TOD Overlay Plan Environmental Impact Statement Preparation Notice

Mahalo for your letter of January 22, 2013 providing comments on the Draft TOD Overlay Plan EISPN. Following are our responses in the order they were presented in your letter.



1. We appreciate you expression of general support and wish to assure you that the Draft TOD Overlay Plan considers the Kamehameha Schools Master Plan (PL MASP 13.2.8) as a baseline condition, and in so doing, preserves the vested rights of Kamehameha Schools. The TOD Overlay Plan is being presented as an overlay to the existing Mauka Area rules, which means that landowners will have the opportunity to take advantage of the density bonuses contemplated under TOD, but will not be obligated to do so. Development in the Kaka`ako Community Development District (KCDD) will proceed in the future pursuant to the existing rules, and the TOD Overlay Plan will represent a development option that will be available to landowners if they choose.
2. While the Draft EIS will document HCDA's commitment to implementing a Complete Streets program, the details concerning implementation will not be addressed. Those details will be addressed during rule making which cannot occur until the HCDA formally adopts the TOD Overlay Plan, which is presently in Draft form. Once the TOD Overlay Plan is finalized, in response to input received during the EIS comment process, the rule making process can begin, and will of course include public hearings. We appreciate your concerns about right-of-way improvements being covered by Chapter 343. However, as evidenced by the 2004 court decision regarding Turtle Bay Resort, the shelf life of an environmental assessment is not perpetual. Even if anticipated roadway improvements

are address in 2014, if they are not implemented in what may be judged by others as a "timely manner", they may be subjected to additional environmental assessment if conditions have changed that may be interpreted as resulting in new, previously undisclosed environmental impacts.

3. The Draft EIS will address the anticipated impacts that TOD will have upon infrastructure in the KCDD.
4. We acknowledge your concerns about the dedication of roadway improvements and the costs of liability. As you know, at the present time, the operation and maintenance of roadways within the KCDD fall under the jurisdiction of the City and County of Honolulu. The Authority is pursuing legislation that would transfer those obligations to the Authority, including liability.

We appreciate your interest in the project and your participation in the Chapter 343 environmental review process. As a Consulted Party, you will be provided a copy of the Draft EIS when it becomes available for your review and comment. We anticipate publication of the Notice of Availability of the Draft EIS in January 2015.

Very truly yours,
LEE SICHTER LLC

Aloha,

Please accept this letter as a request by The Outdoor Circle to be named a consulting party in the Kaka`ako Community Development District Transit-Oriented Development EISPN.

Our statewide, 100 year old advocacy organization is concerned about numerous potential impacts from Transit-Oriented Development (TOD), including but not limited to the proposal to raise the height limit currently enforced in Kaka`ako.

We look forward to a fair and open process to determine the multitude of development issues raised by TOD.

Mahalo,

Robert Loy

VIA EMAIL TO: leesichter@gmail.com, contact@hcdaweb.org

Dear Mr. Sichter and Ms. Mutart,

Environmental Impact Statement Preparation Notice for the Kakaako Community Development District Transit-Oriented Development

The Hawaii Community Development Authority (HCDA) proposes a Conceptual Plan for Transit Oriented Development (TOD) within the Kakaako Community Development District (KCDD), under which the actual scope, timing, use, and intensity of development would depend largely upon the negotiations between individual project developers and the HCDA in accordance with TOD rules that have not yet been formulated. However, the proposed action—which would intend to maximize development in the district—would impact a 605 acre area within the Primary Urban Center, including an unspecified number and mix of parcels, as a result of various unspecified projects. The proposed action would generate one or more substantial secondary impacts; could substantially affect scenic vistas and view-planes; and could require substantial energy consumption.

This review of HCDA's Environmental Impact Statement Preparation Notice (EISPN) for the KCDD TOD is a service activity of the University of Hawaii's Environmental Center to help determine and maintain the optimum quality of the environment. It does not represent the official views of the University of Hawaii. The objectives of our review process are to enhance environmental consciousness, encourage cooperation and coordination, and facilitate public participation. Our review team included Sara Bolduc, Environmental Center.

General Comments:

This EISPN flows from HCDA's determination that, based on HCDA's judgment and experience, an EIS is likely to be required for the proposed action. Chapter 343, Hawaii Revised Statutes, and Chapter 11-200, Hawaii Administrative Rules, do not yet distinguish between the content requirements for EISPNs that result from (1) a notice of determination for a Final Environmental Assessment (FEA), and (2) a "Direct-to-EIS" agency determination that bypasses EA requirements. However, because the "Direct-to-EIS" option omits one layer of public participation that would otherwise occur through the EA process, it is particularly essential for agencies, applicants, and preparers to conduct rigorous and comprehensive consultation prior to

2500 Dole Street, Krauss Annex 19 Honolulu, Hawaii 96822
Telephone (808) 956-7361 Fax (808) 956-3980
An Equal Opportunity/Affirmative Action Institution

and during the preparation of the Draft EIS (DEIS). Absent explicit additional regulations and guidance from the Environmental Council and the Office of Environmental Quality Control about EISPN content in "Direct-to-EIS" situations, it may be useful for such EISPNs to include—or to incorporate by explicit, access-enabled reference—a sufficient amount of background information and project description that would help readers to more fully understand a proposed action, submit more refined and targeted scoping comments, and be better-prepared to participate in the development and review the DEIS.

Overall we stress the requirements that an EIS (1) convey the information succinctly in easily understandable forms, and (2) address the counterveiling social benefits and environmental effects of reasonable alternatives. The following specific comments address potential information augmentation and process enhancement for the KCDD TOD EISPN.

Specific Comments:

1. ***Description of the Proposed Action***

Because the proposed TOD plan would "serve as an overlay on the existing rules governing development in the district," it would be useful to provide, in the EISPN, a citation to the existing rules. It is somewhat unclear how "proposed TOD development" would be substantively different from development that is already proposed in existing plans and would be compliant with existing rules; perhaps a comparative table would be useful. Given the intent of TOD development "to maximize development in the district * * *," it may be useful to quantitatively define, in the EISPN, the limits of targeted maximum development proposed—in terms of multiple metrics and indicators of urban growth and environmental effects—and to include a maximum build-out scenario in the DEIS. What specific types of multi-modal transportation infrastructure would be included in the TOD plan?

2. ***Location of the Proposed Action***

The proposed action would impact a 605 acre area within the Primary Urban Center. How much of this area would be within the footprint of direct effects as opposed to secondary and cumulative effects, and where? It would be useful for the EISPN to provide additional information about the tax map parcels included in the proposed action, such as:

- A map of the area covered by these parcels
- Total number of parcels included
- Size distribution of parcels
- Areal distribution of existing and proposed types of uses
- Existing and maximum population, traffic, and building density
- Area-wide existing and post-project surface permeability and runoff regime

3. ***Environmental and Cultural Sensitivity***

Because the EISPN does not provide a map of the area and does not reference previous assessment documents and independent sources of scientific information, it is difficult to review the assertion that the entire district does not include any environmentally sensitive natural

resources above and below ground, in various environmental media, transiting through the area, and in receiving waters. Given the acknowledged likelihood of encountering burials during property development, within what parts of the district have burials been encountered in the past and to what extent, where are they most likely to be encountered in the future, and how would assessment and mitigation planning for these potential impacts be conducted during DEIS preparation?

4. Planning Horizon

What major phases and timing can presently be identified across the planning horizon for the proposed action? How would the planning horizon interface with related planning horizons for transportation, infrastructure, environmental resource management, and other functional areas, at various levels of political and administrative organization? How would DEIS preparation be conducted to maximize the opportunity for cohesive, coordinated, and integrated planning and implementation? It may be useful to provide a tabulation or graphic representation of these relationships in the EISPN. Does HCDA plan to hold a public scoping meeting for the DEIS?

5. Agency Responsible for the Proposed Action

It may be useful to note that agencies other than HACD are also responsible for controlling development within the KCDD through the issuance of their own discretionary agency decisions. In order to provide a more detailed backdrop for the proposed action, it may be useful for the EISPN to include a table of permits and approvals that would be required for the proposed action. As noted previously, it would also be useful to provide citations for the existing development rules enacted by the HCDA Board. A timeline for the formulation of the new rules could also be provided, along with links to the scope of work for the contract that has been executed for rule development.

To what extent has HACD already solicited County planning advice and input, and conducted agency consultation?

6. Anticipated Future Development

It is somewhat unclear whether or not "redevelopment of the KCDD" is the same action as the proposed "development of the district," and in particular whether or not "other" development within the district" is encompassed within the proposed action. In any event, it would be useful to include more information in the EISPN about the size, scope, timing, use, intensity of development, and potential effects of these "other" projects, perhaps in summary tabular form, so as to better inform community understanding of the context for cumulative impacts that would be assessed during the development of the DEIS. Does "Howard Hughs Corporation" mean "The Howard Hughes Corporation," or is it a different entity?

7. Persons and Communities Impacted by the Action

It would be useful for the EISPN to explain HACD's plan and process for early and open discussion with interested persons and agencies during the development of the DEIS. In this regard, it may be useful to include a list of persons and agencies to be consulted, the topical area and objectives of each consultation, and the overall timeline for completion of the DEIS.

8. Determination/Reasons Supporting Determination

Given the admitted lack of detail about the actual scope, timing, use, and intensity of development, the bases for HCDA's determinations that the proposed action triggers Chapter 343 requirements, and that an EIS is required, are somewhat unclear. Because any proposed TOD development would be regulated by a new set of rules that are yet to be formulated, and it is well established that agency rulemaking in and of itself does not generally trigger HRS 343 requirements, perhaps environmental review of the proposed action would be more appropriate after the rulemaking process is completed? How would government funds be used to actually break ground within the district, short of paying for plan development, EIS preparation, and rulemaking? Although the EISPN discusses "substantial" impacts, effects, and requirements that would perhaps be associated with the proposed action, it does not identify "significant effects" relative to the significance criteria established by law, which if explicitly identified in the EISPN could help focus public participation in the scoping and development of the DEIS. Because "the prevailing rules governing the Mauka and Makai Districts of the KCDD were subject to environmental assessment pursuant to chapter 343" it would be useful for the EISPN to summarize the results of those assessments and provide citations for the supporting documents.

9. Identification and Analysis of Significant Effects

The EISPN and various conventional concerns point to some potentially significant environmental effects, assessment methods, and mitigation measures that seem to deserve careful attention in the DEIS:

> What would be the largest possible population change, and accompanying effects on public facilities, generated by the proposed action?
>
> How would the DEIS evaluate effects on scenic vistas and viewplanes? What would be the extent of height variances included in the proposed action?
>
> What alternatives would be considered to reduce energy consumption? How would the varying environmental effects of these alternatives be portrayed? It may be useful to develop footprint analyses and life-cycle analyses for various components of the proposed actions.
>
> What would be the maximum extent and effect of urban congestion associated with the proposed action, and how would it affect secondary and cumulative effects, given that the district is sandwiched between the dense neighborhoods of Waikiki and Downtown?

What would be the range of effects associated with tsunami run-up, flood inundation, and sea level rise affecting the district under the proposed action, particularly with regard to groundwater resources and subterranean infrastructure?

Thank you for considering our comments on the Environmental Impact Statement Preparation Notice for the Kakaako Community Development District Transit-Oriented Development. Please contact us at 956-3974 if you have any questions about this review, and please send us one paper copy of the Draft Environmental Impact Statement when it is published.

Sincerely,

/s/ David Penn

Response to Comments on Kaka`ako TOD Overlay Plan
Environmental Impact Statement Preparation Notice

Mahalo for your letter of January 22, 2013 providing comments on the EISPN for the TOD Overlay Plan. Following are our responses in the order they were presented in your letter.

1. General Comments: We acknowledge your concerns about the need to provide rigorous and comprehensive consultation during the process of preparing a Draft EIS. It is for that reason that subsequent to the publication of the EISPN, the Authority released the Draft TOD Overlay Plan in May 2013 and subsequently conducted an extensive series of public meetings to present the document and initiate public review of it. Over 100 individuals, landowners, and agency representatives attended those meetings, and provided valuable input that has informed the EIS preparation process. The Authority has no intention of supplementing the EISPN with further information. The Draft EIS will provide sufficient information that decision-makers, agencies, and the general public will need to understand the environmental impacts of the Proposed Action.
2. Please be assured that the Draft EIS will attempt to convey the information in succinct and easily understandable terms.
3. The baseline condition that exists in the Kaka`ako Community Development District (KCDD) is guided by the existing development rules in place. Any future development must conform to those rules. The TOD Overlay Plan is offered as an incentive-based program for landowners who may wish to seek density and/or development bonuses. The TOD Plan is not intended to be a requirement, but rather a development option. Thus, the only alternative to the TOD Plan will be to proceed with development as allowed by the prevailing rules.

4. Specific Comments:

a. Description of the Proposed Action. The Draft EIS will quantify development in the KCDD under the Baseline Condition and the Proposed Action (TOD Overlay Plan). This will be presented in a series of easy-to-read tables and text. The reader will be able to readily assess the quantifiable effects of development at full build out under the existing rules (the Baseline Condition) and the Proposed Action (the TOD Overlay Plan). As the street network in the KCDD already exists, the TOD Plan contemplates transportation infrastructure improvements that will include the implementation of a Complete Streets program, which may include among other things the widening of sidewalks, improved access to the proposed transit stations, and changes to the timing of traffic signals at key intersections. The specific program of recommended transportation infrastructure improvements in the form of mitigation measures will be determined once a traffic study is completed for the Proposed Action. The traffic study, together with its program of mitigations (in the form of streetscape and transportation system improvements) will be presented in the Draft EIS.

b. Location of the Proposed Action. The Draft EIS will include a listing of all tax map parcels included in the KCDD. Unfortunately, it is not possible to prepare a composite map of all these parcels, as there are several hundred of varying sizes and to be included in the Draft EIS, the resulting map would be illegible. Rather, the Urban Design analysis to be included in the Draft EIS will distribute these parcels among Development Blocks, and these blocks will be identified and mapped. The proposed uses of the Development Blocks will be identified. Existing and maximum population together with traffic impacts will be provided. Building densities will also be addressed. With regard to existing and post-product surface permeability and runoff regime, please understand that the entire district is a mature urban area that is already served by an extensive storm-runoff and drainage system. The only permeable areas in the district correspond to park areas, which will be identified in the Draft EIS. Existing park areas will be preserved under the Proposed Action. New park areas will be delineated if applicable.

c. Environmental and Cultural Sensitivity. The Draft EIS will include maps of the area. But, because the KCDD is a mature urban area that consists entirely of developed and/or redeveloped properties and a paved street grid, there are no sensitive environmental resources present. The Draft EIS will disclose previous environmental impact statements that have been conducted for the KCDD. The Draft EIS will also contain a Supplemental Cultural Impact Assessment that will address, among other things, matters relating to burials. However, it keeping with standard protocol to preserve confidentiality for culturally sensitive matters, the Draft EIS will not include a map of

previously identified burials. The Supplemental Cultural Impact Assessment, will, however, include a soils map that can be used to indicate the location of sandy areas (where burials are most likely to have been conducted). With regard to assessment and mitigation planning for burials, subsurface testing will remain the obligation of individual landowners. At such time that they decide to pursue redevelopment of their specific property, they will conduct sub-surface testing to the extent required by law.

d. Planning Horizon. The 2035 Planning Horizon identified in the EISPN corresponds to planning horizons presently utilized by the City and County of Honolulu and the State of Hawaii. The most significant planning horizons existing for other aspects of development that might impact the KCDD are the planning horizons presently existing for the Kamehameha Schools' master planned area in the KCDD, the Ward Neighborhood master planned area to be developed by the Howard Hughes Corporation, and wastewater system improvements being conducted or contemplated by the City and County of Honolulu. With regard to the latter, a sewers master plan update being conducted as part of the Proposed Action analysis will be presented in the Draft EIS and will disclose planning horizons related to wastewater infrastructure that may influence development in the KCDD. However, it is important to understand that, as will be noted in the Draft EIS, the planning horizon for the Proposed Action is arbitrary; the actual development schedule for individual properties will be determined by their owners, and will likely be subject to economic cycles that are unknowable at the time the Draft EIS is being prepared. Thus, the planning horizon discussed in the Draft EIS is used to facilitate an evaluation of impacts with and without the Proposed Action. The actual and ultimate timing of development is beyond the control of the Authority. Lastly, as discussed above, the Authority conducted several public scoping meetings in 2013.

e. Agency Responsible for the Proposed Action. The Authority is solely responsible for promulgating and enforcing rules governing development within the KCDD. Any development within the district requires a development permit from the Authority. By law, the Authority is exempted from the need for discretionary land use approvals from the City and County of Honolulu. All development in the district does, however, require ultimately a building permit from the City. The Draft EIS will identify the prevailing development rules. No specific timeline has been established for rules development pertaining to the Proposed Action, other than that it will occur subsequent to finalization of the Draft TOD Plan. The scope of work for rules making includes the following elements:

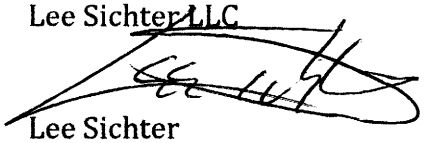
    - Purpose and applicability

- Regulating Plan
- Development Standards
- Active Public Space Typology
- Land Use
- Parking
- Building Type
- Frontage Type
- Complete Street Treatment/Pedestrian Zone Treatment

The HCDA has engaged in regular and systematic coordination with the City and County of Honolulu, including the Board of Water Supply; the Departments of Planning and Permitting, Environmental Services, Transportation Services, and the Honolulu Authority for Rapid Transit.

f. Anticipated Future Development. The terms "development in the district" and "redevelopment in the district" are interchangeable. The term "other development" pertains to development that will occur irrespective of the TOD Overlay Plan, that is to say, development that will occur pursuant to the existing rules. The Draft EIS will discuss the extent of development anticipated in the district pursuant to the Baseline Condition (future without the Proposed Action) and the Proposed Action (future with the Proposed Action). We regret that the spelling error in the EISPN. The correct term is "The Howard Hughes Corporation".

g. Persons and Communities Impacted by Development. The Draft EIS will disclose the consultation process conducted after the publication of the EISPN.



h. Determination/Reasons Supporting Determination. The EIS is being prepared pursuant to Section 11-200-5B, Hawaii Administrative Rules. Government funds will be required for any public infrastructure-related improvements. The Draft EIS will disclose all significant effects identified as the result of the environmental assessment of the Proposed Action. The Draft EIS will include a discussion of previous environmental assessment conducted for the Mauka Area Plan and the Makai Area Plan. Regrettably, the wording of the phrase you cite has led to a misunderstanding. What was meant was that the Mauka Area Plan and Makai Area Plan were subjected to environmental assessment, not the rules per se.

i. Identification and Analysis of Significant Effects. The Draft EIS will disclose anticipated population change, and related impacts on public facilities with and without the Proposed Action. The Draft EIS will utilize photo overlays to demonstrate the visual impact of the Proposed Action on scenic vistas and viewplanes. The extent of height variances will also be disclosed. With regard to energy consumption, it is the Authority's intention to require that all new development be

LEED certified. However, the specific means for implementing this requirement will be left to individual landowners. At the time individual landowners seek development permits from the Authority, their specific strategy for LEED compliance will be reviewed by the Authority. A traffic study will be included in the Draft EIS to address traffic congestion, including secondary and cumulative effects. The Draft EIS will also address the effects associated with tsunami, flooding, and sea level rise.

We appreciate your interest in the project and your participation in the Chapter 343 environmental review process. As a Consulted Party, you will be provided a copy of the Draft EIS when it becomes available for your review and comment. We anticipate publication of the Notice of Availability of the Draft EIS in January 2015.

Very truly yours,
Lee Sichter LLC

Lee Sichter

RE: Draft Kaka`ako Transit Oriented Development Overlay Plan dated May 2013

Dear Mr. Neupane:

Servco Pacific Inc. ("***Servco***") is the current owner of the real property located at (a) 609 South Street on which it maintains its Motor Imports Parts and Service facility serving Toyota, Scion and Suzuki automobiles (the "***Servco South Street Property***"), and (b) 650 Kapiolani Boulevard on which it maintains its Lexus dealership and service department, and 645 Kapiolani Boulevard on which it maintains its pre-owned Lexus and used vehicle dealership (collectively, the "***Servco Kapiolani Property***"). The Servco South Street Property and the Servco Kapiolani Property will be directly impacted by the proposed Transit Oriented Development Plan for Kakaako (the "***TOD Overlay Plan***") as described and set forth in the Draft Kaka`ako Transit Oriented Development Overlay Plan dated May 20, 2013 (the "***Draft 2013 Kakaako TOD Overlay Plan***").

Based on its review of the Draft 2013 Kakaako TOD Overlay Plan, Servco has certain concerns relating thereto and has set forth below the following comments for your consideration:

1. Based on discussions with HCDA staff, Servco understands that the final TOD Overlay Plan is not intended to be mandatory as to the affected lands, but rather will contain a mechanism for the landowner to opt in, but only if the landowner so chooses. If the landowner does not opt in then the Kaka`ako District Mauka Area Rules will continue to govern development of the subject land. The landowner will not be allowed to pick and choose between the Kaka`ako District Mauka Area Rules and the TOD Overlay Plan. This non-mandatory opt in mechanism is not clearly articulated in the Draft 2013 Kakaako TOD Overlay Plan. The next version should clearly and expressly state that the TOD Overlay Plan is not mandatory as to the affected lands, and clarify that the landowner/developer must follow either the TOD Overlay Plan or the Kaka`ako District Mauka Area Rules. A combination of both cannot be used for development of the site. Servco also recommends that you clarify whether this is a one-time only option for the landowner when it next seeks to redevelop its parcel after adoption of the TOD Overlay Plan, or if a subsequent redevelopment of the parcel would allow for a separate opt in option.

2. If the landowner/developer of a parcel subject to the TOD Overlay Plan elects to be subject to and to follow the TOD Overlay Plan, please clarify:

a. The land uses that will be permitted as primary uses or conditional uses and which uses are not permitted within the area subject to the TOD Overlay Plan.

b. What conditions need to be met for development of a parcel if one opts to be governed under the TOD Overlay Plan? For instance:

i. Does the landowner/developer follow the appropriate land uses for its neighborhood as currently designated in the defined in the Mauka Area Plan and Rules?

ii. If a landowner/developer opts into the TOD Overlay Plan is the including of a residential element required to maximize the benefits contemplated under the TOD Overlay Plan?

3. The Draft 2013 Kakaako TOD Overlay Plan should be modified to explicitly state in the text that the Figures and references to a transit plaza associated with the Civic Center Station are only for illustrative purposes, and not a requirement with respect to the Civic Center Station. Servco is concerned that the reader may see the Figures and references presume that a transit plaza must be developed for the Civic Center Station in accordance with the examples and illustrations shown.

4. Page ES-7, Figure ES-6 Cycle Track concept on Halekauwila (also shown again on page 5-56, Figure 5-16): Will the transit support (as currently designed) be built in the center of Halekauwila Street as shown in the illustration? Please clarify the locations of the columns.

5. Page 1-8 Plan Time Horizons. "The planning horizon for the TOD Overlay Plan is 2035." An explanation of what this is intended to mean and include would be helpful.

6. Page 3-5 Strategy LU2 Reserved Housing. "TOD Overlay Zone's additional capacity is estimated to be predominantly residential, with a land use mix estimated at 85% residential and 15% commercial." Please provide an explanation as to why industrial uses are not included in this mix? Is there any intention to exclude such uses under the TOD Overlay Plan and thus require a landowner intending to provide industrial uses to remain under the Kaka'ako District Mauka Area Rules.

7. Page 3-9, Strategy LU6: Will parking be included in the calculation of maximum allowable floor area should a landowner opt into the TOD Overlay Plan?

8. Page 3-10, Achieving TOD – District Opportunities and Challenges: This section states "... the TOD Overlay Plan consolidates growth in the core area, while maintaining existing neighborhoods (i.e. a building currently limited to a low-rise will not become eligible for a high rise structure) ..." Servco requests that HCDA clarify what this statement is intended to mean. An example may be helpful.

9. Page 3-13, TOD Overlay Opportunities: Servco requests that HCDA identify which locations it considers most likely to undergo redevelopment within the time frame of the TOD Overlay Plan (2035). Are these locations indicated on Figure ES-2 TOD Selected Sites and Catalyst Properties?

10. Page 3-16, Figure 3-5 Property Consolidation. Addition of a color legend for this Figure would be beneficial and make it easier to understand the intention?

11. Page 4-22 Item b) Small Transit Plaza Associated with Civic Center Station. "A small transit plaza (1/4 block) should be developed within one to two blocks of the Civic Center Station to act as a meeting point and destination (to be confirmed by HCDA)." Servco finds the phrase "should be developed" to be confusing and misleading. What does this mean? Is it just an illustration of a potential development and use or is it more mandatory in nature in that HCDA will require such a development to occur within this area.

12. Page 5-31, Action MA8.2: "Integrate high quality pedestrian design into the interim use of surface parking lots." If the parking lot is an interim use, Servco questions why high quality pedestrian design would be needed? Servco requests that HCDA clarify its intentions.

13. Page 5-16, Figure 5-9 – Current KCDD Street Grid and Potential Future Connections: The Figure shows a service street between 650 Kapiolani and the One Kapiolani property, and is designated thereon as "opportunity for service street." Servco understands this is only for illustrative purposes - even if Servco opts into the TOD Overlay for its Servco Kapiolani Property? Is Servco's understanding

correct? When will it be determined that a surface street will be required? Who will construct this service street? Servco did not see this service street in the Thoroughfare Plan contained in the Mauka Area Rules.

14. Page 6-4. Building Community, Not Auto-Capacity: Sentence reads "On the other hand, local district streets like Queen Street, Cooke Street, and Ward Avenue are underutilized, with more pavement width than is necessary to carry current traffic volumes." This statement does not appear true. These are heavily trafficked with retail uses.

15. Page 6-16, Figure 6-3 KCDD Street Type-Land Use Relationship. How does Figure 6-3 tie in with Figure 6-2 KCDD Complete Street Typology? What does General Land Use Context on Figure 6-3 mean? How is it intended to integrate and work with the Mauka Area Rules? Sentence reads "Local Streets - Primary: Residential, Automotive (parking only; no drive-thrus, auto sales, etc.)," what does the sentence mean for auto sales? What does "etc." mean? Is this applicable only if a Kakaako property opts into the TOD Overlay Plan?

16. Page 7-4, first paragraph: Sentence reads "Furthermore, given that both station areas are planned for significant redevelopment, multimodal access demand should be based on future build-out conditions." What does this mean? This does not sound like there is an option not to opt-in to the TOD Overlay Plan. Servco understood that the option to opt in applied to all properties.

17. Page 7-13, Figure 7-9 Civic Center Station Access and Circulation. Servco requests an explanation as to how the area along Halekauwila Street will be affected by the contemplated sidewalk improvements and the direct impacts on the landowners whose parcels front on Halekauwila Street?

18. Page 7-21, Figure 7.13 Civic Center Station Vision and Opportunities. Servco recommends the insertion of explicit text to state that Figure 7.13 is meant only as an illustration to depict the noted station vision and opportunities. This text should be made part of the figure number and description.

19. Page 8-9, Strategy PT2, Remove Minimum Parking Requirements. "The following requirements would still apply to all parking built in the district....." Again, this provision does not sound like it is only applicable if a landowner opts into the TOD Overlay Plan. Servco requests that this be clarified.

20. Page 8-10, Recommended Rule Change PT3.1. FAR allocations are inclusive of parking. Again, this provision does not sound like it is only applicable if a landowner opts into the TOD Overlay Plan. Servco requests that this be clarified.

21. Page 8-12, Recommended Rule Change, PT6.1: "In commercial leases, parking must be included as a separate line item, with the quantity of parking to be leased determined by the lessee." Servco does not feel this recommended rule change makes practical sense. Servco does not envision that it would be appropriate for the quantity of parking to be leased to be determined unilaterally by the lessee as this language proposes. The parking to be provided under a commercial lease should be and remain a negotiated item between the lessor and the prospective lessee, and no such rule should be proposed.

22. Page 8-13, Recommended Rule change, PT 7.1. "Regulation permitting tandem and stacked parking by right." Clarify that the proposed rule change would allow the use by a landowner/developer of tandem and stacked parking to meet its parking needs as a matter of right without any need for regulatory approval? Is this going to present any issue or conflict with the City for building permit or other purposes, and is this intended to apply to all Kakaako properties whether or not the property opts into the TOD Overlay Plan.

23. Pages 8-14 through 8-19, Strategies PT8, 9 and 10. These strategies collectively appear to seek to require new multi-family or commercial developments in Kakaako to participate in a Transportation Demand Management Program (TDM) and to join and participate in a Transportation Management Association (TMA).

a. Is this intended to apply to all new Kakaako developments irrespective of whether they opt into the TOD Overlay Plan? That seems to be the intent but it should be clarified.

b. PT 10 states that HCDA should require, as a condition of new commercial development, that large employers (those with 50 or more employees) create, update every 5 years and implement a TDM plan. HCDA should clarify if this means at least 50 employees in a company (which may have locations outside of Kakaako) or just those that have 50 or more employees at the subject location in Kakaako?

c. There is mention of "...copies if documentation to ensure deed notification of mandatory participation in the final TDM program to all subsequent purchasers and owners of the project." Why is deed notification required? What happens if you opt-out of the TOD plan?

d. PT 9.2 and PT 10.2 seek to establish a requirement that new multi-family residential developments and large commercial employers are required to join the TMA. Is this practical and in the context of a multi-family residential development we are not talking about a developer, but rather a homeowners association? This should be clarified and explained. What about the unfairness to new developments in that these requirements would not appear to apply to existing multi-family residential developments or large employers.

24. Throughout the various chapters and in Appendix B, there is a section called Rule Changes for Kakaako (blue background). Will HCDA be formally proposing and going through the rule making process to implement these recommended rule changes? Will these recommended rule changes also be incorporated as revisions to the current Mauka Area Rules, not just as part of the TOD Overlay Plan? Is it intended that these recommended rule changes for Kakaako be all encompassing so it doesn't matter whether you opt into the TOD Overlay Plan? As the recommended rules are currently written, it does not sound like they apply only if you opt into the TOD Overlay Plan. HCDA should clarify its purpose and intent regarding application of the various proposed rule changes to the Kakaako Community Development District in general or only to properties opting into the TOD Overlay Plan.

25. In connection with the planned rail project in Kakaako, a portion of certain Kakaako properties will likely be acquired through negotiation under threat of condemnation and/or actual condemnation by the City for incorporation into the rail project. What is the manner in which the TOD Overlay Plan intends to handle the floor area attributable to the land areas acquired by the City for its rail project? Servco feels that it would be most appropriate for the TOD Overlay Plan to provide that the floor area for development purposes attributable to the land areas acquired by the City for its rail project shall remain with and be usable by the landowner whose land was so taken.

Lastly, please inform us of the manner in which we will receive responses to our above comments, and also how HCDA plans to keep the Kakaako community informed of its responses to all comments and/or questions provided during the public comment period on the Draft 2013 Kakaako TOD Overlay Plan.

If you should have any questions or would like to meet with us to discuss our comments and concerns, please feel free to contact Karen Shimizu at 564-1399 or myself at 564-1344. Thank you.

Sincerely,

SERVCO PACIFIC INC.

January 24, 2014

Ms. Carol Lam
Senior Vice President
Servco Pacific Inc.
2850 Pukoloa Street, Suite 300
Honolulu, Hawaii 96819

Dear Ms. Lam:

Re: Hawaii Community Development Authority Draft Transit-Oriented Development Plan Overlay, Environmental Impact Study

Thank you for your letter dated September 17, 2013 and interest in the subject Draft Kakaako Transit-Oriented Development Overlay Plan ("TOD Plan"). Your comments and questions on the TOD Plan are appreciated and will assist the Hawaii Community Development Authority ("HCDA") in providing more clarity as we move forward with the planning process.

The HCDA is preparing a Draft Environmental Impact Statement ("EIS") which will assess the impact of actions proposed under the TOD Plan. Publication of the draft EIS is expected in the 2nd quarter of 2014 and the time frame for formal public comment on the draft TOD Plan will coincide with the comment time frame for the draft EIS as the draft TOD Plan will be included in the draft EIS. Based on the comments received during the comment period of the EIS, the draft TOD Plan may require revisions to accommodate findings in the EIS. Rulemaking and Rule adoption for implementing the TOD Plan would follow after acceptance of the EIS by the Governor's Office. We note that rulemaking is a public process that requires comprehensive public consultation and a public hearing before the HCDA can adopt the Rules implementing the TOD Plan. Since the draft TOD Plan is still undergoing refinement, the following reflects our most reasonable responses to your questions at this point in time.

1. The TOD Plan and Rules is intended to be an "overlay" to the existing Kakaako Community Development District ("KCDD"), Mauka and Makai Area Plans and Rules. The Mauka and Makai Area Rules will continue to be in effect and act as the operational rules. The details of the how the

"overlay" will be implemented is yet to be decided and will be determined through the rulemaking process.

2. Allowable land uses will continue as to the land uses currently allowed under the Mauka and Makai Area Plans.

3. We note your comment on the transit plaza illustration and will make an appropriate disclosure in the TOD Plan.

4. Column locations for the rail alignment are determined by HART.

5. The planning horizon of 2035 was established to facilitate a comprehensive review of impacts for the purposes of environmental assessment. In actuality, full-build out of the KCDD will depend on economic cycles that cannot be predicted at this time. The year 2035 was selected as the planning horizon because at the time the EIS was initiated, it was the horizon year utilized by the State and the City and County of Honolulu ("City") in their population projections.

6. The land use policies in the TOD Plan focus intensive mixed-use redevelopment in areas near proposed HART transit stations. The estimated percentage allocation between residential and commercial development is based on development pattern that have been observed within the KCDD within the past 30 years. Industrial use in the KCDD is a requirement under Hawaii Revised Statutes, Chapter 206E, therefore, industrial use will continue to be an allowable use in the district.

7. The intent is to include parking in the maximum allowable floor area ratio ("FAR") under the TOD Plan. We note that the intent is to adjust the maximum allowable FAR to allow for inclusion of parking in the FAR. It is intended that in no case would the underlying FAR, exclusive of parking, will be less

than what is currently allowed under the Mauka Area Rules for specific neighborhoods.

8. Not all parcels or neighborhoods in the KCDD have potential for TOD development for reasons including parcel size, potential for consolidation, proximity to transit, encumbrances, and low improvement to land value ratio. For instance, the Sheridan neighborhood consists of small lots with various ownerships, limiting development potential in this neighborhood, hence the TOD Plan will have minimal influence there.

9. Figure 3-7 TOD Selected Sites and Catalyst Properties reflects land parcels that are most likely to have high redevelopment potential which properties included under the TOD overlay will get developed and at which time frame will mostly depend on each individual property owner, though for the purpose of the EIS a time horizon of 2035 is considered.

10. Your comment on a color legend is noted.

11. With the City's plan for 3 HART transit stations in the KCDD, it is necessary to coordinate station access and integration into TOD redevelopment. This aligns with HCDA's comprehensive policies that aim to create a network of safe and comfortable streets with convenient access to transit. The transit plaza associated with the Civic Center Station is not a mandatory requirement but a public space element that we believe is essential and supports HCDA's policy priorities.

12. The HCDA believes surface parking will remain part of the Kakaako streetscape for some time. Consistent with the plan policy, Action MA8.2 optimizes the streetscape for pedestrian experience, safety, and access.

13. This section of the TOD Plan covers multimodal transportation network for the district to achieve a balanced transportation

system for all users. Figure 5-9 is a recommendation of a street network that provides additional connections for autos, service vehicles, and pedestrians. It is HCDA's intent to work with landowners and developers to implement these principles in street design under TOD redevelopment.

14. Under the EIS, a traffic analysis will be conducted and should provide confirmation on traffic volume. As previously mentioned, the findings in the EIS may result in modifications to the draft TOD Plan.

15. This chapter of the TOD Plan touches upon the principles of Complete Streets, which provide parameters in street design that will support the needs of all users. Relating street types to adjacent land uses are one strategy in achieving this desired outcome. The HCDA intends to undertake separate guidelines for a Complete Street program which would be conducted in coordination with the City and other stakeholders.

16. This statement refers to the expected ridership at Kakaako and Civic Center stations. Emphasis is placed on pedestrian access and hence, the recommendations for station integration at the ground level, and with adjacent properties.

17. This section of the TOD Plan recommends strategies for enhancing pedestrian access to transit. Such strategies as sidewalk improvements along Halekauwila Street will require coordination with HART, the City, adjacent landowners and developers.

18. Your recommendation on Figure 7.13 is noted.

19. Your comment for clarification on parking is noted.

20. FAR allocations will be inclusive of parking in the TOD Plan. Parking requirements under the Mauka and Makai Area Plans

and Rules would remain unchanged, though a no parking minimums for TOD sites may be proposed.

21. Your comment on commercial parking is noted.

22. The recommended Rule change, PT 7.1 for tandem and stacked parking is proposed for TOD Rules. Parking requirements under the Mauka and Makai Area Plans and Rules would remain unchanged.

23. The HCDA envisions that a Transportation Demand Management ("TDM") program will require buy-in from stakeholders (new and existing) to have beneficial results. TDM recommendations and strategies may remain in concept in the TOD Plan, whereas Rules for its implementation would be developed at a future time.

24. The HCDA will conduct formal rulemaking for the TOD Plan following its adoption. The various proposed Rule changes in Appendix B are intended to address the TOD Plan. The HCDA may consider a broader application to existing Rules if appropriate.

25. We have been in discussions with HART to encourage prudent planning and integration of the rail transit stations in Kakaako. We anticipate continued dialog with the City and landowners along the rail alignment to arrive at a reasonable approach on allocating entitlements from land parcels acquired by the City for the rail transit project.

We will be happy to meet with you to discuss HCDA's responses provided above, and address any other questions you may have. Please do not hesitate to

contact Mr. Deepak Neupane, P.E., AIA, Director of Planning and Development, at 594-0300 or by email at deepak@hcdaweb.org.

Sincerely,

Anthony J. H. Ching
Executive Director

HAWAII COMMUNITY DEVELOPMENT AUTHORITY

Mr. Anthony Ching, Director
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Dear Mr. Ching:

SUBJECT: Draft Transit-Oriented Development Overlay Plan
Kakaako Community Development District

We have the following comments on the Kakaako Community Development District Draft Transit-Oriented Development Overlay Plan (Plan) dated May 20, 2013:

Guiding Principles

1. The Plan should strive to exceed the requirements of the Kakaako Reserved Housing Rules (HAR §15-218) to address the serious housing cost issues and create affordable housing opportunities. Page 2-2 lists 'Social Equity' as a guiding principle for the Plan, and suggests that people with very low incomes, young people, and seniors will be able to enjoy the benefits of transit-oriented development (TOD) in Kakaako.

   The Kakaako Reserved Housing Rules require 20 percent of for sale and 15 percent of rental residential floor area be reserved for households making no more than 140 percent of the area median income (AMI). The rules also provide an incentive of 100 percent bonus floor area for projects making at least 75 percent of the units affordable for households earning no more than 140 percent AMI.

   For a three-person household, 140 percent AMI equates to an annual income of approximately $123,000; an income level wealthier than 70 percent of Honolulu households. While housing for households earning 140 percent AMI are referred to as "gap group housing" or "workforce housing", these units cannot reasonably be considered affordable housing.

   Considering that Honolulu is an attractive market for wealthy foreign investors, it is unlikely that developers will provide affordable housing units if they aren't required or provided with any incentives to do so. We suggest that the Plan call for the majority of the affordable units used to qualify for incentive bonus floor area ratio be reserved for households earning between 60 percent and 120 percent AMI.

While the reserved housing rules will provide some workforce housing units, we are concerned that the majority of the units will be targeted toward very wealthy individuals.

The Plan includes a number of very progressive and innovative elements that have tremendous potential to create a transit-oriented, vibrant, and walkable community. However, wealthier households use alternative modes of transportation far less than low- and moderate-income households. A failure to create a more mixed-income Kakaako could undermine many of the positive elements of the Plan. In other words, even if all the other components of good TOD are present in Kakaako, if the development that takes place there caters only to the wealthy, the community won't be transit-oriented.

There has been substantial public investment in infrastructure in Kakaako, and the rail project will represent tens of millions of dollars of additional public investment in that community. As such, the Hawaii Community Development Authority (HCDA) should ensure that the value added through those investments benefit a broad spectrum of our population.

2. Page 1-5, second paragraph, last sentence: "The intent of implementing transit oriented development is not to redefine the character of the existing neighborhoods, but to utilize TOD to enhance the existing quality of Kakaako as a whole." The sentence may underestimate the impact of redevelopment in Kakaako. The change from low density, low rise industrial development to high density, high rise residential and commercial development will likely redefine the character of Kakaako. That Plan could be more forthright about the potential impact of new development on the existing character of the community. With little to no additional usable public open space and parks provided, the redevelopmdent may not effectively enhance the quality of life in Kakaako.

Land Use

3. The Plan should address the capacity of existing infrastructure, particularly sewer and water, to deal with the higher densities that will result from the new regulations. The Plan should include a list of major infrastructure improvements needed and should outline a strategy for financing them.

4. It would be helpful to disclose the rationale for the increased height limits proposed for a limited number of projects such as 690 Pohukaina, and how those increased height limits will result in specific community benefits.

5. A strong community benefit package should be required of all development in Kakaako, not only for developers who opt in to the TOD Overlay requirements to meet the severe shortage in community facilities likely if Kakaako is developed at the densities and heights proposed in the Plan. Vancouver, B.C., offers a good community benefit model (requiring parks, day care centers, community meeting facilities, and affordable housing) before approving developments. We are looking at a similar strategy under our TOD program.

6. On page 4-20, the Plan references the Department of Parks and Recreation (DPR) Park and Facilities Standards for park space as being two acres of community park per 1,000 residents. The Plan states that HCDA will use this standard as a guide and that the parks makai of Ala Moana Boulevard will primarily be used to meet that standard.

   The parks located makai of Ala Moana Boulevard, while possibly being sufficient on an acreage basis, will fail to meet the community needs for recreational uses. It is our understanding that while DPR's standard is two acres of park per 1,000 residents, their preference would be for one acre of district park per 1,000 residents and one acre of other community-based parks, which can include mini-parks, 5-acre neighborhood parks, and 10-acre community parks. Some emerging policies indicate a need for urban parks within five blocks of residential development (St. Paul, Minnesota).

   Also, transit plazas, linear greenbelts, and passive parks like Thomas Square will not adequately substitute for active parks with recreational facilities. If it is not possible to provide the park acreage to accommodate active uses in an urban setting, the Plan should include requirements for alternatives such as recreational centers and gyms to compensate for the lack of space for ball fields.

   Two opportunities which could be explored are: 1) a three block expansion of the existing Gateway Park to link the Waterfront Park with Mother Waldron Park (expanding on the idea of a park-to-park connection along Cooke Street proposed in Kamehameha Schools' master plan for Kakaako), and 2) adding park space as part of the redevelopment of McKinley High School block. These sites could accommodate active and passive recreational uses including a recreation center, courts, ball fields, play equipment, walking, jogging, and bicycle paths.

7. The Plan recognizes the need for community and cultural facilities, such as schools, libraries, and community centers, however, it does not indicate a preference for their location. It also does not reflect them in the envisioned land use mix of "85 percent residential and 15 percent commercial." These types of facilities should anchor a community and be located near the planned rail stations, along with other core community services and retail.

8. The Plan calls for redevelopment of portions of the Neal Blaisdell Complex and McKinley High School. While the Complex is under the zoning jurisdiction of HCDA, it is owned by the City and any plans for redevelopment on that site should be undertaken jointly. Pursuant to State Senate Resolution 117, an inventory of State and County lands should be made to determine whether land exchange would further the goals and needs of the respective jurisdictions. The Plan should address how any redevelopment that takes place on either of those sites could be consistent with their historic and iconic character as community landmarks and gathering places. The Plan should discuss the regional impacts of losing convention space, should the Blaisdell Complex be redeveloped without it.

9. The Plan should prohibit or discourage auto-oriented uses such as drive-through facilities and automobile repair and sales near the rail stations.

10. The Plan seems to incorporate many of the same or similar land use objectives and policies as the Oahu General Plan and Primary Urban Center Development Plan (PUCDP). However, except for page 1-3, there is no other reference or discussion regarding how the General Plan and PUCDP should be integrated into the Plan. Although we understand the State may exempt themselves from county plans and zoning regulations in the Kakaako Community Development District, there is an opportunity to recognize that the State and City share many common goals regarding TOD and the development of Kakaako in general. For instance, the City encourages open space in urban areas, multi-modal transportation to reduce automobile usage, complete streets, and connectivity to improve circulation and manage automobile congestion.

    The Plan should include a section that discusses relevant county plans and policies. This new section should discuss the Plan's relationship to appropriate objectives, policies, and principles in the Oahu General Plan, PUCDP, Hawaii Capital, and Thomas Square Special Districts.

11. Provide a definition for "ground-oriented family housing" on page 3-5.

Mobility and Access

12. For your information, our Ala Moana Neighborhood TOD Plan will likely recommend adding bicycle lanes on Kapiolani Boulevard with two vehicle through lanes in each direction and a center turn lane. The Plan should consider incorporating this proposal.

13. Inter-agency coordination to achieve the strategies related to mobility and access, as presented in the TOD Overlay Plan, should be clearly identified with regard to project location, street section and participating agency. (Pg. 5-12)

14. Where new driveways are to be constructed, proper design of the driveway will negate the need for mirrors and noise signals. The use of these devices should be discouraged. (Pg. 5-32)

15. Driveway widths are based on the turning movements of a particular design vehicle requiring access to a development. The widths will be kept to the smallest width practical to minimize impacts to pedestrian traffic, while permitting safe access for vehicles. In most instances, the width will exceed 20 feet for two-way traffic. (Pg. 5-33)

16. Connectivity improvements for the Downtown area (Figure 7-11) should be extended to the Kakaako area and past the area controlled by HCDA.

17. Provide the rationale for prioritizing transit before bicycles in the modal hierarchy (or just change the hierarchy to prioritize bicycling). Bicycling is a fast, healthy, affordable, compact, and non-polluting mode of transportation.

Complete Streets

18. Figure 6-7 shows an aerial photograph labeled "Punchbowl/Kapiolani." However, this photograph actually shows the King Street/Kapiolani Boulevard intersection.

19. Waimanu Street, between Pensacola and Piikoi Street, is currently planned to be converted to a two-way street, not Kona Street. (Figure 5-9)

20. Roadway cross-sections for all streets should be specified. There does not appear to be enough existing right-of-way to achieve complete streets for most roadway facilities. The street section showing the desirable intersection elements (Figure 6-4) indicates a street right-of-way approaching 100 feet which will require additional land from adjacent property owners.

21. Conceptual design for all street intersections should be provided. The type of design vehicle should dictate the required curb radius (for a single unit design vehicle, the curb radius is 28 feet) and the amount of pedestrian storage, sight lines, and Americans with Disabilities Act compliant curb ramps should dictate the required property line radius.

22. A capacity analysis should be performed at each critical street intersection to determine the amount of vehicles and pedestrians that can be adequately processed during the peak traffic periods. The amount of permissible development, in relation to the effects of the intersections proximity to a transit station, should be limited if there is not enough capacity to support the projected vehicular and pedestrian demand. Traffic signal warrants should be performed at all major intersections to determine when traffic signals will need to be installed.

23. Traffic calming devices, such as roundabouts and mid-block splitters, should be provided at strategic locations in the area. The location and type of these devices should be identified. Where space permits, roundabouts should be a preferred strategy to address capacity issues.

24. All unimproved streets, such as portions of Queen Street, Cummins Street, portions of Waimanu Street, portions of Pensacola Street, and especially streets in close proximity to transit stations, should have a definitive time schedule of when the streets will be improved.

25. Curb extensions at intersections could be utilized, provided there is not a significant demand for right turning vehicles, otherwise, a pedestrian island should be considered.

HART Stations and Access

26. The correct name of the plan referred to in Action SA9.1 and Figure 7-11 is the Downtown Neighborhood Transit-Oriented Development Plan.

Miscellaneous

27. All the maps presented as figures could benefit from showing the two station locations at the center of a ¼-mile and ½-mile circle similar to the figures in the Neighborhood TOD Plans prepared by the City. It makes it easier to determine which projects are likely to benefit from access to the transit stations.

Should you have any questions regarding these comments, please contact Shem Lawlor of our staff at 768-8046.

Very truly yours,

December 18, 2014

Mr. George I. Atta, FAICP, LEED AP, CEI
Director
Department of Planning and Permitting
City and County of Honolulu
650 South King Street, 7th Floor
Honolulu, Hawaii 96813

Dear Mr. Atta:

Re: Department of Planning and Permitting Review Comments on the Hawaii Community Development Authority Draft Transit-Oriented Development Plan Overlay, Environmental Impact Study

Thank you for your letter dated October 10, 2013 commenting on the Hawaii Community Development Authority ("HCDA") Draft Transit-Oriented Development Plan Overlay ("TOD Plan"). We have updated the TOD Plan and will be issuing a Draft Environmental Impact Statement ("DEIS") shortly, a copy of which you will be receiving. The DEIS will include discussion on some of your concerns, and following, we offer further comments for your use and information. We welcome any additional comments or concerns on the TOD Plan and DEIS.

Guiding Principles

1. Your comments that "the Plan should strive to exceed the requirements of the Kakaako Reserved Housing Rules to address the serious housing cost issues and create affordable housing opportunities..." are noted, and the HCDA has been evaluating its Kakaako Reserved Housing Rules for any modifications that may be beneficial to the State.

2. The intent of the TOD Plan is to provide TOD development opportunities where it makes most sense, and hence is likely to be near or around the planned transit stations. Not all land parcels are appropriate for TOD density and hence implementation of the TOD Plan is not envisioned to redefine the character of the larger Kakaako.

Land Use

3. The DEIS will include an analysis of the infrastructure capacity for water and sewer systems.

4. Density increases proposed in the draft TOD Plan for certain project parcels are part of the vision for an urban design framework that encourages diversity in mass and volume, and permitted upon the provision of exceptional public benefits. These parcels demonstrate opportunities for redevelopment with capacity increases under rationale including, proximity to transit station, parcel size, encumbrances, potential for consolidation, and land to improvement value ratios. We believe that the discussion on page 4-2 of the TOD Plan clearly articulates the rational for increased height limits being considered for some properties in the KCDD.

5. We believe TOD development will provide public benefit not only in the forms of public facilities and open space, but also quality of life benefits such as accessibility to housing, work, entertainment, and other services within walking distance. We concur communities built this way, such as Vancouver, B.C., are good models of livable, sustainable, and resilient places. Developers who elect to participate in the incentive based TOD Plan, must present a project with exemplary public benefit. A clearer understanding of specific public benefits is expected when TOD rules are developed. However, the addition of a community benefit package to the existing Mauka Area Rules would require an amendment to those rules and is beyond the scope of the Proposed Action.

6. The HCDA will look into opportunities to meet additional community needs for park and recreational uses. To that end, the HCDA recently commenced a master planning process to address parks and recreational needs in the District. We believe that the TOD Plan represents a unique opportunity to work with prospective developers to achieve the outcomes to which your agency, the Department of Parks and Recreation, and the HCDA collectively aspire. The lack of large tracts of publicly owned land within the KCDD makes it challenging to provide additional parks in the District. Purchase of private land for parks would be cost prohibitive. As you have pointed out in your letter, redevelopment of McKinley High School block as well as the

Neal Blaisdell Complex provides opportunities to create additional active and passive recreation space.

7. Land uses for community facilities such as schools are dependent upon planning policy and decisions that will take place outside the TOD Plan. The HCDA has been continually working with the Department of Education in assessing future school needs for the KCDD. The Cultural Impact Statement that has been recently completed, and which will be included in the forthcoming DEIS, concludes that many of the contemporary cultural activities and facilities located within the KCDD are present because of private-sector initiatives, and are largely market driven. To that end, they are, in fact, a part of the commercial development within the District.

8. We concur that any plan for redevelopment of the Neal Blaisdell Complex would benefit from joint efforts of the State and County. We also recognize that decisions concerning the ultimate use of the property rest with the landowner (the "City"). Therefore, addressing the historic and iconic character of redevelopment would be best achieved by the City as part of its redevelopment process. While HCDA's preferences for the site are itemized on page 3-19 of the TOD Plan, it will be the City's responsibility to ensure that redevelopment of the property does not result in the loss of convention space.

9. Industrial uses are not predominate in TOD, however we continue to support industrial uses in central Kakaako. The TOD Plan responds to the desires of landowners in the Central Kakaako neighborhood to preserve the character of the area. We concur commercial drive-through facilities are not an appropriate use near the rail stations. Our plan for access and mobility throughout the District places pedestrians first in the hierarchy. Please refer to Objective D2 on page 2-4 and Objective D6 on page 2-6 of the TOD Plan. In addition, the discussion beginning on page 5-71 and ending on page 5-75 collectively addresses our agency's desire to reduce the predominance of automobile use in the District.

10. Your comment on the Oahu General Plan and Primary Urban Center Development Plan is noted. However, please note that the discussion on page 4-6 of the plan specifically addresses PUC-related concerns about view

corridors. As previously stated, now that the TOD Plan has been published, an EIS is being prepared to evaluate its impacts. We believe that the EIS is the best forum for the relationship of the Proposed Action (the TOD Plan) to existing plans and policies. Chapter Five of the DEIS will address your concerns.

11. The concept of "ground-oriented family housing" refers to the orientation of family-oriented housing to the ground floor of structures, such as townhouses at street level, or larger size units in tower podiums. The intention is place family-oriented housing on lower levels or as close to ground level as possible, which is more desirable for families than living on upper floors.

Mobility and Access

12. Figure 5-15 on page 5-53 of the TOD Plan identifies Kapiolani Boulevard as a "High Stress Bicycle Street" but assumes that additional bike lanes may be added at some point in the future. While the City's recommendation that bike lanes be added to Kapiolani Boulevard is not at odds with the TOD Plan, we would note that the traffic impact study conducted for the EIS did not assume the loss of lanes on Kapiolani Boulevard. Nevertheless, if the City is intending to implement additional bike lanes on Kapiolani Boulevard in the near future, the HCDA can make the necessary adjustments in the Final TOD Overlay Plan.

13. Comment noted.

14. Comment noted.

15. Comment noted.

16. We concur and would work towards inter-agency coordination to achieve such connectivity improvements beyond HCDA's district boundaries. The HCDA is committed to coordinating with its sister agencies at both the City and the State to ensure that connectivity is achieved with streets outside the District Figure 7-11 is not intended as the final depiction of connectivity, but rather is intended to be illustrative of information that was known at the time the TOD Plan was published.

17. Transit was given a higher priority in the modal hierarchy because it carries far more people in comparable street right-of-way compared to a cycle lane. This is not a firm policy but rather a policy approach in considering right-of-way prioritization. Priorities can be adjusted on a contextual basis when considering individual street design.

Complete Streets

18. Comment noted.

19. Comment noted. We have noted since your letter, the conversion of that portion of Waimanu Street has taken place.

20. The DEIS will present typical roadway cross-sections, and these will be incorporated as needed into the final TOD Overlay Plan.

21. Comment noted.

22. A traffic study will be included in the DEIS, which will be used to inform decision making in finalization of the TOD Overlay Plan.

23. Comment noted.

24. Comment noted.

25. Comment noted.

Hart Stations and Access

26. Comment noted.

27. Comment noted.

Should you have any questions regarding these comments, please contact Mr. Deepak Neupane, P.E., AIA, Director of Planning and Development, at 594-0338.

Dear Lee Sichter:

SUBJECT: DEIS Review for the TOD Overlay Plan for the KCDD

The Department of Health (DOH), Environmental Planning Office (EPO), acknowledges receipt of your DEIS to our office on January 8, 2015. Thank you for allowing us to review and comment on the proposed TOD Overlay Plan available on the OEQC website at:
http://oeqc.doh.hawaii.gov/Shared%20Documents/EA_and_EIS_Online_Library/Oahu/2010s/2015-01-08-OA-5B-DEIS-Kakaako-Community-Transit-Oriented-Development-Overlay-Plan.pdf

The DEIS was routed to various branches. The various branches will provide specific comments to you if necessary. EPO recommends that you review the standard comments and available strategies to support sustainable and healthy design provided at: http://health.hawaii.gov/epo/home/landuse-planning-review-program/. Projects are required to adhere to all applicable standard comments.

We encourage you to examine and utilize the Hawaii Environmental Health Portal. The portal provides links to our e-Permitting Portal, Environmental Health Warehouse, Groundwater Contamination Viewer, Hawaii Emergency Response Exchange, Hawaii State and Local Emission Inventory System, Water Pollution Control Viewer, Water Quality Data, Warnings, Advisories and Postings. The Portal is continually updated. Please visit it regularly at:
https://eha-cloud.doh.hawaii.gov

You may also wish to review the revised Water Quality Standards Maps that have been updated for all islands. The Water Quality Standards Maps can be found at:
http://health.hawaii.gov/cwb/site-map/clean-water-branch-home-page/water-quality-standards/.

We request that you utilize all of this information on your proposed project to increase sustainable, innovative, inspirational, transparent and healthy design.

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated January 12, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

1. We acknowledge that you reviewed the document on the OEQC website.

2. We acknowledge that the DEIS was routed by to various branches of the Department of Health which may provide additional comments.

3. We acknowledge your recommendation to review DOH standard comments and available strategies to support sustainable and healthy design at your website.

4. We acknowledge your comment that projects are required to adhere to all applicable standard comments.

5. As HCDA is not a developer, your suggestion that the Environmental Health Portal be examined and utilized will be passed on to individual applicants at the time they enter the Development Permit process.

6. Mahalo for the link you provided to the Water Quality Standards Maps.

7. We will advise Development Permit Applicants of the need to utilize this information you provided.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

HAWAII COMMUNITY DEVELOPMENT AUTHORITY

Hawaii Development Community Authority (HDCA)
461 Cooke Street
Honolulu, Hawaii 96813

Dear HDCA:

SUBJECT: Draft Environmental Impact Statement; Transit-Oriented Development Overlay - Kakaako Community Development District; Honolulu, Hawaii

We have reviewed the Draft Environmental Impact Statement for the Transit-Oriented Development (TOD) Overlay - Kakaako Community Development District.

Subject to *14 Code of Federal Regulation (CFR) Part 77: Safe, Efficient Use, and Preservation of the Navigable Airspace*, the Federal Aviation Administration (FAA) requires notification of proposed construction on and near a public-use airport. Notification is done through submittal of information contained on FAA Form 7460-1, Notice of Proposed Construction or Alteration. FAA notification is done through the following website:

https://oeaaa.faa.gov/oeaaa/external/portal.jsp

FAA notice criteria for proposed construction is required when:

(a) Any construction or alteration that is more than 200 ft. AGL at its site.

(b) Any construction or alteration that exceeds an imaginary surface extending outward and upward at any of the following slopes:

(1) 100 to 1 for a horizontal distance of 20,000 ft. from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway more than 3,200 ft. in actual length, excluding heliports.

(2) 50 to 1 for a horizontal distance of 10,000 ft. from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway no more than 3,200 ft. in actual length, excluding heliports.

(3) 25 to 1 for a horizontal distance of 5,000 ft. from the nearest point of the nearest landing and takeoff area of each heliport described in paragraph (d) of this section.

(c) Any highway, railroad, or other traverse way for mobile objects, of a height which, if adjusted upward 17 feet for an Interstate Highway that is part of the National System of Military and Interstate Highways where overcrossings are designed for a minimum of 17 feet vertical distance; 15 feet for any other public roadway; 10 feet or the height of the highest mobile object that would normally traverse the road, whichever is greater, for a private road; 23 feet for a railroad; and for a waterway or any other traverse way not previously mentioned, an amount equal to the height of the highest mobile object that would normally traverse it, would exceed a standard of paragraph (a) or (b) of this section.

An airspace analysis will be conducted upon submittal of the information to determine the effect on safe and efficient use of navigable airspace and air navigation facilities.

The proposal to increase the height limits of structures up to 700' may affect navigable airspace. The airlines may also have additional operational requirements that may be affected by the higher building heights. We recommend you contact the airport and airlines for further comments.

Sincerely,

Gordon K. Wong

Dear Mr. Wong:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated January 19, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

1. We acknowledge the FAA requirement for proposed construction projects to submit to you FAA Form 7460-1 through the website address you provided.

2. We acknowledge the FAA Notice Criteria you provided in your letter and understand that your staff will conduct an airspace analysis based upon the information submitted.

3. Please understand that no buildings are proposed to be built to heights up to 700 feet at this time. The prevailing height limit in the Kakaako Community Development District is 418 feet. To exceed that height would require an Act of the Hawaii State Legislature. Building heights in excess of the prevailing height limit are discussed in the Draft EIS as an alternative for the purposes of full disclosure.

TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated January 17, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

We acknowledge that your department does not have enough information at this time to provide comments regarding wastewater collection and treatment for the TOD Overlay Plan. As individual applicants enter the Development Permit process, the specifications for specific projects will be submitted to your department for review.

We acknowledge that all wastewater plans must conform with the applicable provisions of Chapter 11-62, HAR.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

Attention: Ms. Amy Mutart

Dear Mr. Ching:

SUBJECT: Comments on Draft Environmental Impact Statement for Kakaako Community Development District Draft Transit-Oriented Development Overlay Plan

The Department of Health (DOH), Clean Water Branch (CWB), acknowledges receipt of your letter, dated December 18, 2015, requesting comments on your project. The DOH-CWB has reviewed the subject document and offers these comments. Please note that our review is based solely on the information provided in the subject document and its compliance with the Hawaii Administrative Rules (HAR), Chapters 11-54 and 11-55. You may be responsible for fulfilling additional requirements related to our program. We recommend that you also read our standard comments on our website at: http://health.hawaii.gov/epo/files/2013/05/Clean-Water-Branch-Std-Comments.pdf

1. Any project and its potential impacts to State waters must meet the following criteria:

   a. Antidegradation policy (HAR, Section 11-54-1.1), which requires that the existing uses and the level of water quality necessary to protect the existing uses of the receiving State water be maintained and protected.

   b. Designated uses (HAR, Section 11-54-3), as determined by the classification of the receiving State waters.

   c. Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).

2. The Kakaako TOD plan includes areas which are regulated by a National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit. Any planning document must address how all activities identified in the document, including new development, re-development, land use, etc., will take into consideration how the activities identified in the plan must comply with the subject area's NPDES MS4 permit. This doesn't just include what construction or building permits will

be required, but rather how the development plan, infrastructure installation and landscaping will be designed to meet water quality requirements.

3. The TOD should incorporate a reminder of NPDES permit coverage obligations (i.e. MS4 permits, Construction and or Industrial Stormwater Permits, etc.) required in Hawaii for discharges of wastewater or certain types of storm water runoff into State surface waters (HAR, Chapter 11-55).

   For NPDES general permit coverage, a Notice of Intent (NOI) form must be submitted at least 30 calendar days before the commencement of the discharge. An application for a NPDES individual permit must be submitted at least 180 calendar days before the commencement of the discharge.

4. The TOD should also incorporate a reminder of Clean Water Act (CWA) Sections 404 and 401 permitting obligations. For projects involving work in, over, or under waters of the United States, it is highly recommended that the project owner contact the Army Corp of Engineers, Regulatory Branch (Tel: 835-4303) regarding their permitting requirements under the CWA Section 404.

   Pursuant to Federal Water Pollution Control Act [commonly known as the CWA], Paragraph 401(a)(1), a Section 401 Water Quality Certification (WQC) is required for "[a]ny applicant for Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may **result** in any discharge into the navigable waters..." (emphasis added). The term "discharge" is defined in CWA, Subsections 502(16), 502(12), and 502(6); Title 40 of the Code of Federal Regulations, Section 122.2; and Hawaii Administrative Rules (HAR), Chapter 11-54.

5. It is the State's position that all projects must reduce, reuse, and recycle to protect, restore, and sustain water quality and beneficial uses. Project planning should:

   a. Treat storm water as a resource to be protected and maximize beneficial uses by integrating it into project planning and permitting. Storm water has long been recognized as a source of irrigation that will not deplete potable water resources. What is often overlooked is that storm water recharges ground water supplies and feeds streams and estuaries; to ensure that these water cycles are not disrupted, storm water cannot be relegated to a status analogous to a waste product of impervious surfaces. Any project planning must recognize storm water as an asset that sustains and protects natural ecosystems and traditional beneficial uses of State waters, like community beautification, beach going, swimming, and fishing. The approaches necessary to do so, including low impact development methods or ecological bio-engineering of drainage ways must be identified in the planning stages to allow designers opportunity to include those approaches up front, prior to seeking zoning, construction, or building permits.

   b. Clearly articulate the State's position on water quality and the use of State waters. The plan should include statements regarding the implementation of methods to conserve natural resources (e.g. minimizing potable water for irrigation, gray water re-use options, energy conservation through smart design) and improve water quality.

   c. Envision the use of green building practices, such as pervious pavement and landscaping with native vegetation, to improve water quality by reducing excessive runoff and the need for excessive fertilization, respectively.

   d. Identify opportunities for retrofitting or bio-engineering existing storm water infrastructure to restore ecological function while maintaining, or even enhancing hydraulic capacity. Particular consideration should be given to areas prone to flooding, or where the infrastructure is aged and will need to be rehabilitated.

   e. Identify all State waters for which considerations must be made. This includes, but is not limited to, subterranean streams, surface waters, wetlands, springs, seeps and coastal areas. Every effort should be made to protect, restore and provide access and recreational use of the State waters for the benefit of the community. This must be identified during the planning stages such that community development plans can include the integration of State waters in early planning and design efforts.

If you have any questions, please visit our website at: http://health.hawaii.gov/cwb/, or contact the Engineering Section, CWB, at (808) 586-4309.

Sincerely,

ALEC WONG, P.E., CHIEF
Clean Water Branch

Department of Health
State of Hawaii
P. O. Box 3378
Honolulu, Hawaii 96801-3378

Dear Mr. Wong:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated January 27, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

HCDA acknowledges the need to review your standard comments at the website address provided in your letter.

1. HCDA acknowledges that the impacts of any project must meet the criteria you identify.

2. As the TOD Overlay Plan is intended to provide guidance for future development by individual landowners, it will be up to future permit applicants to determine whether their proposed project will trigger an NPDES permit and to then specify how their particular development plan will be comply with water quality requirements.

3. Section 2.5 of Chapter Two identifies NPDES as being a required permit. As stated above, it will be up to individual development applicants to submit an NOI form to you.

4. As the TOD Overlay Plan is generally limited in scope to the Mauka District of the Kakaako Community Development District (KCDD), an area extending mauka from Ala Moana Boulevard to King Street between Punchbowl and Piikoi, it will result in no work in, over, or under waters of the United States. HCDA acknowledges that any particular development that may result in any discharge to navigable waters will be required to secure Water Quality Certification from your branch prior to the anticipated discharge activity.

5. HCDA acknowledges that all projects associated with the TOD Overlay Plan must reduce, reuse, and recycle to protect, restore, and sustain water quality and beneficial uses.

   a. It will be up to individual developers to determine how storm water discharge from their particular property might be best utilized as an asset.

   b. Individual projects must address implementation methods to conserve natural resources at the time specific applications for development are submitted to the HCDA.

   c. Section 4.12.6.5 of Chapter Four specifically addresses HCDA's policy to encourage green landscaped podiums as part of new development.

   d. Opportunities to address retro-fitting or bio-engineering of existing storm water infrastructure will be addressed on a case-by-case basis as Development Permit applications are reviewed by HCDA.

   e. The TOD Overlay Plan addresses an area that contains no State waters.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

Dear Mr. Sichter:

This is in response to your letter requesting the Honolulu Police Department's comments regarding the Draft Environmental Impact Statement (DEIS) for the Transit-Oriented Development Overlay Plan - Kakaako Community Development District.

We have reviewed the DEIS and are concerned about the use of the rail system for evacuation purposes. An alternative evacuation plan should be implemented in the event that a natural and/or man-made disaster should cause the rail system to become inoperable.

If there are any questions, please call Major Roy Sugimoto of District 1(Central Honolulu) at 723-3327.

Thank you for the opportunity to review this project.

Sincerely,

LOUIS M. KEALOHA

Dear Chief Kealoha:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated January 29, 2015 commenting on the above document. While we acknowledge your concern about the use of the rail system for evacuation purposes, HCDA has no authority over the use of the rail system. That responsibility rests with the Honolulu Authority for Rapid Transportation (HART). It is our understanding that during times of emergency if evacuations are necessary they are coordinated between the Civil Defense Agency and the Honolulu Police Department. We agree that evacuation plans should take into account the fact that in the event of a natural and/or man-made disaster the rail system could become inoperable.

SUBJECT: **DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS), KAKA'AKO COMMUNITY DEVELOPMENT DISTRICT (KCDD)**
Honolulu District, Island of Oahu
TMK: Various in: Aloha Tower Special District & Kaka'ako

To whom it may concern,

We are in receipt of your request for comments dated *January 12, 2015*, regarding the Draft Environmental Impact Statement (DEIS) for the proposed Transit Oriented Development (TOD) Overlay Plan for the *Kaka'ako Community Development District* (KCDD).

The Office of Conservation and Coastal Lands (OCCL) has reviewed your DEIS and would like to recognize and acknowledge your commitment to addressing potential long- and short-term influences on the proposed project in regard to Global Climate Change and subsequent Sea Level Rise. This is especially relevant for the development of low-lying areas such as Kaka'ako.

Act 83 (*HB 1714*), or the *Hawaii Climate Adaptation Initiative Act*, aims to address the potential effects of Global Climate Change and Sea Level Rise on Hawaii's existing and future infrastructure, environmental resource management, and development. At this time the OCCL and the Office of Planning (OP) are coordinating the development of a State-wide *Sea Level Rise Vulnerability and Adaptation* report that will provide guidance for future development projects; therefore we would appreciate a continued involvement in the planning process.

If you have any questions regarding this correspondence please contact Alex J. Roy, M.Sc. of our Office of Conservation and Coastal Lands staff at 808-587-0316.

Sincerely,

Samuel J. Lemmo, Administrator
Office of Conservation and Coastal Lands

HAWAII COMMUNITY
DEVELOPMENT
AUTHORITY

February 2, 2015

Ms. Amy Mutart, Project Manager
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Dear Ms. Mutart:

Subject: Draft Environmental Impact Statement (DEIS)
Transit-Oriented Development Overlay Plan for the Kakaako Community Development District

In response to a letter received on January 7, 2015, from Lee Sichter LLC regarding the above-mentioned subject, the Honolulu Fire Department (HFD) provides the following:

The HFD concurs with the narratives in Chapter 4, Sections 4.10.8.1 and 4.10.8.2 of the DEIS. We offer further support for those narratives with additional comments, recommendations, and requirements.

The Hawaii Community Development Authority (HCDA) estimates that planned Kakaako developments will increase the residential population by 20,000 to 40,000 individuals by 2030. Those residents will occupy units built in numerous new high-rise buildings. Hundreds of thousands of square feet of new commercial occupancies will attract a multitude of people to the area.

The HFD's current resources will not be able to adequately handle the projected residential and transient populations, proposed new residential structures, and additional commercial development. Our Kakaako and Pawaa Fire Stations are over 40 years old and were not designed to accommodate this proposed growth.

The HFD is committed to meeting national standards for the delivery of first responder services. The National Fire Protection Association (NFPA) is the industry leader in determining acceptable fire service standards throughout the U.S., which is utilized to establish reasonable standards for the delivery of the HFD's services. The HFD strives to achieve this objective by meeting the criteria set forth in NFPA 1710: Standard for

Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations, and Special Operations to the Public by Career Fire Departments.

NFPA 1710 mandates that the travel time for the first-arriving unit responding to emergencies in urban communities, such as Kakaako, be within four minutes. Every minute of increased travel time exacerbates the seriousness of an emergency, placing the first responders and community at greater risk.

Proposed rail infrastructure, traffic calming, and pedestrian friendly street features will impact the HFD's ability to meet those standards. Additional vehicular traffic generated by commercial development will further aggravate the situation. The HFD must acquire additional personnel, equipment, and resources to meet this objective.

The HFD must find alternative funding sources to provide for additional personnel, equipment, and resources to serve the Kakaako community. We recommend that the HFD collaborate with the HCDA to establish and implement an impact fee to fund the HFD resources necessary to service the area's development. The proposed fee should not be less than $1,000 for each residential unit or $2.50 per square foot of commercial development over 10,000 square feet to ensure that the appropriate public safety costs are shared by the developers.

The HFD will also require compliance with the following provisions:

1. Fire department access roads shall be provided such that any portion of the facility or any portion of an exterior wall of the first story of the building is located not more than 150 feet from fire department access roads as measured by an approved route around the exterior of the building or facility.

   A fire department access road shall extend to within 50 feet of at least one exterior door that can be opened from the outside and that provides access to the interior of the building.

2. A water supply approved by the county, capable of supplying the required fire flow for fire protection, shall be provided to all premises upon which facilities or buildings, or portions thereof, are hereafter constructed, or moved into or within the county. When any portion of the facility or building is in excess of 150 feet from a water supply on a fire apparatus access road, as measured by an approved route around the exterior of the facility or building, on-site fire hydrants and mains capable of supplying the

   required fire flow shall be provided when required by the authority having jurisdiction.

3. The unobstructed width and vertical clearance of a fire apparatus access road shall meet county requirements.

4. Submit civil drawings to the HFD for review and approval.

5. The above-mentioned provisions shall be subject to the current Fire Code of the City and County of Honolulu at the time of building plan submittal.

Should you have questions, please contact Assistant Chief Socrates Bratakos of our Support Services section at 723-7105 or sbratakos@honolulu.gov.

Sincerely,

MANUEL P. NEVES
Fire Chief

Ref. No.: PL TOD 18.3

June 10, 2015

Mr. Manuel P. Neves
Fire Chief
Honolulu Fire Department
City and County of Honolulu
636 South Street
Honolulu, Hawaii 96813-5007

Dear Chief Neves:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 2, 2015 commenting on the above document. Following are HCDA's responses to your comments in the order they were presented in your letter.

HCDA acknowledges your concurrence with the DEIS analysis of project impacts on first responders. As it moves forward with TOD, HCDA will strive to ensure that the introduction of the rail line in Kakaako, together with traffic-calming and pedestrian-friendly street features will not impede access by the Honolulu Fire Department. The matter of the impact fee proposed in your letter will be addressed at the time that rules are developed to implement the TOD Overlay Plan.

1. HCDA acknowledges the need for compliance with the 150-foot first-floor standard for HFD access to roadways and the 50-foot requirement for access to at least one exterior door.

2. HCDA acknowledges the requirements presented in your letter for the provision of adequate fire flow for fire protection.

3. HCDA acknowledges the requirement for unobstructed width and vertical clearance for fire apparatus.

4. As discussed in the DEIS, the initiative for new property development or redevelopment rests with property owners in

the District. At the time that detailed development proposals are presented to the HCDA for review and approval, they will be submitted to the HFD for prior review and approval, as is presently the case.

5. HCDA acknowledges that all provisions are subject to the current Fire Code at the time of plan submittal.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching
Executive Director

Executive Director
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Dear Mr. Ching:

SUBJECT: Draft Environmental Impact Statement for the Transit Oriented Development (TOD) Overlay Plan for the Kakaako Community Development District (KCDD)

This responds to your correspondence received on January 7, 2015, requesting our review of the subject project. Based on our review, we have the following comments to offer:

1. Based on the locations of the three KCDD rail stations and the high-density development of the TOD area, safe pedestrian, bicycle, and transit connections are essential.

2. The department supports the construction of workforce housing and mixed-use development in Kakaako.

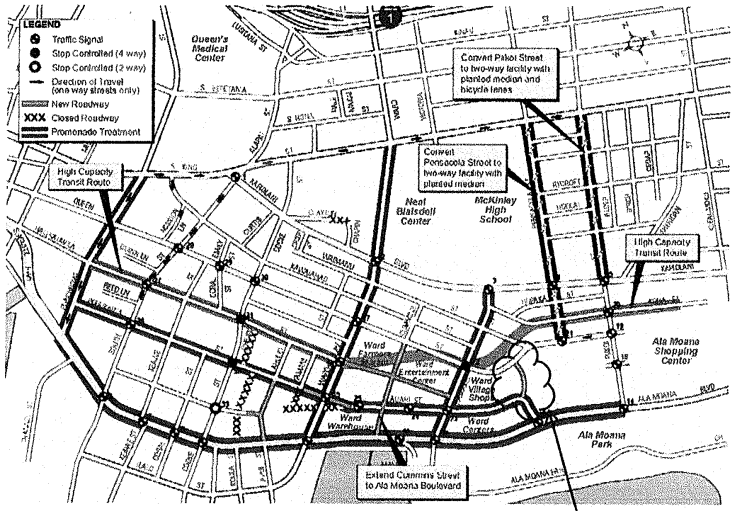
3. The development of all properties and roadways in the KCDD should be consistent with the City's Complete Streets ordinance and include features to encourage walking, bicycling, and use of transit.

4. A Street Usage Permit from our department is required for work that may close any street, traffic lane, or sidewalk. Therefore, the list of permits in Section 0.8 Required Permits and Approvals, pg. 18, should include a Street Usage Permit from our department.

5. Please correct Section 2.3 Existing Traffic Operation, pg. 29: Level of Service at Bishop and King intersection during AM and PM peak hour are C and D, not E.

6. On Figure 4-14: Planned and Proposed Roadway Network Changes (Future Baseline Condition), pg. 93, portion of Queen Street (see attached) identified as a "New Roadway" should be corrected to an "Existing Roadway."

7. All affected Neighborhood Boards, as well as the area residents, businesses, etc. should be regularly apprised of the status of the plan and implementation actions.



Thank you for the opportunity to review this matter. Should you have any questions, please contact Virginia Sosh of my staff at 768-5461.

Very truly yours,

Michael D. Formby
Director

Attachment

Figure 4-14: Planned and Proposed Roadway Network Changes (Future Baseline Condition)

4.7.4.3 Year 2035 Traffic Operations Without The Propose

Year 2035 Baseline traffic volumes at each study intersection were estimated based on the anticipated net change in traffic volumes as determined by the OMPO model outputs. Forecast daily traffic volumes are summarized graphically in Figure 4-15. Forecast AM and PM Peak Hour volumes are presented in Figures 29 to 31 of the Traffic Study presented in Appendix D. A comparison of Existing PM peak hour traffic volumes and the forecast Future Baseline Condition PM peak hour traffic volumes yields the following findings:

- Traffic volumes at study intersections in the PM peak hour would be an average of 12 percent higher in the Future Baseline Condition alternative than under Existing Conditions.
- The largest increases in PM Peak Hour intersection volumes under the Future Baseline Condition would occur at the following five intersections, where the total 4-way approach volume is forecasted to increase by over 1,000 vehicles (representing an increase of over 30 percent at these locations):
  - Pensacola at Kapiolani
  - Ward at Kapiolani
  - Ward at Ahui

Subject: RE: TOD Overlay - Kakaako Community Development District - DRAFT response

Hi Ginny,

I don't think they finished reviewing...I haven't gotten the "OK" to send the email yet. I spoke with Jack, (he just came back to the office today) and he said that TE does NOT support converting Piikoi and Pensacola Streets into two-way roadway. He also mentioned that there was a request to convert one of the streets, if not both, into two-way in the past, and after the review and the investigation, the TE recommended NOT to convert to two-way. I have to look for the work order and see what the reasons were and will let you know.

Regards to Auahi Street, it looks like they'd like to realign Auahi Street, from around Marukai supermarket, to connect to Pohukaina Street. So it Auahi Street east of Ward Avenue won't be closed. Kamani Street is a private road, and I think Auahi Street, west of Ward Avenue is also privately owned.

If you have other questions, let me know.

Thanks!
Rika

Subject: RE: TOD Overlay - Kakaako Community Development District - DRAFT response

Hi Rika,

I just wanted to check in and see if there was any word on if Mark/Craig had finished reviewing the document?

Also....one of the things I was curious about was if there would be any comments on the below figure (page 93 in the document) for the Planned/Proposed Roadway Network Changes.... Does TE support converting Piikoi Street and Pensacola into two way facilities w/ planted median and it looks like Auahi St. east of Ward Ave would be closed? ..... anyway....hopefully your Monday is going well....Thank you ..... Ginny

Subject: TOD Overlay - Kakaako Community Development District - DRAFT response

Hi Ginny,

Craig or Mark is still reviewing, but here's what we have so far.

1. The development of all properties and roadways in the subject area should be in compliance with the City's Complete Streets Ordinance.
2. The new proposed streets should improve the connectivity of the street network in the TOD area.
3. Section 2.3 Existing Traffic Operations, pg. 29: Level of Service at Bishop and King Intersection during AM and PM peak hour are C and D, not E.

I will let you know as soon as they finish reviewing and if the comments need to be revised.

Thank you.

Haleʻolawiʻula Street

Although Haleʻolawiʻula Street currently only accommodates up to 288 daily bicycle movements, this corridor will serve as a critical east-west bicycle connection. Given its alignment under the HART rail alignment, Haleʻolawiʻula Street provides direct access to the future HART Civic Center, Kaka ʻako, and Downtown Stations. Because this is a key transit access route, and there is a substantial projected increase in bicycle volumes between the Future Baseline Condition and Proposed Action (both due to demand for transit access and intra-district travel), Haleʻolawiʻula Street's lack of dedicated bicycle facilities with a corresponding increase in bicycle volume between the Future Baseline Condition and Proposed Action contributes to a significant impact.

Finding: Potentially significant

Pensacola Street

Pensacola Street is a critical southbound bicycle connection at the Diamond Head edge of the project area. This corridor currently accommodates up to 288 daily bicycle movements. The projected increase in bicycle volumes along Pensacola Street between the Future Baseline Condition and Proposed Action is not supported by dedicated bicycle facilities. Pensacola Street is also a key bicycle access route to two future HART stations (Kaka ʻako Station and Ala Moana Station), and Ala Moana Center for bicyclists originating from the Makiki neighborhood. Because this is a key transit access route, and there is a substantial projected increase in bicycle volumes between the Future Baseline Condition and Proposed Action (both due to demand for transit access and intra-district travel), Pensacola Street's lack of dedicated bicycle facilities is considered a significant impact.

The City and County has expressed interest in potentially converting the Pensacola-Piikoi one-way couplet into two-way operation while providing high quality bicycle facilities. This should be studied in the future.

Finding: Potentially significant

Piikoi Street

Piikoi Street is a critical northbound bicycle connection at the Diamond Head edge of the project area. This corridor **currently** accommodates up to 380 daily bicycle movements. Piikoi Street is anticipated to exhibit a 30% increase in motor vehicle turn volumes at Ala Moana Boulevard, which will increase bicycle exposure to turn conflicts. The projected increase in bicycle volumes along Piikoi Street between the Future Baseline Condition and Proposed Action is not supported by dedicated bicycle facilities. Piikoi Street is also provides bicycle egress from two future HART stations (Kaka ʻako Station and Ala Moana Station), particularly for bicyclists destined for the Makiki neighborhood. Piikoi Street is anticipated to exhibit a 30% increase in motor vehicle turn volumes at Ala Moana Boulevard, which will increase bicycle exposure to turn conflicts. Because this is a key transit egress route, and there is a substantial projected increase in bicycle volumes between the Future Baseline Condition and Proposed Action (both due to demand for transit access and intra-district travel), Piikoi Street's lack of dedicated bicycle facilities is considered a significant impact.

The City and County has expressed interest in potentially converting the Pensacola-Piikoi one-way couplet into two-way operation while providing high quality bicycle facilities. This should be studied in the future.

Finding: Potentially significant

Additional Recommended Improvement (non-mitigation)

A bicycle and pedestrian crossing improvement at the King Street/Cooke Street intersection, is recommended as a potential *future* improvement measure. This would help link cyclists between the project area/Civic Center HART station and the Alapai Transit Center/Young Street signed and marked bike route (an east-west connection). This improvement is not recommended as a mitigation measure in this DEIS due to the location of the improvement relative to the project area.

4.6 PEDESTRIAN IMPACTS

Recommended Pedestrian Network Changes (Draft TOD Overlay Plan)

The pedestrian recommendations in the Draft TOD Overlay Plan seek to develop a high-quality pedestrian environment in the project area in order to achieve the goals of a lively, active, and transit-oriented community. Figure 47 illustrates where pedestrian investment is recommended as the district develops and the Proposed Action is realized. These recommended improvements are not stipulated as part of the Proposed Action as described in the Project Description. Thus, the recommendations in the Draft TOD Overlay Plan are only strategies and are not required improvements. The following sections summarize the impacts created as part of the Proposed Action and provide more targeted mitigation measures tied to the stated impacts.

The pedestrian priority types recommended in the Draft TOD Overlay Plan include:

- **Primary pedestrian priority streets** are those that connect key destinations in or adjacent to the district, including HART rail stations, and that will ultimately support active street front uses such as retail stores, public plazas, and entertainment venues. These streets require spacious sidewalks and a high level of pedestrian amenity.
- **Secondary pedestrian priority streets** are those that do not provide direct connections to major destinations or have very high traffic volumes. While these streets may never be ideal for walking along for long distances, they must still be safe enough to accommodate walking, and they should be easy and safe enough to cross that they do not serve as a barrier to **pedestrians**.
- **Low speed streets** are generally service streets that may have narrow widths and where pedestrians and traffic may even be asked to mix in a shared right-of-way. Note that the term "low speed streets" should not be interpreted to suggest that high-speeds are promoted anywhere in the project area.
- **Greenway connections** are streets where there is opportunity to connect parks, greenspace, and public plazas with well-landscaped, shaded, and interesting walking routes.

Other pedestrian network changes recommended in the Draft TOD Overlay Plan relate to conflict reduction, sidewalk expansion, and crossing distance reduction. Any street with on-street parking is proposed to include curb extensions at intersections. Driveway consolidation is proposed throughout the project area to reduce conflicts between motor vehicles and pedestrians and improve pedestrian safety. Building access is concentrated at smaller parking access or service streets in order to reduce search-for-parking traffic and eliminate conflicts with pedestrians. In addition, 5 feet of additional setback is recommended to achieve minimum 15 feet sidewalk

Ref. No.: PL TOD 18.3

June 10, 2015

Mr. Michael Formby, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Formby:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 5, 2015 commenting on the above document. Following are HCDA's responses to your comments in the order they were presented in your letter.

1. HCDA concurs with your expressed need for safe pedestrian, bicycle, and transit connections in the District.

2. We are pleased that the DTS supports the provision of workforce housing and mixed-use development in the District.

3. HCDA is committed to implementing the City's Complete Streets ordinance in the District.

4. Acknowledged. The Tables in Section 0.8 of the Executive Summary and Section 2.5 of Chapter Two have been revised to include reference to a Street Usage Permit.

5. The reference to Level of Service for the Bishop Street/King Street intersection has been corrected on page 85 of Chapter Four (Section 4.7.3.3, Table 4-9).

6. The map was developed as part of the Kakaako Mauka Area Plan Supplemental EIS Transportation Analysis, April 14, 2009, and was included in the Draft EIS for the TOD Overlay Plan as a way to illustrate previous plans for the District as part of the Future Baseline Condition. As such, the base map cannot be modified. However, we will include an annotation on top of the map to indicate the street as "Existing".

7. Acknowledged.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

SUBJECT: **DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS), KAKA'AKO COMMUNITY DEVELOPMENT DISTRICT (KCDD)**
Honolulu District, Island of Oahu
TMK: Various in: Aloha Tower Special District & Kaka'ako

To whom it may concern,

We are in receipt of your request for comments dated *January 12, 2015*, regarding the Draft Environmental Impact Statement (DEIS) for the proposed Transit Oriented Development (TOD) Overlay Plan for the *Kaka'ako Community Development District* (KCDD).

The Office of Conservation and Coastal Lands (OCCL) has reviewed your DEIS and would like to recognize and acknowledge your commitment to addressing potential long- and short-term influences on the proposed project in regard to Global Climate Change and subsequent Sea Level Rise. This is especially relevant for the development of low-lying areas such as Kaka'ako.

Act 83 (*HB 1714*), or the *Hawaii Climate Adaptation Initiative Act*, aims to address the potential effects of Global Climate Change and Sea Level Rise on Hawaii's existing and future infrastructure, environmental resource management, and development. At this time the OCCL and the Office of Planning (OP) are coordinating the development of a State-wide *Sea Level Rise Vulnerability and Adaptation* report that will provide guidance for future development projects; therefore we would appreciate a continued involvement in the planning process.

If you have any questions regarding this correspondence please contact Alex J. Roy, M.Sc. of our Office of Conservation and Coastal Lands staff at 808-587-0316.

Sincerely,

Samuel J. Lemmo, Administrator

COMMENTS

(X) We confirm that the project site, according to the Flood Insurance Rate Map (FIRM), is located in Zones AE, VE, and X. The National Flood Insurance Program regulates developments within Zones AE and VE as indicated in bold letters below, but not in Zone X.

( ) Please take note that the project site, according to the Flood Insurance Rate Map (FIRM), is also located in Zone ____.

( ) Please note that the correct Flood Zone Designation for the project site according to the Flood Insurance Rate Map (FIRM) is ___.

(X) Please note that the project site must comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR), whenever development within a Special Flood Hazard Area is undertaken. If there are any questions, please contact the State NFIP Coordinator, Ms. Carol Tyau-Beam, of the Department of Land and Natural Resources, Engineering Division at (808) 587-0267.

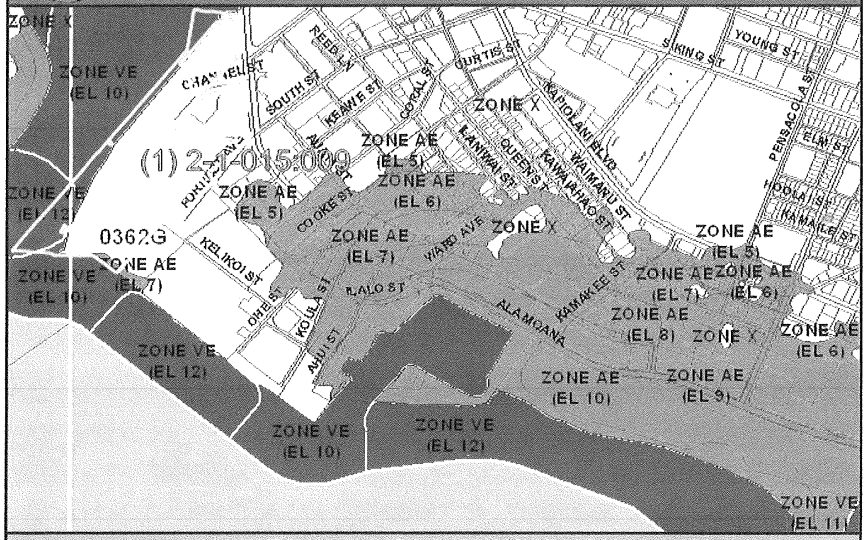
Please be advised that 44CFR indicates the minimum standards set forth by the NFIP. Your Community's local flood ordinance may prove to be more restrictive and thus take precedence over the minimum NFIP standards. If there are questions regarding the local flood ordinances, please contact the applicable County NFIP Coordinators below:

(X) Mr. Mario Siu Li at (808) 768-8098 of the City and County of Honolulu, Department of Planning and Permitting.
( ) Mr. Frank DeMarco at (808) 961-8042 of the County of Hawaii, Department of Public Works.
( ) Ms. Carolyn Cortez at (808) 270-7253 of the County of Maui, Department of Planning.
( ) Mr. Stanford Iwamoto at (808) 241-4896 of the County of Kauai, Department of Public Works.

(X) The applicant should include project water demands and infrastructure required to meet water demands. Please note that the implementation of State-sponsored projects requiring water service from the Honolulu Board of Water Supply system must first obtain water allocation credits from the Engineering Division before it can receive a building permit and/or water meter.

(X) The applicant should provide the water demands and calculations to the Engineering Division so it can be included in the State Water Projects Plan Update.

( ) Additional Comments: _____



( ) Other: _____

Should you have any questions, please call Mr. Dennis Imada of the Planning Branch at 587-0257.

FLOOD HAZARD ASSESSMENT REPORT

NATIONAL FLOOD INSURANCE PROGRAM

FLOOD ZONE DEFINITIONS

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD – The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zone A, AE, AH, AO, V, and VE. The Base Flood Elevation (BFE) is the water-surface elevation of the 1% annual chance flood. Mandatory flood insurance purchase applies in these zones:

- **Zone A:** No BFE determined.
- **Zone AE:** BFE determined.
- **Zone AH:** Flood depths of 1 to 3 feet (usually areas of ponding); BFE determined.
- **Zone AO:** Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined.
- **Zone V:** Coastal flood zone with velocity hazard (wave action); no BFE determined.
- **Zone VE:** Coastal flood zone with velocity hazard (wave action); BFE determined.
- **Zone AEF:** Floodway areas in Zone AE. The floodway is the channel of stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without increasing the BFE.

NON-SPECIAL FLOOD HAZARD AREA – An area in a low-to-moderate risk flood zone. No mandatory flood insurance purchase requirements apply, but coverage is available in participating communities.

- **Zone XS (X shaded):** Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.
- **Zone X:** Areas determined to be outside the 0.2% annual chance floodplain.

OTHER FLOOD AREAS

- **Zone D:** Unstudied areas where flood hazards are undetermined, but flooding is possible. No mandatory flood insurance purchase requirements apply, but coverage is available in participating communities.

Dear Mr. Tsuji:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter that was received by HCDA on February 19, 2015 commenting on the above document. Following are our responses to your comments in the order they were presented.

We note that the Land Division has no comments.

We received the comments from the Office of Conservation and Coastal Lands in a separate letter dated January 30, 2015. The letter from OCCL you enclosed is a duplicate. Our response to the original letter is as follows:

> *"Mahalo for your expression of support for our efforts regarding global climate change and sea level rise. We look forward to the completion of your report on sea level rise and adaptation and to your involvement in the planning process."*

Our responses to comments from the Engineering Division follow:

1. We acknowledge your confirmation of the KCDD's flood zone designations.

2. HCDA acknowledges the requirement that developments comply with the rules and regulations of the National Flood Protection Program.

3. The potable water demands of the project are presented on page 233 of Chapter Four. Section 4.11.1.2 of Chapter Four presents the infrastructure requirements needed to address projected potable water demand. HCDA acknowledges the need for projects that require new water service to obtain water allocation credits from the Engineering Division before Building Permits and/or a water meter is approved.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

HAWAII COMMUNITY DEVELOPMENT AUTHORITY

IN REPLY REFER TO:
AIR-EP
15.0013

February 11, 2015

Mr. Anthony J.H. Ching
Executive Director
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Dear Mr. Ching:

Subject: Kakaako Community Transit Oriented Development Overlay Plan
Draft Environmental Impact Statement (DEIS)

We have reviewed the subject DEIS and have the following comments:

- The entire Kakaako Transit Oriented Development (TOD) Overlay Plan falls within the airspace of Honolulu International Airport and is a major concern for aircraft departing the Airport.
- Of particular concern to Airports Division is TOD Alternative A, where building forms could rise to 700 feet with an option for a cluster of 420-550 feet tall high-rise towers. Any structure that is more than 400 feet high is a major concern for the airlines in this area, due to the one-engine inoperative (OEI) emergency procedure for commercial aircraft. The airlines currently adjust their load factor to take into account the OEI procedure for each aircraft. However, due to the cumulative impact of the number of buildings and the height of the towers being proposed, this OEI procedure becomes more challenging for the airlines and could result in a huge economic loss for the airlines as well as the State. This OEI procedure needs to be examined further and taken into account in terms of the height and location of the buildings by consulting with the airlines.
- The Airports Division strongly recommends to the Hawaii Community Development Authority (HCDA) that the height limit be under 400 feet within the Pauahi and Auahi designated areas in the Kakaako Community TOD Overlay Plan.
- The developer is required to file Federal Aviation Administration (FAA) Form 7460-1, "Notice of Proposed Construction or Alteration" on a case by case basis. This form can be filed online at https://oeaaa.faa.gov/oeaaaexternal/portal.jsp.
- The developer, in addition to filing FAA Form 7460-1 with the FAA, will need to submit their proposals to the Airports Division for review and comment.
- This FAA Form 7460-1 should also be included in the list of "Required Permits and Approvals" in Section 2.5 on page 39.

Should you have any questions regarding the above, please contact Mr. Roy Sakata, Oahu District Manager, at (808)836-6533.

Sincerely,

ROSS M. HIGASHI
Deputy Director – Airports

Ref. No.: PL TOD 18.3

June 10, 2015

Mr. Ross M. Higashi
Deputy Director – Airports
Department of Transportation
State of Hawaii
869 Punchbowl Street
Honolulu, Hawaii 96813-5097

Dear Mr. Higashi:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 11, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

1. We acknowledge that the TOD Overlay Plan Area is located within airspace of the Honolulu International Airport.

2. We acknowledge your advisory concerning one-engine inoperative engine procedures.

3. In 2014, the State Legislature adopted a height limit for Kakaako of 418 feet (including allowances for appurtenant structures atop buildings such as elevator machinery etc.). Thus, Alternative A cannot be implemented unless the State Legislature rescinds its previous legislation.

4. Please be advised that we received a comment letter from the FAA on January 19, 2015. HCDA acknowledges that the filing of Form 7460-1 is conducted on a case-by-case basis and has acknowledged that requirement to the FAA as well.

5. As HCDA receives development applications from individual landowners, they will be submitted to the Airports Division for review.

6. We have included FAA Form 7460-1 in the FEIS' list of Required Permits and Approvals.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching
Executive Director

Subject: **Draft Environmental Impact Statement ("DEIS") for the Kaka'ako Community Development District Draft Transit-Oriented Development Overlay Plan**

Thank you for the opportunity to review and comment on the DEIS for the Kaka'ako Community Development District ("KCDD") Draft Transit-Oriented Development Overlay Plan (the "Draft TOD Overlay Plan"). Victoria Ward Limited ("VWL"), by and through its affiliate, The Howard Hughes Corporation ("Howard Hughes"), respectfully submits its comments regarding the DEIS for the Draft TOD Overlay Plan for your consideration and incorporation into analysis of impacts at KCDD.

As explained in a previous letter to Mr. Anthony Ching, Executive Director, Hawaii Community Development Authority ("HCDA") dated September 3, 2014, a copy of which is enclosed, it is our understanding that the HCDA, in preparing a DEIS for the Draft TOD Overlay Plan, would include the improvements listed below. Notwithstanding the foregoing, it appears that several of the improvements (as identified below) were not addressed.

1. Narrowing of Auahi Street from 4 lanes of travel to 2 lanes of travel: The DEIS does not address this improvement.

2. Road widening along Queen Street and intersection improvements at Queen Street and Kamake'e Street: The DEIS does not address this improvement.

3. Removal of the Cummins Street extension: The DEIS does not address this improvement. In contrast, Figure 4-4: Planned and Proposed Roadway Network Changes (Future Baseline Condition) depicts the extension of Cummins Street to Ala Moana Boulevard.

4. Alternative for preserving the Auahi Street east-west connection in lieu of the Pohukaina Street re-alignment: The Draft TOD Overlay Plan indicates in relevant part that:

> The proposed connection of Auahi to Pohukaina as part of the Howard Hughes development presents an opportunity to create a pedestrian-oriented commercial street. This street would provide a

The Howard Hughes Corporation

www.howardhughes.com

secondary bicycle connection allowing local bike traffic to access retail and services from this corridor. A standard sharrow treatment and bicycle wayfinding signage would be appropriate for this corridor.

See Exhibit A to the DEIS for the Draft TOD Overlay Plan, which is a copy of the Draft TOD Overlay Plan, at Section 5-56 to 5-57. Nevertheless, the DEIS does not address this improvement.

5. Addition of bike lanes and/or shared paths along Auahi Street, Kamake'e Street, Halekauwila Street, Ward Avenue, and other streets within Ward Village: VWL is pleased to note that potential changes to the roadway network under the Proposed Action described in TOD Alternative A include, in relevant part, the designation of primary (separated) and/or shared bicycle paths on Auahi, Kamake'e Street, Halekauwila Street, Ward Avenue, and other streets within Ward Village. See DEIS, Chapter 4, Figure 4-19: Proposed Bicycle Priority Streets – Proposed Actions; see also DEIS, Chapter 4, Section 4.7.8.1.

6. Traffic improvements throughout Ward Village as discussed and identified in the Traffic Impact Report for Victoria Ward Development Phase 2 (June 2014). The DEIS does not address these improvements.

7. Related miscellaneous improvements at various roadway intersections in the region to include, but not limited to, intersection traffic signalization and modifications, left-turn lane, auxiliary lane, lane configuration, pedestrian ways, bikeways and other types of intersection control: Several miscellaneous improvements at various roadway intersections in the KCDD are included in the Draft TOD Overlay Plan at Sections 5-16, 5-17, 5-25 to 5-33, 5-56 to 5-57, 6-30, 7-10 to 7-14. In addition, Section 3.6 of the Transportation Analysis attached as Appendix "D" to the DEIS, relating to the Future Baseline Condition, includes intersection improvements.

8. Raising of Auahi Street by approximately 3' between Ward Avenue and Kamake'e Street with the appropriate slopes to account for transitions and drainage: The DEIS does not address this improvement.

9. Addition of sewer mains in Ward Avenue, Auahi Street, Kamake'e Street, Queen Street and future Halekauwila Street extension: VWL notes that the Future Baseline and TOD Alternative A scenarios included the following improvements:

- Install a 24" relief sewer in Ward Avenue between Ilaniwai and Auahi Streets;
- Reroute the 48" trunk sewer from the Ross Dress for Less and Sports Authority stores into Ward Avenue;
- Replace the 6" sewers in Pohukaina Street between Koula and Ward Avenue with 12" sewers;

The Howard Hughes Corporation
1240 Ala Moana Boulevard
Suite 200
Honolulu, Hawaii 96814

T 808.591.8411
F 808.596.4919
www.howardhughes.com

- Install a 36" sewer in Auahi Street between Kamakee Street and Ward Avenue; and
- Replace the 8" sewer in Auahi Street between Kamakee Street and Queen Lane with a 12" sewer.

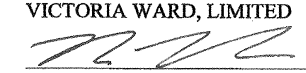
See DEIS, Chapter 4, Section 4.11.2.2, at pages 242-243.

10. Relocation of the existing East End 48-inch sewer main along Queen Street, Ward Avenue, and Auahi Street: The DEIS does not address this improvement.

11. Relocation of 2 existing box culvert crossings on Auahi Street: The DEIS does not address this improvement.

12. 12-inch waterline along Queen Street from Cooke Street to the existing 12-inch main located between Cummins and Kamake'e Streets: VWL notes that the DEIS included this improvement in evaluating future development scenarios. See DEIS, Chapter 4, Section 4.11.1.2, at pages 233-234.

13. Undergrounding of electrical, communication, and cable system along Auahi Street: The DEIS does not address the undergrounding of electrical, communication, and cable system along Auahi Street, specifically. However, the DEIS includes undergrounding, generally, within the KCDD. See DEIS, Chapter 4, Sections 4.11.5.2 and 4.11.7.2.



14. Addition of electrical, communication, and cable system along Ilaniwai Street, Halekauwila Street, Pohukaina Street re-alignment, and Halekauwila Street extension: See comments immediately above in paragraph 10.

VWL is concerned that the DEIS did not address several improvements identified above, which have been clearly contemplated and planned during the next few years as VWL implements the Ward Neighborhood Master Plan. We are concerned that the DEIS has not addressed the necessary cumulative impacts. The impacts related to these improvements, which are near term in timing, should be considered in the DEIS.

VWL appreciates the opportunity to participate in this planning process and to offer comments. Please feel free to contact me should you have any questions regarding the above comments.

Sincerely,

Ref. No.: PL TOD 18.3

June 10, 2015

Mr. Nicholas D. Vanderboom
Senior Vice President
The Howard Hughes Corporation
Victoria Ward, Limited
1240 Ala Moana Boulevard, Suite 200
Honolulu, Hawaii 96814

Dear Mr. Vanderboom:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 20, 2015 commenting on the above document.

The purpose of the EIS is to identify the impact of the TOD Overlay Plan when implemented in the Mauka Area of the KCDD. As discussed in the EIS, the Ward Neighborhood Master Plan has been previously approved by the HCDA and is, therefore, considered to be part of the Future Baseline Condition. Most of the improvements identified in your letter appear to be improvements necessary to implement the Ward Neighborhood Master Plan. As such, they are outside the scope of the Draft TOD Overlay Plan and its corresponding EIS. As a programmatic-level effort, the EIS is not intended to address the potential development actions of a single landowner. If any of the improvements proposed by The Howard Hughes Corporation in implementing the Ward Neighborhood Master Plan has requirement to comply with the provisions of Chapter 343, Hawaii Revised Statutes, that obligation rests with The Howard Hughes Corporation.

Additionally, we provide the following response to your comment #3, and #4.

1. Extension of Cummings Street to Ala Moana Boulevard is not a new addition in the TOD Overlay Plan but a continuation of proposed connection established in the Mauka Area Plan and Rules. The Howard Hughes Corporation may request plan and

rule amendment to address Cummings Street extension. The process of requesting plan and rule amendment is provided in Hawaii Administrative Rules, Sections 15-219-67 through 15-219-72.

2. Extension of Pohukaina Street to Auahi Street is not a new proposal in the TOD Overlay Plan but a continuation of proposed extension established in the Mauka Area Plan and Rules.. The Howard Hughes Corporation may request plan and rule amendment to address Pohukaina Street extension. The process of requesting plan and rule amendment is provided in Hawaii Administrative Rules, Sections 15-219-67 through 15-219-72.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching
Executive Director

RE: Draft Environmental Impact Statement Kaka`ako Community Development District – Transit Oriented Development Overlay Plan dated January 8, 2015

Dear Mr. Neupane:

Servco Pacific Inc. ("***Servco***") is the current owner of the real property located at (a) 609 South Street on which it maintains its Motor Imports Parts and Service facility serving Toyota, Scion and Suzuki automobiles (the "***Servco South Street Property***"), and (b) 650 Kapiolani Boulevard on which it maintains its Lexus dealership and service department, and 645 Kapiolani Boulevard on which it maintains its pre-owned Lexus and used vehicle dealership (collectively, the "***Servco Kapiolani Property***"). The Servco South Street Property and the Servco Kapiolani Property will be directly impacted by the proposed Transit Oriented Development Overlay Plan for Kakaako (the "***TOD Overlay Plan***") as described and set forth in the Draft Environmental Impact Statement for Kaka`ako Community Development District - Transit Oriented Development Overlay Plan dated January 8, 2015 (the "***Draft 2015 EIS - Kakaako TOD Overlay Plan***").

Based on its review of the Draft 2015 EIS - Kakaako TOD Overlay Plan, Servco has certain concerns relating thereto and has set forth below the follow comments for consideration:

1. September 2013 Letter. In response to the early 2013 Draft Kakaako TOD Overlay Plan, Servco submitted a comment letter dated September 17, 2013 (the "***September 2013 Letter***"), a copy of which is attached as part of the Written Comments Section, and Hawaii Community Development Authority ("***HCDA***") responded to those comments by letter dated January 24, 2014, a copy of which is also attached as part of the Written Comments Section. A number of the responsive comments were "Your comment ... is noted" or "Your recommendation ... is noted". Servco does not feel those are appropriate responses and requests clarification and an affirmative response as to how HCDA intends to address those comments under the proposed TOD Overlay Plan.

2. Opt Into TOD Overlay Plan. While Servco realizes that as a result of Act 61 (limiting building heights in Kakaako) there are two (2) alternative TOD Overlay Plans identified as "TOD Alternative A" and "TOD Alternative B", Servco still finds it unclear as to the process by which a landowner opts into the TOD Overlay Plan. Servco understands that the final TOD Overlay Plan is still not intended to be mandatory as to the affected Kakaako lands, but rather will contain a mechanism by which the landowner may opt in, but only if the landowner so chooses. Furthermore Servco understands that a landowner will not be allowed to pick and choose between the Kaka`ako District Mauka Area Rules and the TOD Overlay Plan. Servco

feels that the non-mandatory nature of this opt in mechanism should be clarified and that it should be clearly and expressly stated that the TOD Overlay Plan is not mandatory as to the affected lands, and the landowner/developer cannot pick and choose, but must affirmatively elect to follow either the TOD Overlay Plan or the Kaka'ako District Mauka Area Rules. A combination of both cannot be used for development of any site in the Kakaako District. Servco also continues to recommend that the TOD Overlay Plan clarify whether this election is a one-time only decision by the landowner or when it next seeks to redevelop its land after adoption of the TOD Overlay Plan, or if a subsequent redevelopment of the parcel would allow for a separate opt in election / option.

3. Infrastructure: Please clarify if the intention under the TOD Overlay Plan is to make special improvement assessments against individual and benefitted Kakaako landowners for the cost of street modifications, upgrading water, drainage and sewer capacity. If so what is the percentage of such costs which will be borne by the individual landowners? Will the TOD Overlay Plan simply adopt and incorporate the District Wide Improvement provisions under the Kaka`ako District Mauka Area Rules or is the intention to have separate modified rules to reflect the increased development density?

4. Parking: Throughout the Draft 2015 EIS – Kakaako TOD Overlay Plan, there are references to a drop in the ratio of parking spaces desired per unit. How has or will this reduction be determined? If a survey was conducted, who was surveyed? There is also reference to the removal of on-street parking from certain streets. Has appropriate consideration been given to the potential negative impact this will have on the various Kakaako businesses who depend on the use of on-street parking by their customers?

5. Figures/Tables: It is very difficult to read the street names, which are often too small or too light in contrast. This is important as it provides the reader with a point of reference when reviewing the figure/table. Also, the legend for various figures/tables is often unclear or again, the contrast is poor. This may be the result of attempting to downsize a large map or figure to 8-1/2 x 11 inch size. Servco recommends some link to a larger size version that the reader may access and/or download.

6. New Transit Plaza Associated with the Civic Center Station: There are references to integrating a new transit plaza associated with the Civic Center Station adjacent to the Servco South Street Property. (See for example Page 5, 20 and 310.) It is unclear where this transit plaza is intended to be located and who will be constructing the new transit plaza – HCDA, HART or a private entity/developer? If this is part of the requirements for the proposed Stanford Carr development on the property makai of the Servco South Street Property, it should be so stated. In Servco's September 2013 Letter it stated a concern that a reader might presume that a transit plaza must be developed for the Civic Center Station. If that is not the case it should be clearly stated that references to a transit plaza associated with the Civic Center Station are only for illustrative purposes, and will not be a governmental requirement with respect to the Civic Center Station.

7. Page 15, *Traffic*, Bullet 4: It should be clarified as to how an "industrial street" is to be defined or to clearly define it in the text.

8. Page 15, *Social*, Bullet 1: It should be explained as to what type of revision is being considered to the existing reserved housing program and how in the context of the TOD Overlay Plan this will lead to an to increase in the amount of affordable housing in the District. Is there a time schedule to develop and implement this revised and expanded reserved housing program? This is an important component to be considered by any landowner contemplating redevelopment within the Kakaako District under the TOD Overlay Plan.

9. Page 55, Table 4-3 Newly Identified Cultural Resources; Page 65: There should be an explanation or example as to how the future development and use by the landowners of the properties on which places/businesses are listed on this table will be affected or impacted by this designation. As an example, item 33 is Fresh Café and Loft in Space. There is no explanation or guideline provided as to how this business was selected for inclusion as part of a distinct cultural group. If this designation is made, will the landowner have the right to use the property for another purpose or will there be some approval or financial penalty for doing so? How should a comment (page 65) such as "One mitigation measure may be to encourage lessors to offer adjusted rent spaces for these and similar institutions" impact the landowner? The overall TOD Overlay Plan appears to be based on a plan to incentivize certain desired types of development within the TOD areas, and in that context wouldn't this designation be viewed as a negative incentive?

10. Page 132, Traffic and Rail Noise: This particular bullet point ends with the sentence "the use of 3-foot high sidewalls seemed to be included in the current design". What assurance does Servco and the public have that these 3-foot high sidewalls will be included in the current design to mitigate the noise? What evidence can be provided that it provides worthwhile mitigation of the contemplated rail noise?

11. Service Streets – 650 Kapiolani / South Street: In Servco's September 2013 Letter, Servco requested clarification of a service street between Servco's 650 Kapiolani Property and the adjacent One Kapiolani building property. However, at that time Servco did not mention its concern about another proposed service street which appears to be located on the mauka side of the Servco South Street Property and the adjacent property (Page 30, Figure 2-7 Current KCDD Street Grid and Potential Future Connections). Servco would also like this concern addressed at this time. Servco does not understand how HCDA could make a unilateral decision as purportedly shown in this Figure to place a service street between two properties, without consultation with the affected landowners. Servco requests that HCDA identity from which property it is intended that a taking will occur in order to create the service street as shown.

12. Treatment of Developable Floor Area from Property Acquire by HART: Servco made a general comment in its September 2013 Letter on the 2013 Draft Kakaako TOD Overlay Plan that the TOD Overlay Plan should state the manner in which HCDA will handle the floor area attributable to the land areas being acquired within the Kakaako District by the City/HART for its rail project. As a result of HART identifying a portion of the Servco South Street Property for acquisition in connection with the planned rail project this is a very real issue/concern for Servco and, in Servco's view, any other landowner within the Kakaako District facing a similar situation. Servco continues to believe that it would be appropriate for the TOD Overlay Plan to include a provision which provides that if the City/HART agrees as part of its acquisition of

private lands for its rail project in the Kakaako District that the floor area for development purposes attributable to the land areas so acquired by the City for its rail project will remain with and be usable by the landowner whose land was so taken, and that HCDA will accept and recognize the retention of such floor area.

Servco requests confirmation of the manner in which it will receive responses to its comments set forth above, and also how HCDA intends to keep the greater Kakaako community informed of its responses to all comments and/or questions provided during the public comment period on the Draft 2015 EIS - Kakaako TOD Overlay Plan.

Finally, Servco requests information regarding the current projected timetable for HCDA to (a) issue a Final EIS – Kakaako TOD Overlay Plan, (b) finalize its selection of TOD Alternative A or TOD Alternative B, and (c) adopt final rules for implementing the TOD Overlay Plan. Servco feels it is important for all Kakaako landowners to have a realistic idea as to when these contemplated changes to the manner in which development within the affected areas of Kakaako will be handled will be a reality. It will impact near term business planning within the Kakaako District.

If you have any questions or would like to meet with us to discuss our comments and concerns, please feel free to contact Karen Shimizu at 564-1399 or myself at 564-1344. Thank you.

Sincerely,

SERVCO PACIFIC INC.

Ref. No.: PL TOD 18.3

June 10, 2015

Ms. Carol K. Lam, Senior Vice President
Servco Pacific Inc.
2850 Pukoloa Street, Suite 300
Honolulu, Hawaii 96819

Dear Ms. Lam:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 23, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

1. We regret that you do not feel that some of HCDA's responses to your September 2013 letter regarding the Draft TOD Overlay Plan were "appropriate". Of the 25 comments presented in the letter, twenty of HCDA's responses were detailed. Five responses were briefer. Your comment #3 expressed a concern about a figure being misinterpreted and we responded that an appropriate disclosure would be provided. Your comment #10 recommends the inclusion of a legend for the colors used in Figure 3-5 of the TOD Overlay Plan. HCDA is, in fact, considering whether such a legend will be added to the figure. Your comment #18 requests that specific language be added to Figure 7-13 of the TOD Overlay Plan to clarify that it is merely an illustration. HCDA decided to wait to see if any others had difficulty in interpreting the meaning of the figure before deciding whether any changes were warranted. No other comments were received. At this point in time, no revisions are anticipated. Your comment #19 expresses a concern that the recommendation might extend to others beside those who opt into the TOD Overlay Plan. That is not HCDA's intent. And finally, your comment #21 expresses your belief that the recommendation does not make any sense. As is the case with your comment #18, HCDA has waited to

see if any other parties have expressed a similar concern. To date, they have not. HCDA has not yet determined whether Rule Change PT3.1 will be included in the Final TOD Overlay Plan.

2. You raise a valid concern that will be addressed during final rule making for the TOD Overlay Plan.

3. A determination regarding the assessment of infrastructure improvement fees has not yet been made. Once the EIS process has been concluded, the proposed rules to implement the TOD Overlay Plan will be reviewed for finalization. Infrastructure improvements will be most likely implemented as district wide improvement projects as provided for in Hawaii Revised Statutes §206E-6. The HCDA is required to adopt rules for implementing district wide improvements and your concern will be addressed at that time.

4. No parking survey has been conducted. The Draft TOD Overlay Plan presents a generalized desired outcome for parking. Once the EIS review process has been completed, the Draft TOD Plan will be finalized, and at that time, all comments received regarding it will be addressed and potential rule changes will be reviewed and adjusted, if needed, prior to being made available for public review. The availability of on-street parking for Kakaako businesses is a valid concern.

5. We appreciate your comment regarding the legibility of figures and tables. We agree that the provision of this information on-line will aid in its readability.

6. As indicated in our response to your comment #11 of your September 2013 letter, a transit plaza is not mandatory but is consistent with HCDA's vision. Whether it would be constructed, and by whom, is not known at this point in time. It is, therefore, not a formal requirement.

7. The following definition has been added to the Glossary of Terms in the Final EIS:

   "Shared Industrial Street: A street in Central Kakaako whose usage includes frequent vehicular activity related to abutting light industrial uses along it."

8. The bullet you identify is located on page 15 of the EIS's Executive Summary. It is not intended as an exhaustive cross-referenced list of every detail in the document. As identified in the Table of Contents for Chapter Four, a discussion of the HCDA's revised Reserved Housing policy is presented in Section 4.10.5.2 of Chapter Four.

9. Table 4-3 in Chapter Four is intended to summarize the findings of the Supplemental Cultural Impact Statement regarding newly identified cultural resources. It is followed by an extensive discussion of each resource category beginning on page 59 of Chapter Four and ending on page 65. The methodology employed for identifying new cultural resources begins on page 58 in Chapter Four. Please understand that the new identifications do not indicate "groups" as stated in your letter. They indicate "cultural resources". This designation is not intended to impose any restrictions or limit any rights or use. Rather, it is intended to acknowledge that contemporary resources can have a cultural value. HCDA acknowledges that ultimately the market will decide over the long term whether identified cultural resources survive in place, relocate, or disappear. The EIS is intended to disclose information.

10. The implementation of noise mitigations on the elevated rail line is the responsibility of HART. Your question is best addressed to HART. The noise study HART conducted for its EIS evaluating the impacts of rail concluded that the 3-foot high parapets were adequate. The TOD Overlay Plan EIS is disclosing that information.

11. The Draft TOD Overlay Plan and the EIS that evaluates it present initial recommendations, not final unilateral decisions. The recommendation is based upon a detailed study conducted by the traffic consultant retained by HCDA. If this recommendation were to be implemented, it would likely require the acquisition of land from both adjoining parcels.

12. Your comments about floor area and takings raise a valid concern. The HCDA believes that it can be resolved in the manner you have proposed as an agreement between Servco and City/HART.

This letter responding to your comments will be mailed to you and will also be included in the Final EIS for the TOD Overlay Plan together with your comment letter, as will all other comment letters and HCDA's response letters thereto.

The HCDA anticipates submitting the Final EIS for acceptance to the Governor's Office through the Office of Environmental Quality Control by the end of June 2015. The Final EIS will be published in the Environmental Bulletin after acceptance by the Governor's office. The HCDA will initiate TOD Plan finalization and TOD Rule making process once the Final EIS is accepted by the Governor's office and published in the Environmental Bulletin.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

Mr. Anthony J. H. Ching, Executive Director
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Attention: Ms. Amy Mutart

Dear Mr. Ching:

Subject: Transit Oriented Development (TOD) Overlay
Kakaako Community Development District (KCDD)

Thank you for providing the Honolulu Authority for Rapid Transportation (HART) with the opportunity to comment on the Hawaii Community Development Authority (HCDA) KCDD TOD Overlay Plan Draft Environmental Impact Statement (DEIS) dated January 8, 2015, with notice published in the *Environmental Notice* on January 8, 2015. The DEIS discusses two TOD alternatives: Alternative A, which examines TOD opportunities when the maximum building height is 700 feet; and Alternative B, which examines TOD opportunities when the maximum building height is 418 feet. Both TOD alternatives incorporate strategies identified in the Draft TOD Overlay Plan published May 20, 2013 (Appendix A to the DEIS). HART supports HCDA's overall effort to develop a TOD Overlay Plan in the KCDD. We would like to provide clarification with respect to the Honolulu Rail Transit Project (HRTP) and feedback on the following aspects of the DEIS:

- **Terminology:**
  - The HRTP employs a rail technology called "light metro." Please note that references to the rail technology should be termed light metro instead of light rail, rail rapid transit, HART rapid transit, or any other iteration thereof.
  - The rail project should be referred to as the "Honolulu Rail Transit Project" or "HRTP," not "HART." HART is the semi-autonomous agency of the City and County of Honolulu (City) that is responsible for the development and construction of the HRTP. See, e.g., page 9 of the Executive Summary of the DEIS ("The fixed guideway transit system – HART – is presently under construction.")
  - Page 7-24 of the Draft TOD Overlay Plan (Appendix A) regarding Alternative A employs the term "dual columns." This should be replaced with the term "straddle bent columns."

- **Downtown Station:**
  - The DEIS states that HART will provide a pedestrian overpass over Nimitz Highway at the Downtown Station (Draft TOD Overlay Plan pages 5-8 and 7-18 of Appendix A to the DEIS). This concourse enables rail passengers to directly access the station from either side of the highway. HART encourages HCDA to coordinate with the City and the Hawaii Department of Transportation Highways Division, which has jurisdiction over Nimitz Highway, to enhance the pedestrian crosswalk at this location.
  - HART supports the concept of a pedestrian-scramble intersection, as mentioned in Station Access (SA) 9.2 of the Draft TOD Overlay Plan (page 7-18 of Appendix A to the DEIS), and suggests considering a signalized left turn from Bishop Street to Nimitz Highway in the diamond head-bound direction.
- **Parking:** The DEIS recognizes the need to provide for and manage limited vehicle access to transit stations (Draft TOD Overlay Plan, SA4, page 7-7 of Appendix A to the DEIS). HART would like to emphasize that it is coordinating with the City's Department of Transportation Services (DTS) to accommodate transit passenger drop-off by TheBus or TheHandi-Van close to the stations. HART includes at least one service vehicle access easement at each transit station. Due to site constraints, HART is not providing automobile parking at any of the stations in the KCDD. Any short- or long-term parking, as well as kiss-and-ride drop-offs, would have to be provided by the City, HCDA, or private land owners.
- **Bicycle Connectivity:** The DEIS encourages bicycle connectivity and storage at the HRTP stations and on the trains (Draft TOD Overlay Plan, SA3, page 7-5 of Appendix A to the DEIS). HART is designing the system to accommodate bicycles on assigned trains, as well as narrow ramps along stairs ("bike troughs") at stations to assist rail passengers in maneuvering their bicycles through station level changes. HART is also providing bicycle racks at each station for passengers who prefer to park their bikes while they ride the train. At certain stations where it can be accommodated, HART may support the installation of bicycle lockers. HART also notes that construction of a cycle track under the guideway, as identified in Figure 5-16 Potential Cycle Track on Halekauwila and described on page 5-56 of the Draft TOD Overlay Plan (Appendix A of the DEIS), will need to address relevant safety, security, and maintenance considerations.
- **Transit:** HART supports SA2 Maximize feeder transit connectivity of the Draft TOD Overlay Plan (page 7-5 of Appendix A to the DEIS), which encourages "a seamless connection between feeder bus routes and the rail line." Although most of Kakaako will be within convenient walking distance to a rail transit station, the development of intermodal transit facilities, such as a transit center, will help to enhance mauka-makai connections for workers, patrons, and other users in Kakaako. Such facilities could also enhance regional connectivity for areas not currently served by the rail system, such as East Honolulu or even Windward Oahu. Priority bus facilities along key arterials such as South Street or Ward Avenue will also help to facilitate mobility.

- **Pedestrian Access:** The DEIS suggests several pedestrian improvements along Halekauwila, Queen, and Pohukaina Streets (Draft TOD Overlay Plan, SA8.2, page 7-14 of Appendix A to the DEIS). HART supports the suggested improvements and encourages HCDA to coordinate with the City DTS and Department of Planning and Permitting to develop those pedestrian improvements around rail stations.
- **Signage and Wayfinding:** HART has developed a signage and wayfinding manual for areas within the limits of the stations. Although this manual precedes an external signage and wayfinding plan, the station specific manual aligns with the goals of SA5 Ensure Clear Wayfinding in the Station Area of the Draft TOD Overlay Plan (page 7-7 of Appendix A to the DEIS), regarding MA5 Implement a Coordinated Signage and Wayfinding Program of the Draft TOD Overlay Plan (page 5-20 of Appendix A to the DEIS). HART will work with HCDA, the City, and other private and public stakeholders to coordinate district-wide signage and wayfinding efforts outside of the station.
- **Rail Noise:** Section 4.8.3.1. (pages 131-133) is inconsistent with the Honolulu High-Capacity Transit Corridor Project (HHCTCP, now known as the HRTP) Final Environmental Impact Statement (FEIS)/Section 4(f) Evaluation (June 2010) related to noise and vibration impacts generated by the HRTP. Please refer to the HHCTCP FEIS Chapter 4.10.3 Environmental Consequences and Mitigation for additional information. HART would like to clarify that in accordance with Chapter 4.10.3 of the HHCTCP FEIS, noise mitigation for the HRTP includes 3-foot high parapet walls, which are also known as sound barriers, along the guideway, wheel skirts, and sound absorptive materials under the track along the following properties in the KCDD: 860 Halekauwila Street and 1133 Waimanu Street. HART encourages HCDA to ensure that developers consider HRTP in the design of new buildings.

If you have any questions, please feel free to contact Ms. Aki Marceau, Land Use and Sustainability Manager, at 768-6177 or amarceau@honolulu.gov.

Sincerely,

Daniel A. Grabauskas
Executive Director and CEO

Ref. No.: PL TOD 18.3

June 10, 2015

Mr. Daniel A. Grabauskas
Executive Director and Chief Executive Officer
Honolulu Authority for Rapid Transportation
City and County of Honolulu
1099 Alakea Street, Suite 1700
Honolulu, Hawaii 96813

Dear Mr. Grabauskas:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 20, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

1. We will endeavor to correct references to the HRTP system.

2. Acknowledged.

3. The term will be revised in the Final TOD Plan.

4. Acknowledged.

5. Your suggestion is acknowledged. However, HCDA has no jurisdiction over the intersection of Bishop Street and Nimitz Highway.

6. Acknowledged.

7. Acknowledged.

8. Acknowledged.

9. Your suggestion is noted.

10. Acknowledged.

11. A new paragraph has been added to Section 4.8.3.1 in Chapter Four of the FEIS to improve the document's consistency with the HRTP EIS:

    "As specified in the Honolulu High-Capacity Transit Corridor Project Final EIS, noise mitigation for the Honolulu Rapid Transit Project includes 3-foot high parapet walls, which are known as sound barriers, along the guideway, wheel skirts, and sound absorptive materials under the track along the following properties in the KCDD: 860 Halekauwila Street and 1133 Waimanu Street."

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching
Executive Director

AJHC/DN

Honolulu, Hawai`i 96813

Draft Environmental Impact Statement
for the Kaka`ako Community Development District Draft
Transit—Oriented Development Overlay Plan

Hawaii's Thousand Friends has the following general and specific comments on this DEIS.

The DEIS states that HCDA will determine what course of action to take regarding TOD after the EIS process is completed. The FEIS must provide information on the time-line and the process including.

The DEIS does not mention if HCDA has the ability to grant additional height and density variances and/or exemptions over and above the incentives granted for TOD projects. This information must be included in the FEIS.

The FEIS must explain what course of action HCDA will take if public infrastructure improvements do not keep up with the increased capacity of the selected Alternative.

Best Management Practices are mentioned in the DEIS several times but there is no definition of those practices. The FEIS must provide information on what methods; measures and practices will be used during construction to "mitigate the short-term impacts of construction activities, including impacts on traffic, noise quality, and air quality."

The FEIS must provide information on the short and long-term, direct, indirect or cumulative social and economic impacts from redevelopment and new TOD on existing residential neighborhoods, businesses, Thomas Square, McKinley High School, public spaces, possible evictions from homes and businesses for redevelopment and gentrification because this information is not in the DEIS.

The FEIS must provide information on the long-term, direct, indirect and cumulative economic and social impacts from TOD projects on areas adjacent to KCDD and within the ½ mile TOD radius.

0.6 Unresolved Issues

It is stunning to read the unresolved issues identified in the DEIS and it is not explained in this document how or when these issues will be resolved.

- Lack of the relief sewer line to "resolve capacity" issues
- Lack of up to date population data from the City and County of Honolulu
- Uncertainty of "community amenities" until a time when a property's redevelopment plan is approved by HCDA
- Lack of a Parks Master Plan
- Date when implementation of the incentive based program will be implemented

0.2 Summary of Proposed action and Alternatives

- Explain what "exemplary public benefits" are and identify the process to award these benefits.
- The FEIS should explain the process HCDA will use to create the specific parameters of the incentive zoning that will be addressed during TOD Overlay rule making by HCDA. Will HCDA hold public hearings on rule making? Will the public have an opportunity to present testimony?
- The FEIS should explain the process HCDA will use in the selection of the TOD Alternative. Will HCDA hold public hearings prior to their selection? Will the public have an opportunity to present testimony on the selected Alternative?

Potable Water

- The FEIS must identify the types of water saving measures that will be required of each development.
- Will a dual water system be required for each new TOD project and redevelopment?
- Section 2.3.7.2 seems contradictory. One sentence says that the water distribution system is adequate to meet peak hour domestic demand for either alternative but describes how approximately 37,600 linear feet of existing 6 and 8-inch water mains will need to be replaced with new 12-inch diameter mains to meet both peak hour domestic demands and fire flow requirements. Which statement is correct?
- The FEIS must provide information on whether the current water distribution system is adequate to accommodate both Alternatives or whether the above improvements need to be place before approvals will be granted and construction begins.

Wastewater

- Has the site for the new pump station been selected? Will the new pump station be publically or privately funded? Has funding for the station been appropriated?
- The DEIS says that "the City is presently studying preliminary alignments for new Relief Sewer Corridors to address sewage flow outside of KCDD to help reduce demand on existing flow outside of the KCDD."
  - When will the City study be completed?
  - Explain in the FEIS if HCDA will approve projects before the City completes the study and needed infrastructure is in place.
- The FEIS must provide information on whether there is adequate capacity at the Sand Island Wastewater Treatment Plant to handle the additional wastewater generated by KCDD TOD.
- Within the 20-year horizon what has HCDA determined to be the exit point when TOD projects will no longer be socially or economically viable?

- The DEIS acknowledges that wastewater surcharge will continue to be a problem but because of the sewer line depths, spills will not occur. While wastewater may not rise to street level any wastewater outside of a pipe goes somewhere.
- The FEIS must explain where wastewater outside of a pipe goes and identify short-term, long-term, direct and cumulative impacts on public health, the environment, underground water (karsts), marine life and the ocean ecosystem from these spills.

Solid waste

- The DEIS states that "private contractor provided collection services might be required to meet future increased demands" but does not provide any information beyond that statement.
- The FEIS must provide data on the additional number of collection trucks needed to accommodate the anticipated residential and commercial growth and identify the direct, indirect and cumulative social impacts from increased noise and traffic.
- Will affordable/workforce housing projects be serviced by the city or will individual owners and renters have to pay for private solid waste collection? If it is the later explain in the FEIS the impacts of the additional costs.

Drainage

- The DEIS states that "The existing drainage system is *inadequate* to accommodate and dispose of design storm rainfall quantities in both the *existing* and *future* conditions" and that "HCDA presently has no current schedule for design or construction of improvements that have been identified to address existing deficiencies, including pavement resurfacing and new drain inlets and/or catch basins." (Emphasis added)
- The FEIS must identify the direct, indirect and cumulative impacts on public health, the environment and coastal ecosystems from the current inadequate drainage system.
- The FEIS must identify in what phase of the TOD approval process will a developer have to show that drainage is adequate for their project.
- The MAIP describes the criteria to calculate rainfall runoff and states that the existing major trunk drain lines would discharge an estimated 2,500 cubic feet per second of rainfall runoff to the ocean.
- The MAIP concludes that the existing drainage system is inadequate to accommodate and dispose of design storm runoff quantities in both the existing and future conditions.
- Since the DEIS did not identify any short or long-term, direct, indirect and cumulative impacts on human health, marine life, and coastal ecosystem from discharging 2,500 cubic feet per second of rainfall into the ocean that information must be provided in the FEIS.
- The FEIS must also identify the types of pollutants in the runoff and their impacts on marine life, coastal ecosystems, underground water and human health.
- The DEIS states "Since most of the future improvements were anticipated to be vertical development, additional rainfall runoff, due to development was anticipated to be negligible; and as such, surface water pending concerns and existing drainage system inadequacies would not be exacerbated" and while the "existing drainage system has deficiencies, the Proposed Action will not exacerbate them." This is an unsatisfactory answer.
- The FEIS must explain how the above conclusion was reached and provide a time line showing when improvements will be made to correct this intolerable situation and identify the short and long-term, direct, indirect and cumulative social, economical and environmental impacts caused by the existing inadequate drainage system.

- The FEIS must address whether the Mauka Area Infrastructure Plan recommendations on how to reduce future runoff quantities are requirements that each developer must follow or just suggestions.
- Will a National Pollutant Discharge Elimination System general permit be required for each TOD project or can/will HCDA obtain a general permit for all TOD projects?

Electricity

- The FEIS must address whether renewable energy sources will be required for each private development.
  The FEIS must identify the direct, indirect and cumulative effects on the environment and energy consumption if renewable energy are implemented for each project.
- Has the location for the proposed Cooke Street Substation been identified? Will the new substation be adequate to serve the additional loads required for all TOD Alternatives?
- The FEIS must identify the short and long-term and cumulative social and economic impacts on energy consumption and TOD projects if HECO does not build a new substation "within" and "beyond" 9 years.

Traffic/Transportation

- The DEIS states that "The increase of residents, visitors and workers in the Mauka Area will exacerbate traffic conditions" with "Slower travel times anticipated" but does not define "slower" and does not provide any information on impacts on residents and businesses within KCDD and traffic along main corridors i.e. Kapiolani, Ala Moana Blvd.
- The FEIS must provide information on the short and long-term, direct, indirect and cumulative social economics impacts of "slower" traffic on residents, businesses and traffic within and outside of KCDD.
- The DEIS states "...there are no intersections within KCDD that deteriorate from LOS E or better under the Future Baseline Condition to LOS F under the proposed action" but does not provide any information on the LOS of those intersections under either Alternative A or B.
- The FEIS must provide the same information on intersections within KCDD for Alternatives A and B and then evaluate the short and long term, direct, indirect and cumulative social, economical and environmental impacts from all three Alternatives.
- The DEIS states that "...three intersections along Ala Moana Boulevard (at South Street, Cooke St and Ward Avenue) and two on Ward Ave (at Queen Street and Kapiolani Blvd.), are forecast to operate at LOS F under Future Baseline Condition and would operate at LOS F under Proposed Action."
- The FEIS must provide information on the short and long-term, direct, indirect and cumulative social and economic impacts of the LOS F at these intersections on traffic and the quality of life of residents and businesses within KCDD and commuters outside KCDD.
- The DEIS lists mitigation measures to facilitate improved bicycle, pedestrian, and transit access within the KCDD but does not discuss how these measures will ease and improve conditions outside of KCDD. This information must be in the FEIS.
- The FEIS must explain what is meant by "Traffic delay under proposed action is not anticipated to result in a level of delay to busses requiring additional buses or operating costs compared to the Future Baseline condition. Therefore, no significant transit operations impact resulting from proposed action."
- The FEIS must explain how buses would not be delayed under the same LOS F conditions that will impact car traffic at these intersections.

- The FEIS must explain how "Rail will strengthen the connection between Kapolei, downtown Honolulu and Kaka`ako, UH Manoa and Waikiki" when the rail line is not slated to go to UH Manoa or Waikiki.
- The FEIS must identify the streets that will be "reconstructed" as "shared industrial streets,' define the purpose, and provide information on the short and long-term, direct, indirect and cumulative social and economic impacts on residents, businesses, and traffic within KCDD and outside of KCDD from implementing this change.
- The DEIS mentions inter-agency coordination and partnerships is needed to provide adequate mobility and access but does not provide information on what measures and processes have been or will be implemented to accomplish this goal. Identify the agencies involved and provide information in the FEIS.
- What type of "streetcar" identified in Figure 2-8 will be used to connect destinations within and outside of Kaka`ako? Will the "streetcar" be on a fixed rail? Explain why a streetcar is needed and how the will be different from busses.
- The DEIS states that depending on which scenario is selected TOD within Kaka`ako is anticipated to create 13,382 to 76,196 construction jobs over the next 20 years. Yet, no information on impacts is provided.
- The FEIS must provide information on short and long-term, direct, indirect and cumulative economic and social impacts from increased traffic created by construction jobs on air quality, noise, and traffic congestion within KCDD, adjacent neighborhoods and transportation corridors in and around Kaka`ako..
- To get an accurate picture of travel patterns the FEIS must provide information on how many people will travel by rail, bus, walk or bicycle to their jobs within Kaka`ako.
- Are the estimated 11,887 residential units and estimated 36,219 jobs used to develop TAZs current numbers or future numbers?

Social Impacts

- The DEIS states that an important unanswered and currently unanswerable, question is the actual timing of this build out. Yet, residents are asked to comment on developments that are anticipated to occur over 20 years.
- The FEIS must explain how the comments, predictions and mitigation measures made in this in 2015 will be still relevant in 2035.
- The FEIS needs to explain how the determination was made that "increased residential population growth within Kaka`ako due to higher densities under the Proposed Action generally means people already on Oahu would live in Kaka`ako rather than somewhere else..." and that "...that...additional full-time residential population in Kaka`ako does not mean growth in the island wide population"
- Was immigration of people moving to Oahu from other countries, other islands or other states to retire, work, or move back home or to purchase a condo as a second homes and or vacation rentals considered in making these statements?
- The DEIS states that "Market forces will in reality determine the actual development, nature, location, and characteristics of any Kaka`ako hotel." That may be true but the fact that hotels are being considered in residential and commercial areas as a part of the TOD Overlay Plan means that eventually hotels will be incorporated into KCDD and unless the social and economical impacts of introducing transient uses into areas outside of resort zoning the true impacts will never be known.
- The FEIS must provide information on the short and long-term, direct, indirect and cumulative social, economical and environmental impacts on existing neighborhoods,

traffic, businesses and quality of life from introducing hotels and tourism into the residential and commercial KCDD.

- Explain in the FEIS how approval of the FEIS does not create an entitlement to develop three hotels somewhere within an identified TOD half-a-mile zone.
- Explain in the FEIS how a "part-time resident" will help generate new jobs and what types of jobs.
- Explain in the FEIS how the conclusion was reached that "...part-time residents will conservatively not be counted among the island wide impacts" when part-time residents will use our islands resources and infrastructure..
- The FEIS must evaluate the direct and indirect social impacts on full time residents living in a condominium complex where a substantial number of condos are either lived in part-time or used as transient vacation rentals.
- The DEIS states that "...it also builds upon the current Ward Centers and Kamehameha Schools Master plans, which will have more street level activity" but does not explain in what way TOD builds on these two plans.
- The FEIS must explain how the Proposed Action builds on these plans and if the already accepted Kamehameha Schools and Ward Centers Plans can be modified or granted variances and/or exemptions to allow TOD.

Noise

- Since many travel corridors within and outside of KCDD exceed 65 DBL noise level and are considered unacceptable the FEIS must identify the short-term, long-term, direct and cumulative impacts on public health from these unacceptable noise levels.
- The FEIS must provide information on the noise level objectives for interior and exterior noise.
- Are double pane windows a requirement in TOD projects? If not, explain why.
- The FEIS must define what noise impacts are anticipated from TOD projects on current KCDD residents and identify what mitigation measures are being proposed.
- The FEIS must address the short and long-term, direct and indirect social and economic impacts to residents, businesses who will be forced to either close all windows and/or use air conditioning because of the combined outside noise of rail, construction and increased population.
- The FEIS must identify the impacts from the use of air conditioning on electrical resources.
- The FEIS must identify specific measures to address increased impacts from noise levels on parks, open spaces and recreational areas.
- The FEIS must identify what interior and exterior noise levels are acceptable in the KCDD and how those levels will be reached.

Schools

- HCDA promotes the benefits of TOD having good access to schools. Unfortunately area elementary schools Royal and Ka`ahumanu are operating at near capacity and may not be able to accommodate large surges in enrollment in the future. So walking to school is out.
- The only school option mentioned in the DEIS is the possible use of state property at 690 Pohukaina, which has been selected for reserved housing. There is no other statement about providing schools in KCDD.
- The FEIS must explain why HCDA is not requiring landowners to provide land and/or funds toward the development of schools for children that their developments will attract

- Working with the DOE projections below the FEIS must provide information on the short and long-term, direct, indirect and cumulative social and economic impacts of not planning or building new schools to accommodate the projected population.
    - TOD Alternative A at build out would generate enough students from Kaka`ako alone to fill more than three elementary schools, almost enough to fill one middle school and one high school.
    - Future Baseline Condition is almost the equivalent of one additional elementary school and about one-quarter each of additional middle and high schools
    - TOD Alternative B, the impact numbers are equivalent to 60% of one elementary school and nearly one-fifth of additional middle and high schools.
- Since schools seem to be a very low priority in this DEIS there is a concern that Kaka`ako is not being developed for families but for part-time owners and transient vacation rentals. And as shown in other sections of this DEIS the number of part-time residents out numbers permanent residents.
- What provisions has HCDA put into place to prevent KCDD from becoming dominated by part-time residents and resort type uses?
- Since it is unlikely that land within Kaka`ako will be donated for schools the FEIS must identify long-term, direct and cumulative impacts facing students living in Kaka`ako but forced to go outside their community to attend school such as the lack of community cohesiveness since schools are community gathering places, safety crossing busy streets, transportation etc.

Housing

- The DEIS states that redevelopment in the Mauka Area may result in the displacement of some tenants and/or apartment or condominium unit owners if the owner of an under-utilize property decides to redevelop to achieve the maximum allowable density. But does not provide any information on the impacts of people being moved out of there homes and businesses
- The FEIS must provide short and long-term, direct, indirect and cumulative social and economic impacts on residents and business owners displaced by redevelopment.
- The FEIS must provide information on the long-term, direct, indirect and cumulative social and economical impacts from the loss of community, loss of businesses that service those communities, residential and business relocation, whether relocation assistance will be provided by the landowner and the ability and willingness of HCDA and other state and county agencies to help with relocation.
- The FEIS must provide information as to whether eminent domain can be used in the redevelopment of property.
- The DEIS states that "Under HCDA reserved Housing Policy 20% of all new units will be build as workforce housing" and for "landowners and/or developers to achieve density incentives, workforce housing may even take on greater percentages in some areas."
- The FEIS must define the "areas" where additional incentives can be given, what the incentives will be, and how those incentives will benefit the general public.
- The FEIS must provide information on the long-term, direct, indirect and cumulative social and economical impacts on residents and businesses living and working near one of the areas receiving density incentives.
- The primary areas susceptible to loosing homes and businesses are Sheridan Track, which is half in the TOD area and Central Kaka`ako, which is primarily small businesses because

the pressure from being surrounded by high rises buildings whose high cost will eventually drive the owners to sell their properties
- The FEIS must provide information on the short and long-term, direct, indirect and cumulative social and economical impacts on these communities surrounded by high-rise developments.

Parks and Open Space

- The DEIS states that "Neither HCDA, the primary provider of parks and recreational facilities in Kaka`ako, nor the city Dept of parks and Recreation plan to construct additional parks in or near Kaka`ako, suggesting that impacts will continue to existing parks in the region."
- The FEIS must identify the long-term, direct, indirect and cumulative health and social impacts of the lack of parks on children living in high-rises and not having opportunities within their neighborhood for active and passive recreation and on parents seeking opportunities to play sports with their children.
- What does "already negotiated open spaces" mean? At what stage of the process do these negotiations take place?
- In the FEIS identify the term and uses of "negotiated open spaces."
- In the FEIS define and state the purpose of "activated spaces."
- If the Proposed Action directs HCDA to tie a minimum of fee ($ per SF) or per FAR to public active space explain in the FEIS why a tiered program is being proposed instead of a direct minimum fee?
- What criteria will be used to determine if a public space is "usable" or "neighborly?" What types of "multiple functions" would be considered in evaluating whether a public space is "usable" and "neighborly"?
- The DEIS states that "..it is HCDA's position that the nearby Ala Moana Regional park is sufficient to meet the future needs of Kaka`ako's growing population."
- The FEIS must explain how this conclusion was reached.
- HCDA believes that population growth in Kaka`ako would result in the need for additional parks personnel but HCDA's budget for park facilities is $0.
- Unless more parks are built in Kaka`ako pressure on nearby Ala Moana Regional Park will be increased and that impact will be felt around the island.
- The FEIS must identify the long-term, direct, indirect and cumulative social, economic and environmental impacts of overcrowding at Ala Moana Regional Park on Kaka`ako residents and the island population that uses Ala Moana Park.
- The DEIS states that current HCDA rules require that 55 sq feet of recreational space be allocated per dwelling unit development in Kaka`ako. The City and County standards calls for 110 SF of green space per dwelling unit for any high-rise multi-family or town house development anywhere on the island.
- KCDD doesn't even meet Oahu standards and HCDA still cannot or will not provide public parks.
- The FEIS must identify the direct, indirect and cumulative social impacts on KCDD residents from inadequate green open space and parks in their community.
- The DEIS states that a Parks Master Plan would thoroughly study park needs and the best way to meet those needs but that such a study has not been conducted.
- HCDA has known for years that rail transit would go through KCDD and that with or without TOD KCDD would grow and need more parks but obviously parks are not a priority because this study has not even begun.

- The FEIS must explain why a Parks Master Plan was not done *before* or in conjunction with this DEIS and explain the implications of not having a study that shows park needs and provides direction for the development of parks within KCDD

Cultural Resources

- The DEIS states that "Implementation of the Proposed Action could potentially impact several contemporary cultural resources identified in the District including facilities, public parks and grounds, memorials and commemorations, religious and spiritual gathering places and public art installation and entertainment centers" but does not provide any information on how or which contemporary cultural resources will be impacted.
- The FEIS must identify the public parks and grounds, memorials and commemorations, religious and spiritual gathering paces and other public installations and centers, identify their uses and value then evaluate the potential short and long-term, direct and indirect and cumulative social and economic impacts on each of the cultural resources.
- Nowhere in this DEIS are the long-term impacts of higher density and close proximity to historic parks and building discussed.
- The FEIS must provide information on how historic parks and buildings will be impacted by the close proximity of higher, denser and closer development.

Visual

- The DEIS provides many examples of how mauka-makai and view planes will be impaired.
    - "It is anticipated that the build-out of the Mauka Area under Future baseline Condition or either TOD alternative will impair the existing mauka-makai views"
    - "The greatest impacts will be seen with the higher intensity growth in number and frequency of high-rise buildings under TOD Alternative A" with "TOD Alternative B resulting in impacts greater than the Future Baseline Condition, but less than the TOD Alternative A."
    - "Under either Alternative, panoramic views from identified viewpoints, and existing high-rise or low-rise buildings will be curtailed, but existing view corridors along major mauka-makai streets will be preserved."
    - This statement isn't true as seen in Photo Plates 4-36,4-37 and 38 Coral Street at Ilalo Street showing makai-mauka views lost to high rises.
    - "Buildings fronting Ala Moana Blvd and situated in the Makai Area *will have reduced views* of the Ko`olau Range..." (Emphasis added)
        - What buildings are referred to in the Makai Area that *will have reduced views* of the Ko`olau Range?
    - "...buildings along Kapiolani and in the Thomas Square Neighborhood will have reduced views of the ocean" but "This is typical of an urban environment where external views of landscapes are slowly exchanged for framed views and new architectural features."
- The FEIS must identify and explain the long-term, direct, indirect, cumulative social and economic impacts from the loss of ocean and mauka-makai views on an island culture, tourism and existing and future residents within and outside of KCDD.
- The DEIS states that one of the methods to preserve "visual resources" is to "Encourage staggered building heights (tower configurations should provide skyline diversity)"

- Since "encourage" is not a requirement but just a suggestion the FEIS must explain how "suggesting" instead of requiring staggering building heights will help preserve "visual resources" especially since TOD projects are incentive driven.
- One of the methods suggested to help "maintain the KCDD's long-term residential desirability" is to provide guidelines ensuring that building placement is "neighborly."
- The FEIS must provide a definition of "neighborly" and identify how implementing this type of placement will ensure that a development will retain its residential desirability.

Shade and Shadows

- This section is a series of illustrations Figures 4-40 to 4-53 showing shade and shadows from the different scenarios but there is no information on short and long-term and cumulative impacts of shadows and shade on existing neighborhoods, daytime solar glare, reflective surfaces on buildings and cars, visual impacts on adjacent neighborhoods such as Punchbowl or the increased need for more electricity because of the lack of sunlight. The FEIS must address these issues.
- The DEIS mentions that due to development pressure Mother Waldron Park, surrounded by potential sties eligible for participation in the TOD Overlay Plan, may need "public improvements that animate and improve the existing park."
- The FEIS must define "animate," identify the types of improvements envisioned for the park and explain the short and long-term, direct, indirect and cumulative impacts caused by being surrounded by TOD projects.
- The FEIS must address how any proposed changes will impact the historical features of Mother Waldron Park, which is listed on the State Register of Historic Places.

Secondary and Cumulative Impacts

- The DEIS states that "... implementation of TOD, when added to other adopted and proposed projects of a similar nature (such as other TOD projects envisioned by the City along the transit line corridor) may have a significant affect on a regional scale, and at an island wide scale."
- While this statement acknowledges there could be a "significant affect" on a regional and island wide from other TOD projects HCDA seems to think that Kaka`ako is like Las Vegas, what happens in Kaka`ako stays in Kaka`ako and does not have a impact outside its 602-acre borders.
- Development within the KCDD 602-acres carved out of the center of urban Honolulu has a ripple effect that cannot be ignored.
- The FEIS must evaluate and define the long-term, direct, indirect and cumulative social, economical and environmental impacts of transient oriented development in KCDD on the islands natural resources and regional infrastructure.
- The DEIS states that "Kaka`ako situated in the Primary Urban Center is intended to accommodate a substantial portion of O`ahu's population growth over the next 25 to 30 years." While that may be a true statement if TOD in KCDD takes up all the infrastructure capacity and public funds what are the long-term, direct, indirect and cumulative impacts on others wishing to develop in the PUC? What are the impacts on the development of the Second City?
- The FEIS must provide information on the cumulative direct and indirect social, economic and environmental impacts of TOD on the surrounding areas, travel corridors through KCDD, island wide water, sewer, electricity demands, impact on the Second City and percentage of funds for infrastructure.

- The FEIS must provide information on long-term, direct, indirect and cumulative social and economic impacts on others wishing to develop properties in the PUC but can not due to lack of infrastructure funds and capacity.
- The DEIS states that "The Proposed Action will have long-term effects on the decisions by Oahu residents about where to live, work, and play, which will, in turn lead to a redistribution of population." This statement seems to imply that more Oahu residents will move to KCDD rather than the Second City or other areas of the island.
- The FEIS must explain how that conclusion was reached.

0.5 Summary of recommended mitigation measures

- The seven Objectives in this section only deal with mitigation measures to "improve quality of life" within the 602-acres of the Kaka`ako Community Development District.
- These measures do not consider nor evaluate the multitude of short and long-term, direct, indirect and cumulative social and economical impacts on adjacent communities ranging from increased pressure on schools and parks, loss of views, loss of wind and sunlight, increased shadows, increased noise, reduced air quality, increased traffic and major transportation corridors going through KCDD.
- The FEIS must address the impact of the above issues on areas adjacent to KCDD.

1.2.3 Non-Governmental Master Plans

- The FEIS must explain why the Kamehameha Master Plan and the Ward Neighborhood Master Plan are mentioned in this DEIS TOD Overlay Plan.
- Does mentioning these two approve plans in this DEIS mean that the Plans can be revised and modified to add TOD?
- The FEIS must state whether the Kamehameha Master Plan and Ward Neighborhood Plan, which have been approved by HCDA, are eligible for TOD because of inclusion in this DEIS.
- Since Kamehameha's Master Plan and Ward Neighborhood Plans are mentioned in this DEIS the FEIS must provide information on the short and long-term, direct, indirect and cumulative social and economic impacts on the existing businesses, residents, traffic, infrastructure, view plains, air quality, and noise on surrounding areas. This information is especially critical if HCDA allows changes to the approved plans and grants variances or exemptions that could include increased height and density.

Alternative A

Land Use/Urban Design/ Mobility and Access

- What factors were considered when the decision was made to add hotels in the KCDD?
- The FEIS must address the direct, indirect and cumulative social and economic impacts on affordable housing, traffic, qualify of life, safety and security of adding transient uses in residential neighborhoods
- The FEIS must identify the "specific properties within the Mauka Area for consolidation to promote redevelopment. "
- The FEIS must clarify if the "incentive program to correlate allocation of active (open) spaces for additional height and capacity" is part of the "incentive program" which grants greater height and density bonuses or a separate program.
- If this is a separate program then the EIS must identify how many "incentive" programs there are within the TOD Overlay Plan and identify the purpose of each program.

- Since the two "iconic towers (heights between 500 and 700 feet with have greater impacts the location of those buildings and their direct, indirect, secondary and cumulative social, economic and environmental impacts on surrounding areas, traffic, air quality, increased shadows etc. must be included in the FEIS.
- Since one of the features of TOD is to "promote" "round the clock" activity in and near transit stations the FEIS must provide information on the direct, indirect and cumulative social and economical impacts on surrounding areas from the twenty-four hour activity
- and identify the amount and types of security that will be offered at each station.
- The DEIS states that for a "limited number of properties" an increased maximum allowable building heights" will be offered to encourage "exemplary" buildings. Other than this statement there is no information on what is the "maximum" height allowable or an "exemplary building."
- The FEIS must identify the location of the "limited number of properties," give the maximum height limit and provide a definition of an "exemplary" building.
- The DEIS states that one of the urban designs is to "preserve mauka-makai view corridors." Other than the identifying existing streets as view corridors what are the mauka-makai view corridors that will be preserved?
- The DEIS states that one of the reasons for the "iconic" towers is to provide "exceptional public benefits."
- The FEIS must explain what the "exceptional public benefits" are and how they are different from the benefits sought in the incentive program(s).
- The FEIS must identify the neighborhoods where "iconic" towers will be permitted and provide information on the direct, indirect, secondary and cumulative social and economic impacts from these extremely tall buildings on the surrounding neighborhood quality of life including air quality, noise and traffic.
- In the FEIS explain what measurement is being used to create a "significant separation" between iconic towers and identify how that measurement was reached.
- Provide information on the types of "flexibility" being offered in considering urban design.
- The DEIS promotes the establishment of a "design review process to ensure quality of building design." When will the "design review process" be established? How will participants be selected?
- The DEIS says that a district-wide traffic calming plan will be developed. What is a "district wide" traffic calming plan, what is the purpose, will the plan cover the entire 602-acres KCDD, how will traffic calming measures impact or improve major corridors within and outside of KCDD?
- What does a Downtown/Kakaako/Ala Moana "circulator system" that "enhances access to HART stations and key KCDD destinations and those in adjacent districts" consist of? If the system consists of busses or streetcars explain why there is a need for this system and explain how providing shuttle service does not defeat the purpose of TOD and Smart Growth, which is to live a healthy lifestyle by being able walking to destinations.
- What does "unbundle parking stalls from residential units to allow consumers to consider the optional purchase or rental of a stall" mean and what is the purpose? If the purpose is to provide a "buy in" program what are the impact on low-income homeowners, renters and businesses that need parking spaces?
- What does unbundle parking costs from commercial leases mean and how will it impact small businesses and their customers?

1.4 Guiding Principles of TOD

- One of the guiding principles of TOD is "to coordinate land use and transportation by concentrating development along reasonable direct corridors, so that most destinations are on the way to other destinations." In the FEIS provide a description of a "reasonable direct corridor" and provide information on how this corridor will directly and indirectly impact traffic on major transportation corridors within KCDD and outside of KCDD.
- One of the guiding principles is to provide tools needed "to ensure that the public realm is safe, comfortable and inviting for people of all ages and abilities."
- Describe the "tools" being considered and identify who these "tools" are designed for.
- One of the guiding principles is to direct "concentration and intensified activities near frequent transit."
- The FEIS must explain if "transit" includes bus stops. If bus stops are available for TOD then the FEIS must provide information on the direct, indirect and cumulative social, environmental and economic impacts of TOD at area bus stops on surrounding neighborhoods, residents and businesses, traffic, quality of life, increased noise.
- One of the guiding principles is to focus "improvements on those areas that have a higher potential for redevelopment... and buildings that have exceeded their useful life."
- How is the "useful life" of a building determined and who makes that determination?
- Explain what a "legible" public space is and provide an example.

2.2 Objectives of TOD

- Objective D1:
  - What are "reasonably direct corridors?"
  - What are the traffic, environmental and social impacts from spreading "demand throughout the day"?
- Objective D2:
  - What is the purpose of "minimizing the distances between intersections...?"
  - What are the direct, indirect and cumulative impacts on traffic and pedestrians when distances between intersections are minimized?
- Objective D3:
  - Design the spaces adjacent to HART stations...in ways that maximize access and benefit to the community.
    - Define what "spaces" are referred too.
    - What types of "spaces" will be considered a benefit to the community and how will that determination be made?
    - Define a "resilient neighborhood" and explain how it is different from a regular neighborhood.
- Objective D6:
  - Define "manage parking supply and demand" and explain how it will work for people who want a car, want more than one car and people driving to visit residents and businesses.
- Objective 2.3
  - In the FEIS list the "regulatory policies" that will ensure long-term tenure of affordable units.

2.3.1 Neighborhood Character

- Does the statement "The Proposed action explores the possibility of residential and mixed uses on these two potential development sites to support civic improvements" refer to developing property that is currently part of McKinley High School?

TOD Alternative A

- In the FEIS provide information on the short and long-term effects, direct, indirect and cumulative effects on the coastal environment, mauka-makai views, loss trade wind, loss of sunlight, noise, and coastal public access from developing higher densities including a hotel at the HECO property?
- The FEIS must provide information on the cumulative, short and long term, direct and indirect social, economic and environmental effects on Irwin Park, which is listed on the State Register of Historic Places, from the envisioned high intensity development and hotel at the HECO property
- The DEIS fails to identify the short and long-term environmental and social effects on McKinley High School and the students from the development of an iconic 700 - foot tower at Blaisdell Center. This information must be provided in the FEIS.

TOD Alternative A

- The FEIS must identify the short and long-term, direct, indirect and cumulative social and economic effects on decreased trade wind and sunlight, traffic, on existing buildings, residents and businesses from building more and taller towers above 400 feet to create a "dramatic skyline."

TOD Alternative B

- Pauahi Neighborhood
  - The FEIS must explain the long-term and cumulative effects of the loss of mauka-makai vistas from Ala Moana beach and Ala Moana Park, diminished sunlight and trade winds and eviction on existing residences and businesses from redeveloping the area between Auahi St and Ala Moana Blvd. "...to a high-rise residential neighborhood."

TOD Alternative B

- The FEIS must provide information on the short and long-term, direct and indirect and cumulative social, economic and environmental impacts from increased traffic, air quality, noise, eviction of residents and businesses, and water and sewer availability associated with the consolidation and development of privately owned and "selected" parcels near the Civic Center HART and in Central Kaka`ako.
- What are the cumulative, short and long term and cumulative impacts to small businesses located in the Central Kaka`ako Neighborhood from increased redevelopment pressure and the likely decrease of low-cost rental space?

2.3.2 Land Uses

- Explain in the FEIS how high intensity development with increased capacity in Kaka`ako will "Minimize island-wide development pressure on rural areas..." when property owners in rural areas can and will continue to seek approvals to develop their property?
- The DEIS says that up to three hotels are envisioned for Kaka`ako yet Table 2-1: Development Capacity in TOD Alternatives A Hotel Units lists four sites – Central Area Mauka, Aloha Tower, Auahi Neighborhood and Thomas Square.
- Which is the correct number of hotels planned for KCDD?

- The FEIS must provide information on the cumulative, short and long term impacts, direct and indirect social and environmental affects from increased noise, traffic, loss of quality of life and changing character of a neighborhood when adding tourist destinations where such uses don't presently exist.

2.3.2.1 Hotels and Tourism

- Describe how the "opinion" was reached that there is a demand for hotels within the Kaka`ako area?
- Explain how developing hotels in KCFF furthers HCDA's mandate to *meet the vast unmet community needs of lack of affordable housing and insufficient commercial and industrial facilities for rent, and necessary infrastructure for basic livability, such as parks and open space.*
- The DEIS touts one of the advantages of instituting TOD in KCDD is that development will be incentive driven thus increasing the ability to create more affordable housing yet the statement on this page says "As much as feasible, the HCDA will couple the reserved housing requirement with incentive-base zoning."
- Explain in the FEIS what is meant by "as much as feasible."

2.3.3 Mauka Development Parameters

- In the FEIS define the statement "The TOD Alternatives test the results of new FAR and height limitations, and the application of very general design standards..."
- Provide a definition of "as of right."
- In the FEIS identify the location and purpose of "tested sites" and explain the process used in selecting those sites?

Figure 2-2 Distribution of Building Heights – TOD Alternative A

- Describe in the FEIS what is the fall back position if Alternative A is selected as the preferred Alternative but the height limits imposed in Act 61 are not repealed.
- In the FEIS describe the types of "measures" and processes in place to ensure that incentive zoning programs are carefully managed to ensure that the community amenity is proportional and out weights any adverse effects caused by additional building bulk.

2.3.4 Urban Design

- Provide information on the following in the FEIS
  - What measures and processes are in place to "ensure" that a building is appropriately cited?
  - Define "typed streets" and describe their purpose?
  - Define and describe the purpose of "flexible" in this context.
  - Define "form-based framework" and describe the purpose.

2.3.6.5 parking

- Since many existing small businesses rely on customers coming from outside Kaka`ako describe in the FEIS how "park once," complete streets and parking calculations will impact their businesses?

2.3.7.8 Traffic Signal System

- The DEIS states that a regional study of existing and projected traffic flows is needed to determine signal timing.

- The FEIS must provide information on when such a study will be done and what agencies will be involved in this study. It is critical to have this information before TOD projects are approved and "entitled" because traffic is not only a problem for KCDD residents and businesses but for people traveling through, around and beyond KCDD.

3.3.2 Summary Description of Baseline Condition

- The Mauka Rules allow properties, currently with inadequate infrastructure, to retain the current FAR but once the infrastructure is upgraded the FAR will increase.
- Explain in the FEIS if a supplemental EA will be required when the FAR is increased and whether an EA will be for each project or cover the entire KCDD. This information is necessary because this DEIS is based on current data.

3.3 Comparing the Future Baseline Condition and the TOD Alternatives

- It is unclear why the text differs from the tables showing hotel units. The text states that three hotels will be allowed but both Table 3-2 and Table 3-3 list five hotel units – General Area Mauka, Aloha Tower Special District (twice), Auahi, and Thomas Square.
- The FEIS must provide the correct number of hotels and information on the direct, indirect and cumulative affects of adding transient accommodations and tourism into residential and commercial neighborhoods.
- The FEIS must explain why hotels are being considered in Kaka`ako and why tourism and transient accommodations are appropriate in residential and commercial neighborhoods.

Table 3-5:Population Comparison in 2035 – Proposed action vs. Future Baseline Condition

- How was the *Average De Facto Population* determined?
- Under both Alternatives the *de facto population* exceeds the *full time residential population*. Since the *de facto* i.e. not permanent residents population exceeds permanent residents the FEIS must identify what population – transient or permanent TOD projects will be built for?
- The FEIS must provide information on how a *de facto population* that surpasses the *resident population* meets the objectives of HRS 206E.
- The FEIS must identify what, if any, controls or requirements are in place to prevent the current trend of temporary residents as opposed to permanent residents.

4.2 Topography, Geology, and Soils

- This section states "Additional fill material may be imported from elsewhere on Oahu as needed in the redevelopment of individual properties" and that "...the Proposed action provides an additional opportunity to mitigate sea level rise issues to some extent; as individual properties are redeveloped, their at-grade elevation can be raised by the use fill material to create a higher base elevation."
- The DEIS does not provide any information on the type(s) or amount of soil to be imported nor are receiving locations identified.
- The FEIS must provide this critical information because unless EAs are required for each TOD project this DEIS is the only opportunity to evaluate the short and long-term, direct, indirect and cumulative impacts of imported soil on the environment, air quality, runoff and coastal areas.
- If is impossible to provide site-specific information, regarding these critical concerns, in the FEIS then supplemental EAs must be required for each TOD project that will import soil.

4.7.5 Comparing 2035 Future Traffic Conditions With The Proposed Action To Baseline Conditions Without The Proposed Action And To existing Conditions

- The DEIS states that the Makai area was not included in the TOD Overlay but this section includes Makai.
- The FEIS must state whether Kaka`ako Makai is being considered in this DEIS TOD Overlay Plan and available for TOD projects.

Table 4-15 Travel Demand Comparison

- The FEIS must state whether the term "household" refers to the number of units or the number of people.

Table 4-18: 2035 Peak Hour Intersection Level of Service – Proposed Action (TOD Alternative A)

- Several intersections in this table and identified on page 110 were found to be at D, E and F FOS levels and potentially significant at 2035 TOD build-out.
- Table 4-22 states that with mitigation levels at Ala Moana/South Street and Ala Moana and Cooke Street and Ala Moana and Ward will remain at LOS F due to side street traffic. While HCDA is improving traffic conditions within the 602-acre Community Development District traffic flowing from KCDD adds to the congestion of main travel corridors.
- It is unacceptable to quote the 2009 EIS and say that there is no feasible mitigation. If that is the conclusion without TOD then what is the conclusion with TOD?
- Ala Moana and Kapiolani are major corridors connecting people traveling east and west. From these findings the impact on traffic in these corridors from TOD within KCDD will be impossible.
- The FEIS must identify mitigation measures that will relieve traffic congestion at these critical intersections or not approve TOD projects in KCDD until mitigation measures are in place that truly relieve congestion at these bottleneck intersections.
- The FEIS must provide information on the short and long term, direct, indirect and cumulative impacts on traffic, air quality, and quality of life from these unimproved intersections.
- Since HCDA does not have jurisdiction over the streets in Kaka`ako what agencies are responsible for implementing mitigation measures at these low functioning intersections?

4.10.6 Health Care

- According to the DEIS EMS considers metropolitan Honolulu to be on the cusp of needing a new EMS unit and is in discussions with HCEA for another 24-hour/day site in Kaka`ako at the old Fisherman's Wharf site. What is the status of these talks?
- The DEIS states that long-term care hospitals, health care clinics, specialty care facilities, acute care hospitals are all located outside Kaka`ako.
- The FEIS must provide information on whether a new EMS will be built in KCDD and whether health care clinics and acute care hospitals are proposed as part of TOD projects, whether those facilities will be privately or publically funded and must include the short-term, long-term, direct and cumulative social and economical impacts of not providing these types of facilities as part of TOD projects.

4.10.8 Public Emergencies and First Responders

- The DEIS states Future Baseline Scenario would at full build-out require an increase of ten on duty fire fighters, two support staff, and two fire trucks. Twice those numbers would need to be added for TOD Alternatives A and B.
- In the DEIS HFD states that HFD's "ability to provide services in Kaka`ako will also be impacted by TOD including rail infrastructure, traffic calming and pedestrian friendly street features, and the potential increase in vertical height of the area's buildings."
- The DEIS does not provide any information on the long-term, direct and cumulative impacts on public safety if the required fire fighters, staff and fire trucks are not a requirement in the selected Alternative. That information must be provided in the FEIS.
- The DEIS states that under the Future Baseline Scenario at full build out would require an increase of about 31 police officers, based on December 2012 ratio of 8.9 police officers per 10,000 people in District 1 with TOD Alternative B requiring 8.9 police officers when including the de facto population at full build-out would generate a total demand for nearly 40 police officers. Alternative A will demand 43 police officers at build-out plus rental of a small field and report writing office.
- These are all critical public health and safety services and the DEIS only states the deficiencies but doesn't provide any guidance or recommendations on how, when or where these services should be included in TOD projects.
- The FEIS must provide information on the short-term, long-term, direct, indirect and cumulative social, economic and safety impacts on people living and working within KCDD if these vital services are not provided at the quantity and quality identified by each of Oahu's first responders.

4.9 Air Quality

- Identify what types of "agricultural operations" in the project area cause air pollutants?

4.12.5.1 Urban Design

- The DEIS states that some neighborhoods could have a discontinuous visual appearance where redevelopment occurs on lot-by-lot basis. Visual contrasts between older and newer buildings could increase and there is a potential for incompatibility, and/or abrupt transition between older and new buildings.
- While the DEIS acknowledges that there will be "incompatibility" and "abrupt transitions between old and new buildings" it does not identify potential short and long-term and cumulative social, environmental and economic impacts on existing residences and businesses from a new tower on residents and businesses from cutting off sunlight, wind, loss of community, loss of sense of place, increased traffic and noise. This information must be presented in the FEIS.
- In the FEIS explain how a site becomes "entitled"?
- The DEIS acknowledges that TOD Alternative A would change the character of the overall Mauka area but does not provide information on the impacts from those changes.
- The FEIS must provide information on the short and long term, cumulative social, economical and environmental impacts on residents and businesses from increased traffic, air quality, noise, loss of sense of place, potential eviction for redevelopment, and loss of community.
- The FEIS must discuss the short and long term, direct, indirect and cumulative social and economic impacts on individuals displaced by redevelopment, the loss of a home to luxury condos and loss of small local businesses to larger homogenized businesses.

4.12.6.8 Light and Glare

- In the FEIS explain what types of street level landscaping will absorb light.
- In the FEIS explain how HCDA would enforce "limiting the hours of illumination" when one of the features of Kaka`ako is that it will be a active 24-hour area and one of the stated needs for lighting is safety.
- In the FEIS providing information on whether "limiting the hours of illumination" applies to high-rise residents and businesses and if so how this strategy will be enforced and impacts on residents and businesses.

5.0 Relationship to Land Use Plans, Policies and Controls

5.2.2 Hawaii State Plan (Chapter 226)

- In the FEIS explain how the TOD Overlay alternatives comply with §226-3 Overall because the DEIS does not show how community and social well-being, caring for others and the well-being of community will be sustained, enhanced or achieved.
    - (3) Community or social well being is a value that encompasses many things. In essence, it refers to healthy social, economic, and physical environments that benefit the community as a whole. A sense of social responsibility, of caring for others and for the well-being of our community and of participating in social and political life, are important aspects of this concept.
- The TOD Overlay Alternatives do not comply with §226-4 State goals to "enhance[s] the mental and physical well-being of the people" and "nourishes[s] a sense of community responsibility, of caring, and of participation in community life." This is statement especially true since the number of part time residents including tourists is greater than the number of full time residents.
- The TOD Overlay Alternatives do not comply with §226-12 Objectives and policies for the physical environment—scenic, natural beauty, and historic resources because the alternatives do not "Promote the preservation of views and vistas to enhance the visual and aesthetic enjoyment of mountains, ocean, scenic landscapes, and other natural features." Instead each alternative blocks or decreases views and vistas.
- The TOD Overlay Alternatives do not comply with §226-16 Objective and policies for facility systems—water because none of the alternatives promote the reclamation and "productive use of runoff water..." or promotes "water conservation programs and practices..."

5.2.4 State Ocean Resources Management Plan

- The TOD Overlay Alternatives do not comply with the State Ocean Resources Management Plan which seeks to "improve coastal water quality by reducing land-based sources of pollution" because the "existing major trunk drain lines would discharge an estimated 2,500 cubic feet per second of rainfall runoff to the ocean." None of the Alternatives offer solutions to prevent this discharge and improve water quality.
- The TOD Overlay Alternatives do not meet the Management Goal to "enhance and restore existing public shoreline areas and scenic vistas" instead the massive development of high rises including TOD projects will obliterate almost all public shoreline scenic vistas.

5.2.6 State of Hawaii Environmental Protection Act (Chapter 343 & 344, HRS)

- Chapter 343 requires disclosure of the "environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the

community..." and "measures proposed to minimize adverse effects and alternatives to the action and their environmental effects." Very few environmental and social welfare effects have been presented in this DEIS.
- The FEIS must provide information on environmental, social. economical and cultural impacts.
- The DEIS TOD Overlay Alternatives do not meet HRS 344 State Environmental Policy to:
    - Establish "communities which provide a sense of identity...and aesthetic and social satisfaction with the natural environment which is uniquely Hawaiian"
    - Promote recycling of waste water
    - Promote open space in view of its natural beauty...
    - Foster lifestyles compatible with the environment...
    - Develop communities, which provide a sense of identity and social satisfaction in harmony with the environment...

5.3 County Plans, Policies, and Controls

- The DEIS TOD Overlay Alternatives do not meet the following General Plan policies
    - III Natural Environment
        - Objective A Policy 7 *Protect the natural environment from damaging levels of air,...and noise pollution.* Object B Policy 2 *Protect Oahu's scenic views, especially those seen from highly developed and heavily traveled areas*
    - IV Housing Objective A Policy 10
        - *Promote the construction of affordable dwellings, which take advantage of Oahu's year-round moderate climate.*
    - X Culture and Recreation Objective D
        - *Require all new developments to provide their residents with adequate recreation space*

Hawaii's Thousand Friends
25 Maluniu Avenue, Suite 102
PMB 282
Kailua, Hawaii 96734

Ladies and Gentlemen:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 19, 2015 commenting on the above document. We note that your letter consisted of 20 pages and was unsigned.

Following are responses to your comments in the order they were presented in your letter.

Timeline:

1. HCDA's authority is limited by the legislation that enabled it and the rules that guide development within the District. HCDA is permitted to grant variances from its administrative rules pursuant to Hawaii Administrative Rules §15-217-82.

2. Development proposals submitted by landowners must be reviewed and approved by City agencies with responsibilities pertaining to infrastructure (sewers, water, streets, etc.). If a project is approved by HCDA but is denied a sewer connection permit, for example, the project cannot proceed until such time that the City determines there is adequate sewer capacity for the project or the applicant makes the necessary improvements to accommodate the project. Implementation of the selected Alternative ultimately depends upon the initiative of individual landowners regarding the development/redevelopment of their respective properties.

3. Best Management Practices is a standardized term that is codified in federal law and refers to practices to mitigate environmental impacts in a manner that is commonly recognized as being desirable and effective. They vary depending upon the nature of the activity. For example, HAR, §11-55-01 mirrors 40 CFR §122.2 and defines the term "Best management practices" or "BMPs" as "…schedules of activities, prohibitions or designations of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of State waters. Best management practices also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. Hawaii Administrative Rules Chapter 11- 55, titled "Water Pollution Control," implements the National Pollution Discharge Elimination System (NPDES) permitting program for point source water pollution control in the State of Hawaii, under authority delegated to Hawaii by the federal Environmental Protection Agency (EPA) pursuant to the Clean Water Act (CWA), 33 U.S.C. §1342(b). As the proposed TOD Overlay Plan represents an overarching plan to guide future development in the KCDD in response to the presence of rail, it is premature to commit to specific project-related BMPs, that are shaped in large part by the actions associated with a specific development. Specific BMPs must be articulated by developers at the time they submit development applications to HCDA and its sister agencies for review and approval.

4. The specific information you request cannot be known until such time that an individual property owner submits a development proposal. The EIS is essentially a programmatic document that provides a high level overview of the issues. To that end, the general socio-economic impacts have been evaluated to the best of our ability at this point in time.

5. Section 6.5 of Chapter Six presents a discussion of secondary and cumulative effects. The following paragraph has been added to address your concerns:

   "Long-term direct effects will likely include increases in population-related activities including the increased presence of people, both residents and visitors and improved economic conditions resulting of their demand for goods and services. Long-term indirect effects can extend to the redistribution of goods and services to accommodate the redistribution of population anticipated by TOD."

   The socio-economic impact analysis presented as Appendix G in Volume Two of the EIS presents an exhaustive discussion of direct, indirect, and cumulative economic and social effects of the Draft TOD Overlay Plan.

Unresolved Issues:

1. In each instance, the discussion under Section 6.6 of Chapter Six identifies why an issue is unresolved and what must be done to resolve it. Some of the action needed is the responsibility of other agencies over which HCDA has no control or influence. However, in the course of deliberations with other agencies, HCDA has been reassured that actions are being taken to address the identified issues.

Summary of Proposed Action and Alternatives:

1. Exemplary public benefits are those benefits that will contribute to achieving the Objectives identified in the Draft TOD Plan (beginning at page 2-3). They are not awarded, but rather are considered to be points of negotiation between a prospective developer and HCDA.

2. HCDA will work with its consultant team to develop a detailed program for the incentive-zoning concept. Public hearings will be held to receive public and agency input on the program.

3. At this point in time, HCDA can only implement Alternative B because it is proscribed by Act 61 (2014) of the State Legislature. Before adopting the TOD Overlay Plan and Rules, the HCDA is required to conduct two separate public hearings as required by Hawaii Revised Statutes 206E.

Potable Water:

1. The EIS discloses the intent of HCDA to require developers to comply with LEED certification. It is premature to identify specific water saving measures because they are project-specific, depending upon the nature of the project.

2. No, HCDA has no provisions for a dual water system. The existing water supply infrastructure in Honolulu does not support a dual water system and therefore it would not be practicable to require a dual water system on individual projects.

3. The statements are not contradictory. The reference to new mains pertains to fire-flow. The phrase "both peak hour domestic consumption demand requirements and" has been deleted from the end of Section 2.3.7.2 of Chapter Two to clarify the intent of the statement.

4. The TOD Overlay Plan will be implemented on a project-by-project basis, depending upon the timing of development proposed by individual landowners. Upgrades to the existing system to will be determined on an as-needed basis. The entire system does not need to be upgraded before any new development occurs.

Wastewater:

1. The site for the new pump station has not been selected by the City. It will be up to the City to determine the source of funding.

2. The City has provided no information to HCDA as to the anticipated date of the study's completion. While HCDA may approve projects before the completion of the study, they may not be granted a sewer connect permit if the City determines there is not adequate capacity to accommodate them. Thus, the City will ultimately determine which projects can move forward and which might be delayed by needed sewer improvements.

3. Once the second digester is competed, HCDA has been advised by the City that the Sand Island WWTP will have the necessary capacity.

4. We are unable to answer your question. The social or economic viability of a specific project 20 years hence will be based on a variety of factors that are unknowable at this point in time.

5. Sewer mains and sewer manholes are typically designed to flow partially full, meaning that the depth of wastewater flowing in the pipes is typically less than the diameter of the pipe. A surcharged sewer system means that the sewer mains are flowing full and the fluid level is above the top of the pipe within the sewer manholes. Sewer mains and sewer manholes are built water-tight. In a surcharged condition, barring any defects in the pipes or manholes, the wastewater remains within the sewer mains and manholes and does NOT leave, go outside of, the sewer system.

   There are several measures in place that minimize the possibility of wastewater leakage:

   a. Since 2000, the City's Department of Environmental Services (ENV) has instituted a program to repair or replace sewer mains that, by measurement, have a potential to leak.

   b. The City's design standards require that newly installed sewer pipes be tested during construction. If the pipe leaks during the test, it will not pass; and only pipes passing the leak test are accepted by the City.

   c. The City's Standard Specifications require precast concrete manhole installation where the pipe invert is below the ground water table, which would apply for a majority of the Kaka'ako Mauka Area.

   d. By the City's sewer design standards, sewer lines are required to have minimum 4' cover beneath pavements; therefore at the sewer manholes, there is at least 4' of height that the fluid level could rise to before overflowing at the sewer manholes.

   Although the sewer system may be surcharged, the wastewater will stay within the systems pipes and manholes.

6. Please see response #5 above. In the event of a leak or spill (release), the Department of Health (DOH) mandated emergency response procedures would be followed to contain/minimize the release amount and to protect the public's health. In the event of a nearshore wastewater release, deterioration of the nearshore water quality could result, but would depend on the size of the release and its location with respect to the shoreline. The ocean is typically a self-cleaning entity; and over time, the DOH tested parameters will normalize to the point where the public can be advised that the water is safe for recreational use. Unless a large volume is released or the releases are frequent, cumulative impacts to the public health or to the ocean ecosystems are not anticipated.

Solid Waste:

1. It is the responsibility of individual landowners to contract for solid waste pick up.

2. The TOD Overlay Plan is a conceptual plan. It is not possible to calculate the number of collection trucks that will service the KCDD. Whether an individual building is serviced once or twice a week will depend upon the size of the building and the number of occupants – numbers which are unknown at this point in time. In addition, collection routes may be combined such that a new building may not even require additional collection vehicles.

3. Solid waste collection services are provided by both private companies as well as the City's Refuse Division. It is up to each individual project to determine which service it prefers and to request them.

Drainage:

1. The EIS is a disclosure document.

2. The discussion in Section 4.11.4.2 goes on to state that because most of the future improvements were anticipated, the impact will be negligible.

3. At the time an application for a development permit is submitted to HCDA.

4. Correct.

5. The EIS is a disclosure document.

6. The impacts of the existing system have been addressed in the previous EIS for the Mauka Area.

7. Runoff from an urban area typically includes petrochemicals from roadways. These pollutants have existed for nearly 100 years and are not known to have a significant effect on receiving waters.

8. The statement provided in the EIS is a valid conclusion.

9. The determination was made by consulting civil engineers. All new projects must comply with City, State and Federal standards as discussed on page 250 and 251 of Chapter Four.

10. Project requirements are presented at the top of page 250 in Chapter Four.

11. Each new project must determine whether it triggers the NPDES Permit requirement.

Electricity:

1. It is HCDA's intent that new projects be designed for LEED certification. HCDA will not require projects to develop renewable sources of electricity. Each project will be expected to engage in energy conservation. The result will be a reduction in demand.

2. Please refer to the discussion in paragraph two at the top of page 253. A preliminary location has been identified but that may change given that the final decision is more than a decade away. If a new substation is constructed, it will be sized to address demands at the time of its construction.

3. This is beyond the scope of the TOD Overlay Plan EIS.

Traffic/Transportation:

1. Slower means that traffic speeds may decline. Please see discussion of Traffic Impact Criteria on page 69 of Chapter Four.

2. Tables 4-13 and 4-18 in Chapter Four provide a detailed and specific account of the anticipated impacts.

3. Please see Table 4-18.

4. Please see Table 4-18 and the discussion under Section 4.7.5.

5. The EIS is a disclosure document.

6. Table 4-8 presents the specific impacts of changes in Level of Service. The following statement has been added to Section 6.3 in Chapter Six:

   Increases in vehicular traffic will result in slower vehicular travel times, especially during peak hour travel periods. Intersections operating at Level of Service F will impede the movement of vehicles, including the transport of goods and the provision of some vehicular-oriented services.

7. The implementation of mitigation measures within the KCDD is not anticipated to create significant effects outside of the District.

8. The statement means that delays are not anticipated that would require the addition of new buses to the fleet.

9. For intersections operating at Level of Service F, all vehicles utilizing those intersection during peak travel hours will experience the same general effects.

10. Reference to UH and Waikiki has been deleted from the statement under Section 4.7.7.

11. Section 4.7.9.2 identifies the specific industrial streets in Central Kakaako. The impacts of street reconstruction are beyond the scope of this EIS. The reconstruction of City streets will likely trigger a separate environmental assessment.

12. The agencies involved would include the State Department of Transportation and the City Department of Transportation Services.

13. The streetcar service presented in Figure 2-8 is meant to provide an example for illustrative purposes. No specific decisions about types of streetcar service have been made.

14. The Socio-Economic analysis presented in Appendix G includes an exhaustive discussion of impacts resulting from new job creation.

15. As discussed in several separate sections of the EIS (e.g., traffic, noise, and air quality) construction impacts are generally short-term in nature.

16. Please refer to Section 4.7.3.2 of Chapter Four regarding Trip Generation and Travel Mode. The traffic models utilize trip generation data assumptions provided by OMPO.

17. Future numbers.

Social Impacts:

1. As explained in the EIS, a horizon year must be provided for purposes of comparison. The reader is advised that the EIS is programmatic in nature.

2. For the purposes of the EIS, they are assumed to be relevant in the future. However, conditions may change.

3. Please refer to Section 1.6 of Appendix G for a discussion of increased residential growth as it relates to Kakaako-specific impacts versus island wide impacts.

4. Yes. Please refer to the discussion under Section 2.2 of Appendix G pertaining to part-time residents.

5. Eventuality is not a foregone conclusion. The EIS fully addresses the impacts of new development in KCDD associated with TOD, including the possibility of hotels. Please note that hotel uses are allowed in other portions of Honolulu outside of Waikiki as discussed in Section 3.4.1.2 of the City's Primary Urban Center Development Plan.

6. We believe the analysis presented as Appendix G accomplishes that.

7. As discussed in the EIS, every new development requires a Development Permit approval by HCDA. The EIS is a disclosure document, not an entitlement.

8. A part-time resident requires goods and services but during a shorter time period than a full-time resident. The cumulative impact of part-time residents will generate demand for additional goods and services, but not likely at the same rate as full-time residents.

9. The discussion under paragraph (1), Section 2.7.4 of Appendix G states that part-time residents are counted. Without a specific citation, we cannot find the statement you allege to be made in the document.

10. We believe the information you request is beyond the scope of a programmatic EIS.

11. As the Ward and Kamehameha Master Plans were approved prior to the preparation of the Draft EIS, they are considered to be part of the baseline condition.

12. Modifications and/or variances tend to be relatively minor in character, when compared to the overall scope of a master plan.

Noise:

1. Noise levels are regulated by the State Department of Health. Exposure to excessive levels of noise can result in hearing impairment, based upon the extent of exposure, and in less severe circumstances, the loss of sleep if the excessive noise occurs overnight. Loss of sleep, in turn, can lead to a reduced ability to concentrate during daytime activities.

2. Chapters III and IV of Appendix E address noise level objectives, which are stated in terms of compatibility.

3. The level of detail you request is beyond the scope of this programmatic EIS.

4. As discussed in Section 4.8 of Chapter Four, the EIS uses a methodology of using noise receptors as a means of identifying potential impacts. This is an acceptable practice utilized by the State Department of Health to evaluate noise impacts.

5. In Hawaii, the construction of new apartment buildings, office buildings, and commercial buildings usually include the provision of air conditioning, which often results in windows being closed, regardless of ambient noise conditions outside. A discussion of the specific impacts experienced by individuals who may choose to close windows on a case-by-case basis is beyond the scope of the EIS.

6. The EIS takes the use of air conditioning into account as part of its analysis of electrical impacts.

7. Tables 2 and 3 of Appendix E present results of the noise analysis along identified roadways, which is a methodology acceptable to the State Department of Health.

8. We believe the overall analysis presented in Appendix E accomplishes this.

Schools:

1. HCDA is actively working with the State Department of Education to address concerns about schools.

2. Correct.

3. School-related impact fees fall under the jurisdiction of the State Department of Education.

4. Please see #1 above.

5. Section 7.2.5 of Appendix G addresses the Proposed Action's impacts on education.

6. We respectfully disagree with your conclusion.

7. As discussed in the EIS, the number of potential hotels is limited to three. HCDA has no control over the character of use of new residential units by their owners.

8. We do not agree with your conclusion. Please see #1 above.

Housing:

1. It is believed that the net gain in new residential units in the District will present new opportunities for tenants who might be displaced, thus allowing them to remain in the District.

2. The following discussion has been added to Section 4.10.13.3 in Chapter Four:

   While the potential redevelopment of some existing residential and commercial properties is possible, resulting in the displacement of some occupants and/or businesses, the addition of new housing opportunities and new commercial activities in the KCDD, both under the Proposed Action and the Future Baseline Condition, will provide new housing and commercial opportunities which could enable displaced residents and/or businesses to relocate elsewhere in the District, thereby mitigating to some degree the impact of displacement.

3. Please see response #2 above concerning impacts. Matters concerning relocation assistance by other agencies are beyond the scope of this EIS. The HCDA presently has no policy concerning relocation assistance.

4. Eminent domain can be theoretically used for any property, but there is no current intention by HCDA to do so.

5. The EIS is a disclosure document.

6. The term "areas" means specific projects. The elements of the incentive-based program will be fleshed out during rule making for the TOD Overlay Plan.

7. The EIS addresses the breadth of impacts associated with new population growth in the District. The provision of density incentives is generally included in this analysis.

8. Your conclusion reflects one possible outcome.

9. A new discussion has been added to Chapter Four:

   4.10.13.6 Displacement of Existing Residents/Tenants/ Businesses

The potential transformation of the Mauka Area under either the Future Baseline Condition or the Proposed Action could result in the displacement of some existing residents and/or businesses, as the result of property redevelopment or because increasing property values may result in higher real property taxes which certain businesses may not be able to afford. This is a natural consequence of a community based redevelopment initiative. However, as discussed briefly above, the provision of new residential and commercial opportunities within the very same community will help, to some degree, to offset the negative impacts of displacement. Properties within the Sheridan Neighborhood portion of the KCDD and the Central Kakaako Neighborhood are particularly susceptible to this potential outcome. It may become necessary for HCDA to consider adopting measures that could aid property owners and/or tenants affected by displacement.

Parks and Open Space:

1. The EIS is a disclosure document.

2. As discussed in the EIS, the HCDA has implemented a separate initiative concerning park planning for the District, which is identified as an Unresolved Issue in the EIS.

3. It means open space resources that have been negotiated during the HCDA's review of an application for a Development Permit.

4. The following definition for Negotiated Open Spaces has been added to the Glossary of Terms:

   Areas of open space that have been identified and required during the HCDA's review of a Development Permit application.

5. The term is defined in the fifth bullet on DEIS page 265.

6. Mauka Area Rules (HAR, Chapter 217) require public facilities dedication in the form of land or a cash-in-lieu, if approved by the HCDA board, for all development projects in the Kakaako Community Development District. Any development under the TOD plan will still require the base public facilities dedication as provided in the Mauka Area Rules. So, there is already a provision for a direct land dedication as a condition for development. In addition, the TOD Plan provides for a tiered public facilities dedication fee requirement for any additional incentive provided to development project under the TOD Plan.

7. The term "neighborly" pertains to a qualitative judgment concerning the proximity of a feature to a neighboring property. Criteria include proximity, access, visual impact etc.

8. The EIS is a disclosure document.

9. This conclusion is based on the fact that Ala Moana Regional Park is defined by the City as a regional park providing recreational opportunities for a vast area of Honolulu that includes Kakaako.

10. The EIS is a disclosure document.

11. As discussed above, HCDA has undertaken a separate planning initiative pertaining to the provision of parks and open space.

12. These considerations are being addressed as part of the above-mentioned parks planning initiative by HCDA.

13. That is correct.

14. HCDA is not required to comply with the City's standards. Please see discussion under #2 above.

15. Information provided on the City & County of Honolulu, Department of Park and Recreation indicates that there is over 800 acres of parks and open space in urban Honolulu between Chinatown and Waikiki. Therefore, we believe that there is adequate park and open space in urban Honolulu.

16. The study has, in fact commenced.

17. The parks study could not begin until the socio-economic impacts of the Draft TOD Overlay Plan were identified, as disclosed in Appendix G of the EIS.

Cultural Resources:

1. Please refer to Figure 4-7 and Table 4-3 in Chapter Four.

2. We believe that Section 4.6 of the EIS accomplishes this.

3. This is discussed in Section 4.6.3 of Chapter Four. Please refer in particular to the first paragraph on DEIS page 60 in Chapter Four.

4. Please see response #3.

Visual:

1. The EIS is a disclosure document.

2. Section 4.12.2 of Chapter Four discusses the City's Primary Urban Center Development Plan, which is the over-arching planning document that provides the baseline discussion for why views are protected. The protection of views is important for many reasons including, but not limited to the cultural values associated with named and storied places and the scenic attributes of mountains and ocean, which are valued by residents and visitors alike.

3. The EIS is a disclosure document.

4. In some instances, the specific placement of a building to achieve a staggering effect may not be possible due to site limitations or constraints such as cultural resources, existing or proposed utilities, or requisite setback requirements, to name a few.

5. Correct.

6. Neighborly is a qualitative term intended to introduce civility and maturity to the conversation. A "neighborly" building placement takes into account considerations expressed by adjacent tenants or building occupants.

Shade and Shadows:

1. A discussion of shade impacts is specifically addressed at the top of DEIS page 297 in Chapter Four. The discussion of glare and reflective surfaces is not relevant to this particular section. The presence of shade does not result in a lack of sunlight, rather, a reduction in the amount of sunlight that might be otherwise visible. The projection of shade over a building does not necessarily mean that lighting demand within a particular building may increase. Even in shaded areas, ambient light is typically available in abundance. Building glare is a consideration that is addressed during HCDA's review of Development Permit applications.

2. The EIS is a disclosure document.

3. The term "animate" when used in the context of urban design means to increase activity, access and/or usage. The EIS, in its totality, addresses these impacts.

4. Specific potential impacts upon Mother Waldron Neighborhood Park from immediately adjacent development

projects can only be assessed when a specific project is known and an application for a Development Permit is submitted to HCDA. General impacts on the Park have been addressed throughout the EIS, and particularly in sections pertaining to traffic impacts, noise impacts, cultural impacts, and visual impacts.

Secondary and Cumulative Impacts:

1. The EIS is a disclosure document.

2. We do not agree with your assessment of HCDA's views.

3. The development impacts of Kakaako have not been ignored, as is evidence throughout the current EIS, as well as previous EISs conducted for the Mauka Area and the Makai Area.

4. We believe that the EIS accomplishes this task.

5. The Proposed Action will not "take up all the infrastructure capacity and public funds" as you assert. In fact, it will provide new infrastructure and generate additional government revenues as discussed in Appendix G. In general, development opportunities in the PUC are generally limited to the rehabilitation of existing properties. TOD in Kakaako will not necessarily undermine or restrict the rehabilitation of other properties in the PUC. We suspect that development decisions in the Second City are guided largely by geographic considerations, and thus, are also not affected by TOD in Kakaako.

6. We believe the EIS in its totality addresses these concerns to the extent they are relevant.

7. This is beyond the scope of the EIS. Infrastructure capacity varies from area to area and the hypothetical lack of capacity

for, say sewers, in one area does not preclude over-capacity in another.

8. The statement was not intended to suggest a preference of one over the other. People will move to areas that provide them with the attributes that best serve their individual and familial needs. The statement you quote is intended as a general observation and a practical disclosure.

Summary of Mitigation Measures:

1. The EIS is a disclosure document.

2. The section on Mitigations is not intended to address impacts. Impacts are discussed throughout Chapter Four. Where specific mitigation measures are warranted, they are presented.

3. While the primary intent of the EIS is to address the impacts of the Proposed Action within the area under the authority of the HCDA, regional impacts are addressed throughout the document where applicable.

Non-Governmental Master Plans:

1. The EIS discusses the fact that these master plans were approved prior to the preparation of the Draft TOD Overlay Plan and are, therefore, considered to be part of the Future Baseline Condition.

2. Modifications to the master plans can be made to accommodate TOD, but they must be submitted to the HCDA as amendments to the existing plans, and approved by the HCDA pursuant to established procedures.

3. The following discussion has been added to the end of Section 1.2.3 in Chapter One:

Implementation of the TOD Overlay Plan will present Kamehameha Schools and Howard Hughes Corporation with an opportunity to embrace new opportunities related to transit-oriented development. However, in order to do so, the existing master plan must be formally amended and that amendment must be approved by HCDA.

4. Your request is beyond the scope of the EIS. The EIS is focused on the impacts of the Draft TOD Overlay Plan rather than the impacts of the already approved Kamehameha and Ward Neighborhood master plans.

Alternative A:

1. The decision was primarily based on City policy as expressed in Section 3.4.1.2 of the Primary Urban Center Development Plan that notes that PUC sites outside of Waikiki will be needed for hotels. The decision also takes into account the experience of the urban design consultant in TOD planning for other cities in the United States and Canada.

2. We believe that the totality of the EIS accomplishes this as a programmatic level document.

3. Please see Figure 3-5 in Appendix A.

4. It is intended to be.

5. Only one overall incentive program is contemplated.

6. Figure 4-1 in Appendix A identifies the Neighborhoods where an *iconic tower* could conceivably be located. The specific siting of such a tower must be initiated by the landowner. The EIS in its totality addresses the impacts of siting such a tower together with other elements of the Draft TOD Overlay Plan.

7. Detailed information concerning security and the nature of twenty-four activity is beyond the scope of the EIS.

8. See #7.

9. Please refer to Chapter 4 of Appendix A.

10. Please refer to Figure 3-7 in Appendix A.

11. Please see Figure 4-5 in Appendix A.

12. Correct.

13. They are the same.

14. See response #6 above.

15. See Figure 4-2 in Appendix A.

16. Flexibility in urban design is discussed throughout Chapter Four of Appendix A.

17. Specifics about Design Review have not yet been decided. This will occur after HCDA revises the Draft TOD Overlay Plan to a Final document.

18. Traffic calming is generally addressed in Chapter 6 of Appendix A. Specific elements of the plan have not yet been formulated. The Plan will focus on the Mauka Area. The Plan will coordinate with planning efforts by the State DOT and the City's DTS to support traffic calming initiatives in areas adjacent to the District.

19. Access to transit stations is addressed in Chapter 7 of Appendix A. Shuttle service and other means of access including bicycling are considered to be supportive of and consistent with pedestrian initiatives.

20. Unbundling refers to the current requirement that a certain amount of off-street parking stalls be provided for every new residential unit or square footage of commercial area. Separating the parking stall requirement from the unit or floor area creates new opportunities for improving the efficient use of existing and new parking stalls. Please refer to Chapter 8 of Appendix A.

21. Please see response #20.

Guiding Principals of TOD:

1. A reasonable direct corridor is street or roadway that is typically used as the most direct route for traffic to major destinations (such as Downtown or Ala Moana Center). The traffic study presented in the EIS as Appendix D addresses impacts on all roadways in the District including direct corridors such as Ala Moana Boulevard, Queen Street, and Kapiolani Boulevard, among others.

2. The EIS is a disclosure document.

3. Please see discussion on page 6-27 of Appendix A.

4. The EIS is a disclosure document.

5. The discussion in Appendix A, beginning on page 5-35 addresses transit, including buses. The EIS includes an impact analysis of buses as well as light rail transit.

6. The EIS is a disclosure document.

7. Useful life is determined by the landowner/building owner.

8. A legible public space is a public area that is designated for public use, such as a sidewalk.

Objectives of TOD:

1. See Response #1 in Guiding Principals above.

2. It helps to reduce demand during peak travel times in the morning and afternoon.

3. It creates more flexibility for pedestrians in choosing their route.

4. See analysis throughout Appendix D.

5. Spaces are areas between buildings and structures.

6. The space under the elevated rail, for example.

7. A resilient neighborhood responds in a positive way to change.

8. See Chapter 8 of Appendix A.

9. See discussion of the HCDA's Reserved Housing Policy in the EIS.

Neighborhood Character:

1. No.

TOD Alternative A:

1. The information you request is disbursed throughout the EIS in the various sections pertaining to the topics you identify. For example, the analysis of shadows on the HECO site is addressed in the Shadow discussion in Chapter Four.

2. The information you request is disbursed throughout the EIS in the various sections pertaining to the topics you identify.

3. The information you request is disbursed throughout the EIS in the various sections pertaining to the topics you identify.

TOD Alternative A:

1. The information you request is disbursed throughout the EIS in the various sections pertaining to the topics you identify.

TOD Alternative B, Pauahi:

1. The information you request is disbursed throughout the EIS in the various sections pertaining to the topics you identify.

TOD Alternative B:

1. The information you request is disbursed throughout the EIS in the various sections pertaining to the topics you identify.

2. The value of the subject properties will likely increase, resulting in higher property taxes for the property owner. To the extent that the property owner passes these on to the tenants, costs to tenants may increase. This could result in some tenants being forced to relocate their business elsewhere.

Land Uses:

1. Rural landowners may seek development approvals, but the City and State will be less inclined to grant approvals when new density opportunities are available in existing urban areas.

2. Table 2-1 does not say that. You have misread it.

3. 3.

4. See discussion throughout Chapter Four in relevant sections such as traffic and noise.

Hotels and Tourism:

1. It was based upon a consultant's review of market conditions.

2. We don't know what the KCFF is. The development of hotels will make better use of the particular property where they are being considered. Under an incentive based program, the provision of more affordable housing units might be negotiated as part of the review of a hotel development permit.

3. The TOD Overlay is an incentive-based program. HCDA's Reserved Housing policy affects all new development.

4. See previous response.

Mauka Development Parameters:

1. It means that they evaluate the impacts of FAR, height, and general urban design standards.

2. Already permitted or approved.

3. All TOD eligible sites, as identified in Figure 2-1 were evaluated by the urban design consultant based on property size and proximity to the light rail line, among others.

Distribution of Building Heights:

1. Alternative could not be implemented.

2. That responsibility rests with HCDA staff.

Urban Design:

1. The appropriate siting of new buildings will be addressed under the adoption of proposed rules to implement TOD.

2. Please refer to Figure 4-10 in Chapter Four.

3. Certain streets may be modified from their original form, for example, four travel lanes reduced to three or two.

4. The entire TOD Overlay Plan is based on a non-Euclidean methodology, which takes the attributes of individual properties into account.

Parking:

1. The intent is to increase pedestrian activity, which would result in greater foot traffic and more exposure for small businesses.

Traffic Signal System:

1. The EIS is a disclosure document.

2. The timing of traffic signals is the responsibility of the City and County of Honolulu Department of Transportation Services for City streets and the State DOT for Ala Moana Boulevard. These agencies are constantly making adjustments to the system, but must coordinate for longer-term studies. It is not known when they might undertake a larger analysis.

Summary Description of Baseline Condition:

1. The EIS is a disclosure document.

2. A Supplemental EIS may be necessary if HCDA considers increasing FAR beyond what is already allowable under the Mauka Rules and the final TOD Overlay Plan.

Comparing Baseline and Alternatives:

1. General Area Mauka is a summary category. There are only three sites.

2. It does. You have misread Table 2.1.

3. Please see discussion under Section 2.3.2.1 of Chapter Two. Hotel development will benefit commercial areas such as the Ward commercial areas and the Blaisdell property by increasing the daily census of those areas.

Population Comparison 2035:

1. Please see the extensive discussion of methodology in Appendix G.

2. Both. As Kakaako becomes a more popular commercial destination, more commercial activities will appear. This has been the recent case for new restaurants in the area. The introduction of rail to area will help accomplish this.

3. A healthy community includes a variety of accessible land uses, especially those commercial uses that directly benefit residents. This is not inconsistent with the intent of 206E.

4. It is beyond the authority of the State to regulate how an apartment owner may choose to occupy their unit or sub-let it to others.

Topography, Geology, Soils:

1. The EIS is a disclosure document.

2. This is beyond the scope of the EIS, and will be determined by individual landowners at the time they choose to develop their property.

3. There are many development projects that do not trigger environmental assessment. This EIS presents a programmatic-level review. Other mechanisms, such as an NPDES permit,

grading permit, or building permit, are intended to address more specific impacts.

4. We respectfully disagree. The importation of soil for use as fill material is not a trigger identified in Chapter 343.

Comparing 2035 Traffic:

1. The Makai Area is not being proposed for TOD projects, but it does have roadways within it that are part of the overall traffic network.

2. See Response #1.

Table 4-15 - Travel Demand Comparison:

1. People.

Table 4-18:

1. The EIS is a disclosure document.

2. The EIS is a disclosure document.

3. The TOD Overlay Plan will contribute additional traffic to some areas.

4. The intention of the City's rail project is to provide a method of alternative transportation that will help to reduce automobile congestion along key corridors.

5. Not all impacts can be mitigated. However, by focusing on Complete Streets and improving pedestrian and bicycle access, the TOD Overlay Plan is proposing to reorganize transportation mode priorities, and therein, influence people's choices.

6. The appropriate sections on Air Quality and Traffic in Chapter Four do this.

7. The City's DTS is responsible for intersections within the KCDD and the State DOT is responsible for intersections on Ala Moana Boulevard.

Health Care:

1. They are on-going.

2. The EIS is a disclosure document.

3. The character of future TOD projects rests with the choices made by individual landowners. The market will respond to demand as needed. It will be up to the City to determine where it might choose to locate a new EMS unit.

Public Emergencies:

1. The EIS is a disclosure document.

2. The EIS is a disclosure document.

3. If additional fire fighters are not provided to meet future projected demand, response times may increase. The purpose of an EIS is to identify early on what future needs may be. It is then up to government to address those identified needs.

4. The EIS is a disclosure document.

5. It will be up to the City to make those determinations. The EIS identifies the need, which is the first step towards solving the problem.

6. We feel that Appendix G adequately discusses these concerns. If vital services are not provided, service times will likely increase.

Air Quality:

1. The use of lawnmowers and similar types of exhaust producing equipment for landscape maintenance can affect air quality.

Urban Design:

1. The EIS is a disclosure document.

2. The EIS addresses these impacts in the appropriate sections of Chapter Four.

3. A site is "entitled" when development permits are granted.

4. Chapter Four identifies the impacts of implementing Alternative A and B. The change of visual character is largely an aesthetic issue and is disclosed in the EIS to the extent required.

5. See Response #2 above.

6. Please refer to Response #9 under the Housing category above.

Light and Glare:

1. Trees and hedges.

2. A 24-hour active area does not mean that all businesses are open all the time. Safety lighting can be accomplished by directional lighting or shielded lighting rather than flood lighting.

3. Limiting hours of illumination is intended to address such matters as commercial activities and the lighting of external facades, to name a few.

Relationship to Land Use Plans:

1. The livability of a community, in terms of pedestrian friendliness and accessibility of the streetscape contributes to social well-being. Please refer to the discussion on page 2-2 of Appendix A.

2. See Response #1 above.

3. The identified view corridors are generally consistent with existing mauka-makai roadways. Section 226-12 is not intended to prohibit development of all property.

4. In promoting LEED certification for new development, HCDA intends to address concerns about water conservation and the productive use of runoff.

State Ocean Resources Management Plan:

1. The KCDD is an existing urban area that is serviced by an existing drainage system. As such, runoff will continue to be generated. The EIS discloses this. Promoting alternative transportation modes is one way of improving ocean water quality because it can help to reduce petro-chemical releases on roadways.

2. Public shoreline vistas at Kakaako Waterfront Park are currently limited to lateral views because the mounds in the park prohibit mauka view from the shoreline. TOD projects in the Mauka Area will not impact lateral views along the shoreline.

Environmental Protection Act:

1. The EIS is a disclosure document. Please refer to the discussion under Section 4.10.13 in Chapter Four.

2. The entire EIS document is devoted to addressing these impacts. In particular, please refer to Appendices C and G.

3. As an existing high-density urban area, the KCDD is admittedly limited in the provision of natural environment that is uniquely Hawaiian. This has been the case since the mid-1900s. Recycling of wastewater will be addressed on a project by project basis. The provision of open space is an important aspect of any new development and will be addressed by rules to be enacted for the implementation of TOD. The lifestyles of urban residents will be improved through the implementation of the Complete Streets program as discussed in the EIS. The intent of the TOD Overlay Plan is to improve the urban environment.

County Plans:

1. As a high-density urban area, the Mauka Area of Kakaako includes virtually nothing that could be described as "natural environment". Thus, no natural environment would be undermined by TOD.

2. As discussed in the EIS, the provision of affordable housing is a principal goal of HCDA.

3. As discussed in the EIS, the HCDA is actively addressing concerns about recreational space under a separate master planning process.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching
Executive Director

AJHC/DN

RE: Comments Regarding the Kakaako Community Transit Oriented Development Draft EIS

Dear Director Ching,

Thank you for the opportunity to provide comments and address community concerns related to the *Kakaako Community Transit Oriented Development Overlay Plan's Draft Environmental Impact Statement.*

We welcome the opportunity to expand upon the positive benefits of more walkable, and sustainable neighborhoods in urban Honolulu. At the same time, we observe that the *Draft EIS* contains a number of areas that lack adequate discussion or information upon which to make substantive policy decisions that will affect existing residents and businesses. Specifically, we focus on areas of incomplete or insufficient information and analysis relating to: a) impacts upon small businesses in Central Kaka'ako, b) adequacy of transportation/roadway improvements, c) adequacy of recreational/open space requirements, and d) adequacy of public infrastructure systems.

Impacts upon Central Kakaako Industrial Zone Small Businesses
As noted in the August 22, 2008 comments submitted by Senators Chun Oakland, Fukunaga and Slom, and Representatives Brower and Rhoads, we are concerned that the *Kakaako Community Transit Oriented Development Draft EIS* does not address how the proposed zoning changes associated with TOD Alternative A or TOD Alternative B, and related transportation changes will affect small businesses within the Central Kakaako industrial zone.

On one hand, adoption of a more comprehensive "Complete Streets" program to make streets more pedestrian-friendly and promote multi-modal transportation alternatives includes streets within the Central Kakaako industrial zone as candidates for street widening and sidewalk improvements: these include portions of Queen Street west of Ward Avenue (primary), Halekauwila Street (primary), Queen Street east of Ward Avenue (secondary), Ilaniwai Street (secondary), Dreier Street (secondary), Waimanu Street (secondary) and Ahui Street (secondary), source: *Figure 4-20, Proposed Pedestrian Priority Streets, page 106.*

1

On the other hand, for businesses on these streets who rely upon parking in front of their establishments for their particular customer or service base (e.g., auto repair shops, etc.), adoption of a requirement for wider sidewalks can also mean the loss of square footage from which to conduct their businesses, or loss of readily-available customer parking.

The *Draft EIS* should address the following questions:

1. What criteria were used to select the primary and secondary pedestrian priority streets identified in *Figure 4-20*?

2. Have the *Draft EIS* consultants met with Central Kakaako small business owners and property owners to identify concerns associated with implementation of 'Complete Streets' pedestrian-friendly features like wider sidewalks?

3. If yes, what alternatives have the *Draft EIS* consultants explored to implement pedestrian-friendly modifications to the designated streets that may reduce the likely impact of pedestrian-friendly modifications upon area businesses?

4. What alternatives have the *Draft EIS* consultants explored to mitigate against potential business loss or other adverse impacts associated with 'Complete Streets' features along their designated streets? If they have not done so, they should meet with businesses along these designated streets to determine what potential adverse impacts might result from adoption of the recommendations for pedestrian-friendly priority streets.

Adequacy of Transportation Impacts Analysis

According to the comparisons of Year 2035 and existing travel mode/trip generation conditions in the *Draft EIS* (*pages 218-19, Table 4-11: Travel Mode Comparison, Year 2035 vs. Existing*), total trips by all modes of transportation to, from and within the study area will double as a result of expected development within the Future Baseline Condition, with traffic within the district increasing by one-third.

As such, it is difficult to understand why the *Draft EIS* fails to quantify the extent of public roadway improvements needed to improve traffic flow within the Kakaako Community Design District (KCDD).

For example, *Figure 4-14, Planned and Proposed Network Changes (Future Baseline Condition)*; *Figure 4-17, Proposed Street Connections: Proposed Action* (establishing two-traffic patterns for Piikoi-Pensacola, new street connections, service roads and pedestrian-only roads); *Figures 4-18, Proposed Motor Vehicle Priority Streets, 4-19, Proposed Bicycle Priority Streets,* and *4-20, Proposed Pedestrian Priority Streets* identify proposed improvements to the vehicular, bicycling and pedestrian flow within the district, but there is no identification of the costs of adopting the proposed actions.

The Draft EIS should address the following questions:

1. What are the estimated costs of adopting the proposed improvements/actions identified in *Figures 4-14, 4-17, 4-18, 4-19 and 4-20*, and which agencies and branches of government would be responsible for their implementation?

2. In your response to Question 1, please provide the criteria or basis for determining which agencies and jurisdictions are responsible for implementation costs. During the past two decades, HCDA and the State Legislature funded most, if not all, of the roadway improvements associated with Improvement Districts 1 through 10. What financing strategies is the EIS consultant proposing for implementation of traffic improvement actions identified above?

3. Will the adoption of the proposed improvements identified in *Figures 4-14 through 4-20* assist in mitigating traffic congestion conditions identified for the following streets, whose conditions are at LOS E or LOS F during peak traffic flow periods: a) Ala Moana & South, b) Ala Moana & Keawe, c) Ala Moana & Coral, d) Ala Moana & Cooke, e) Ala Moana & Koula, f) Ala Moana & Ward, g) Queen & Ward, h) Kapiolani & Ward?

   If not, why not? What improvements can be made to address the LOS E or LOS F conditions associated with the above-listed streets, which would continue in spite of Proposed Action listings from *Figures 4-14 through 4-20*?

4. Has the *Draft EIS* consultant evaluated other regional traffic analyses for congestion remedies that include access to and from the H-1 Freeway, and including such neighborhoods as Waikiki, Ala Moana, McCully-Moiliili, Downtown to Nuuanu/Liliha in terms of traffic flow associated with H-1 Freeway usage? If not, why not?

Adequacy of Regional Parks and Open Space Requirements

The section on Public Parks and Grounds contained in *Section 4.6.3.3, Public Parks and Grounds (page 190)* is cursory at best, and fails to address the deficiency in public recreational space for the Ala Moana/Sheridan and Kakaako region that we originally discussed in response to the *2008 Draft Mauka Area Plan*:

> *"The DMAP Draft SEIS identifies the grossly-inadequate level of public park spaces within Kaka'ako mauka, e.g., with only nine acres of existing park space (five acres are public) in conjunction with the City & County of Honolulu's parks planning standard of two acres of park space for every 1,000 residents of an area. Meeting City & County standards would mean that 60 acres of park spaces are needed for the Kaka'ako mauka area, which means that the projected park spaces for Kaka'ako mauka are deficient by over 50 acres." (August 22, 2008 Comments, Draft Mauka Area Plan).*

We therefore raise the following questions:

1. Has the EIS consultant considered expanding upon public recreational improvements to address the paucity of existing public recreational space by identifying Thomas Square, b) Neal Blaisdell Center, c) Kaka'ako Waterfront Park, d) Ala Moana Regional Park, e) Kewalo Basin Park, and f) other Kakaako Makai lands transferred to Office of Hawaiian Affairs as areas that may be suitable for expanded public recreational uses and development?

2. If not, why not? If yes, please provide examples of financing arrangements that other cities and states have pursued to leverage public recreational lands for maximum public benefit and use.

Adequacy of Regional Public Infrastructure Systems

The *2008 Draft Supplemental EIS Mauka Area Plan (Vol. 1)* noted that HCDA's Improvement District (ID) program helped to implement roadway and utility improvements within the Kakaako District.

The program was funded largely through the State legislature, with contributions from property owners and public utility companies, and focused on reconstructing and/or widening streets, installing streetlights, curbs, gutters, and sidewalks, improving drainage, sewer and water systems, and upgrading and undergrounding electrical power and telecommunication.

Over $203 million dollars was expended by the State/HCDA to complete 10 ID projects, 5 of which were within or partly within the Mauka Area and the rest located in the Makai Area. (*2008 DSEIS, pages 2-25*).

The infrastructure evaluation noted that total costs for improving the district, including upgrading sewer and water systems, increasing electrical power systems and communications systems, were estimated at approximately $ 113,701,000. (*2008 DSEIS, page 2-28*). Most of the estimated costs of regional infrastructure upgrades identified in 2008 have not been undertaken by the HCDA through requests for legislative funding or other financing methods between 2009-present.

A. Hydrology and Storm Drain Systems

In 2008 the estimated cost to make drainage improvements in the Kakaako Mauka area was estimated at $5,549 million dollars. The *Kakaako TOD Overlay Draft EIS* notes that "the existing drainage system is inadequate to accommodate and dispose of design storm rainfall runoff quantities in both existing and future conditions." *(TOD Overlay, Draft EIS, page 248).*

We raise the following questions regarding the incomplete nature of the information provided:

1. What are the projected costs to correct the existing drainage system deficiencies for storm rainfall runoff quantities for present and future conditions?

2. What steps has the HCDA taken since 2008 to address existing drainage system deficiencies for that portion of the Kakaako Mauka area in which the drainage system is inadequate?

3. Are most of the existing drainage system deficiencies located in Central Kakaako, where Improvement District-11 was previously proposed as the next step towards state upgrades to the infrastructure?

4. If yes, what actions can the State HCDA and appropriate city agencies take to address existing system deficiencies and mitigate those deficiencies?

5. What corrective and mitigation actions should the State HCDA and appropriate city agencies take regarding storm water/drainage system deficiencies to meet the development timetable for residential housing and other projects that the HCDA has approved since 2008 in the Kakaako Mauka area?

B. Sanitary Sewer Systems

In 2008, the estimated total cost to improve sewer systems in the Kakaako area was $49,482 million dollars.

The *TOD Overlay Draft EIS* cites an *October 15, 2014 Economic Impact Assessment (Table 7.10)* in restating the same public infrastructure costs, and noted that the 2008 sewer infrastructure improvement costs for Kakaaka Mauka were $49,482 million dollars, whereas *Table 7.10* included a correction to that amount in 2012 dollars, or $53,938,733 million dollars.

However, a 2014 *"Adjustment"* reduced the expected cost by $50 million dollars to $3,253,120.00. A footnote in *Table 7.10 (e)* states, "Large differences between 2009 EIS and 2014 adjustments for water and particularly sewer are explained in Belt Collins report for this EIS." The report makes no reference to the location of this information.

In *Appendix K,* the *Kakaako Sewer Master Plan's* update (prepared by Belt Collins in December 2014), "Opinions of Probable Costs," proposes a number of mitigation measures related to surcharged sewers, with a future baseline cost of $3,400,000 (rounded).

We therefore have the following questions regarding the sanitary sewer systems:

1. What are the projected costs to upgrade the existing sanitary sewer systems, as identified in the *2009 Mauka Area Infrastructure Plan* (MAIP)?

2. What is the basis for the December 2014 modifications in estimated costs to upgrade the sanitary sewer systems, which were initially calculated at $49,482 million dollars in 2008?

3. The *TOD Overlay Draft EIS* states that the City Department of Environmental Services and City Department of Design and Construction have only recently

received the *2009 Kakaako Mauka Area Infrastructure Plan* (MAIP), and neither has reviewed the Plan's improvements, nor included the projected sewer flow into the City's own projections for Sand Island Wastewater Treatment Plant projections (*TOD Overlay Draft EIS, page 248*). What is the reason for the delayed delivery of the 2009 MAIP to City agencies?

4. Have the HCDA and the City Department of Environmental Services and City Department of Design and Construction identified alternative technology solutions for sanitary sewer system upgrades to meet the needs of residential housing and other projects that the HCDA has approved in the Kakaako Mauka area since 2008?

5. *Appendix B (pages 27-28)* of the *Draft EIS* identifies the need for a comprehensive vulnerability assessment and mitigation plan for the Kakaako Community Development District. Which state or city agency would be responsible for undertaking such a study on behalf of the HCDA? Would such a study be required to meet federal requirements (e.g., flood insurance, etc.) and related requirements? If yes, has this requirement been discussed among city, state and other regulatory agencies, and what is the timetable for development of such a comprehensive vulnerability assessment and mitigation plan?

6. What actions should the State HCDA and appropriate city agencies take regarding sanitary sewer system upgrades to meet the development timetable for residential housing and other projects that the HCDA has approved since 2008 in the Kakaako Mauka area?

C. Solid Waste Disposal Program

The *TOD Overlay Draft EIS* states, there are "no existing or proposed solid waste disposal facilities located within the Mauka Area. All collected solid waste is disposed of outside the Mauka Area; at refuse transfer stations, recycling centers, composting/mulch sites, the Waimanalo Gulch Sanitary Landfill, the H Power plant in Campbell Industrial Park, other State Department of Health permitted facility, such as the PVT landfill in Nanakuli." (*TOD Overlay Draft EIS, p 373*).

We have the following questions regarding the solid waste disposal system:

1. What is the estimated range of solid waste disposal needs for which the EIS consultant reports that no disposal facilities are located in the Mauka Area?

2. What is the estimated cost for privately-contracted collection services to meet the expansion of solid waste disposal needs in Kakaako's Mauka Area? Will privately-contracted collection services be sufficient to handle residential, commercial and/or industrial needs under both the TOD Alternative A and B proposals?

D. Water Systems

In 2008, the *Draft EIS* estimated that the cost to improve water systems in Kakaako Mauka area was $4,700,000. The *TOD Overlay Draft EIS* identifies

approximately 37,600 linear feet of existing 6 and 8 inch diameter water mains will be needed to upgrade to 12 inch diameter mains to accommodate fire flow requirements.

We have the following questions regarding the adequacy of the information provided:

1. What are the projected costs to upgrade the existing water systems, particularly with respect to water lines located in central Kakaako?

2. What actions should the State HCDA and appropriate city agencies take regarding water system upgrades to meet the development timetable for residential housing and other projects that the HCDA has approved in the Kakaako Mauka area since 2008?

Thank you for the opportunity to submit the foregoing comments. We look forward to further public review of the *Kakaako TOD Overlay Draft EIS*.

Sincerely,

Councilmember Carol Fukunaga

Honolulu, Hawaii 96813

Dear Councilmember Fukunaga, Senator Chun Oakland, and
Representatives Brower and Saiki:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 23, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

Impacts on Central Kakaako:

At the top of page two of your letter, you suggest that adoption of a requirement for wider sidewalks can also mean the loss of square footage from

which businesses conduct their business, or a loss of ready-available customer parking.

As indicated in the Note section of Figure 4-20, "Recommendations in the Draft TOD Overlay Plan are only strategies and not required improvements". The Draft EIS does not indicate the amount of space to be reallocated for pedestrian movement, the specific type and location of each pedestrian improvement to be constructed on each street, or whether parking will be lost. A separate transportation design process will be necessary to develop conceptual and engineering designs, make design decisions, and weigh modal and street use tradeoffs.

As noted in Appendix D of the Draft EIS, "HCDA has worked with the Central Kakaako community and determined that the industrial character of the area should remain". In some cases, the industrial character of streets are preserved by creating shared street environments that provide more formal parking stalls, rather than haphazard parking arrangements that exist today that can be unsafe or uncomfortable for people walking along the street or to commercial locations. Streets where a shared street application may be appropriate include Waimanu Street, Kawaiahao Street, Queen Street, Hopaka Street, Coral Street, Kona Street, Cummins Street, Kamani Street, and Ilaniwai Street.

Furthermore, the parking analysis conducted as part of the Draft TOD Overlay Plan by HCDA's Transportation consultant, Nelson\Nygaard, indicates that the existing supply can be optimized in order to accommodate current parking demand.

1. The following criteria were employed to develop the pedestrian priority network:

   - Existing and anticipated pedestrian demand as a result of future redevelopment;
   - Key HART access streets for people walking to rapid transit stations;

- Retail access or retail streets should prioritize pedestrian movement and create a welcoming environment to people walking to and between commercial/retail locations; and
- Locations where walking might be uncomfortable or where existing pedestrian infrastructure is inadequate for current or future demand.

2. The Draft EIS transportation consultants did not conduct individualized outreach to every potentially affected business. This is due in large part because the precise design details of streets recommended for pedestrian priority designation would not be known until more detailed corridor redesign processes commence. Only the range of potential pedestrian improvements was provided in the Draft EIS. Stakeholders (including the business community and interested community members) had the opportunity to attend several open houses to provide input, offer ideas, and voice concerns. This level of outreach conducted by both the Draft EIS transportation consultant and HCDA was sufficient to gather business input related to pedestrian improvements and potential parking loss.

3. Please see response #4.

4. No alternatives have been developed. The pedestrian improvements are sufficient to ensure safe and comfortable pedestrian movement in the advent of a threefold increase in daily pedestrian crossings with no commensurate or appropriate increase in pedestrian capacity. Likewise, the Complete Streets network approach developed in the Draft TOD Overlay Plan and accompanying Draft EIS provides designated parking access streets to help limit search-for-parking traffic and reduce parking search times. Because every street in Central Kakaako cannot serve every purpose to every user, the transportation consultant established parking access

and on-street parking supply priorities along strategic streets. That said, on-street parking will likely remain on many pedestrian priority streets and in cases where limited parking supply removal might be proposed during the implementation phase, existing and future off-street parking supply will accommodate parking demand.

Adequacy of Transportation Impacts Analysis:

Near the bottom of your page 2, you state, "As such, it is difficult to understand why the Draft EIS fails to quantify the extent of public roadway improvements needed to improve traffic flow with the Kaka'ako Community Design District (KCDD)."

The rationale of employing a Complete Streets network and design approach to the Kakaako Community Development District (KCDD) was twofold: (1) to help achieve the community and livability goals of the TOD Overlay Plan and (2) to increase the person carrying capacity of the network, rather than the vehicle carrying capacity. The Draft EIS's proposed improvements address traffic flow by enhancing the quality of service to transit, walking and bicycling to encourage people to shift to alleviate motor vehicle traffic demand. The TOD Overlay Plan's proposed improvements respond to shifting demands in the presence of denser urban development and more robust pedestrian, transit and bicycle networks (including the impact of HART). These shifting demands correspond to a decrease in total daily motor vehicle trips from 77.3% under Existing Conditions to 71.3% of under the Future Baseline Condition and 69.6% under the TOD Alternative A/B. Thus, TOD Alternative A/B provides far greater benefit to traffic capacity and flow by reducing the total number of daily motor vehicle trips traveling to and throughout the KCDD.

Likewise, the impact of pursuing additional traffic flow and vehicle capacity improvements employed in the Baseline Condition (in the form of roadway widening and increased turn lane capacity) would present significant impacts on adjacent land uses (in the form of takings, potential parking loss, and

reduction of sidewalk capacity for pedestrian access, shop displays, café seating, etc.) compared to the TOD Alternative A/B proposed mitigations. Roadway widening and turn lane capacity mitigations would also present far higher capital costs compared to the TOD Alternative A/B's person carrying capacity mitigations.

1. Figure 4-14 presents the original roadway changes proposed in the Kakaako Mauka Area Plan Supplemental EIS Transportation Analysis (produced by the consultancy EDAW, Inc., dated April 14, 2009). The design assumptions necessary to provide cost estimates are not available to the Draft EIS consultants and, as such, cannot be produced. Figures 4-17 through 4-20 present proposed network changes and modal street priorities. These priority designations do not include specific design details and, as such, could not accurately have cost estimates applied. However, the Draft EIS consultants developed typical cross sections for the proposed mitigations located in Appendix D of the Draft EIS. These cross sections illustrate the proposed changes to streets with recommended mitigation measures for the Proposed Action. Streets with varying sidewalk widths are illustrated with ranges. All cross sections are conceptual and would require further engineering study prior to implementation.

   Based on these cross sections, the following high level, order-of-magnitude cost estimates have been developed. These costs include capital costs, labor, construction engineering, survey and design, contingency, and project administration, cost estimates do not constitute engineering-level cost estimates and, depending on level of utility removal/relocation, right-of-way acquisition, and other major cost factors, may vary significantly from the costs listed below.

   - Ward Avenue: $300,000
   - Cooke Street: $140,000

   - South Street Protected Bike Lanes: $250,000
   - Punchbowl Street Protected Bike Lanes: $240,000
   - Central Kakaako Industrial Shared Streets: $6,600,000 (Includes segments of the following streets with curbless street design: Waimanu Street (2,525 ft), Kawaiahao Street (2,585 ft), Queen Street (2,275 ft), Hopaka Street (1,070 ft), Coral Street (455 ft), Kona Street (1,350 ft), Cummins Street (430 ft), Kamani Street (715 ft), and Ilaniwai Street (1,190 ft).);
   - Pedestrian crossing improvements (along all corridors): $4,600,000
   - Ala Moana Shared Use Path: $1,300,000
   - Pensacola Street Restriping/Bike Lane: $290,000
   - Piikoi Street Restriping/Protected Bike Lane: $305,000
   - Halekauwila Street Cycle Track: $330,000

   Implementation of the proposed improvements/actions will likely occur through a number of different funding mechanisms or sources, including HCDA, State Legislature allocated funds, OMPO allocated funds, the City and County of Honolulu (to a lesser extent), Hawaii Department of Transportation (to a lesser extent), and any number of the grant opportunities. Grant opportunities might include MAP-21 Transportation Alternatives Program (TAP), MAP-21 Recreational Trails Program (capital and O&M), Transportation Investment Generating Economic Recover (TIGER) Grant Program, FTA 5307 access to transit funding (1% of total funding requirement), CDC DP14-1417 Partnerships to Improve Community Health, and HUD/DOT/EPA Partnership for Sustainable Communities grants, among others. Private developers would also be funding partners, helping to pay for pedestrian improvements that directly affect their development sites.

2. The list of funding sources and mechanisms is based on common funding options available for similar project in other places and the likely jurisdiction partners that would likely fund one or more proposed improvements. No financing plan was developed for this EIS as each project would likely be implemented on a piecemeal basis, which is subject to funding availability at the time of implementation, and the timing is presently unknown.

3. Proposed improvements in Figures 4-14 through 4-20 will assist in mitigating traffic congestion by increasing the person carrying capacity of streets, creating environments that support trips made via HART rail and improving connections to HART. Table 4-22 lists proposed actions that will mitigate the impact of LOS E and F affected intersections. Two intersection have potentially substantial and unavoidable impacts: Queen & Ward and Kapiolani & Ward.

4. The TOD Overlay Plan acknowledges the importance of the H-1 freeway to regional connectivity and the Draft EIS ensures proposed mitigation measures do not significantly impact ingress and egress to on-and off-ramps. Likewise, the TOD Overlay Plan develops strategies and proposed improvements to support regional rail trips via HART and internal trip capture that take trips off of the H-1 freeway.

Adequacy of Regional Parks and Open Space Requirements:

1. As discussed in Section 6.6 of Chapter Six, HCDA is presently engaged in outreach concerning the preparation of a Parks Master Plan to address recreational needs in the KCDD. As the outcome of this process is at this point in time unknown, the current EIS identifies the matter as an Unresolved Issue. Decision-making concerning the parks you identify cannot occur until our park master planning effort is completed. For this reason, the matter of expanding public recreational uses was not more fully addressed in the EIS. Figure 4-8 in Chapter

Four of the EIS identifies already committed privately developed and maintained public spaces as well as potential future private and public developments that can expand public open spaces in the KCDD.

2. See response above. In light of our current efforts, the issue of financing arrangements for the purpose of leveraging public recreational lands for maximum public benefit and use is clearly pre-mature for the purposes of the TOD EIS, and will likely be addressed by HCDA under the umbrella of its parks master planning effort.

Adequacy of Regional Public Infrastructure:

A. Hydrology and Storm Drain Systems

1. Per the City's Storm Drainage Standards, any increase in storm water runoff generated within the property shall be retained or disposed of on-property; commonly referred to as a "no net increase" in runoff. As there will be no net increase in runoff due to the developments within the Kakaako Mauka Area, there will be no net impact to the City's drainage system. Therefore, the determination of where the existing drainage system deficiencies are and what is required to correct the deficiencies is being left to the City. Anticipated mitigation actions are suggested in Item 5 response, below.

2. We have not taken any steps to address existing drainage system deficiencies within the Kakaako Mauka Area since 2008.

3. The existing drainage system deficiencies are NOT solely located where Improvement District 11 was proposed. It

is noted that Improvement District 11 scope of work only addressed localized drainage deficiencies; such as for localized ponding and installation of curbs, gutters and sidewalks.

4. The existing drainage deficiencies result from storm water runoff generated from lands mauka of the Kakaako Mauka Area, when combined with runoff generated from the Kakaako Mauka Area, being larger than the amount that can be conveyed thru the existing drainage system within the Kakaako Mauka Area. A Regional Drainage Master Plan encompassing land upslope of the Kakaako Mauka Area would need to be prepared, which would then become the basis for determining the required drainage infrastructure improvements and projected costs. As there are multiple jurisdictions involved, HCDA, State Department of Transportation, and the City's Department of Environmental Services to name a few; determining which entity would take the lead and prepare the Regional Drainage Master Plan would need to be discussed and agreed to.

B. Sanitary Sewer Systems

1. As noted in Table 7.10, the projected cost to upgrade the existing sanitary sewer system as identified in the 2009 Mauka Area Infrastructure Plan (MAIP) is approximately $53,938,733 in 2012 dollars.

2. The basis for the Draft EIS sewer system infrastructure costs was the Sewer Master Plan Update for the Kakaako Mauka District (Sewer Master Plan), which was included as Appendix K in the Draft EIS. The specific mitigation measures and costs were provided on Page 9, Table 8:

Opinion of Probable Construction Costs. The major difference between the Sewer Master Plan and the 2009 MAIP is that the Sewer Master Plan includes the City's proposed diversion of sewage flow from the 60" Ward Avenue trunk. The Sewer Master Plan computations included a minimum diversion amount of 27 million gallons of sewage per day, which would alleviate surcharged conditions in Ward Avenue, Auahi Street, and South Street.

3. The 2009 MAIP was transmitted to the City's Department of Planning and Permitting (DPP) on October 31, 2012. On March 1, 2013, Belt Collins, HCDA's engineering consultant, clarified that the October 31, 2012 transmittal included the sanitary sewer (wastewater) master plan, for which review was requested.

4. During Belt Collins' discussions with ENV, the topic of alternative technology solutions for sanitary sewer system upgrades was not broached. HCDA has not had discussions with the City Department of Design and Construction relative to sanitary sewer system upgrades.

5. Appendix B (pages 27-28) – The City's DPP would be the likely agency to lead a vulnerability assessment for greater Honolulu. HCDA would participate in the study to the extent necessary to address issues in Kakaako. The Federal Government developed the flood insurance rate maps (FIRM) that determined the land areas requiring flood insurance and established the base flood elevations (BFE); no additional studies are required by the Federal Government. However, if a development will impact the BFE, then the DPP will require the developer to prepare

additional studies and prepare a letter of map revision to revise the FIRM, if necessary.

6. Belt Collins prepared the Sewer Master Plan for HCDA, which specifies the sewer system upgrades necessary to service the planned development within the Kakaako Mauka Area, and transmitted it to the City Department of Environmental Services (ENV) and to the DPP as these agencies are jointly responsible for reviewing and approving the Sewer Master Plan. Based on the approved Sewer Master Plan, DPP will either inform the sewer service requestor that their sewer connection application has been approved or not; in which case the sewer service requestor would need to coordinate with ENV to determine the minimum sewer improvements necessary for the proposed construction. The above outlined actions will assist proposed developments meet their development schedules.

C. Solid Waste Disposal Program

1. The increase in solid waste generation is estimated to range between 59,000 and 75,000 tons per year; or 214% to 244% respectively. The calculations account for the land uses represented in the water/sewer master plan analyses (i.e., residential/hotel, civic/office, industrial, and commercial/retail), for the existing, future, TOD A and TOD B scenarios.

2. The cost for privately-contracted collection services are typically paid for by the development or lessee and not by the City and County of Honolulu or State of Hawaii; and, therefore, not included in the Draft EIS. HCDA anticipates that the demand for privately-

contracted collection services will drive existing companies to expand in size or allow new companies to compete; thus meeting the needs within the Kakaako Mauka Area.

D. Water Systems

1. The projected costs of $41,900,000 to upgrade the existing water system within the Kakaako Mauka Area are noted in the Water Master Plan Update, HCDA Kakaako Mauka District (Water Master Plan), which was included as Appendix J in the Draft EIS; in Section 4 Opinions of Probable Cost.

2. Belt Collins prepared the Water Master Plan for HCDA, which specifies the water system upgrades necessary to service the planned developments within the Kakaako Mauka Area, and transmitted it to the Board of Water Supply (BWS) for review, comment, and eventual approval. Based on the approved Water Master Plan, BWS will inform the water service requestor of the minimum improvements required in order to obtain BWS approval of the proposed construction. BWS's minimum required improvements will probably consist of water main installation from the project to the closest existing 12-inch water main. The above outlined actions will assist proposed developments meet their development schedules.

Subject: Comments on the TOD Overlay Plan Draft Environmental Impact Statement (DEIS)

For the volume of information provided in the 1,152-page DEIS issued on January 8, 2015, and without previous meaningful engagement of the community in the development of the TOD Overlay Plan, 45 days is is too short a period for community residents and the public to carefully review its contents and to provide written constructive and usable comments on a proposed action of such magnitude and significance.

The Draft Environmental Impact Statement ("Statement") should disclose the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and state, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.

In reviewing the DEIS, we found far more unanswered questions to the proposed action than information to on the impacts and the mitigation measures to address significant adverse or potentially adverse impacts on the Kaka'ako Community Development District ("KCDD") environment, residents, and businesses.

The following provides our comments and questions, and look forward to having them addressed pursuant to HAR Sections 11-200-18 and 11-200-22.

KŪ: Kaka'ako Ūnited
PO Box 235965 • Honolulu, Hawaii 96823
www.kakaakounited.org • info@kakaakounited.org

KŪ

Ensuring the quality of life for an integrated Kaka'ako community from mauka to makai.

General Comments on the Statement

1. The Statement's discussion of "social impacts" generally describes only positive results of the TOD Overlay Plan, promoting the TOD concept. While there may be some merit to this argument, it is not balanced with what are likely to be direct and indirect adverse consequences that are contrary to the purposes expressed in Chapter 206E, HRS, for the KCDD. One major impact is the loss of small industrial service businesses due to economic and financial pressures brought about by the TOD, including diminished business activity during lengthy and nearly continuous construction and rising land values that drive up property tax assessments.

   Also, increased development potential allowed by the TOD tends to favor larger properties. Most of Central Kakaako's small properties are excluded from the TOD Overlay zone so they do not reap the purported benefits of density bonuses, but they surely will be negatively affected by them. Where is the analysis of these impacts in the DEIS and what mitigation measures are proposed to help retain small businesses, especially those of an industrial service nature? The Statement does not address this critical part of the community and how it will be preserved and enhanced. Not only is the preservation of these businesses contained in HCDA's governing statute, chapter 206E, HRS, it is in the Hawaii State Plan, specifically stating that a priority guideline to effect desired growth distribution and land resource utilization is the support of the redevelopment of Kaka'ako into "a viable residential, *industrial*, and commercial community." Section 226-104(8), HRS.

2. The TOD Overlay is an ambitious plan that calls not only for increased density on private properties, but also extensive right-of-way and other infrastructure improvements. There is no clear plan for how these improvements will be financed and over what period of time. Given the scope of the proposed construction activity necessary to implement the plan, it is difficult to accept the characterization of the construction activity as "short-term" since it is likely to occur over several decades. Certainly the history of the KCDD thus far strongly suggests this. The DEIS should include an estimated build-out schedule and proposed phasing plan, including but not limited to the impacts and plan for minimizing the disruption to the existing businesses and residents of the district.

3. It is unclear why TOD Alternative A was even discussed since it has already been superseded by legislation passed in 2014 amending chapter 206E, making this an unrealistic alternative to the proposed action. The portion of the funding used for the analysis of Alternative A could have been better used to address 1 and 2 above and to consider other more creative and forward-looking alternatives, such as the use of Transfer of Development Rights (TDR), rather than additional density bonuses and building heights to achieve the desired development pattern near transit stations. There is great opportunity for TDR in Kaka'ako because the prime redevelopment sites are owned by just two major landowners. Why was this alternative not discussed? Were other alternatives than the above proposed actions considered? If so what were they and why (what criteria were used) were they discarded?

4. The Statement does not adequately address how the proposed action will conserve the natural resources so that land, water, visual, air and other natural resources are being

protected, preserved and the KCDD's unique natural environmental characteristics are being safeguarded, particularly its shoreline and marine resources pursuant to sections 226-11 and 344-3, HRS. The Statement provides information on the significant degradation that would occur but provides no specific details on natural resources, particularly those unique to the district, and a plan on how this will be addressed or mitigated in accordance with chapter 343.

5. While the Statement dutifully goes through the various federal, state, and county plans checking, off that the proposed action is consistent with or not applicable to these plans, more is needed. More careful study of the intent, objectives, and guidance by these plans, e.g. the Hawaii State Plan and its functional plans, the Hawaii Environmental Policy, the Coastal Zone Management Plan, State Ocean Resources Management Plan, etc. is needed. The agency needs to amend its Overlay Plan to conform with with the intent and objectives of the aforementioned plans. Some of these issues are cited in the following specific comments.

Specific Comments and Questions

The following provides comments and questions on specific actions in the Statement that must be addressed before an assessment can be made whether the significant impacts on the environment can be reduced or adequately mitigated:

1. 0.2(p 4) Summary of the Proposed Action and Alternatives.
   The Proposed Action is intended to be an incentive-based program providing incentives to landowners: in exchange for density bonuses, landowners would be required to provide exemplary public benefits. Please provide details of the incentive program; and, more specifically, provide a schedule of the type and amount of "bonuses" and correlating these with the "exemplary public benefits" that must be provided for each type of bonus. Current HCDA practices require minimal public benefit from a developer that builds denser, higher and closer concrete structures adversely impacting residents and businesses therefore please provide a more specific definition of "public benefits" and "exemplary" public benefits.

   The Statement also tells us that TOD is intended to optimize KCDD's development by promoting the use of smart growth principles, multi-model transportation, and walkability. What exactly are the principles of "smart growth" that will be applied to KCDD? This is a concept with many definitions and variables. Chicago's historic master plan, for example, ensured "every citizen to be situated within walking distance of a park." If HCDA is using this criterion for its TOD, we should expect more public parks and green spaces in the district. Instead, HCDA is approving developments that build more concrete structures rather than green and quality sustainable public spaces to enable residents living in denser and closer high rise buildings to enjoy their surrounding open environment. The Statement should provide more specific details of the general concepts that sound great but without more, tare merely dreams for Kaka'ako rather a plan for action. KCDD deserves a more comprehensive implementation plan that maps out how the mauka and makai plans will be executed to build an integrated, sustainable community – this is smart growth. Currently, developers are building for their own benefit rather than aligning with an integrated community district inclusive of mauka and makai lands. This is not the concept of "smart growth" development.

Using the term without more is deceptive. More study and information is needed to first identify how the proposed action will affect the KCDD and to determine the impacts and benefits that will result.

2. 0.3(p 6) Use of Public Funds or Lands for the Proposed Action
The proposed action intends to use public funds to implement a complete streets program, requiring funding by the City. Please provide the complete streets plan for KCDD, including the actions needed, budget required, and lead agencies with whom HCDA is working to plan and implement the program. What will be the disruption caused by the requirements? What is the timeline for execution and will it be done in phases? If so, specify the timetable and actions per each phase; and how the community will be involved and informed about the plan and schedule of development.

3. 0.3(p 10) Social Impacts
   - Improved public health. Please provide documentation for statements made that Kaka'ako will benefit from improved public health, reduction of traffic injuries or fatalities, reduction of air pollution, etc. when the current conditions are not healthy and will be less so with the anticipated construction and density of building and with no evidence to date that the agency is executing a plan to improve the necessary infrastructure –roads walkways, sewers, etc.
   - Improved access to housing. Please specify the basis for HCDA's statement that the proposed action will encourage more housing in an accessible location proximate to existing job centers when earlier in this Statement, it was reported that jobs would be reduced and housing will still be unaffordable to 80% of the resident population at 140% of AMI (unless this changed in accordance with the 2014 Report of the Reserved Housing Investigative Committee).
   - Improved parking options. While the proposed action is expected to offer a menu of different types of on-street parking treatments and policies to encourage long-term parking management strategies at the district scale to provide more efficient utilization, there is no district-wide parking plan. Has HCDA developed and adopted a parking plan for the district, including public and private parking, and how they will be managed for the district? If so, please provide a copy of the policies and parking management for efficient parking control for the district.

4. 0.4(p 7). Summary of Beneficial and Adverse Impacts - Employment.
Chapter 206E, HRS, the governing statute for the development of KCDD, envisioned a mixed-use, mixed-density, mixed-income community. In addition to affordable and mixed income residential, it was to attract and support a diverse range of businesses -- light industrial, commercial, and retail. TOD, smart growth, and the Mauka Area Plan are also based on principles of creating a community of mixed uses, balancing residential with business , recreation and other amenities.

However, the HCDA's Alternative B is changing the character and undermining the vision for KCDD by making it a bedroom community, increasing the residential population (73%) and reducing to only 27% the non-residential sf of development, with the result of eliminating 7,555 jobs/workers. What is HCDA's justification for not following the law and plans? What conditions have changed for HCDA to act contrary to law? Please provide justification for this

changed direction, and, whether HCDA is submitting legislation to reflect this change. If legislation is not submitted, please provide details on how HCDA has and will work with developers and community to address this conflict with the governing law, principles and existing plans.

5. 2.3.1(p 7) Neighborhood Character.
What is the distinct character of Kaka'ako that the proposed action will exhibit? The character is now lost to high-rise residential buildings with no aesthetic quality or design aligned with the character of the neighborhoods. While the seven neighborhood zones and the Aloha Tower Special District have been identified by types of buildings and services offered in these zones, nothing reflects the character or quality or history of the zone. HCDA has apparently made no effort to engage the community members in discussions of the history, sense of place and vision for the various Kaka'ako neighborhood zones. Document what HCDA has done to identify the neighborhood character. In other TOD sites, the City has engaged the residents and businesses in the area to identify the "sense of place" for the neighborhood so that the station can reflect that character. Has HCDA done or does it have plans to do this? Provide specific documentation, including dates and community residents involved in these efforts, if any, and the result of these discussions, specifically what input was used in creating the neighborhood "character"? Chapter 8 lists agencies and community meetings but these appear to have been informational and means by which the agency could gather input on its TOD Plan not the identification of the "character" of the neighborhood zone.

6. 2.3.2.6 (pp 18-20) Residential
The "affordable" housing policy discussed in the Statement is dated and brings into question whether the document is forward-looking to Kaka'ako's future in 2035 --a future that, by law, requires housing for a diverse population at varied income levels. The 2011 Hawai'i Housing Planning Study ("Study"), the major source document on our state's housing needs, found that between 2012 and 2016, Hawai'i will need at least 28,000 units to meet the total housing demand. The Study looked at the demand at each household income level, and determined that only 1,944 units --6.9%-- are needed by households making between 120% and 140% of area median income (AMI). Yet HCDA's rules currently allow for *all* for-sale "reserved"-- HCDA's term for "affordable"-- housing units to be priced above 120% of AMI. The same goes for *all* "workforce" housing. This policy exists even though the market can easily meet the need for such high-end units (a family of four at 140% of AMI can afford an apartment costing $758,000--the median apartment costs only $348,000). It's at the lower price points where HCDA must require developers to build "reserved" and "workforce" housing -- a need recognized by HCDA's own Reserved Housing Investigation Committee ("Committee"); in its report the Committee recommends that the top threshold of 140% AMI be lowered to 120% of AMI to build housing for those at the moderate income level.

The Committee further recommended that units sold to qualified buyers remain in the affordable pool for at least 30 years. Yet the DEIS fails to reflect this recommended change. It should also be noted that the City's unilateral agreements imposed upon developers require that 20% of units be priced for sale to households earning 120% of AMI or below, and the City has recommended this percentage be increased to 30%. It seems unacceptable for a "forward-looking" document not to reflect both State and City recognition that it is in the public interest to require lower household income qualifying levels and longer terms for retaining units in the "reserved" (affordable) housing pool.

Based on the above, what is the agency doing to pursue the recommendations of the Committee? Provide documentation of efforts to implement the recommendations, including the revision to this Statement.

7. 2.3.2.7(p 20) Parks and Open Space
While the Statement identifies new recreational open spaces such as plazas, the specific identification of public open green spaces and parks is missing. The only allocation of parkland identified is in a "redeveloped Blaisdell Center Park" and a "redeveloped HECO site" in the Thomas Square Neighborhood -- not in the KCDD where the density and closeness of residential buildings will be increasing, i.e. on the makai side of Kapiolani Blvd.

The national standard followed by the City is two acres of park for every 1,000 residents. If HCDA followed that standard in its planning for the district, it would set aside at least 84 acres for public parks. To date, there are only 53.59 acres in parkland. Instead, of more open green spaces for the 42,000 (or 46,000) residents, there is less, with more concrete plazas rather than quality open green public spaces and parks. Based on the law (chapter 206E,HRS) and the plans (mauka and makai), the agency should create a comprehensive park plan that addresses the needs of current and future residents, workers, and visitors in the district. If one does not now exist, it should, and it should include the open green spaces set aside as parks, the cost to build and maintain, sources of funding –private and public-- and the timetable to ensure that these lands are available at the build-out.

8. 2.3.5 (p 24) Building Height
TOD Alternative B introduces significant height increases, and indicates that tall residential towers could include a cluster of 420-550 feet residential towers and three residential towers to 700 feet – one in the Pauahi and Auahi neighborhoods and one as part of the potential redevelopment of Blaisdell Center. Is this possible? The current law (Act 61) prohibits any building above 418 feet. How will the TOD Overlay Plan address this restriction? Will the Statement be revised and what will the effect be on this DEIS and the attendant analyses of the impact of the proposed action?

The mauka plan's "Future Baseline" EIS contemplated 5.0 FAR, including parking; but Alternative B increases the density in TOD sites to a maximum of 10 FAR. What mitigating actions will be taken to provide for air, water, sewer, open space and mobility requirements so that the district will not lose its character or create urban vertical blight through the proposed action?

9. 2.3.6(p 26) Transportation.
Multi-modal transportation requires planning and infrastructure. What is the transportation "system" planned for KCDD? Nothing seems to be planned; only pilot demonstrations. A plan is more than a drawing of streets; it requires coordination with various federal, state and city agencies to design feasible and safe roads, bike paths, pedestrian walkways around and within the district. Has HCDA worked with the various private and public entities to develop a comprehensive transportation plan—one that is coordinated with and specifies responsible entities within government jurisdictions and private landowners to develop the roads, on and off street parking to accommodate the anticipated users, bikeways, and walking paths

throughout the district? Does HCDA have an implementation plan and timeline and budget identifying funding sources to execute its transportation plan if it has one.

Currently the significant impact of already over-taxed streets and roads will be further congested and eroded as Alternative B anticipated 42,000 additional residents will be moving into the area (and Alternative A with 46,000 residents). There does not appear to be any plan -- short- or long-range-- for the entire district. HCDA indicates that this is not its direct responsibility and "may require inter-agency coordination or partnerships to ensure implementation." What has HCDA done to date to explore which agencies are involved and what partnerships and costs might be required? What is the plan of action, including agreements with appropriate agencies and partnerships, and the costs for its execution? Has HCDA identified who will pay the costs? What are the effects of the proposed action on the economic and social welfare of the community and state, and what actions will be taken to minimize adverse effects? If HCDA does not yet have a plan, what has it done to date and what does it need to do to provide this essential information to assess the environmental impacts of the proposed action?

10. 2.3.7 (pp 36-39) Infrastructure.
This is a major concern of community residents and businesses. It affects their health, safety, and quality of life. A comprehensive plan for the entire district, not piecemeal building by building, project by project, studies, is needed to build KCDD properly. HCDA should indicate what studies have been completed, the cost and, if affecting various landowners/developers, what amounts have been assessed to those directly involved in increasing the load on the following infrastructure requirements for healthy, safe living:

- 2.3.7.1(p 36). Drainage. The existing drainage system is inadequate to accommodate and dispose of storm rainfall quantities in both the existing and future conditions. This is a significant impact on the environment not to mention the health and safety of residents. However, without further data or analysis, the Statement concludes that the build-out of vertical buildings will have negligible impact on the current already significantly impacted condition. Please provide additional research on this matter as it is important to the health of those who live, work and visit the district. Further, it would be irresponsible to dismiss the need for a plan to design and construct improvements that have been identified as needed to deal with the existing deficiencies. It is inexcusable that this current deficiency is not addressed; and, further, that it is unacceptable that additional buildings –even vertical ones with less runoff – are added without first addressing the existing problems of the district's poor drainage system. HCDA should develop and budget for corrective actions to address the drainage system deficiencies which adversely affect the health and quality of life of current and future residents. Please provide documentation on the deficiencies and the impacts of the deficiencies on the environment and people, estimated cost to construct the improvements needed, and funding source and timetable to address these deficiencies alongside the timetable for the proposed build-out.

- 2.3.7.2(p 37) Potable Water. Alternative A at full build-out will increase demand by approximately 1.11 million gallons per day over the Future Baseline Condition while Alternative B would increase demand by approximately 800,000 gallons per day. In either case, upgrades are needed in addition to the upgrades that have already been made. Specifically, the study reports that the current water mains must be upgraded to replace

37,600 linear feet of existing 6-8 inch mains with 12-inch mains to meet peak hour consumption and fire flow requirements. What is the timeline for the upgrade, the cost, and source of funding?

- 2.3.7.3 (p 37) Wastewater Collection and Treatment. Under Alternative A full build-out would increase daily wastewater flow rates by 1.2 million gallons over the Future Baseline Condition while Alternative B would increase it by 300,000 fewer gallons per day. While several CIP projects have been budgeted by the City to improve trunk lines, rehabilitate sewer lines and to add a new pump station in the area, the current problems with sewer smells lead residents to believe that these were budgeted but not funded. Please provide the documentation showing the enhancements above, including the work order, date completed, and cost.

  Please also provide the City's study results for the Relief Sewer Corridors and timeline for and source of funding, whether budgeted and approved, for the replacements of sewer lines. The DEIS states that even with the improvements a number of sewer mains will remain surcharged. Please provide a description of which sewer lines will be surcharged and documentation and source of assessment that the system would meet peak flow requirements and will not engender spills.

- 2.3.7.4(p 37) Solid Waste Disposal. Even with 42,000 (or 46,000) more residents there is no modification to the solid waste disposal program planned within the mauka area. Please provide documentation of the study to justify this conclusion. And specify why private contractor collection services will be used instead to meet increased demands. We have seen a private contractor used for the existing system but the problem is an expedient and not long-term fix so please explain why HCDA prefers this "band-aid" approach rather than upgrading the "system"

- 2.3.7.5(p 37), 4.11.5(p 254). Electricity. How is HCDA proposing to address the threefold increase in electricity demand of Alternative B? The Statement merely indicates what HECO may do, i.e., "may serve the additional loads from its Iwilei and Kewalo Substations...or..." and beyond nine years, "...will likely need to secure an additional substation site." Has HCDA met with HECO to find more sustainable, energy efficient options? Surmising what the utility may or may not do is not good planning nor does it provide the necessary data and options to determine how to provide an operational necessity for residents and businesses in KCDD. Please provide information on how the estimated demand was calculated, and what efforts, if any, have been made to meet with HECO to create a long-range plan for electrical service for KCDD. If not, HCDA should meet with HECO and develop agreements and a plan for stable and reliable power for the additional 42,000 (or 46,000) residents plus the additional businesses, workers and visitors to KCDD anticipated through 2035 to ensure that the build-out will not fall short and diminish the quality of life and activity due to the lack of firm, adequate power.

  Words are empty without a plan to comprehensively address the infrastructure required for the health and safety of those who live, work and play in the district. The impacts are tremendous on the infrastructure and environment – currently we have poor streets and roads, poor storm water drainage during heavy rains, sewer smells emanating from

roadways and particularly pungent after the rains, no public schools, no grocery stores, and not enough parks.

HCDA cannot manage the KCDD without first mapping out the essential elements of a community and coordinating with government, landowners and developers, and the residents and small businesses already living and working in the district to ensure the infrastructure can carry the current and added load of 42,000 (or 46,000) additional residents plus the thousands more workers and visitors to the district. Please provide the specific plan for infrastructure enhancements or replacements to ensure there is sufficient carrying capacity of the roads, sewers, waste water treatment, storm drains, potable water, parks, and schools, and include an estimated timeline for various improvements, budget, and sources of public and private funding (and whether there have been commitments or encumbrances for these items). Although probable costs are reported (eg. Appendix K, reports the total cost for sewer mitigation for TOD Alternative A is $4.5 million), there is no information on the source of funding, and timetable for completion of these mitigation measures and, in particular, as they relate to the proposed action in those identified areas in the district. What are the other impacts and mitigation measures required during construction of these and other infrastructure projects?

11. 2.4 (p 39) Implementation.
    When significant impacts are anticipated, as in this massive proposed action disrupting current businesses and residents in the district, it is distressing, given the agency's actions in approving permits and long-term leases with little regard for the surrounding community, that there is no specific implementation plan or even a strategy as to how the build-out will occur. The Statement merely provides in one paragraph that the proposed action "will be adjusted to accommodate public input as appropriate." This is insufficient disclosure of the environmental effects of the proposed action, all which come with implementation. This must be provided to determine the impacts and needed mitigating measures needed to ensure that the quality of the environment is not irreparably degraded.

12. 4.7 (p 65) Traffic
    The DEIS recognizes that the increase of residents, visitors and workers will exacerbate traffic conditions with slower travel times and that the major intersections will run at LOS F. Traffic and travel delays already challenge current residents, workers and visitors to the district. What plan for a better circulation of multi-modal transportation is proposed? Please provide your multi-modal plan, budget and timeline for execution.

13. 4.8 Noise
    4.8.2(p 127) identifies the KCDD traffic noise levels along Nimitz Hwy, Ala Moana Blvd, Kapiolani Blvd, King Street, Ward Avenue, Piikoi, Punchbowl, Pensacola, South and Cooke Streets where the noise was typically greater than 65 DNL along the rights of way due to the large volumes of traffic on those major thoroughfares. Additionally, Figure 4-24 depicts crosshatched areas where traffic noise levels generally exceed 65 DNL and are considered to be "Significant Exposure--Normally UNacceptable" (SE-NU)."

    The Department of Housing and Urban Development (HUD) requirements establish three zones: acceptable (project can be approved); normally acceptable (project would have to be evaluated individually); and unacceptable (project would not, as a rule, be approved). HUD's

standard for interior auditory environment at residences shall not exceed a day-night sound level of 45 DNL. And, further, the maximum permissible sound level under the Department of Health (DOH) standards for residential areas and public spaces is 55 dBA/DNL during the day and 45 dBA/DNL at night (Section 11-46-4, HAR).

Clearly the current noise levels are unacceptable under any of the standards. The proposed action will double the traffic and street loading by 2035 and increase the residential density by over 50%. Despite being aware that existing noise levels are harmful to health and in violation of federal and state standards and guidelines as well as mandatory requirements, the Statement does not address specifically how the existing unacceptable and illegal noise levels will be mitigated.

More specifically, the Statement should address the following:

- What is the TOD noise standard for interior and exterior buildings for the district? Is it using DOH or federal standards? Please specify and provide a chart of the noise standards alongside the actual noise level for the various streets in the district.
- The KCDD noise level is currently unacceptable under federal (EPA, HUD) and state (DOH) guidelines and at levels harmful to public health. How will this be mitigated for each of the areas listed above? Please provide a plan, including mitigation measures, timetable, cost, source of funding and who is responsible for executing the plan.
- What is the noise level of all other areas in the district (those delineated in Figure 4-24 as well as all other areas), and, if unacceptable or normally acceptable (day-night noise levels of 45 DNL for interior and exterior buildings), how specifically will the noise levels be mitigated? Provide specific measures, timetable, cost, and responsible agents to execute the mitigation.
- How will the hundreds of units which have single pane windows in these areas be retrofitted as recommended under section 4.8.3? And who will pay for retrofitting the units?
- Have federal (EPA) and state (DOH) agencies been notified that the noise levels are not within federal or state standards in many parts of the district? And, if so, what was the response and did they provide recommendations for mitigating these violations? Please provide a copy of the notification; and, if this was not done, justification for not providing notice.
- Has the public been informed that the existing noise levels exceed federal and state statutory noise standards? If not, when will it be done and by what means?

14. 4.8.3.1(pp 131-33) Traffic and Rail Noise

Although the Statement states "Under full development of worst-case scenario under the proposed action in 2035 essentially no significant increase in traffic noise levels are expected except for sections of Kamakee Street between Ala Moana Boulevard and Auahi Street" and "The results of the analysis indicate very small changes in 2035 traffic noise levels associated with the worst-case scenario under the proposed action." Yet the Statement also provided data showing that there are significant impacts due to the current and future unacceptable noise levels (above 55 DNL/dBA during the day and 45 DNL/dBA at night) even with the buffer zone of 192 feet on either side of the rail and use of closure and air conditioning in residential units:

- At 700 Richards Street rail noise levels of 65-62 DNL
- At 610 Cooke Street rail noise level 56-62 DNL
- At other Waldron Neighborhood Park predicted noise levels of 47 DNL
- At 860 Haekauwila Street predicted noise levels are 57-61 DNL
- At Uraku Tower predicted noise levels are between 60-61 DNL

The Statement provides a troubling assessment of mitigation measures and their ineffectiveness at pages 132-33: The noise mitigation measures for residential units in areas with exterior noise levels that exceed 65 DNL will typically involve the use of closure and air conditioning but the "use of sound attenuating walls or barriers will be of limited effectiveness" for mid- and high- rise buildings adjacent to roadways of the rail corridor; and, further "as the density of these mid- and high-rise structures increase along the transportation corridor, their reflective surfaces will tend to increase the background noise."

Based on the above assessments of the unacceptable noise levels and the ineffectiveness of mitigation measures currently assessed, please provide the following:

- Explain why and how specifically the conclusion was made that the doubling of the occupancy and transportation and traffic in 2035 will not increase the noise levels when the noise levels along the major streets are already at unacceptable levels.
- Explain the Statement's conclusion that only very small changes to the noise level is expected in 2035 with the addition of the rail and its impact as described above when the noise levels are currently exceeding the DOH and EPA standards for residential and public spaces.
- Have the EPA, HUD and DOH been notified that the planned development will not meet required safe noise guidelines nor has it found adequate mitigation measures for the mid- and high-rise residential units to be built along the transportation corridor? Please provide a copy of the notification and response. If these agencies have not been notified, please provide a justification for non-notification; and a commitment to notify and work with these agencies to find more viable mitigation measures than offered in the Statement.
- Noise levels at parks should not exceed 45 DNL/dBA, yet this is already exceeded in those parks adjacent to Ala Moana Boulevard. Who is responsible for mitigating the current noise levels to ensure compliance with federal and state laws? Has the DOH been notified of the excessive noise levels? If so, please provide a copy of the correspondence; if not, provide reasons for not informing DOH. And, will the agency notify these regulatory agencies and the public? If not, why not?
- What are the specific mitigation plans to address unacceptable noise levels (in violation of federal and state standards) at the KCDD parks, and affected hospitals, recreation areas, and other spaces frequented by the public and residents?
- According to the Statement, all units within 190 feet on either side of the rail will require closure and air conditioning to be habitable. Who will be responsible to notify and compensate those affected? Have residents and businesses in the affected areas been notified? Please provide correspondence of the notification.
- Who is responsible for addressing and mitigating noise levels in the district? For the TOD areas along the rail line? As the entity responsible for KCDD, HCDA should work with HART/TOD administration to develop a noise and mitigation plan for areas along the line. Has HCDA done this? And if so, please provide report of the status of these

meeting(s). And if closure and air conditioning are required, including any retrofitting, what is the plan, including a budget, to meet the needs of its community. Please provide the plan or any evidence that this major health hazard is being addresed, including the anticipated mitigation measures required and an estimated budget.

- The Statement does not address how the density of and glass on mid- and high-rise units will affect the noise levels other than stating that the noise levels will increase. How specifically will the noise level in the district be assessed, charted, and addressed and by whom?
- Many older units which are also high rises have single pane windows. What entity will be responsible for retrofitting these units if noise levels exceed federal and state guidelines at any stage of the build-out? What is the plan for addressing this problem and how it will be executed, including who is responsible for paying the mitigation costs.
- When will DOH (or contractor) assess the noise levels of existing high rises and buildings? The base line measurements are required on all affected areas especially those already identified as adjacent to current excessive noise areas. Please provide any correspondence with DOH and/or contractors

15. 4.10.7(p 183). Education Facilities.
There are no public schools in KCDD. The current elementary schools outside the district are near capacity and therefore there is definite need to plan for the future influx of working families who will no doubt have children needing a school in the district. What is the result of the DOE exploratory study of using its Pohukaina site as a school once again? If not there, where in Kaka'ako would a school be located? This is a major deficiency that has significant social impact on residents now and in the future. Please provide a report on the options for schooling our children in Kaka'ako and a plan, including costs, to implement the various scenarios and options other than the general cost estimates provided at page 188. What has HCDA done to address DOE's understanding that space would be made available for a school facility within the development project using the Pohukaina site? What is HCDA doing to facilitate the implementation of the DOE exception to meet the currently much-needed elementary school?

16. 4.10.8.1(p 190). Public Emergencies and Public Safety.
At build-out for Alternative B the district will require an additional 32 staff plus two additional fire trucks while Alternative A will require twice the number of staff, which will cost between $3.6 to $6.2 million, depending on the alternative, and anticipated construction costs for an expanded station ($8 -10 million).

Similar requirements are provided by the current non-existent police force in the district, with almost $3 million needed for staffing under Alternative B and over $4 million for Alternative A. Add to the personnel costs, the facilities annual rental cost of approximately $30,000.

Both these services are essential for the district currently and in the future and requires planning for the location of these services and the coordination with the police and fire

departments. Please report and provide any agreements on providing the staffing, budget, and facilities for these services.

17. 4.10.9 (pp 192-97) Recreational Facilities.
Open green space is critical to the health and quality of life for the 42,000 (or 46,0000) residents at full build-out. If lands are not set aside now, these natural resources will be irrevocably committed to the substantial detriment of the economic, social, health and environmental quality of the community for the long-term. KCDD residents should not be deprived of the same quality of open green space as the city standard of 110 sf of green space per unit instead of the contemplated 55 sf of recreational space (which is not green and open). The proposed outdoor recreation spaces by Howard Hughes Corp and Kamehameha School are plazas. Are these to be green open spaces? Please provide more specific descriptions of the efforts to meet chapter 206E requirement for parks and green open spaces.

If HCDA cannot estimate the cost of parks maintenance and appears not to be able to manage the parks, has it contemplated transferring responsibility of parks management to the City and/or Department of Land & Natural Resources? Has HCDA met with these agencies to explore possibilities? If not, why not? Please address this major requirement for green open public spaces, particularly in denser, closer and more vertical concrete living, as required not only by Chapter 206E, HRS, but also by Section 344-3, HRS(2) requiring that the programs, authorities and resources enhance our quality of life.

18. 4.11.7(p 255) Telecommunication Utilities.
With the additional residents and businesses and with the view toward 2035, what plans are being explored with Hawaiian Telecom to upgrade and plan for the future when everyone will require high speed internet service –and at lightning speed? School children are already starting to use computers and smart phones at younger and younger ages and will demand more advanced technological tools. Nothing about this 2035 future so important to our economy is discussed or planned for in the Statement. The Statement should explore these options to truly pursue the community of the future in a systems approach—connecting environment, home, business, education, culture, and recreation in an energy-efficient and technologically advanced system.

19. 4.12 (p 257) Aesthetic Environment
The Mauka Area plan viewplane should be maintained as one of the major assets of urban Honolulu –views of the mountain to the ocean and of its iconic Diamond Head (not a concrete building the height of Diamond Head). The proposed actions contemplating the dismissal of these concerns based on a "NIMBY" attitude by the HCDA is misplaced. This is the heart and soul of Hawaii and the reason many visit and live in this paradise state. This is the legacy that our wise policymakers put into law in chapters 226 (Hawaii State Plan), 344 (State Environmental Policy) and chapter 206E (Hawaii Community Development Authority). Let not the expediency of money degrade the environment which, once leveled and concretized, will be irreplaceable.

The Statement should report specifically on plans to maintain and enhance the aesthetic natural beauty of the district, the costs, and the plan for its public and private funding. The development of guidelines as proposed at 4.12.6.3 is inadequate. More is needed. Aethetics is

also subjective and should involve those who must spend their days in the environment. What efforts were made by the agency to involve those who live in the district to provide input on the guidelines and viewplanes in careful and meaningful ongoing discussions? Does the agency have an advisory group; not the consultants calling focus groups together? If so, please provide a report of the meetings, dates, participants, and input that was used to determine the aesthetics/tower siting and design and other aesthetic components of the proposed action alternatives.

20. 8.2 (pp 1-9) Community Outreach

- What was the purpose of the open house meetings held on four days in May 2013? Was it to merely inform the attendees about the TOD plan? What was the objective(s) of those meetings? One of the major TOD principles is community involvement in developing the plan, particularly in identifying the character of the neighborhood. If one of the objectives was to obtain community input, were the comments incorporated into the TOD Plan? In reviewing the comments on pages 4-9, and reviewing the TOD Plan, it appears that very little of the input seems to have gotten into the plan or Statement. Why not?

- It appears that a consultant created the plan with staff and presented this at the community meetings with very little effort to incorporate concerns or ideas from those who took the time to attend the meetings. Please provide a chart itemizing the comments from community members (not the developer or its staff) listed on pages 4-9 and next to each comment describe where it is included in or reasons for not including in the TOD Overlay Plan and the Statement.

- Other TOD sites in the City have ongoing advisory councils to provide input on the TOD Plan. Why was this element missing in creating the KCDD TOD Plan? Is the agency going to correct this oversight? If so, please describe the the process by which it will create such an advisory council, how it will select the members, and how it will operate to provide ongoing input and feedback in creating TOD areas that reflect the character of the neighborhood.

- Also missing from the invitation list are major agencies that are responsible for the health and safety of the public, e.g., the State Department of Health and US Environmental Protection Agency. Why were these excluded? What are the agency's criteria for identifying agencies from which it requests input and comment? And how did HCDA identify the community members invited to comment?

Ref. No.: PL TOD 18.3

June 10, 2015

Kaka`ako United
P. O. Box 235965
Honolulu, Hawaii 96823

Ladies and Gentlemen:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 22, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

Length of Comment Period:

The 45-day comment period is established by law. We regret that you feel there is insufficient time to provide comments.

Effects of the Proposed Action:

We believe that the EIS is sufficient to address the requirements of Chapter 343 and Section 11-200, HAR.

Unanswered Questions:

The conclusion of the Draft EIS comment period does not necessarily mean that the conversation about the Proposed Action has ended. As you are aware, the HCDA must still consider the adoption of rules to implement the TOD Overlay Plan. Public comments will be accepted as part of that process.

General Comments:

1. As discussed in the EIS, the TOD Overlay Plan is presented as an incentive-based program. Individual landowners are free to take advantage of the program or develop their property as

allowed by the existing Mauka Area Rules. The extent of construction impacts will be defined by the timing of specific development projects. While the EIS presents a 2035 planning horizon, actual development pursuant to the Proposed Action could conceivably extend a decade or more beyond that date. Rather than represent continuous construction activity district-wide, this means that individual construction projects will likely occur more irregularly during a longer period of time. For this reason, we do not agree with your characterization of "continuous construction".

Yes, it is true that some businesses may be displaced for a variety of reasons during the next 20 or more years. To more clearly address this possibility, the following discussion has been added to Section 4.10.13.3 in Chapter Four:

> *While the potential redevelopment of some existing residential and commercial properties is possible, resulting in the displacement of some occupants and/or businesses, the addition of new housing opportunities and new commercial activities in the KCDD, both under the Proposed Action and the Future Baseline Condition, will provide new housing and commercial opportunities which could enable displaced residents and/or businesses to relocate elsewhere in the District, thereby mitigating to some degree the impact of displacement.*

With regard to property size, while smaller properties are to some extent excluded from the TOD Overlay Plan, they still retain the ability to redevelop pursuant to existing Mauka Area Rules. The Mauka Area Rules already provide density bonuses and exemptions from off-street parking requirement for all of the Central Kakaako neighborhood with the intent of maintaining the industrial use within Central Kakaako. As addressed above in the new language in Section 4.10.13.3, expanded opportunities pursuant to TOD will help to preserve small business opportunities in Kakaako by providing them an

opportunity to potentially relocate within the District if they so choose. A rising tide lifts all boats.

2. Please see our response under General Comments above. Individual construction projects are, indeed, short-term. How and when individual property owners will respond to new opportunities will be determined by a variety of reasons, many of which are beyond the scope or control of HCDA. We believe that the characterization of future development activity as presented in Section 6.6 of Chapter Six, pertaining to Unresolved Issues, accurately describes the dilemmas associated with predicting the timing or phasing of development in the District.

3. As discussed in the EIS, it would have been imprudent not to include an analysis of TOD Alternative A. Transfer of development rights (TDR) in the form of density transfer within the Kakaako Community Development District (KCDD) is already provided for in the Mauka Area Rules. The EIS does not discuss TDR from outside of the KCDD because any additional density coming into the KCDD from outside cannot be accommodated without changes in the urban design that would impact the allowable height and bulk of buildings within the KCDD.

4. As an extensively developed existing urban area, Kakaako's natural resources are extremely limited. Planning for redevelopment in Kakaako began several decades ago and the necessary infrastructure to accommodate this development has already been constructed. The redevelopment of Kakaako, including its visual impacts, and effects on water consumption and air quality have been addressed in the current EIS as well as two previous statements. As discussed in the current document, redevelopment in Kakaako will help to preserve valued natural resources in rural areas on Oahu.

5. As a programmatic-level document, the discussion of compliance with existing plans and policies fulfills the intent of Chapter 343. We respectfully disagree with your characterization that more discussion is needed.

Specific Comments and Questions:

1. As discussed in Section 6.6 of Chapter Six (Unresolved Issues), the structure of the incentive based program has not yet been developed. This will occur during rule making. The EIS discusses the overall impacts of the Proposed Action. These impacts would not be significantly altered by the program. The term public benefits refers to development project attributes that would improve quality of life for both the tenants of the project and the general public. The term exemplary focuses on the objectives of the Proposed Action. Please refer to Chapter 4 of Appendix A for an extensive discussion of the subject.

   Again, please refer to Chapter 4, as well as Chapter 6, of Appendix A for further detail. HCDA is not using Chicago's criteria…it is developing its own.

2. Complete Streets can be accomplished through a public-private partnership with the private sector taking the lead. Individual development projects can help to implement the program presented in Chapter 6 of Appendix A. Complete Streets initiatives will be coordinated with the City's Department of Transportation Services. However, the program depends upon choices made by individual landowners. Thus, without knowing who may step forward, or when, no timeline can be offered at this time.

3. Please refer to the studies referenced on page 5-16, 5-25, and 5-38 of Appendix A.

As discussed in Section 4.10.5.2, HCDA is revising its Reserved Housing program in an effort to increase the provision of affordable housing in the KCDD.

The issue of an overall parking plan will be addressed during rule-making. Please refer to the discussion in Chapter 8 of the Appendix A.

4. Hawaii Revised Statutes §206E-31(4) provides for a mixed-use district whereby industrial, commercial, residential, and public uses may coexist compatibly within the same area. The TOD Overlay Plan as well as the Mauka Area Plan and Rules allow for industrial, commercial, residential, and public uses within the district. Therefore, HCDA disagrees with your characterization that it is acting contrary to the law. The primary development pattern in the last 30 years has been towards providing new residential opportunities with a healthy mix of commercial development. There is no change in direction. The term bedroom community is not applicable to Kakaako. As discussed in the EIS, the TOD Overlay Plan provides for a mixed-use district where industrial, commercial, residential, and public uses can co-exist compatibly within the same area.

5. The existing character of the neighborhoods is discussed at length in Section 2.3.1 of the EIS Chapter Two, and in Chapter 1 of Appendix A. The history of the area is presented in Appendix C, the Supplemental Cultural Impact Assessment for the Proposed Action. HCDA has conducted several community meetings in May, 2013 to get community input on the Draft TOD Overlay Plan. Meeting attendees are listed on page 3 of Chapter Eight of the EIS. Attendees were invited to comment on all aspects of the Proposed Action and their written comments were collected by HCDA. In addition, the HCDA has made the draft TOD Overlay Plan available at its website for public review since May 2013.

6. HCDA shares your concern. HCDA's Reserved Housing policy has been revised as discussed in Section 4.10.5.2 of Chapter Four in the EIS. Specific provisions regarding the implementation of the Reserved Housing policy as it pertains to TOD will be addressed during rule-making.

7. Please refer to the discussion in Section 6.6 of the EIS Chapter Six for a HCDA's statement regarding of its park planning efforts.

8. Your conclusion in is error. Alternative A includes building heights in excess of 400 feet. Alternative B is limited to building heights of 418 feet. Your statement regarding FAR for Alternative B is also erroneous. Please see discussion on page 23 of the DEIS Chapter Two. The discussion of mitigations to address building density and height are presented throughout Chapter Four of the EIS.

9. The TOD Overlay Plan is the plan intended to address multi-modal transportation in the KCDD. It has been and will continue to be coordinated with HART and the City's DTS. A specific budget for transportation improvements has not yet been determined. The EIS evaluates the Draft TOD Plan. Once the EIS is finalized, the Draft TOD Plan can be finalized. This effort will be followed by rule-making. At that time, the necessary elements will be in place to begin budgeting. With regard to funding, please see Response #2 above.

10. The EIS presents updates to the existing Water and Sewer Master Plans for KCDD. Please refer to Appendices J and K.

    With regard to Drainage, please refer to Section 4.11.4.2 of Chapter Four in the EIS. The status of the existing system is fully disclosed. The analysis was conducted by HCDA's engineering consultant and no further studies are required to determine what the impacts of the Proposed Action will be.

HCDA recognizes its obligation to address existing deficiencies.

No timetable or budget has been developed at this point in time for the requisite upgrades to the water system identified in the EIS.

With regard to the City's sewer improvements, HCDA is not able to provide the information you request. Please address your request to the City's Department of Environmental Services. To our knowledge, the City has not yet completed its Relief Sewer Corridor study. We understand that it published an EIS preparation notice for the study two years ago, but has not yet published a Draft EIS. That document will be the best source of current information once it is published. The City's timetable and budget cannot be determined until it completes its study and publishes its own EIS. This is why issues pertaining to the relief sewer line are presented as an Unresolved Issue in Section 6.6 of Chapter Six in the EIS. In the meantime, please refer to Appendix K in the EIS.

The current system for solid waste disposal is adequate as determined by HCDA. As the TOD Overlay Plan is incentive based, it will be up to individual landowners to participate. They will make their own arrangements for private collection on an as-needed basis.

Information regarding electrical demand was provided by Ron Ho & Associates and included in the analysis presented to HCDA by its engineering consultant, Belt Collins Hawaii LLC. The public utility is obligated to provide electricity to meet anticipated demand. The EIS presents HECO with information that it requires to conduct preliminary planning. HCDA will continue to provide HECO with information as specific development permit applications are presented to HCDA for review. HECO is working closely with the Public Utilities

Commission to address the issue of providing sustainable energy on Oahu.

As discussed in Chapter Four of the EIS, the Mauka Area Infrastructure Plan (MAIP) has been updated to address anticipated TOD demand (see Appendices J and K). The Transportation analysis presented in Appendix D fully addresses the status of roadways in the District. The information you request is all in the EIS. As discussed previously, timetables and sources of funding cannot be provided at this time, as the implementation of the TOD Overlay Plan will depend upon the timing of individual landowners. Please refer to Sections 4.11.1 and 4.11.2 in the EIS for a discussion of impacts and mitigation measures related to water and sewers respectively.

11. The statement on page 39 of Chapter Two is sufficient for the purposes of the programmatic-level EIS. Environmental effects are fully disclosed in Chapter Four of the EIS. To understand the full dynamic of the Proposed Action, the entire EIS document must be carefully read.

12. Chapters 5 through 8 of Appendix A together address the full breadth of the TOD Plan's multi-modal program. A budget and timeline for implementation is not yet available.

13. Specific noise mitigations for residential units exposed to noise levels in excess of 65 DNL are presented in the last paragraph of Section 4.3.8.1 of Chapter Four in the EIS.

    Please refer to Appendix E of the EIS for existing noise standards.

    Section 4.3.6 of the EIS's Chapter Four presents a discussion of noise impacts and recommended mitigations. Individual development projects adjacent to major roadways will be responsible for addressing noise mitigation. Specific

timetables and budgets cannot be determined at this time because specific building plans are not known.

The discussion in Section 4.8.3 pertains to new construction. Redevelopment adjacent to Ala Moana Boulevard has been occurring since the mid-1980s. It is up to individual property owners to address the issue of excessive traffic noise. The degree to which it is relevant depends upon such factors as the distance of a building in relation to the street and its orientation to the street. Retrofitting existing units is beyond the scope of the EIS.

The EIS is a disclosure document and has been presented to all required agencies, including the State Department of Health. The DOH's comments are presented at the end of Chapter Eight in the EIS.

The public has been notified pursuant to the publication of the Draft and Final EIS, as well as through previous EISs published by HCDA.

14. The two statements cited, one concerning traffic and the other concerning rail, are not inconsistent or conflicting: they address different subjects. Because the TOD EIS does not focus on the construction or operation of the rail system, HCDA must rely upon information presented by HART concerning noise impacts in the rail EIS. HCDA's noise consultant reviewed the HART EIS for the information pertaining to rail-related noise impacts.

    Appendix D, the Transportation Analysis for the TOD Overlay Plan, concludes that implementing a multi-modal strategy in Kakaako will help to mitigate impacts.

    The Noise Study's conclusions (see Appendix E) need no further analysis or explanation. Although noise conditions

exceed standards in some areas, they will not be significantly worsened.

The EIS has been distributed to all required agencies, including the State Department of Health. Neither HUD nor the EPA have been notified. In Hawaii, federal noise regulations are enforced by the State Department of Health.

With regard to existing noise at parks, please see the response above. As discussed in Appendix E, noise levels depend upon proximity to the noise source. For example, while portions of Ala Moana Regional Park immediately adjacent to Ala Moana Boulevard are periodically exposed to excessive levels of noise, interior areas are not.

There are no current plans to address existing noise levels at existing KCDD parks or other spaces frequented by the public.

The responsibility to address the noise impacts of rail for new buildings adjacent to the rail line rests with the property owner and will be addressed at the time of new building construction. The TOD Overlay Plan considers the siting of buildings in proximity to the rail line as an important consideration to reduce noise exposure. The EIS is a disclosure document and is a matter of public record.

As discussed in the EIS, HART is responsible for mitigating rail noise in areas where it is deemed excessive. For new development in Kakaako, individual property owners will be responsible for addressing noise impacts.

We are uncertain as to the meaning of your question pertaining to glass. Please refer to Appendix E for a discussion of how noise impacts were assessed.

As discussed above, the matter of retrofitting older (existing) units is beyond the scope of the EIS. Plans for retrofitting are

the responsibility of existing owners and will likely be addressed by them on a case-by-case basis. We are unable to determine if the cost of retrofitting will be borne by the property owner or passed on to tenants.

The assessment of noise levels for existing buildings is conducted by DOH on a case-by-case basis, as needed. Please contact DOH for further information.

15. HCDA continues to work closely with the DOE to address the long-term issue of schools that serve the KCDD. Discussions concerning Pohukaina are ongoing. HCDA is confident that requirements for a new elementary school will be addressed eventually.

16. There is nothing to report regarding police and fire personnel at this time. However, please note that HPD presently provides service to Kakaako. Your statement regarding police being non-existent is inaccurate. Future planning for new police and fire personnel is ongoing and will be addressed in coordination with new development in Kakaako.

17. Information on the City & County of Honolulu, Department of Parks & Recreation indicates that there is over 800 acres of parks and open spaces in urban Honolulu between Downtown and Waikiki. As discussed in Section 6.6 of EIS Chapter Six, HCDA is presently conducting an outreach program for Parks Master Planning. The need for new green open spaces will be addressed as part of that effort.

18. Responsibility for telecommunications services rests with Hawaiian Telcom. HCDA has not been advised of any specific plans for the utility to upgrade its service. The provision of faster internet speeds, while desirable, is beyond the scope of the EIS.

19. The TOD Overlay Plan complies with the City's requirement to preserve view corridors along mauka-makai oriented streets in the District. Prevailing height limits within the Mauka District have been established by the State Legislature pursuant to Act 61 in 2014. The redevelopment of Kakaako has been articulated as a goal of the State since the early 1980s. Construction of new buildings within the District, in compliance with the preservation of identified view corridors, is not prohibited. We acknowledge your conclusion that more is needed to protect views, but we respectfully disagree.

20. The purpose of the May 2013 meetings was to introduce the Draft TOD Overlay Plan to the public and to take comments. The Plan was introduced several months before the EIS began to be drafted, thereby allowing all interested parties to comment on it. The Plan remains in its draft form until the conclusion of the EIS. Comments on the Draft Plan, as well as those concerning the EIS, will be considered in the course of finalizing the Plan.

    As indicated above, the process of finalizing the TOD Overlay Plan has not yet been concluded. HCDA has no current plans to itemize the comments as you request.

    The HCDA has created its own process for community input on the Draft TOD Overlay Plan. No changes in its current process are anticipated.

    The Draft TOD Plan and the Draft EIS were provided to the DOH. Please see the end of Chapter 8 for DOH comments on the Draft EIS.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

Subject: Kakaako Community Development District
Transit Oriented Development Overlay Plan
Draft Environmental Impact Statement

Dear Mr. Ching:

The Airlines Committee of Hawaii (ACH), which is comprised of 20 signatory airlines that underwrite the State of Hawaii Airports System, appreciates the opportunity to comment on the Draft Environmental Impact Statement for the Kakaako Community Development District Transit Oriented Development (TOD) Overlay Plan.

Although the Kakaako TOD Overlay Plan is very conceptual at this time, due to the Kakaako Community Development District's (KCDD) proximity to Honolulu International Airport (HNL), the ACH has concerns relative to the potential impact to HNL's airspace and airline operations.

Specifically with Alternative "A" and the Auahi and Pauahi development blocks, portions of those blocks appear to be laterally within the protected envelope for the RNAV (RNP) 26L approach. Depending upon the specific location and height (especially if it is up to 700'), there could be the possibility of that approach needing to be modified, and ultimately the changes would reduce the safety margin and usability of the approach (potentially steeper descent angle and/or higher minimums).

If aircraft are using that approach, it means that we are in IMC Kona-wind conditions, and that RNAV (RNP) type approaches represent the future standard in terms of the FAA NextGen program, it is an important consideration.

Furthermore, the KCDD falls within the airspace of HNL, as well as within One-Engine Inoperative (OEI) obstacle accountability areas for many commercial aircraft. As a result, further development in the area may adversely impact airline operations by encroaching on OEI corridors, and could restrict flight payload and/or stage length as well as decrease safety margins.

Unfortunately, absent more specific details relative to building heights, locations and other airspace obstruction information, it is not possible to provide more concise comments. Therefore, the ACH firmly believes that a meeting to discuss the HCDA's plans well in advance of a filing of the FAA Form 7460-1 is imperative to ensure a successful outcome for the HCDA, HNL and airlines.

Please feel free to contact us at (808) 838-0011 if you have questions.

Sincerely,

Blaine Miyasato

Dear Messrs. Miyasato and Shelby:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 23, 2015 commenting on the above document. Following are responses to your comments in the order they were presented in your letter.

As discussed in the EIS, Alternative A cannot be implemented unless the State Legislature repeals Act 61 (2014) to allow building heights in Kakaako to exceed 418 feet. As also disclosed in the EIS, the specific timing of new building construction (and the extent to building height up to the current prevailing limit of 418 feet) will be determined by individual property owners. HCDA concurs that it would be appropriate to meet with representatives of your organization in advance of filing FAA Form 7460-1.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching
Executive Director

DEPUTY DIRECTOR

RECEIVED
2015 FEB 24 PM 3 14
HAWAII COMMUNITY
DEVELOPMENT
AUTHORITY

February 23, 2015

Mr. Anthony J. H. Ching
Executive Director
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Dear Mr. Ching:

We have the following comments on the Kakaako Community Development District (KCDD) Transit-Oriented Development (TOD) Overlay Plan Draft Environmental Impact Statement (DEIS) dated January 8, 2015:

Land Use

1. The DEIS acknowledges a shortage of active recreational spaces to accommodate the growing population in Kakaako but does not suggest mitigation measures. To the extent possible, the Final Environmental Impact Statement (FEIS) and the Kakaako Parks Master Plan should provide recommendations for providing new sports facilities within walking distance of the KCDD.

2. Despite a dramatic change in community character from an industrial neighborhood to an urban mixed-use community, the DEIS does not address the need for other community facilities such as libraries, community centers and senior centers that serve as gathering places and improve quality of life. These types of uses should be required as much as is practicable within new developments, particularly near the rail transit stations.

3. The DEIS indicates that the Hawaii Community Development Authority (HCDA) will exceed the requirements of the Kakaako Reserved Housing Rules (HAR §15-218) by encouraging units available to households that make less than 120 percent of the area media income. HCDA should also seek to extend the period of affordability to at least 30 years, if not 60 years or perpetuity, to maintain the affordability of these units. This is particularly important near the rail transit stations because lower income households will particularly benefit from the affordable access that the rail system will provide.

4. The DEIS continues to posit a variety of changes to the Neal S. Blaisdell Center (Blaisdell Center) site. The City and County of Honolulu is currently undergoing an economic feasibility and master planning process to determine the future of Blaisdell Center based on community feedback and technical analysis. While the City appreciates that the HCDA must anticipate potential future uses of the site, the FEIS should remove extensive details that do not correspond with the City's actual intentions, such as expanding Thomas Square Park to where the concert hall exists today.

5. The proposed view preservation zone, which cuts diagonally through the Blaisdell Center site, may severely limit the City's redevelopment options for Blaisdell Center and should be removed. This view does not exist today and will be difficult to administer since it does not follow a public street.

6. The KCDD TOD Overlay Plan should prohibit or discourage auto-oriented uses such as drive-through facilities and automobile repair and sales near the rail stations.

Infrastructure

7. Storm drainage in the KCDD is acknowledged to be a recurring problem, yet no measures are proposed to remedy the situation despite upwards of billions of dollars of private investment and a change in neighborhood character from industrial to high-rise urban. The FEIS should explore potential drainage improvements, including low-impact development (LID) concepts.

Transportation

8. A program schedule should be provided in the FEIS specifying when sidewalk improvements, in particular in areas around transit stations, will be constructed.

9. Several figures in the DEIS indicate that Kona Street, between Pensacola Street and Piikoi Street, will be converted to two-way operation. This should be revised to indicate that Waimanu Street has already been converted to two-way operation.

10. Exhibits showing proposed bicycle and pedestrian connections should extend beyond the KCDD boundaries to show connection to a coherent regional circulation system. It is not clear whether this is the case from the diagrams provided in the DEIS.

11. It is unclear if the new roadways bounded by Ward Avenue, Queen Street, Kamakee Street and Auahi Street, as shown within the Howard Hughes development area, are planned by the landowner.

12. Likewise, it is unclear if the landowner plans to extend Pohukaina Street to be a vehicular connection to Ward Avenue or Auahi Street. The anticipated schedule of when this will be needed and constructed should also be described in the FEIS.

13. The proposed roadway sections in the DEIS are still being reviewed by the Traffic Review Branch. More detailed comments will be provided when more information is available with regard to the anticipated travel characteristics of motorists, bicyclists, pedestrians and transit users.

14. Plans to convert South Street, between Pohukaina Street and Queen Street, to two-way operation should be included in the FEIS.

15. Consideration to convert Punchbowl Street to two-way operation should also be included.

Should you have any questions regarding these comments, please contact Renee Espiau of our staff at 768-8050.

Very truly yours,

George I. Atta

City and County of Honolulu
650 South King Street, 7th Floor
Honolulu, Hawaii 96813

Dear Mr. Atta:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 23, 2015 commenting on the above document. Following are HCDA's responses to your comments in the order they were presented in your letter.

1. As HCDA's parks master planning process has just gotten underway, it will not be concluded in time for its recommendations to be included in the FEIS. This is why the process is identified as an Unresolved Issue in Chapter Six, Section 6.6 of the DEIS.

2. HCDA concurs that community facilities are an important element of a vibrant community. To that end, we are engaged in ongoing discussions with the DOE about the provision of school and education related facilities within the Kakaako Community Development District (KCDD). Each mixed-use residential development within the KCDD is required to provide fifty-five square feet of recreation space per dwelling unit, which can be provided as indoor or outdoor space and serve as a gathering place for the residents of the development. This requirement is applied uniformly to market as well as affordable housing projects including elderly housing projects. HCDA has also established an indoor community gathering place on the ground floor of the historic American Brewery Building adjacent to the Honuakaha affordable housing project.

In addition, with each new development project the HCDA seeks to establish community gathering places that are accessible to the general public, examples of which are evident in the Ward Neighborhood Master Plan and the Kamehameha Schools' Kaiāulu 'O Kaka'ako Master Plan.

3. We will consider your recommendation regarding the extension of the period of affordability.

4. The HCDA shares the City's and the general public's concern regarding the apparent deficiency of park space within the KCDD. Neal S. Blaisdell Center is a 22-acre publicly owned property in the heart of Kakaako as well as urban Honolulu that has tremendous redevelopment potential. Therefore, in recognition of the City's as well as the general public's concern regarding the lack of park space in urban Honolulu, the HCDA is merely suggesting in the TOD Overlay Plan that the City's anticipated redevelopment of the property could present a real opportunity to expand parks and public facilities in urban Honolulu. The discussion on redevelopment of the Neal S. Blaisdell Center is framed as a potential redevelopment scenario and the HCDA does not believe that the discussion in any way limits the City's potential redevelopment plan for the property.

5. The Mauka Area Plan as well as the City & County's Primary Urban Center Development Plan emphasize the need to preserve mauka-makai views within the Primary Urban Center. Given the already existing development in urban Honolulu, it is impractical and unfeasible to maintain a panoramic mauka-makai view in the urban area. Given that, the HCDA's intent in the Mauka Area Plan is to preserve mauka-makai views along major mauka-makai streets and key mauka-makai view corridors. To that effect, the Mauka Area Plan and Rules identify Punchbowl Street, South Street, Cooke Street, Ward Avenue, Kamakee Street, and Piikoi Street as view corridor streets. Since South Street, Cooke Street, and Ward Avenue

have bends in them, it was necessary to create view preservation zones so that the mauka-makai view throughout the whole length of the street could be preserved. HCDA acknowledges the comments regarding the view preservation zone through the Blaisdell Center property. However, we believe that view preservation is a public benefit that both HCDA and City should support.

6. We appreciate the recommendation and will take it up during rule-making for the TOD Overlay Plan.

7. HCDA is committed to requiring the implementation of low-impact development concepts for drainage in as much as low impact drainage can be achieved in a dense urban environment.

8. Street right of ways within the KCDD belong to the City. As such HCDA believes that routine improvements and maintenance falls under the purview of the City.

9. The requested revisions have been made.

10. We have determined that this change is not necessary on the maps. To show the bicycle and pedestrian connections extending beyond the KCDD would likely confuse the reader by suggesting that the larger regional system is the responsibility of HCDA. The TOD Overlay Plan is limited to the KCDD.

11. The draft Transit Oriented Development Overlay Plan presents some opportunities for potential future street connections within the KCDD. Within the area bounded by Ward Avenue, Queen Street, Kamakee Street, and Auahi Street, the landowner has already committed to extend Halekauwila Street to Kamakee Street. HCDA is working with the landowner to explore other connection possibilities.

12. The Mauka Area Plan and Rules clearly indicate Pohukaina Street is to be extended to join with Auahi Street on the Diamondhead side of Ward Avenue. Construction of this extension will be dependent on HCDA receiving CIP funds from the Legislature to construct the improvements.

13. Acknowledged.

14. Comment acknowledged.

15. Comment acknowledged.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

February 25, 2015

Mr. Anthony J. H. Ching
Executive Director
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Dear Mr. Ching:

SUBJECT: Draft Environmental Impact Statement for the Transit-Oriented Development (TOD) Overlay – Kakaako Community Development District, Honolulu (Primary Urban Center)

Thank you for the opportunity to review and provide our input regarding the above subject project.

The following are our comments and concerns:

- We have no comments at this time, since Hawaii Community Development Authority's (HCDA) recommendations in this Draft TOD Overlay Plan are only strategies and not required improvements. Please keep the Department of Facility Maintenance updated as this project progresses.

Following are general comments for any of the recommended improvements that are approved:

- Provide necessary Best Management Practices for the project site including the catch basin located along abutting streets (City, State DOT Highways, State HCDA and Private).

- All work to be performed within City-owned streets right-of-way, which abuts the subject project, shall require the proper City permits (Street Usage Permit, Grading/Trenching Permit, etc.).

- All work within the City streets right-of-way shall be to City Standards.

- All damages to existing City's infrastructure(s) shall be repaired or replaced in-kind using the same or alternate City approved material(s), with all work to be accepted by the City and at the cost to the contractor.

- As part of this study, is HCDA also doing annual maintenance cost of the surrounding infrastructures that are recommended to be constructed as part of this project? This information will be essential to the various government or private agencies in their short- and long-range maintenance budget planning to assure minimal impact on the environment and public safety.

If you have any questions, please call Mr. Kyle Oyasato of the Division of Road Maintenance at 768-3697.

Sincerely,

Ross S. Sasamura, P.E.
Director and Chief Engineer

Dear Mr. Sasamura:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 25, 2015 commenting on the above document. We acknowledge your statement that you have no specific comments about the Proposed Action at this time. HCDA also acknowledges and agrees with your general comments concerning BMPs, the need for proper City permits, compliance with City standards, and obligations for repairs to damaged infrastructure. With regard to annual maintenance cost estimates, it is HCDA's intent, as provided in §206E-6, Hawaii Revised Statutes, to dedicate infrastructure improvements undertaken by HCDA to the City & County of Honolulu ("City"). Once dedication of the infrastructure to the City is completed, it is intended that maintenance of the infrastructure will be within the purview of the City.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Re: Draft Environmental Impact Statement for the Kaka'ako Community Development District Draft Transit-Oriented Development Overlay Plan (File no. PL TOD 18.2)
Honolulu Ahupua'a, Kona Moku, O'ahu
Tax map key (1) 1-5-010:012

Aloha Mr. Ching:

The Office of Hawaiian Affairs (OHA) is in receipt of your December 18, 2014 letter requesting comments on the draft environmental impact statement (DEIS) for the Kaka'ako Community Development District Draft Transit-Oriented Development Overlay Plan.

The Kaka'ako Community Development District (KCDD) is 601.6 acres, stretching between the Punchbowl district to the north, Ala Moana Shopping Center and Waikīkī to the east, and the Downtown area and Honolulu Harbor to the west. However, for planning purposes the total area is divided between Kaka'ako mauka, and Kaka'ako makai. The proposed actions will occur predominantly in the mauka area, where there are planned transformations towards a truly urban, high-rise, 24-hour, mixed-use neighborhood. No changes are planned for the makai area. In 2012, the Honolulu Authority for Rapid Transportation (HART) elevated light-rail transit system identified three transit stations within the KCDD: two in Kaka'ako mauka, the Civic Center and Kaka'ako station; and one at the Aloha Tower Special District, Downtown station.

OHA is aware that the DEIS has been prepared to address the future opportunities presented by the introduction of an elevated light-rail system and to disclose the impacts of the

additional development occurring from the light rail system. All impacts are accounting for full build-out by 2035.

OHA appreciates the efforts in the plan to allow for diversified transportation--from public transportation such as the bus, to bicycle, and pedestrian access--by providing comfortable sidewalks, walkable communities, and quality pedestrian and bicycle access. The diversification will decrease traffic congestion, and promote walkable communities by reducing the need for short inefficient auto trips. In addition, specific integrations in the design create a modal hierarchy based on pedestrian first followed by public transit, bicycles, and autos.

The KCDD does not discuss improvement for water and sewage lines, which will be challenged by the high growth of housing, jobs, and overall individuals in the area. The plan states that "no modification to the solid waste disposal program within the Mauka Area is proposed,"[1] bringing further concerns of capacity for the added population in the district. The plan has the private contractors filling the need, stating that the "expansion of private contractor provided collection services might be required to meet future increased demands."[2]

OHA's main concern lies with the high likelihood of iwi kūpuna being disturbed during ground altering activities. The area is known for a high concentration of iwi, especially along the ancient shoreline sand deposits. In addition, in the mauka area there are four large documented cemeteries: Ka'ākaukukui Cemetery, Honuakaha Smallpox Cemetery, Kawaiaha'o Cemetery, and the King Street Roman Catholic Cemetery. Also, hundreds of unmarked burials were discovered along Nimitz Highway and Ala Moana Boulevard.

As with all subsurface ground disturbances, OHA does request assurances that should iwi kūpuna or Native Hawaiian cultural deposits be identified during any other ground altering activities, all work will immediately cease and the appropriate agencies, including OHA, will be contacted pursuant to applicable law. Given that the KCDD contemplates significant development in this area, we ask that the HCDA takes step to ensure that future developers are made aware of these procedures, as well.

Mahalo for the opportunity to consult. Should you have any questions, please contact Jeannin Jeremiah at 594-1790 or by email at jeanninj@oha.org.

'O wau iho nō me ka 'oia 'i'o,

Dear Dr. Crabbe:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 23, 2015 commenting on the above document. Following are our responses to your comments in the order they were presented in your letter.

1. The EIS does, in fact, identify specific improvements for water and sewer lines, but offers no timetable for implementing those improvements. Please refer to Chapter Four, Section 4.11.1.2 for identified water improvements, and Section 4.11.2.2 for sewer improvements.

2. We would like to clarify any misunderstanding regarding solid waste collection. The practice of private buildings being serviced by private collection companies will continue into the future as new, privately-owned buildings are constructed. Thus, there will be no change to this protocol. This should not be interpreted to mean that solid waste collection will be ignored. It will in fact be required, but will not place a burden on the City's collection services.

3. HCDA shares your concern regarding *iwi kūpuna* and is committed to adhering to the SHPD's requisite protocol regarding inadvertent finds including contacting various agencies as required by law. Future developers will be informed of these obligations as well.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching
Executive Director

February 23, 2015

Mr. Anthony Ching, Executive Director
Hawaii Community Development Authority
461 Cooke Street
Honolulu, Hawaii 96813

Attn: Ms. Amy Mutart

Dear Mr. Ching,

SUBJECT: Comments on Draft Environmental Impact Statement for the Kaka'ako Community Development District Draft Transit-Oriented Development Overlay Plan

The Office of Environmental Quality Control has reviewed the Draft Environmental Impact Statement (EIS) for the Kaka'ako Community Development District (KCDD) Draft Transit-Oriented Development (TOD) Overlay Plan, and offers the following comments for your consideration.

1. We note the Hawaii Community Development Authority (HCDA) is stated as the Applicant (for the EIS) in Section 1.5 on page 17. Pursuant to Chapter 343 HRS, for this subject agency action, HCDA is technically the Proposing and Determination agency, and not an Applicant.
2. The Executive Summary, which may be the extent of the document read by some lay persons, includes some concepts and technical terms that could stand clarification, such as: "surcharged" in the discussion on wastewater (pg. 8); how the bullet point on pg. 9 that states "The Proposed Action will generate up to a 16% increase in motor vehicle trips over the Future Baseline" is consistent with the bullet point on pg. 10 indicating reduced air pollution will result from the Proposed Action; and significantly more detail on the topic of Improved Parking Options on pg. 11, which does not seem to connect with the limited discussion in Section 2.3.6.5 where parking is casually addressed in terms of Floor Area Ratio (FAR).
3. Describing what "floor plate controls" mean (in the bullet point under Urban Design in Section 1.3) may help lay readers come to a better understanding of the project. Additionally, the first paragraph in the discussion on Neighborhood Character in Section 2.3.1 would be much more lucid with a reference to a Figure to help explain how the TOD overlay apparently does not apply to the entirety of the KCDD-Mauka Area. This section also interjects the concepts of Neighborhood Master Plans and Land Blocks (in the

paragraph for the Auahi Neighborhood on pg. 10) and the City and County of Honolulu's Neighborhood TOD Plan (in the paragraph for the Aloha Tower Special District on pg. 13) without any discussion of the relevance of these planning documents or terms. Similar to above, the concepts of "progressive parking strategies or approaches" along with 'Transportation Demand Management strategies or measures" are briefly mentioned (in the Auahi Neighborhood's two paragraphs on TOD Alternative A & B), but this important community issue could use substantially more treatment throughout the document.

4. The treatment of considerations related to Sea-level Rise is generally quite thorough and commendable, particularly in the report included in Appendix B; however this important issue is then minimized in Section 4.4.2.1 of the main document, by the contention that 2035 is an appropriate planning horizon for the topic. While this time frame may be the relevant for various other issues addressed in the EIS, it seems appropriate to consider flooding throughout the expected lifespan of any building constructed during the planning horizon of 2035, which might very well approach the 2100 timeframe of significantly higher likelihood of sea level induced flooding.
5. Paragraph 4.7.5.2 discusses Year 2035 Roadway Conditions with the Proposed Action, and refers to Figure 4-17, which illustrates Proposed Street Connections under the proposed action and depicts numerous Opportunities for Service Streets. However, some accompanying discussion of such opportunities in the text would be very helpful. Further, many of the similar Figures in the Traffic section of the EIS are reproduced at such a small scale and with such light text as to make the information difficult to comprehend.
6. As you may realize, not every reader consumes the entire voluminous EIS document, but instead may look to specific sections that presumably address a particular concern. For many readers seeking to evaluate an action's impact on the environment, the discussion of Significance Criteria is one such section that may likely be read in isolation; we note in this case, the abbreviated discussion of these 13 criteria established by the rules implementing Hawaii's EIS process gives rather short shrift to the detailed information contained throughout the lengthy document. For example, the simple statement "that new development will employ energy savings strategies," could be significantly expanded to provide some detail on the important concern of a project's Energy Consumption. At a minimum, references could be made under each of the 13 Significance Criteria to appropriate discussions embedded elsewhere in the many hundreds of pages of material in the document.

Thank you for the opportunity to comment. If you have any specific questions or concerns, please contact Mr. Tom Eisen of my staff at (808) 586-4185 or by electronic mail at Thomas.Eisen@doh.hawaii.gov.

Sincerely,

Jessica Wooley

Ms. Jessica E. Wooley, Director
Office of Environmental Quality Control
Department of Health
State of Hawaii
235 South Beretania Street, Suite 702
Honolulu, Hawaii 96813

Dear Ms. Wooley:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 23, 2015 commenting on the above document. Following are our responses to your comments in the order they were presented in your letter.

1. The wording in Section 1.5 of Chapter One has been corrected.

2. An explanation of the term surcharge had been added to page 9. The language on page 10 has been clarified to indicate that the reference is to peak travel hours. Additional language has been added to Section 2.3.6.5 to summarize the Parking Policies and Incentives presented at the beginning of page 8-5 of Appendix A (the Draft TOD Overlay Plan).

3. A reference to the explanation of floor plate controls in Appendix A has been added to the bullet point in Section 1.3. With regard to your recommendation about a reference to a Figure in Section 2.3.1, that reference already exists in the first paragraph. The reference to Land Blocks has been deleted. However, given the extensive public discussions about the City's rail system and its planning, we feel that reference to the City's Neighborhood TOD Plan is not overly burdensome to the reader. A reference to the discussion of TDM strategies in the Draft TOD Overlay Plan has been added to the discussion in the Auahi Neighborhood description.

4. A clarification regarding building life has been added to Section 4.4.2.1.

5. A cross-reference to the relevant discussion in the Draft TOD Overlay Plan (Appendix A) has been added to the discussion in Section 4.7.5.2. With regard to your comment about general figure size, we recognize that the Figures in the printed document may be difficult to read for some. However, we would note that the DEIS was widely circulated in digital form, which allows a zoom-in feature for individual figures. The only printed copies distributed were requested by your agency, the City's Department of Planning and Permitting, and the State Department of Transportation. We received no requests for printed copies from the general public or private organizations.

6. We agree with your recommendation and have added cross-references to the discussion of Significance Criteria where appropriate.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

To Whom It May Concern:

Subject: Draft Environmental Impact Statement (DEIS) for the Transit Oriented Development (TOD) Overlay Plan for the Kaka'ako Community Development District (KCDD), Multiple TMK's, Kaka'ako, O'ahu

Mahalo for consulting with the Department of Hawaiian Home Lands (DHHL) regarding the subject DEIS. DHHL supports the general concept of TOD and has been monitoring Honolulu City and County's planning process in this regard. DHHL supports the implementation of a system that provides incentives for improvements to infrastructure capacity. Such improvements could potentially facilitate the development of future DHHL projects and are designed to offset impacts from increased densities in the urban core, therefore improving the quality of life for our beneficiaries as well as the general public.

Please also consult with the Kewalo Hawaiian Homestead Association and the Papakolea Community Development Corporation as they may have programs, projects, or activities that could benefit from the proposed TOD.

The Department of Hawaiian Home Lands has no other comments to offer at this time. If you have any questions or require more information, please contact the Planning Office at 620-9517. Mahalo again for the opportunity to participate in the environmental review process.

Aloha,

Marvin Kaleo Manuel

SUBJECT: Comments by Kamehameha Schools to the TOD Overlay Plan Draft Environmental Impact Statement noticed on January 8, 2015 (the "DEIS"), for the Implementation of Transit-Oriented Development in the Kaka'ako Community District (the "Proposed Action")

Dear Ms. Mutart:

Kamehameha Schools ("KS") maintains its general support of the Proposed Action, which (a) provides an incentive zoning method where developers may elect to provide amenities in exchange for additional development rights, (b) recognizes, and does restrict or impose additional conditions on the development of KS' lands under its vested Master Plan (PL MASP 13.2.8) approved by the Authority on September 9, 2009, and the Mauka Area Rules then in effect (part of the "*Future Baseline*"), (c) attempts to be closely coordinated with the development plans of KS, and (d) allows a developer of KS' lands covered by its Master Plan to opt in to the incentive zoning program.

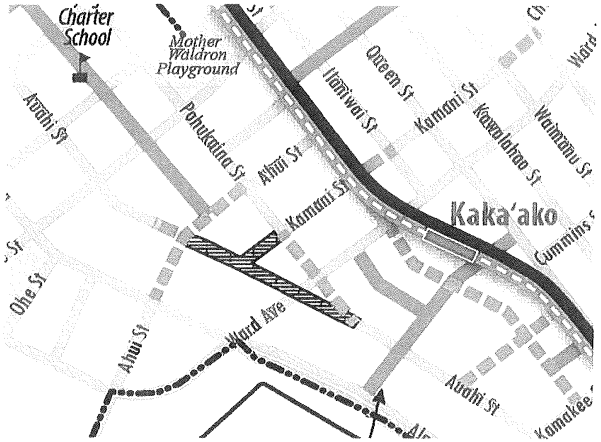
THE DEIS provides that public funds will be used for the on-going maintenance of publicly owned streets, and the improvements to the facilities envisioned by the Proposed Action may be implemented at the discretion of the overseeing agency, including the City and County of Honolulu (the "City"). KS reiterates that KS and other owners (including apartment owners) are paying real property taxes to the City to design, construct, repair, and maintain roadways and related infrastructure in Kaka'ako, including liability for the same. Such costs of, and liability for, such the improvements made to public property pursuant to the Proposed Action should rest with the City or the Authority and not shifted to private projects developed under the Future Baseline. Because the establishment of an Improvement District is not within the purview of the Proposed Action or the DEIS, it should not be imposed on residents and property owners in Kaka'ako.

The Complete Streets program is an integral component of the Proposed Action and KS supports this program throughout the district to create a more pedestrian and bicycle friendly environment. A key aspect of the Complete Streets program is to coordinate its implementation with the City, as the owner

of most streets in the district. With the City's enactment of Ordinance 12-15 (2012) titled "*Complete Streets*," the Authority should describe how it intends to work with the City, so that complete street components, such as nonstandard roadway widths and surfaces, pedestrian friendly special sidewalk treatments and uses are approved and accepted by the City. Without such coordination, complete streets may not be realized.

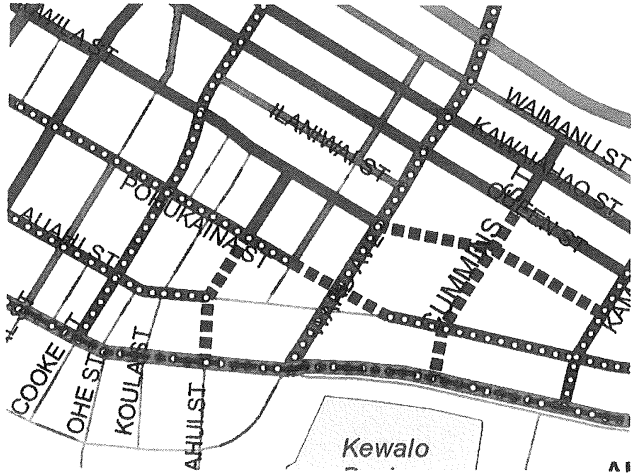
As described above, KS' support is conditioned on the Proposed Action's recognition of KS' vested development rights. KS' Master Plan envisions programmed open spaces, permeability between adjacent projects, local serving commercial development along key streets such as Auahi Street, and the creation of pedestrian and bike friendly environments to improve connectivity in our master planned area. Any significant alteration to existing roadways or the creation of new un-programmed road linkages in the mauka district would hamper this vision and require rigorous study, public discussion, and consensus among all key stakeholders.

Our concern is specifically directed at recent discussions of opening Auahi Street to connect to Ward Avenue. The DEIS and the Proposed Action specifically provide that Auahi Street between Ward Avenue and Ahui Street be "*Closed to Autos (Pedestrian Connection Only)*" (Figure 5-9 "*Current KCDD Street Grid and Potential Future Connections*," the relevant portion is attached hereto). Further, the Authority's previous and current Mauka Area Plans and the recent Final Supplemental EIS for the current Mauka Area Plan (the "Final EIS") all show that Auahi Street as closed to vehicular traffic (Figure 2-5 "*Roadway Network*," the relevant portion is attached hereto). KS cannot support any consideration for opening Auahi Street and any delay in the realignment of Auahi Street to connect to Pohukaina Street, as shown on the attached, without further study, including supplements to the DEIS and the Final EIS. The scope of any "temporary" opening of Auahi Street to evaluate traffic impacts should be carefully evaluated (whether such action is permitted or necessary) and its terms and conditions limited in scope and duration to prevent short and long-term adverse effects on businesses along Auahi Street and to maintain pedestrian and vehicular safety within the district.



We appreciate the opportunity to provide these comments and look forward to participating with an open discussion on critical issues that will need to be addressed moving forward.

Sincerely,



Kamehameha Schools

Walter F. Thoemmes III

Honolulu, Hawaii 96813-3036

Dear Mr. Thoemmes:

Response to Comments
TOD Overlay Plan Draft EIS
Kakaako, Honolulu, Hawaii

I am writing in response to your letter dated February 23, 2015 commenting on the above document. Following are our responses to your comments in the order they were presented in your letter.

1. We appreciate your general support of the Transit Oriented Development Overlay Plan.

2. We acknowledge your preference that future improvements to roadways and infrastructure should be funded by the overseeing agency and not be shifted to private development projects. Your opposition to the establishment of an Improvement District is noted.

3. HCDA is committed to working with the City to coordinate the implementation of Complete Streets in Kakaako. This collaboration has already begun to occur, in the form of meetings with the Department of Transportation Services. In addition, applications for development permits are submitted to the City for review and comment.

4. HCDA supports the vested development rights of Kamehameha Schools. We acknowledge your concerns about the possible opening of Auahi Street. However, as you noted in your letter, the roadways in Kakaako are under the authority of the City and County of Honolulu. While HCDA can raise

your concerns, it does not have final say over decision making by the City.

Mahalo for participating in the Chapter 343, Hawaii Revised Statutes, environmental impact statement review process.

Sincerely,

Anthony J. H. Ching

DRAFT

1 INTRODUCTION

DRAFT

URBAN SYNERGY IN KAKA`AKO

"As a net is made up of a series of ties, so everything in this world is connected by a series of ties. If anyone thinks that the mesh of a net is an independent, isolated thing, he is mistaken. It is called a net because it is made up of a series of interconnected meshes, and each mesh has its place and responsibility in relation to other meshes."

- The Buddha

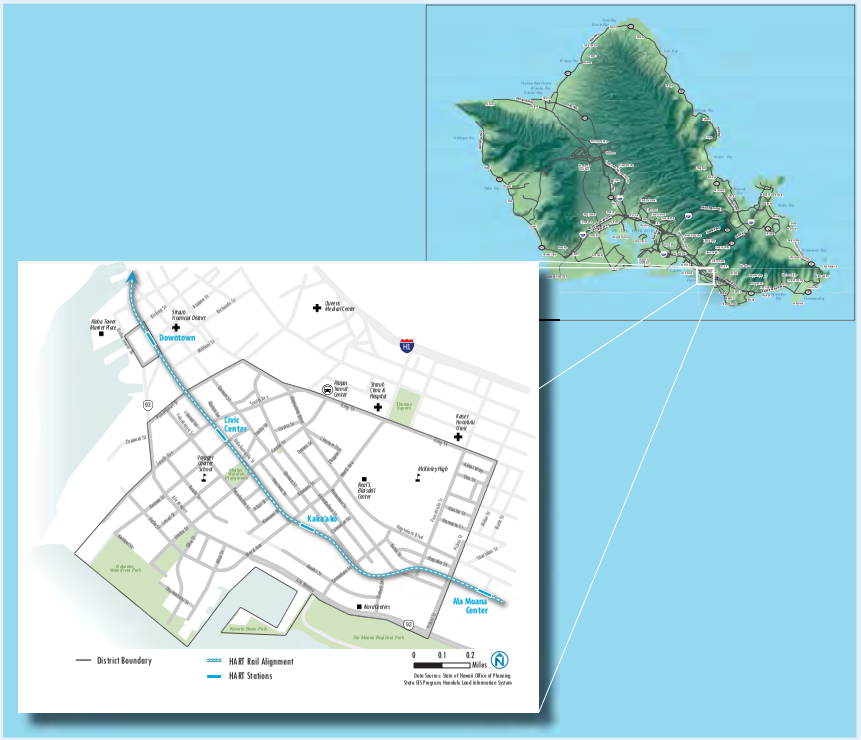
DRAFT

O`ahu development patterns
prior to Western contact
1778 AD

"Planning for indefinite expansion is now wasteful and obsolete. The city of the future will have a better sense of its natural limits: it will attempt to make the most of what it has, rather than to evade its actual difficulties and its actual deterioration by encouraging its population to move out to the outskirts and permit the interiors to become more completely blighted. Good planning means rehabilitation: it means beginning over again and doing the job right."

—Lewis Mumford, *Whither Honolulu? (1939)*

O`ahu development patterns now
2012 AD



DRAFT

DEFINITIONS & CONTEXT

**Kaka`ako Community Development District (KCDD):** Upon passage of Chapter 206E, Hawaii Revised Statutes Kaka`ako was designated as the first Community Development District under the Hawaii Community Development Authority (HCDA)—a public corporate entity responsible for planning and revitalizing redevelopment areas. Legislators found that Kaka`ako was significantly underdeveloped and under utilized relative to its central location in urban Honolulu. The 601.6-acre KCDD, pictured below, is bounded by King Street on the north, Piikoi Street and Ala Moana Regional Park on the east, Punchbowl Street and the property line between Pier 2 and Pier 4 on the west, and the Pacific Ocean on the south. HCDA was then given jurisdiction over the 3.4-acre Aloha Tower Special District in Downtown Honolulu. The Aloha Tower Special District is located on the makai side of Ala Moana Boulevard and is bounded by Richard Street, Bishop Street, and Aloha Tower Drive.

TOD Overlay: HCDA recognizes the need to leverage existing transit services to develop a transit-oriented community. In 2012, Honolulu City Council's approval of an elevated fixed rail system to extend from East Kapolei to Honolulu and include three new rapid transit stations in the KCDD further validated the need to develop a plan and rules to guide transit-oriented development (TOD). The new rules would be enacted as an "overlay" to the existing district rules.

TOD Overlay Plan: The TOD Overlay Plan represents a comprehensive analysis of the issues and opportunities associated with TOD in Kaka`ako. Once an environmental impact statement disclosing the anticipated impacts of TOD is prepared and accepted, rules will be adopted that will guide TOD in the KCDD.

1 INTRODUCTION

PROJECT PURPOSE

The Hawai`i Community Development Authority (HCDA) and the Kaka`ako community have a vision for the Kaka`ako Community Development District (KCDD) to be a sustainable, highly livable, culturally vibrant, economically strong, healthy, and walkable urban neighborhood. This vision is manifested in the Kaka`ako Mauka Area Plan and Rules as well as in the Makai Area Plan and Rules. HCDA plans to work with many partners to develop the district into an internally diverse network of housing, businesses and amenities; while simultaneously strengthening the district's critical role in preserving the health of greater urban Honolulu.

The Kaka`ako Community Development District's (KCDD) Transit Oriented Development Plan and Rules Overlay (TOD Overlay Plan) enhances the policies and direction set forth in the previously established district plans and rules by maximizing development through the use of smart growth principles, multi-modal transportation, and walkable neighborhood design. The intention of the TOD Overlay Plan is to foster development that creates well-used and well-loved urban places that are safe, comfortable, diverse, attractive and representative of the diverse character in the Kaka`ako community, while providing safe and comfortable streets and convenient access to the district's three future Honolulu Authority for Rapid Transit (HART) stations.

Figure 1-1 Elements of Transit-Oriented Development in KCDD

Transit-oriented neighborhoods are places that, by their design, allow people to drive less and walk, cycle, and take transit more. This is achieved by concentrating higher-density, mixed-use, human scale development around transit stops and stations. Transit-oriented neighborhoods provide **mobility and access** through well-connected and well-designed networks of streets, creating walking- and cycling-friendly streets. Such places help to reduce unnecessary auto travel by locating a wide range of needed **services** close to where people live and work. Transit-oriented neighborhoods allow developers to build more efficiently, maximizing the use of space for productive uses such as housing, offices, entertainment, retail, and services. Communities built in this way have proven to be particularly livable, sustainable, and resilient places.

Image from HCDA

Typical weekday peak traffic congestion on Lunalilo Freeway (H1). Due to Honolulu's geographic constraints, travel demand is funneled into a limited number of Ewa-Koko Head corridors.

WHY A TRANSIT-ORIENTED KCDD MATTERS FOR O`AHU

Honolulu and urban O`ahu are regarded as places of great natural beauty with a unique quality of life. However, O`ahu faces a number of challenges including high housing costs, high energy prices, high levels of traffic congestion and auto dependence, increasing obesity rates, urban design that restricts walking and healthy activities, and a high level of dependence on imported oil for energy and mobility.

- **Honolulu has among the most expensive housing in the nation**—the median housing price in Honolulu is $576,500[1]
- **Honolulu is highly reliant on fossil fuels**—over 90% of energy consumed in Hawai`i is from imported petroleum[2]
- **Honolulu has the worst traffic congestion in the nation**—the average driver spent 58 hours in traffic in 2012[3]
- **10 square miles of land were developed** on O`ahu between 1992 and 2005[4]

Transit-oriented development can help to address each of these challenges, particularly in urban areas where good bus service and pedestrian infrastructure is already in place, amenities and services are abundant, and is in close proximity to major job centers. The KCDD represents the region's best opportunity to create a rich urban neighborhood that reduces per capita demands on energy, land, and other valuable resources, creates affordable housing opportunities, and reduces the overall cost and impact of living, while simultaneously building a culturally rich and vital urban neighborhood in the heart of urban Honolulu. This is no small feat; it is necessary to address threats to Honolulu's livability and environment.

PROJECT BACKGROUND/CONTEXT

Policy Context

This TOD Overlay Plan evolves from a rich history of planning for urban Honolulu and the Kaka`ako community. The coming introduction of rail transit - in parallel with community driven interest in creating a city that is highly walkable, friendly and safe for cyclists - is an impetus for this plan. However, a changing transportation paradigm is only a representation of a much broader movement to bring vitality to urban Honolulu, reflecting the values of native Hawai`ian culture, particularly stewardship of land and environment, preservation of native culture, openness to the visiting world, and responsibility to local people and their prosperity.

This plan builds directly on the Mauka Area Plan and Rules and the Makai Area Plan and Rules and references many other important guiding plans and policies.

Mauka Area Plan and Rules was adopted in the fall of 2011. This plan provides the strongest policy foundation for the district, as it was developed around Smart Growth principles, placing high value on sustainable development, quality urban form, and creation of walkable streets and pedestrian scale environments. The Mauka Area Plan and Rules were developed with the anticipation for an additional overlay that would enhance the Smart Growth principles established in its guidelines. Thus, this TOD Overlay Plan functions as an extension and not only translates the principles in the Mauka Area Plan and Rules to other parts of the district, but also is developed to integrate district development, transportation networks and active public spaces into a tightly-knit network.

PUC

Primary Urban Center: Development Plan. The PUC Development Plan addresses O`ahu's Primary Urban Center, including Kaka`ako, as it functions as a critical piece of O`ahu's overall development pattern. The PUC plan implements the community's vision for the urban center as expressed in the O`ahu General Plan and outlines necessary actions in order to accomplish the vision. The actions focus on land use, transportation, infrastructure and public facilities; all of which are important components of this TOD Overlay Plan. Specifically addressed are the land use and transportation sections that promote goals and ideas around:

- Protecting and Enhancing Natural, Cultural, and Scenic Resources
- Cultivating Livable Neighborhoods
- Promoting In-Town Housing Choices
- Developing Honolulu as Pacific's Leading City
- Creating a Balanced Transportation System

HAWAI'I 2050

**The Hawai`i 2050 Sustainability Plan** was developed as a "people's plan" with more than 10,500 participants. The Hawai`i 2050 Sustainability Plan addresses the future of Hawai`i through an economic, social and environmental lens, filtering a common ground that suggests ideas to encourage a long-term economic strength, environmental stewardship, and quality of life for Hawai`i's citizens and visitors. In 2011, the Hawai`i State Plan (Chapter 226, Hawai`i Revised Statutes), was amended to include the Hawai`i 2050 Plan's definition of sustainability. New priority guidelines and principles to promote sustainability were also added to the

Hawai`i State Plan. As set forth in the State Plan, "Sustainability means achieving the following:

1. Respect of the culture, character, beauty, and history of the State's island communities;
2. Striking a balance between economic, social, community, and environmental priorities; and
3. Meeting the needs of the present without compromising the ability of the future generations to meet their own needs."

This TOD Overlay Plan recognizes the importance of long-range sustainability as a primary influence in the development and well-being of the Kaka`ako community. 2050 Plan principles permeate this Plan.

LEED-ND

LEED for Neighborhood Development. Offering a balance of ideas and smart growth principles at a neighborhood scale, this rating system was composed by great minds on the forefront of community building and environmental preservation. Their knowledge and case studies offered in the LEED ND manual present a means of translating global issues relating to green neighborhood development into individual diverse communities within Kaka`ako. The guiding elements in the manual are headlined under ideas such as Smart Locations and Linkages, Neighborhood Pattern and Design, and Green Infrastructure and Buildings.

MAPR

Makai Area Plan and Rules. As set forth in the 2011 Conceptual Plan for the Makai District, the area of the KCDD makai of Ala Moana Boulevard (and including the Aloha Tower Special District) is envisioned as the community's gathering place that welcomes all people with enriching cultural, recreational, and educational public uses. It will serve as a safe and secure place for neighboring residents and visitors; sustaining public uses on public-owned lands for the greater public good; offering enriching cultural facilities; incorporating a Hawai`ian sense of place in the design of area public facilities; and ensuring future sustainable operation of the area's public facilities. While the TOD Overlay Plan proposes no new development in the Makai District directly related to the proposed transit stations, it envisions the integration of the Complete Streets concept throughout the Mauka and Makai Districts.

Landowner Plans. The TOD Overlay is also closely coordinated with the development plans of the two major landowners in the KCDD: Kamehameha Schools and the Howard Hughes Corporation.

District Boundaries and Size

The TOD Overlay encompasses the entire Kaka`ako Community Development District (KCDD) including the Aloha Tower Special District. The KCDD is comprised of two areas, one of which is approximately 450 acres on the mountain (mauka) side of Ala Moana Boulevard bounded by Piikoi Street, Punchbowl Street and King Street ; hereinafter referred to as the "Mauka Area." The second area in the KKCD is approximately 151.6 acres on the ocean (makai) side of Ala Moana Boulevard bounded by Ala Moana Regional Park and the property line between Pier 2 and Pier 4 at the Honolulu Harbor shoreline; hereinafter referred to as the "Makai Area." The Aloha Tower Special District is comprised of approximately 3.4 acres located on the ocean side of Ala Moana Boulevard bounded by Richard Street, Bishop Street and Aloha Tower Drive. The total area addressed in the TOD Overlay Plan is approximately 605 acres.

The Kaka`ako Community Development District is composed of several sub-neighborhoods, each with its own unique character. With the exception of the Makai District and Aloha Tower Special District, these neighborhoods were defined in the Mauka Area Plan and Rules based on existing and emerging land uses, building forms, and land tenure patterns combined with the influences of major transportation corridors and adjacent districts. Each neighborhood will be influenced differently from the provisions laid forth in this Overlay. The intent of implementing transit oriented development is not to redefine the character of the existing neighborhoods, but to utilize TOD to enhance the existing quality of Kaka`ako as a whole.

Figure 1-2 Neighborhoods in the KCDD

The KCDD has nine neighborhoods each with their own emerging character predominant land use.
Source: Nelson\Nygaard

KAKA`AKO'S DIVERSE NEIGHBORHOODS

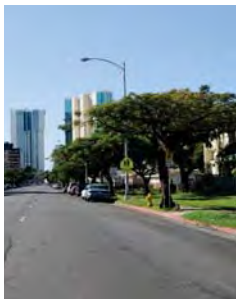
Pauahi is presented in the Mauka Area Plan as a mixed-use "urban village." The name of the neighborhood honors the legacy of Princess Bernice Pauahi Bishop, who is the benefactor of Kamehameha Schools - the major landowner in this area. HART's proposed Civic Center station is located within this neighborhood. The Mauka Area Plan envisions the Pauahi neighborhood as a high-rise area with pedestrian scaled podiums and active frontages. Several properties on the mauka side of Ala Moana Boulevard are owned by Kamehameha Schools. The implementation of the Kamehameha School's Master Plan will help to activate the Pauahi neighborhood and potentially areas along busy Ala Moana Boulevard.

Auahi is emerging as Kaka`ako's retail and entertainment center. Recent development has generated a marked increase in pedestrian activity, particularly in the vicinity of Auahi and Kamakee Streets. This activity is expected to multiply as the Howard Hughes Corporation, the majority land holder in this neighborhood, builds out its master plan. The Auahi neighborhood is envisioned to expand upon its retail and entertainment base providing active frontages and lively pedestrian environment with high-rise residential towers above. HART's proposed Kaka`ako Station is slated to be built on the master planned property making this district a gateway to Kaka`ako's Kewalo Basin Harbor and waterfront promenade for rail transit patrons.

Kapiolani is a neighborhood where land uses are strongly influenced by the busy Kapiolani Boulevard corridor. As a link between Downtown Honolulu and Waikiki, the Kapiolani corridor is an attractive location for high-rise mixed-use development, including retail stores, services and showrooms at grade level, and office and residential uses on higher floors. The continuous canopy of monkeypod trees and wide planting strip at the curb line lends a distinctive character to the corridor that enhances its value for future development and as a shaded, comfortable street for pedestrian traffic. The entire neighborhood is within a five minute walk from either a proposed HART station or one of TheBus transfer stations.

Thomas Square District is a neighborhood makai of the historic Thomas Square park.[1] The park is surrounded by properties that are home to some of Honolulu's major cultural and educational venues – the Honolulu Academy of the Arts, the Neal S. Blaisdell Center, and McKinley High School. The majority of the Thomas Square District land west of the park is owned by the City and County of Honolulu, Hawai`i State Department of Education, and the Hawaiian Electric Company. While there are no immediate redevelopment plans for the lands west of the park, these properties are in many ways ideal candidates for transit oriented redevelopment. The properties are large, relatively under-utilized, and well-connected to the urban grid and a wealth of services and amenities.

Aloha Tower Special District is a single property that is a part of a much larger neighborhood near downtown Honolulu. The property is owned by the Hawaiian Electric Company and is situated next to the Aloha Tower Marketplace and entertainment complex. It is immediately adjacent to HART's proposed downtown station. In early 2013, Hawai`i Pacific University secured the lease of the Aloha Tower Marketplace property and announced its intention to locate student dormitories on a portion of the property. This proposed use is consistent with and supportive of transit oriented development.



Central Kaka`ako is composed primarily of small lots with individual ownership. Predominate land uses in this area are service businesses, many with an industrial character, such as repair shops and production facilities. As a distinct reminder of the district's legacy as a light-industrial and residential community, Central Kaka`ako is valued as a convenient location for service businesses and this Plan intends to maintain the existing character because of the important role these businesses will play in providing services to the many new residents expected to move into the area. Significant redevelopment is not expected in this area because of the small lot size. However, some improvements are needed and there are opportunities to create more pedestrian tolerant linkages between other important redevelopment areas and HART stations.

1 While Blaisdell Center and the high school are situated within the Thomas Square District, Thomas Square Park and the Academy are not.

Civic Center is characterized by government and other important civic buildings spread out in a campus-like setting. Only a small portion of this neighborhood falls within the KCDD and therefore this Plan has relatively minor influence on the overall character of the neighborhood. HART's proposed Civic Center station will be located within a five minute walk from most government buildings providing employees convenient access to rail transit. Given the existing campus character and the scale and ambiance of the significant and historic buildings in this area, existing zoning parameters will remain in place. The TOD Overlay Plan is expected to have marginal direct impact.

Sheridan is predominately a residential neighborhood composed of small, fee simple lots. This established residential neighborhood also includes active commercial uses fronting King Street and the historic Makiki Christian Church located along Pensacola Street. The KCDD's Sheridan neighborhood area represents approximately half of the larger Sheridan Tract, which is bisected by Piikoi Street. The land use, small lot size, block size and land tenure patterns are very similar to the other half of Sheridan Tract, which is located on the Diamond Head side of Piikoi Street, just outside the KCDD. While some building renovations and redevelopment does occur in this area, the scale and pace of change is slight compared other areas of Kaka`ako. Residents in this neighborhood will be within walking distance of HART's proposed Ala Moana Station.

Purpose and Legislative Intent

The Hawai`i State Legislature created and empowered the Hawai`i Community Development Authority (HCDA) with the enactment of Chapter 206E, HRS with comprehensive planning, regulation and development responsibilities. Section 206E-33, HRS governs HCDA's planning and development activities to ensure that HCDA functions consistent with legislative intent. Although this Overlay, along with the current district plans and rules in its entirety, address all the policies defined in Section 206E-33, HRS, the TOD overlay focuses on rule 206E-33, HRS in light of the direct correlation to transit oriented development.

> *HRS 206E-33.3. Activities shall be located so as to provide primary reliance on public transportation and pedestrian facilities for internal circulation within the district or designated subareas.*

Plan Time Horizons

The planning horizon for the TOD Overlay Plan is 2035. The analysis conducted for the TOD Overlay Plan assumes 2013 as the baseline, but includes data assembled from prior years by the State of Hawai`i, the City and County of Honolulu, and the large landowners in the district.

TOD OVERLAY PLAN FORMAT

The KCDD TOD Overlay Plan is guided by a set of goals, objectives, and policies presented in Chapter 2 of this report. Several chapters set forth ideas, strategies, regulations, and implementing actions to realize the KCDD vision.

Chapter 2 Guiding Principles

Chapter 2 defines the goal of the TOD Overlay Plan as well as the objectives and policies that guide the recommendations set forth in subsequent chapters. Plan goals are organized around six key factors known to promote sustainable, transit-oriented development.

Chapter 3 Land Use

Chapter 3 describes the existing land use patterns in the KCDD and the principles and land use alternatives that can achieve plan goals. This chapter describes the results of a development propensity analysis that indicates where TOD is most viable and beneficial in the KCDD.

Chapter 4 Urban Design Framework

Chapter 4 describes principles for achieving a high quality and highly functional urban form including development of new high-rise buildings, view preservation, active public space, and development of community amenities.

Chapter 5 Mobility and Access

Chapter 5 describes how the development of a diverse and resilient transportation system supports the goals of the KCDD.

Chapter 6 Complete Streets

Chapter 6 describes a new framework for mobility and access in the KCDD - Complete Streets - and establishes basic street and intersection design principles to guide future street design and operation. Complete Streets are designed for all users, with priority given to the pedestrian and modes that prioritize efficient movement of people through the limited urban rights-of-way that must support new district development.

Chapter 7 HART Stations and Access

Chapter 7 describes the integration and role of the three HART rail transit stations in organizing development in the KCDD and needed improvements to ensure safe, efficient, and comfortable access for district residents and employees traveling by rail.

Chapter 8 Parking and Transportation Demand Management

Chapter 8 provides recommendations for managing parking in the KCDD, including policies and practices that allow developers to reduce the footprint and impact of parking on this increasingly urbanizing area. Further the chapter explores approaches to reducing unnecessary auto travel and parking demand, which are critical to developing walkable, vibrant, and interesting streets.

Chapter 9 Implementation - To Be Developed

Chapter 9 defines key steps for implementing the KCDD TOD Overlay Plan.

DRAFT

2 GUIDING PRINCIPLES

DRAFT

2 GUIDING PRINCIPLES

Kaka`ako Community Development District: A Sustainable Community

The TOD Overlay Plan is developed as a part of a long legacy of thought and consideration focused on improving the overall quality of the Kaka`ako Community Development District (KCDD). Located at the heart of the urban Honolulu area, KCDD is positioned to be an important growth center for the region. Residential and job growth located in this transit rich district can help to reduce consumption of land elsewhere on the island and lessen the environmental impacts of development and mobility by bringing jobs and residents to a complete neighborhood where they can shop, work, recreate, and find tranquility. The KCDD envisioned by this plan celebrates the great cultural history of the place, but does so with an urbanity, thoughtful design, and environmental consciousness previously unmatched in Hawaii.

Project Goals and Objectives

The goal of the TOD Overlay Plan is to develop the Kaka`ako community in ways that promote the shared values of livability, environmental, social and economic sustainability and resiliency in the face of change. The result must enhance the distinct character and history of the Kaka`ako community, and contribute to the environmental, social and economic health of the region. The TOD Overlay Plan is designed to seamlessly integrate with the district's three future Honolulu Authority for Rapid Transit (HART) stations and express the agency's dedication to placemaking through enhanced urban form.

The objectives and policies outlined on the following pages are based on the "6 D's" of pedestrian focused, transit-oriented, community development.

KAKA`AKO: AN EVOLVING URBAN COMMUNITY

If, like in many cities, food trucks, green business start-ups and redevelopment of light industrials buildings are the signs of a burgeoning cultural district and more significant redevelopment, then Kaka`ako is on the brink of something great.

Kaka`ako is:

WHY TRANSIT-ORIENTED DESIGN MATTERS IN KAKA`AKO

Transit-oriented neighborhoods promote Honolulu's shared values of a healthy environment, social equity, economic strength, and neighborhood resiliency. TOD supports better transit service and also makes places more conducive to walking and cycling and in doing so provides a number of key benefits to communities:

INCREASED LIVABILITY

Transit-oriented neighborhoods are safe and enjoyable places to walk, cycle, and to spend time outdoors for people of all ages and abilities. The world's successful TOD districts have proven to be particularly livable and healthy places where walking and cycling are fun and easy.

HEALTHY ENVIRONMENT

Transit-oriented neighborhoods can help to reduce energy consumption and automobile use. With reduced fossil fuel consumption, transportation in transit-oriented communities leads to improved air quality and produces fewer greenhouse gas emissions. Careful design of streets and public spaces can reduce the volume of water runoff, lessening their impact on local watersheds.

SOCIAL EQUITY

Transit-oriented neighborhoods provide high quality transportation options for all community members, including those who can't drive a private car — a group that includes people with very low incomes, young people, and some seniors. Transit-oriented communities reduce the overall household cost of living by reducing the need to drive and thereby reducing household transportation costs. By incorporating the principles of universal design, transit-oriented neighborhoods are accessible to people of all abilities.

Transit is a travel option available to people of all ages and income levels.
Image from Nelson\Nygaard

ECONOMIC STRENGTH

Transit-oriented neighborhoods promote a strong regional economy by providing workers and shoppers with efficient access to places of employment, shopping and other activities. Shifting more travel to non-auto modes also reduces roadway congestion and improves goods movement, which can yield additional economic benefits. Finally, investment in walking, bicycling, and transit is often more cost-effective way of providing mobility and access than measures such as new parking facilities or new freeway or street lane miles. More compact and complete neighborhoods allow for more efficient use of existing infrastructure and scarce land—a particularly relevant issue on O`ahu.

Transit-oriented design contributes to economic development efforts
Image from Nelson\Nygaard

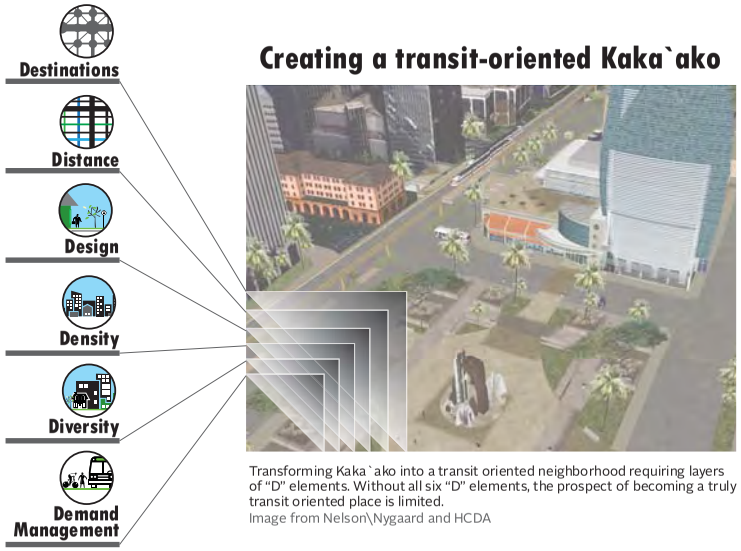
ENHANCED RESILIENCY

Transit-oriented neighborhoods can adapt to changing circumstances; they can achieve a desirable quality of life for their residents and workers even as the surrounding urban and natural environments evolve. For example, when neighborhoods apply the principles of universal design and provide transportation options for people of all abilities, they become resilient in the face of an aging population. When communities rely more on walking, cycling and transit, they can respond more flexibly to changes in energy prices.

The TOD Overlay Plan's objectives and policies are based on the "6 D's" of pedestrian focused, transit-oriented, community development:

D1: Destinations
Coordinate Land Use and Transportation

D2: Distance
Create a well-connected street network using Complete Streets Principles



D3: Design
Create places for people

D4: Density
Concentrate and intensify activities near frequent transit

D5: Diversity
Encourage a mix of uses

D6: Demand Management
Encourage the "auto trip not taken" through a systems management approach

Figure 2-1 The 6 "Ds" of Transit-Oriented Neighborhood Design

Transforming Kaka`ako into a transit oriented neighborhood requiring layers of "D" elements. Without all six "D" elements, the prospect of becoming a truly transit oriented place is limited.
Image from Nelson\Nygaard and HCDA

Objective D1: Destinations

Coordinate land use and transportation

Coordinate transportation and land use by concentrating development along reasonably direct corridors, so that most destinations are 'on the way' to other destinations. When transportation and land use are well coordinated, transit, walking and biking can provide more people with fast, direct and cost-effective access to more destinations.

Policy D1.1 Locate highest density of uses near high-capacity, high-frequency transit, including high frequency bus and HART stations

Policy D1.2 Sustain the district's mixed use character and encourage a mix of land uses around transit stations, near transit corridors and transfer centers to spread demand throughout the day and create an interesting and dynamic pedestrian environment.

Policy D1.3 Create quality connections between the Kaka`ako district and neighboring districts to extend the viability of active transportation choices.

Objective D2: Distance

Create a well-connected street network using Complete Streets principles

Implement complete streets policies and develop a holistic transportation system in KCDD, finding ways to maximize the capacity to move people by developing environments that encourage people to walk, bike and take transit, rather than driving for all trips. A well-connected street network shortens travel distances, making it possible for people to walk or cycle to transit service quickly and conveniently from places they live, work, shop, and play and supporting walking and cycling as everyday transportation options. Implementation of the complete streets network will require coordination between work at street level and the need to consider upgrades to utilities to support new development.

Policy D2.1 Provide a fine-grained street network, minimizing the distances between intersections and avoiding streets that do not connect into the greater grid.

Policy D2.2 Create a multimodal mobility network, providing a continuous high quality environment that encourages active transportation and quality public spaces throughout the district.

Policy D2.3 Balance system uses by creating multimodal streets with priority for moving people rather than cars through design treatments that encourage walking, biking and taking transit.

Policy D2.4 Make walking and cycling access to frequent transit as direct as possible.

Policy D2.5 Complete streets implementation will be coordinated with the implementation of new utility infrastructure necessary to catalyze and support development.

Objective D3 : Design
Create places for people

Create streets and public spaces that are carefully designed with the needs of people in mind. The public realm should be safe, comfortable, and inviting for people of all abilities and ages. To achieve these objectives, transit-oriented neighborhoods have complete streets designed to meet the needs of a range of users, and they provide inviting public spaces that welcome lingering, gathering and celebration. Development in transit-oriented community development also reinforces the distinct history, culture, and character of Kaka`ako's neighborhoods using context-sensitive design and enhancing the pedestrian environment.

Policy D3.1 Design streets to relate to buildings in a way that creates porosity, interest, and public space opportunities

Policy D3.2 Design streets that are accessible and easily navigated by users of all abilities

Policy D3.3 Design parking and parking access to support a pedestrian-oriented realm

Policy D3.4 Design the spaces adjacent to HART stations and alignment through Kaka`ako in ways that maximize access and benefit to the community.

Policy D3.5 Design spaces that integrate the history, culture, and character of Kaka`ako.

TRANSIT ORIENTED DEVELOPMENT FOR ALL

"Many of the urban design features commonly associated with TODs have been linked to higher rates of walking and biking and lower probabilities of being overweight or obese. The construction of affordable housing near transit helps to ensure that these benefits are extended to lower-income households, which tend to be at higher-risk for many obesity-related diseases."

Center for TOD

Objective D4: Density
Concentrate and intensify activities near frequent transit

Encourage more intensive development near frequent transit (transit service that arrives every 15 minutes or better) to enable livable, walkable, and resilient neighborhoods. To function well, higher density development should be combined with the other principles of good transit-oriented development, creating a compact community with a connected street network, well-designed buildings and public spaces, a mix of land uses, and managed demand for private vehicle travel. In Kaka`ako, more intense land use will relieve development pressures on suburban and rural areas by attracting development to urban areas in the District that can be well served by a variety of modes.

Policy D4.1 Encourage mixed-use redevelopment along transit corridors.

Policy D4.2 Offset increased development heights with increased active public space amenities that directly benefit the building's residents and tenants.

Policy D4.3 Plan for density that supports community character and promotes a high quality of life.

Objective D5: Diversity
Encourage a Mix of Uses

Create an internally diverse and vibrant mixed-use community through the provision of a range of housing choices, services and facilities which improve the quality of life for residents and businesses.

Policy D5.1 Provide a mix of housing types at varying densities and costs.

Policy D5.2 Preserve and enhance active public space.

Policy D5.3 Include a broad mix of commercial and light industrial uses that are compatible with an urban village.

Objective D6: Demand Management
Encourage the "Auto Trip Not Taken" through a systems management approach

Develop a comprehensive systems approach to parking and travel demand management. This will include developing the Kaka`ako district in a way that allows residents of the district to meet many of their needs within the district, avoiding the need to travel longer distances for basic life needs. Combined with the emphasis on high quality, convenient, reliable and competitive transportation choices, these policies can have a wide range of positive benefits, including reducing traffic congestion and air pollution, making better use of existing capacity and infrastructure, increasing traffic safety, and improving public health.

Policy D6.1 Manage parking supply and demand consistent with the goals of reducing driving trips.

Policy D6.2 Create an environment within Kaka`ako that will enable residents to meet many of their needs within the district, reducing the need to drive outside of the district for all trips.

Policy D6.3 Ensure that all non-auto mobility choices are designed to be convenient and competitive with the auto to maximize non-auto travel.

DRAFT

3 LAND USE

DRAFT

3 LAND USE

Future Land Use: Creating Complete Connected Neighborhoods

Kaka`ako is located in Oahu's Primary Urban Center. This central area benefits from long-term investments in public infrastructure and proximity to employment centers, schools and entertainment. Investment in consolidating and improving the urban footprint in Kaka`ako also corresponds directly to the preservation of O`ahu's outlying rural areas and helps to reduce the cost burden for new roads, water and sewer lines. TOD Overlay land use policies build on the Mauka Area Plan and Rules (2011), Makai Area Plan (2005) and Makai Area Conceptual Master Plan (2010). Using these plans as a base, the TOD Overlay better integrates the HART transit system into the KCDD, by focusing on policies that advance access to daily needs and support shared quality of life concerns such as raising a family, getting to school, commuting to work, operating a business, and aging in place.

The Kaka`ako TOD Overlay anticipates more people in more types of buildings, resulting in a rich, varied urban fabric. Together, plan policies work to minimize spaces allocated for automobiles, while enhancing spaces for people. The result is a mixed-use, urban neighborhood with shaded - walkable streets and richly textured architecture. With this Plan, HCDA has an opportunity to create a "how-to" primer to leverage Kaka`ako's function as a major node in the regional transportation network by promoting positive collaboration and place-making.

"The best transportation choice is just being there" (Amory Lovins)

A common misconception exists that dense, busy cities result in endless congestion. However, countless studies have shown that typical suburban housing developments are often more congested than dense urban areas. In well-designed, higher-density, mixed-use neighborhoods with good pedestrian, cycling and transit access people tend to own fewer cars and ultimately drive 20-40 percent less annual miles than the same households would in more auto-dependent locations.[1] Scalable and synergistic, the transit-friendly land use principles represented in this plan's TOD objectives, work together to support the creation of positive feedback loops – encouraging neighborhood design that lets people find what they need close by, and provides opportunity to walk, bike or take transit to get there.[2]

The Kaka`ako TOD Overlay Plan land use strategies support this effort by bolstering the mixed use district as defined in the Mauka Area Plan. The TOD Overlay Zone increases both the variety and amount of residential housing and introduces new opportunities for area activities such as a limited number of hotels and office buildings. The increase in capacity is tethered to new community amenities and public realm enhancements, the substructure that supports urban lifestyles. Reinforcing strong land use and transit planning partnerships lays the groundwork to develop walkable neighborhoods (see Mobility & Access in Chapter 5), improve public health, lower vehicle miles traveled (VMT), and reduce GHG emissions, all while increasing sociability.

1 G.B. Arrington and Kimi Iboshi Sloop (2010), "New Transit Cooperative Research Program Research Confirms Transit-Oriented Developments Produce Fewer Auto Trips," ITE Journal (www.ite.org), Vol. 79, No. 6, June, pp. 26-29
2 Todd Litman (2011), "Land Use Impacts on Travel: Current State of Knowledge," Planetizen (http://www.planetizen.com/node/50451).

TOD Land Use Overlay: New Tool For Vibrant Neighborhoods

The TOD Plan will increase overall capacity within selected areas of the Mauka District (see Figure 3-1) to permit more people and businesses to locate in close proximity to the HART rapid transit system. The Overlay Plan boosts the intensity of uses over the "as of right" development in Mauka Chapter 217 rules (now 3.5 FAR not inclusive of structures associated with parking garages) using an opt-in, incentive zoning process. TOD Overlay development protocols leverage this growth to contribute to identified public benefits, while at the same time achieving a reasonable overall rate of return for the developer. This process will provide opportunities to:

- Reduce household costs associated with storing automobiles and driving
- Concentrate activities where there is the greatest level of accessibility
- Minimize land pressure on rural areas, and preserve Oahu natural resources
- Anticipate a variety of building types meeting the needs of a variety of income levels, at different life stages

Public benefits associated with TOD Overlay redevelopment are grouped into the following four categories:

1. Livability

On par with existing Mauka Area Rule requirements, under the TOD Overlay, 7% net sq. ft. of buildings must be allocated towards livability improvements for building tenants. This includes balconies, shared common areas, recreation rooms or gyms dedicated for the use of tenants.

2. Public Realm and Site Design

When living and working in urban environments, access to parks and the public realm is essential. A performance-based system ensures that both the site and building can respond to this need. Intra-block access lanes can serve as greenways, as conduits for pedestrians and cyclists, as well as include pocket parks and plazas for

WHAT IS INCENTIVE ZONING?

Incentive zoning is a land use regulation that encourages the creation of developer funded community amenities or building and land use designs that a community wishes to promote. Under an incentive zoning method, developers provide amenities (or payments allocated towards those amenities) in exchange for development rights often in the form of additional FAR (Floor Area Ratio).

More intensive use of property generates greater profits, a trade-off for providing the amenity sought by the community. Incentive zoning programs need to be carefully managed to ensure that the value of the community amenity is proportional and outweighs any adverse effects caused by additional building bulk.

WHO'S USING IT?

The Mauka Area Rules rely on incentive zoning to increase densities over 1.5 FAR. This program provides an extra .3 FAR for select uses (industrial uses, nursing facilities and assisted living).

The City of New York first created incentive zoning in 1961 to acquire available open space in densely packed commercial or business districts. Under this zoning, the city grants a floor area bonus by special permit for improving a subway station.

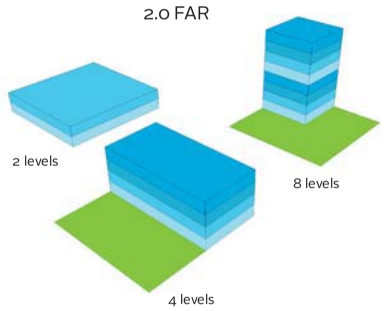
Development is allowed in San Diego's downtown is between 6 FAR and 10 FAR. Here, FAR incentives are used to preserve historic buildings, provide ground floor public uses, and cultural uses. FAR bonuses are also offered for green roofs, 3-bedroom units, employment uses, and affordable housing.

social interaction. Overlay Rules also include performance measures for usable green roofs and podiums, as well as vertical green walls, landscape planting within the right of way and sustainable storm water systems.

3. Set of Coordinated Park Improvements

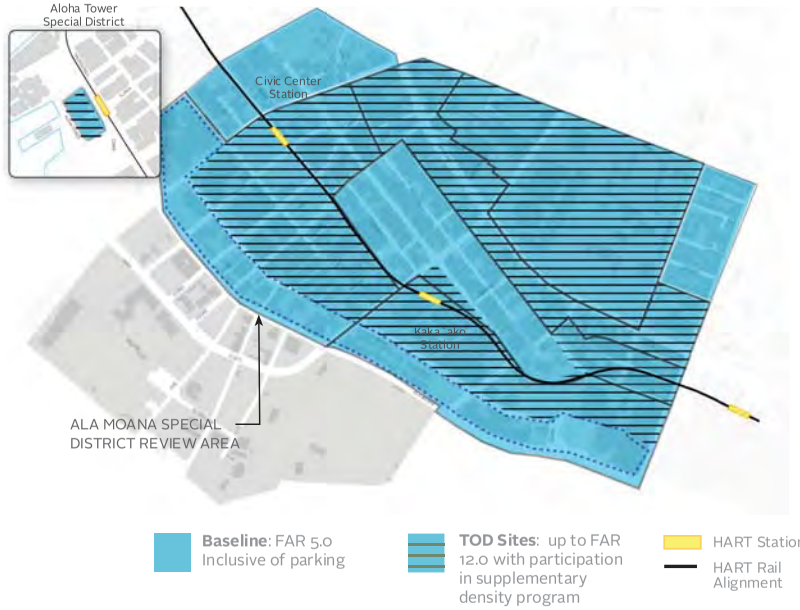
The Overlay offers an option for land owners to dedicate in-lieu fees to identified parcels for public improvements (mauka or makai of Ala Moana Boulevard). This option is particularly critical for high value properties that can't be expected to accommodate the full amount of open active space on site. Options might include improving the "Lei of Green" promenade identified in the Makai Conceptual Master Plan, and/or the creation of a new 20,000 SF plaza associated with Civic Center HART Station. By coordinating district wide improvements, HCDA brings meaningful new public areas to the District in partnership with the private sector.

4. District-wide Access + Mobility



Greater densities require an array of mobility options. The Overlay will require internal streets for parking garage access, passageways for pedestrians to supplement street network, and transportation management strategies such as car share, bike storage, and transit pass programs.

Figure 3-1 TOD Overlay Area Eligible for Proposed Capacity Increases



TOD Performance Based Controls

Today's cities are cleaner and safer relying on a variety of environmental controls. As such, planners can reduce an emphasis on controlling the impacts of specific types of uses, and focus more on improving overall urban quality. In this mixed-use district, capacity is controlled by using FAR (floor area ratio), a performance based measure that provides flexibility on how a building fits into a particular site. FAR controls that regulate overall gross floor area are supplemented by form-based rules that guide the size, siting and general treatment of buildings. In the TOD Plan and Mauka Rules (2011) these controls are found in the Regulating Plan - with details on allowable building types, regulations that provide for pedestrian orientation, and apply limitations on building bulk and massing and view preservation.

Floor Area Ratio Defined: The simple diagram above shows the application of 2.0 FAR across a site. Two stories covering the entire parcel of land, four stories on 50% of the parcel, or eight stories on 25% of the parcel.

Figure 3-2 Kaka`ako District Density

District Character: Encouraged Land Use Types

Strategy LU1 Diverse residential building types, ground-oriented family housing in proximity to transit stations

Providing access to more affordable housing is a priority for the TOD Overlay. Honolulu residents bear both high living and transportation costs. According to the City and County of Honolulu General Plan, which measures the Housing and Transportation Affordability Index, the average Honolulu resident spends 61% of his/her income on housing and transportation costs, (or 32% on housing and 29% on transportation respectively). However, in location efficient places such as Kaka`ako, these expenses can be significantly reduced. The Center for Transit Oriented Development finds an average reduction of 16% in transportation costs for households located in transit-rich neighborhoods. Additionally, providing for housing choices close to employment centers and in proximity to high capacity transit reduces commute times, and as a consequence, could potentially reduce the number of vehicles needed by a household.

The demographic character of the population living near transit also influences transportation demand. Different household types have differing travel behaviors. Studies show that as housing diversity increases, per-household transit trips also rise, and per-household car trips decrease.[1] In particular, lower-income households may not only own fewer vehicles but are also more susceptible to changes in gas prices and thus can be more transit-dependent.[2]

The TOD Plan introduces the opportunity for participating properties to increase overall capacity while reducing building volumes dedicated to storing automobiles. Allowing and promoting a mix of building types at higher overall intensities will provide variety – not only in the character and feel of a neighborhood, but also in the cost and feasibility of construction – influencing the end results for tenants, lessees, entrepreneurs and property owners, producing a mixed-income district.

Strategy LU2 Reserved housing

TOD Overlay Zone's additional capacity is estimated to be predominately residential, with a land use mix estimated at 85% residential and 15% commercial. As capacities increase in Kaka`ako, so does the potential for more reserved housing. All properties within Mauka Area are already required to meet the Kaka`ako Reserved Housing Rules. This requires that applicants for a multifamily development on a lot >20,000 SF must provide at least twenty percent of the residential floor area in the development for sale or rental to qualifying persons.

Strategy LU3 Transit-friendly land uses such as "third places," full-service grocery stores, cultural and community amenities

Kaka`ako is transitioning to become a full time, 24-hour neighborhood that can better compete in terms of desirability with residential locations outside the City's core. In order to retain and attract new residents, the neighborhood should focus on creating places for people, from small shops, to a full service grocery store, to cultural and community amenities, medical services, and day care. In particular, HCDA promotes land uses that encourage transit use throughout the day (peak period, mid day, nighttime, weekend) so as to encourage "round the clock" activity in and near transit stations.

Overlapping networks of uses are what make urban districts thrive. A limited number of hotels will be considered in up to three locations in proximity to the district transit stations. Hotels under consideration include full service, business, and condo-hotels for travelers seeking to stay outside of the tourist districts. A Kaka`ako-based hotel will be a transit -ride from the airport, and will be highly accessible for meetings and work engagements at the commercial core, or convention center.

1 Transit Cooperative Research Program Report 128. Sponsored by the FTA. Effects of TOD on Housing, Parking and Transit

2 CTOD (2009) Mixed Income Housing near Transit: Increasing Affordability with Location Efficiency

Action LU3.1 Prioritize capital spending for the placement of key community amenities within proximity to the station locations, including libraries, senior centers, and community centers.

Action LU3.2 Work with local developers and businesses to site a full service grocery store in Kaka`ako. The City's Primary Urban Center Plan points out that grocery stores require more floor area and service facilities than typical retail uses, warranting special incentives.

Action LU3.3 Explore impacts of hotel uses, and implement tools to ensure that Kaka`ako remains a district oriented with a local full-time residents rather than overwhelmed as a tourist destination.

Strategy LU4 Creative uses, including interim uses, pop-up restaurants & food trucks, and artist interventions

Often new business start-ups rely on access to cheap, flexible spaces that can be reconfigured and redesigned or leased temporarily to "test-out" new markets. Similarly, vacant or under-utilized land such as weekend parking lots can provide free or cheap space for local gatherings. Kaka`ako currently is host to "Eat the Street" the popular monthly gathering of local food trucks at the corner of South and Halekauwila. Other temporary use activities include street mural program and pop-up restaurants.

Action LU4.1 Draft a "road map" how-to guide for temporary uses, particularly for sites undergoing construction or long-term redevelopment - so that properties can evolve while remaining active.

Urban Fare, an urban grocery store in the Roundhouse Neighborhood is part of Vancouver's waterfront redevelopment serves as a "Third Place" for the surrounding community.

THIRD PLACES

"Third Places" - small neighborhood grocers, coffee shops, pubs or post offices that allow residents to mingle and have social interactions. Hallmarks of a true "third place:" free or inexpensive food and drink; highly accessible, within walking distance, involve locals – those who habitually congregate there; welcoming and comfortable; both new friends and old should be found there.

- Ray Oldenburg

Action LU4.2 Ensure that the code allows for co-working spaces, live work and other flexible uses.

Action LU4.3 Include artist space, and/or arts community spaces as part of an optional bonus amenity in the incentive zoning system for added density.

Strategy LU5 Adaptive re-use of character buildings

In addition to nationally registered historic properties in the Civic Center, Kaka`ako also contains a variety of buildings of interest that highlight the "old Hawaii" of early twentieth century architecture, from wood-framed plantation style retail to modernist civic buildings to aging WWII-era Quonset huts.

Character buildings should not be lost to redevelopment, but rather retained to provide context, and a sense of place in changing neighborhoods. Tools and incentives for both preservation and adaptive re-use of these building – particularly in Central Kaka`ako are needed. Here, the Mauka Rules existing density transfer programs could be expanded to provide incentives for property owners to preserve (and in many cases, restore) character buildings, providing new revenue that could be re-invested in the property.

SHARED USE AGREEMENTS

In the City of Arlington, VA the Arlington Arts Incubator and related City policies prioritize joint use agreements in various publicly owned locations that allow arts organizations to reuse spaces during "off hours." The Arlington Arts Incubator also invested in a set/costume workshop that acts as a shared resource and brings together the broader artistic community.

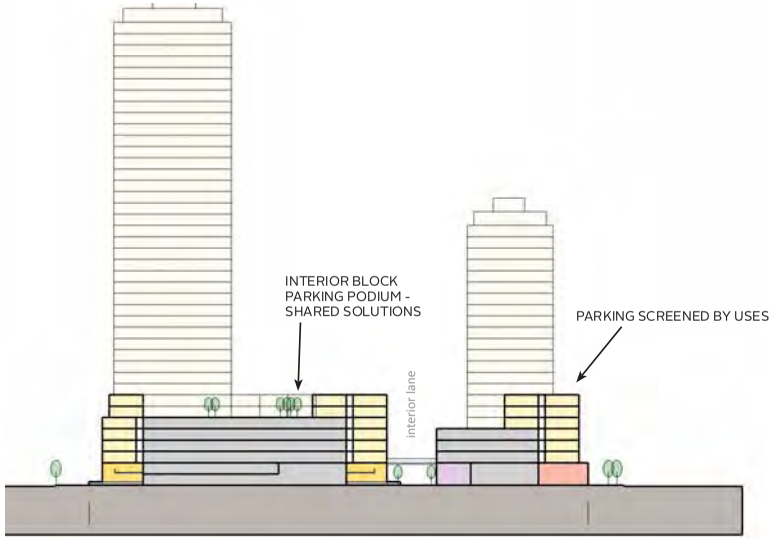
Parking, Land Use, and Density Controls



The treatment of off-street parking within a neighborhood has an impact on the quality of the public realm. Parking facility location and configuration (see Figure 3-3) influence not only building form and land use options, but also the ways in which future users will travel to or interact with the neighborhood. With the introduction of high capacity transit, and complete streets, Kaka`ako is transitioning to a "park once" location (see Chapter 8 for more information). These strategies encourage people who drive to the neighborhood to park only once, and walk to a variety of destinations. Flexible, context-sensitive parking strategies make better use of existing parking resources,

TOOLS: HISTORIC PRESERVATION

In Portland, density may be transferred within the neighborhood where the Historic landmark is located or to any site within two miles of the landmark. By allowing unused development potential to be transferred, redevelopment pressure on the landmark is lessened and a potential source of income is provided, as the owner may sell these rights to the owner or developer of the receiving site. Portland recently adopted zoning changes that extend this capability to "contributing" buildings in the Pearl District or those that are ranked on the City's Historic Resource Inventory.

Many cities also rely upon small grant programs dedicated to the restoration of qualifying buildings. A grant program could be designed to reimburse a small property owner a percent of the total cost of a façade renovation and construction up to a fixed dollar amount (such as $10,000.) Additionally, a Design Services Grant reimburses related facade design services up to dollar amount (such as $10,000).

Figure 3-3 Relationship of Parking Location and Building Form

as well as the design and treatment of parking structures in future buildings.

One strategy that is particularly important to ensure that parking demand and supply are in balance is to include volumes associated with parking into overall density controls. Under the Mauka and Makai Rules, building volumes associated with above-ground parking are not included in the maximum FAR calculation. Yet, it is understood that for each building to accommodate parking structures, one to two FAR are generally required (depending on the building's use). The TOD Plan shifts this strategy to recognize parking and its impacts as a land use.

Adaptive re-use project on Ala Moana Boulevard
Image from VIA Architecture

Sunshine scuba shop (Cooke and Queen)
Image from VIA Architecture

Strategy LU6 Off-street parking utilization: "Right Size" parking supply for both commercial and residential uses by including parking in FAR

The quality of urban experience is related directly to the minimization of the automobile's impact on streets and land uses. Building too much parking can have the following negative impacts:

- Dedicating excessive space to parking causing streetscapes to be overpowered by garages;
- Increasing the cost of new housing units, and negatively impacting the economic success of redevelopment projects;
- Influencing higher lease rates and artificially limiting new uses.

The Whole Ox (327 Keawe Street)
Image from VIA Architecture

However, building too few spaces can also result in frustration on the part of retailers, residents and neighbors when on-street spaces are in high demand.

As the form and character of Kaka`ako shift, ultimately motor vehicle ownership in transit station areas will decline, but this must be a carefully managed transition. Developers are incentivized to supply parking based on actual demand to maximize the efficiency of parking's use.

Strategies to aid in the transition include appropriately pricing parking, car sharing and parking management tools (See also Parking Strategies in Chapter 8).

Action LU6.1 Parking supply may be phased or accommodated in satellite locations in order to provide additional flexibility. Phasing structured parking and alternately leasing a portion of parking from nearby surface lots can add to, or improve overall project feasibility.

Action LU6.2 Reinforce the policy that all spaces are used efficiently and reduce the need for single use reserved spaces in order to promote a district wide, park once strategy.

Action LU6.3 Consider working with developers and financiers to further explore options for sharing the financing of a new parking structure.

Action LU6.4 Clearly communicate the per-unit cost of a parking space to consumers. "Unbundling" allows an optional purchase or temporary rental of a stall enables drivers to make a more rational assessment of parking costs.

TRIP NOT TAKEN

In the Bay Area, planners have learned that reducing parking requirements means providing adequately for other mobility options, such as car share, transit or cycling. The GreenTrip certification program started by the non-profit Transform in the Bay Area works to negotiate with municipalities for reductions in required off-street parking spaces for multi-family buildings when developers can provide the following set of strategies:

- Unbundling parking spaces
- The provision of long term transit passes
- Car share for residents

To qualify for the GreenTrip program, buildings must be located within close proximity to high frequency transit access.

The program monitors the transportation impacts of the participating buildings. The first five pilot projects provide the equivalent of 80,000 years of free transit passes and 24,000 years of Carshare for residents of Green trip buildings.*

* For more information see Transform, Oakland California Green Trip program, http://www.transformca.org/GreenTRIP

Achieving TOD: District Opportunities and Challenges

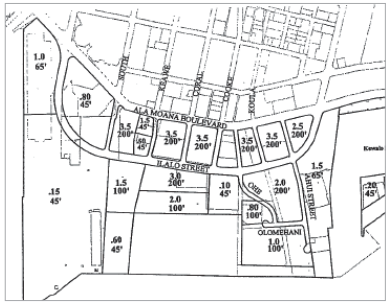
Although the project boundary consists of the entire HCDA Kaka`ako District, most of which is within either a 0.25 or 0.5 mile walking distance from a future HART rail station, not all areas of the district will experience significant land use changes under the TOD Overlay.

The TOD Overlay Plan consolidates growth in core area, while maintaining existing neighborhoods (i.e. a building currently limited to a low-rise will not become eligible for a high rise structure), public parks and major public assets to ensure continuity and longevity for users. As such, the TOD Overlay will have minimal impact on following Mauka Area locations:

- Sheridan, an existing low-scale, residential neighborhood;
- The majority of Central Kaka'ako identified as low rise industrial and service business areas;

- Civic Center, a neighborhood that contains major historic sites and civic structures with no immediate plans to redevelop; and
- Ala Moana Special District Review Area which maintains Mauka Area Rules limitations on heights and density (as noted on Figure 3-2).

Ala Moana Special District Review



Encompassed by either the Kamehameha Schools or Ward Center Master Plans, the series of blocks mauka of Ala Moana Boulevard are subject to the following policy provision in the Mauka Rules: *"a negotiated number of taller, 400' towers are allowed, the remainder of the buildings are allowed to 100' height limits."*

Due to the desire to ensure views to the waterfront from properties Mauka, limitations on overall capacity increases are maintained in this area. However, these areas will be eligible to participate in parking reductions and district wide parking management plans as well as opportunities for new uses.

Kaka`ako Makai

In 2010, HCDA adopted the Kaka`ako Makai Conceptual Master Plan (KMCMP) as the neighborhood vision. While a broad mix of uses are currently allowed, the KMCMP designates a preference for commercial and civic-oriented uses and residential uses are excluded by statute.. Maximum heights allowed in this location vary between 45' on the waterfront, stepping up to 200' along Ala Moana Boulevard with an FAR of up to 3.5 not inclusive of parking.

The KMCMP, the Kewalo Basin planning process, and plans for public park enhancements showcase this area as a leading location to cluster community-oriented uses. Areas within Makai are eligible for associated parking reductions, provided they maintain existing density limitations.

Makai Height and Density Controls
Makai Area Plan (2005)

A table on the following two pages outlines the existing policy priorities and the specific opportunities and challenges to achieving TOD land use objectives for each neighborhood in the Kaka`ako District.

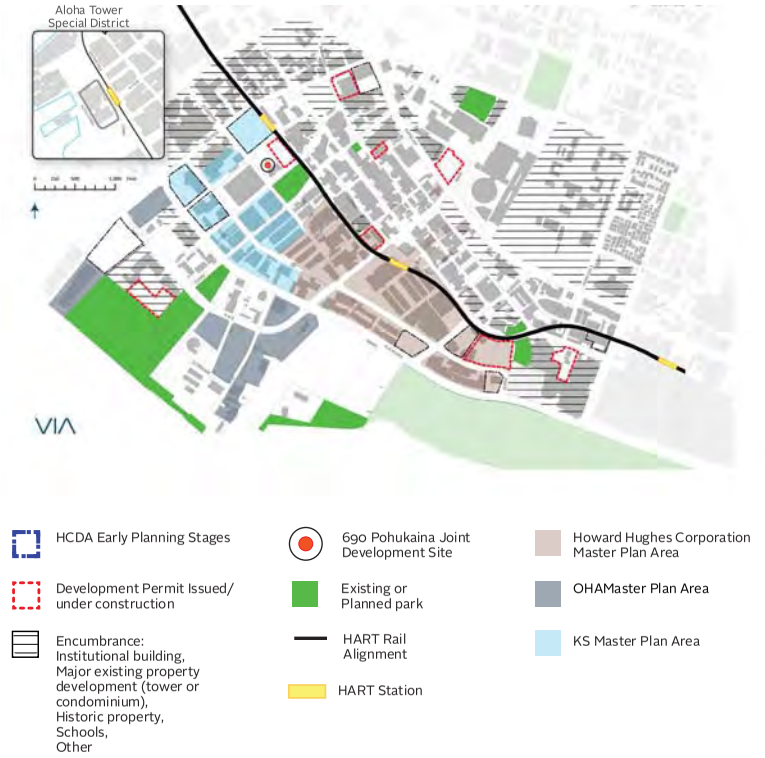
District	Existing Land Use Characteristics and Policy Priorities	Challenges and Opportunities for TOD Land Use Objectives
Aloha Tower Special District	This is a single property that is part of downtown Honolulu's waterfront neighborhood. Owned by the Hawaiian Electric Company, it is immediately adjacent to HART's proposed transit station.	The HECO substation occupies half of the Aloha Tower Special District site. Its location adjacent to the transit station makes it a prime candidate for transit oriented development to be coordinated with the downtown Honolulu waterfront and public realm enhancements.
Auahi	The vision for this area is as an urban, mixed-use location with a cluster of taller, predominately residential buildings. Its core is an emerging entertainment and retail center in the vicinity of Auahi and Kamakee Streets near HART's proposed Kaka`ako Station. Ward Street is a connection over Ala Moana Boulevard to Makai and the waterfront parks. Queen Street Park is also located in this district. Howard Hughes Corp. is a major landowner with an existing, entitled master plan.	Opportunities leveraging more intensive uses for increased community benefit in collaboration with a major property owner and the design of clear, friendly access to Kaka`ako Station. Flexible land use strategies should help developers to take advantage of mobility options and provide guidance for integrating transit directly into development plans.
Pauahi	Kamehameha Schools is principal landowner in this area. HART's Civic Center Station, Mother Waldron Park and the proposed 690 Pohukaina project are located in this district. Pauahi is envisioned as a high-rise, predominately residential area with some adaptive re-use of existing buildings. A priority on walkable active streets include Auahi Street as a retail street, and Cooke Street enhanced by a green linear park. This vision is also coordinated with Kamehameha Schools Master Plan, completed in 2010.	Challenges associated with the siting of the future elevated rail alignment and station include ensuring that infrastructure does not detract from the urban environment. Opportunities include developing a comfortable, public interface for the Civic Center station, coordinating public open space amenities, and improving streetscapes to support trips by transit, walking and cycling. Flexible land use strategies should help developers to take advantage of mobility opportunities and provide guidance for integrating transit directly into development plans.
Civic Center	The civic heart of Honolulu, this district contains historic buildings in a campus like setting. HART's Civic Center station is located adjacent to Civic Center, providing for enhanced access to the district.	Opportunities to ensure good connections into the major destinations and land uses in Civic Center. Existing zoning and development parameters will remain in place, and there is likely to be limited new redevelopment in this area.
Sheridan	This existing residential neighborhood consists of small lots with approximately 90 ownerships. The historic Makiki Church is located in this area and includes active historic uses on King Street. The Mauka Area Rules restricts density in this area to 2.0 FAR where infrastructure is lacking and building heights to between 45-65'. The neighborhood will be a blend of both older and new mid- to low rise residential uses	Due to limited development potential in this neighborhood, the TOD Overlay will have minimal influence. Challenges exist to improving the safety and convenience of walking into the Sheridan Neighborhood from nearby destinations and from the Kaka`ako transit station.
Thomas Square District	Across on the makai side from the historic Thomas Square park, Thomas Square District houses some of Honolulu's major cultural and educational institutions – the Honolulu Academy of Arts, the Neal S. Blaisdell Center and the McKinley High School. These constitute large ownerships by the City and County of Honolulu, as well as Hawaiian Electric Company. Thomas Square District is within a five- minute walk of both Kaka`ako and Civic Center station.	Several major publicly owned properties present opportunities for TOD redevelopment and possible public/ private partnerships, particularly the Blaisdell Center. In this area the TOD Plan can leverage the provision of new high rise mixed-use buildings to make needed improvements to the existing arena and performing arts facilities. The vision for this area includes coordinated and enhanced public spaces as well as connectivity improvements to establish better transportation access both through and into these large properties.

District	Existing Land Use Characteristics and Policy Priorities	Challenges and Opportunities for TOD Land Use Objectives
Kapolani	All of Kapolani is within a five minute walk of one of the HART stations. It is also a major bus corridor linking the downtown Honolulu, Ala Moana Center, and Waikiki. New high rise development along Kapolani includes a mix of retail, larger stores and showrooms and offices, with residential above.	Although much of Kapolani has already developed, there are several locations that may provide good opportunities for TOD, as well as contribute to an employment corridor with added height and density. These locations might support office towers, or residential developments, including a mix of high-rise or mid-rise apartment buildings.
Central Kaka`ako	Composed of smaller lots (less than 20,000 SF), this district contains about 200 small ownerships and is generally unimproved, lacking storm drains and other utilities. Services, employment, and light industrial uses predominate, including repair shops and craft production facilities. This area has limited redevelopment potential, with FAR capacity limited to 1.5 in the core area until infrastructure improvements are made.	Land use policy seeks to maintain and support existing local business, and to incubate the growing residential neighborhood, promote the siting of new services. Opportunities exist to promote flexible strategies for adaptive re-use. Some lots within Central Kaka`ako along Halekauwila may be eligible for TOD opportunities because of the HART rapid transit alignment.

TOD Overlay Development Opportunities

To understand the potential for growth with the TOD Overlay, for the purposes of the Plan HCDA conducted a systematic review of the area to identify those locations most likely to undergo redevelopment within the time frame of the Plan (2035) as well as meet the necessary criteria, such as lot size, to host a major project. This assessment focuses on:

- Existing property ownership assembly, land tenure and development permits;
- Key policy priorities of the adopted Mauka and Makai Area Plans;
- Property impacts resulting from the three HART stations and alignment;
- Redevelopment potential as denoted by a "land-to-improvement value" ratio.



Sites thought to have potential to redevelop under the Overlay Plan have high land assembly potential, a low land to improvement value ratio, and an absence of major encumbrances. In some cases, properties impacted by the HART alignment will also have a greater potential to redevelop. This process provided the TOD Overlay Plan with a working framework to characterize future growth. However, it is important to note, infill redevelopment may ultimately take place at a variety of different scales, from full-block development to partial-block development, to small scale adaptive re-use projects.

Development Activity in the District

Current property development information in the Kaka'ako District is shown on Figure 3-3. To support and refine growth estimates, development permits, sites under construction, as well as sites in early

Figure 3-4 Kaka`ako District Development Activity

planning stages were considered.[1] These properties may have reduced likelihood to redevelop within TOD Overlay Plan Rules, due to existing private investment, phasing of permits and timing. The map also shows two existing master plans entitled under Mauka Rules (Chapter 22), as well as the location of the Office of Hawaiian Affairs land holdings in the Makai area.

Property Consolidation

Figure 3-4 shows the current assembly of property within the Kaka`ako district. There are several major property owners located within the Mauka and Makai District areas including the State of Hawaii, the Office of Hawaiian Affairs, Hawaiian Electric Company, Howard Hughes Corporation and Kamehameha Schools. Central Kaka'ako and the Sheridan neighborhoods are shown with limited property consolidation.

Acres	Major landowners in the Kaka`ako District
106.56	HCDA
55.71	State of Hawaii (DLNR + DOE)
53.66	Kamehameha Schools
58.8	Ward Center/ Howard Hughes Corporation
29.1	Office of Hawaiian Affairs
25.6	City and County of Honolulu
12	Hawaii Electric Company

In order to participate in TOD Overlay enabled height and density increases, a property must be large enough to support major projects (40,000 SF minimum) or constitute the assembly of one to three parties to achieve a potential development block. An assembled site must also accommodate the requirements for additional height and density such as, setbacks and spacing requirements, as well as parking, infrastructure improvements and access requirements.

Land to Improvement Value

Of particular relevance to this process is an understanding of the "redevelopment tipping point." This generally means that the value of a proposed development must exceed the value of the existing return on the property. In this instance, the comparison is between the "as of right" development within the adopted Mauka Rules 2011 combined with the Master Plans for Kamehameha Schools, and the Howard Hughes Corporation properties (both vested under the 2005 Mauka Area Rules (Chapter 22). It is important that there is enough added development incentive in the TOD Overlay that the property owners would undertake risk associated with redevelopment and re-invest in their property to achieve a greater intensity of use and greater returns along with providing public benefits such as enhanced public realm, parks and active spaces and increased street connectivity.

In the absence of a market study associated with this process, land to improvement value ratio can be used as a factor in estimating redevelopment potential. The ratio has been calculated using the 2012 Tax Assessor data from the City and County of Honolulu. Figure 3-5 shows the ratio of each parcel's assessed value of improvements to the assessed value of the land. Ratio values less than 0.5 are typically considered to score favorably for redevelopment, meaning the land was assessed at a value of at least twice as that of the improvements. Many recent real estate developments in Kaka'ako show a high land to improvement value ratio, indicating a relatively low likelihood for redevelopment within the time frame of the Plan.

1 Information on property development received 1-25-2013.

Figure 3-5 Property Consolidation

Figure 3-6 Land-to-Improvement Value

TOD Identified Sites

Sites identified in green are those that offer the best opportunities for redeveloping under the TOD Overlay Plan, with potential capacity increases.

In summary, these sites include consolidated properties (or may be consolidated with 1 or more owners), those that have a low improvement to land value ratio (a high redevelopment potential), are located within the eligible Mauka Area, and may be impacted by the HART rail Alapai and Ala Moana construction.

The remaining sites within the eligible area may also redevelop, but have less potential to meet all TOD requirements.

The selected sites identified in Figure 3-6 meet identified TOD Objectives: mobility and access, availability of services, and development potential.

Figure 3-7 TOD Selected Sites and Catalyst Properties

TOD Catalysts and Joint Partnerships

TOD identified sites are in public and/or private sector ownership. However, for those sites held by HCDA or its public partners offer especially good opportunities for pioneering projects. By providing both a vision for, and regulatory assistance to TOD redevelopment projects, HCDA can help create new project comparables that are distinct from the current market place offerings; simultaneously cultivating developers with expertise in high-quality mixed-use development, public realm and pedestrian design treatments, urban parking management, and transit-friendly access strategies.

The Kaka`ako District encompasses several larger sites that present opportunities for joint development partnerships. Sites are listed in the table below and mapped on Figure 3-6.

SITE	PROPERTY OWNER	DISCUSSION
1. Blaisdell Center	City and County of Honolulu	The Blaisdell Center currently contains a major arena and convention center with a 6,000 space parking garage. If redeveloped these uses could be consolidated in an dynamic center for the arts, with associated residential uses, and park space (see vision diagram on following page).
2. HECO Kaka`ako Site	HECO	One of the larger consolidated properties in the Mauka District, the HECO site is the location for company storage and staging. A partnership for TOD redevelopment would place significant housing opportunities in to this valuable, centralized location.
3. Aloha Tower Special District Site	HECO	Located on the waterfront downtown, and directly adjacent to a new HART station, this area provides an opportunity for both new uses and integrated development.
4. McKinley High School	State of Hawaii	In the interim, joint and shared use agreements are an option for community oriented activities on a more urban campus. The school site could be redeveloped as a 21st century school to serve a number of different purposes.
5. 690 Pohukaina Mixed-use Residential Project	HCDA Joint Development	In a public private partnership at 690 Pohukaina HCDA is working with a private developer (Forest City) to create up to 850 residential units near to the future HART Civic Center station including both market-rate and reserved housing. The development project will also incorporate potential improvements to Mother Waldron Park and fronting streets. Allowable land use may include 95,000 square feet of non-residential uses. Associated community benefits are being negotiated.

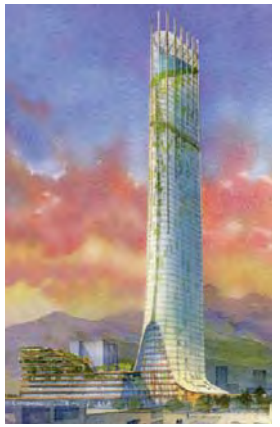
Blaisdell Center Opportunity

To take full advantage of this site, a new vision for Blaisdell encompasses the following features and attributes:

- Consolidated land uses to extend historic Thomas Square Park across King Street
- A completed street grid with improved vehicular connections through Blaisdell and a site design based on pedestrian access
- Options for a tall, iconic tower
- Opportunities for reserved housing
- A redesigned state of the art performance center
- Consider placement of a new business-oriented hotel to meet demand for visitors coming to Honolulu's Downtown for work purposes
- Include a multi-plex cinema
- Include sustainable site design, and green building techniques
- Provide a coordinated mobility and access strategy, with shared parking arrangements and ensure that people arrive at the site using all modes, including walking, cycling and transit.

LA LIVE

Downtown LA created this 54-story tower adjacent to the Staples Centers and the LA Convention Center. The project also mixes two hotels, JW Marriott and Ritz Carlton for a total of 1,000 rooms. The most exciting part of the LA Live concept is the dynamic public spaces, which include outdoor concerts, a restaurant row and cinemas, and even a Grammy museum.



690 Pohukaina
Joint Development Opportunity

In partnership with a private developer (Forest City), the 690 Pohukaina project will redevelop an existing surface parking lot on the `Ewa side of Mother Waldron Park with opportunities for new rental housing in the core of Kaka`ako. This new iconic building in the heart of the district, within close proximity to Civic Center station will provide a maximum of 804 residential units. Of these units, there are approximately 390 affordable units. The project also includes as much as 95,000 square feet of non-residential uses.

Livability and amenities include uses such as a community center/club house, natural drainage practices and a minimum LEED Silver accreditation. The developer will also take on improvements and programming for Mother Waldron Park including public art, green landscaped plazas, and a major pedestrian connection that links Mother Waldron Street to Keawe Street to the west.

Forest City is now working with HCDA on the development of a single tower program to maximize height and reduce visual impact.

Forest City Rendering of 690 Pohukaina Project Proposal
Image from Forest City

DRAFT

4 URBAN DESIGN

DRAFT

4 URBAN DESIGN

Urban Design Framework

The Urban Design Framework for the Kaka`ako TOD Overlay Plan builds upon the vision established by the Mauka Area Plan to promote street-level activity, with safe, comfortable public spaces and a diverse array of uses. Urban Design strategies in this chapter clarify HCDA priorities for the relationships between people, the landscape, and the built environment. Particular to the achievement of the TOD Overlay Plan goals and objectives will be the selective introduction of additional height and density into this already urban location. This chapter designates a framework and a set of design principles that will guide the placement and design of new building forms, balancing additional capacity with elements that help to create a comfortable, livable urban location.

Development scenario of build-out under the TOD Overlay Plan. An array of taller, slender towers are envisioned near by the Civic Center, and Kaka`ako Transit Stations.
Image from VIA Architecture

Building Height, Tower Floorplates, and Skyline

The Island of O`ahu is known as "the Gathering Place," and Honolulu is its center of activity." Its skyline, set against a forested mountain backdrop and the curve of Mamala Bay, is unmatched by many of the world's metropolitan areas. Kaka`ako is located centrally between the downtown core and Waikiki, and is well positioned to accommodate taller buildings. Adding to Honolulu's skyline here will visually connect these two recognizable areas, while providing a skyline that will be seen by visitors and residents from vantage points across the south shore of O`ahu.

The careful placement and design of tall buildings can help to create a sense of place by framing and focusing views between the built and natural environments. Even now, there are limited views to either the Ko`olau ridge or the ocean from the heart of the district, however, vertical development strategies have the potential to cultivate new views for residents, employees and visitors while also aligning to street end vistas identified in the Mauka Area Rules Mauka-Makai View Corridor (see Figure 4-2).

The TOD Overlay Plan will utilize best practices in urban design to encourage exemplary buildings and advance the development of well-sited, tall, slender towers. Together, these buildings will create a skyline of framed peek-a-boo views through and between towers, as well as green spaces on podiums that will enhance views down from neighboring buildings and residential areas on the slopes of Punchbowl, Makiki and Pauoa. The sensitive application of height allowance paired with quality streetscape design can produce the characteristics of a comfortable pedestrian-oriented environment on the ground plane, while adding to the overall capacity in Honolulu's primary urban center.

Current Mauka area tall buildings consist of a preponderance of 200' long and 400' tall "slab" towers that tend to create a monotonous form and height. The TOD Overlay provides adjustments that help temper this form of development by encouraging both a diversity of high rise types, and a hierarchy of building form. Also, the new rules help establish better livability by concealing exposed parking garages and responding to the transit investment in the district.

The proposed set of High Rise Building Types aim to strike the right balance between constraints on building mass and volume, aesthetics and market feasibility. This is because smaller tower floor plates (below 11,000 SF) can become more luxury-oriented as the ratio between surface skin (the exterior facade) and interior is increased, bringing up the cost of the building envelope per interior salable square foot. Too heavy of an emphasis on narrow floor plates means that fewer towers will be built, and goals for making Kaka`ako a Hawai`i resident-focused, high-capacity neighborhood would not be achieved. This is why the TOD Overlay Plan includes more affordable building options, together with a tall floor plate option of a mid-range of 11,000 SF untethered from the previous lot size requirements found in the Mauka Rules (It is still required that all buildings must have a parcel at a minimum lot size of 40,000 SF to participate in the TOD Overlay height and density increases).

The TOD Overlay Plan also identifies a limited number of opportunities for the placement of iconic buildings (see Figure 4-1). These 700' towers will only be allowed with the provision of exceptional public benefits and with progressive green building practices and high architectural quality. Allowing these icons, HCDA is adding a sculptural element to the skyline, while condensing the building footprint. A variety of controls listed in the following table are explored, including tower floor plate maximums and spacing requirements, but perhaps the most important is the introduction of a design review program that can respond to the specific context and will begin to develop a culture of urban design quality in Kaka`ako.

Figure 4-1 Maximum Heights

Maximum allowable heights are established by High Rise Building Types, including limitations on bulk and massing. The base height in Mauka Area will be increased to 420' in areas illustrated on the map below. Towers of 550' are limited to development lot sizes of 90,000 SF or greater, with one tower allowed per development site. One iconic building with a maximum height of 700'is allowed in each of the Auahi, Pauahi and Thomas Square Neighborhoods.

420'/ 550'

400'

420'/550' / 700'

700' Iconic Tower limited to one structure in Puahi, Auahi, and Thomas Square Neighborhoods.

Maintain Existing Mauka / Makai Area Rules (maximum heights allocated by district, including the HECO Aloha Tower Site)

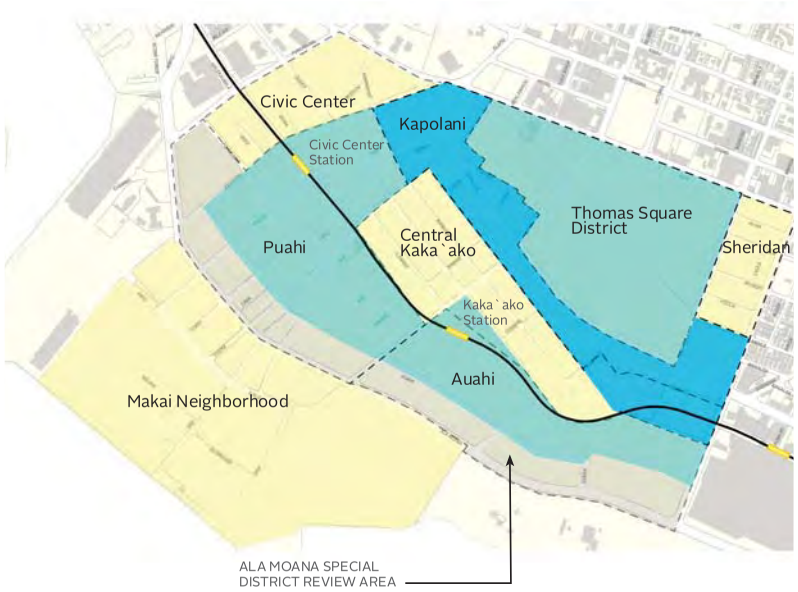


Figure 4-2 Building Siting and View Preservation

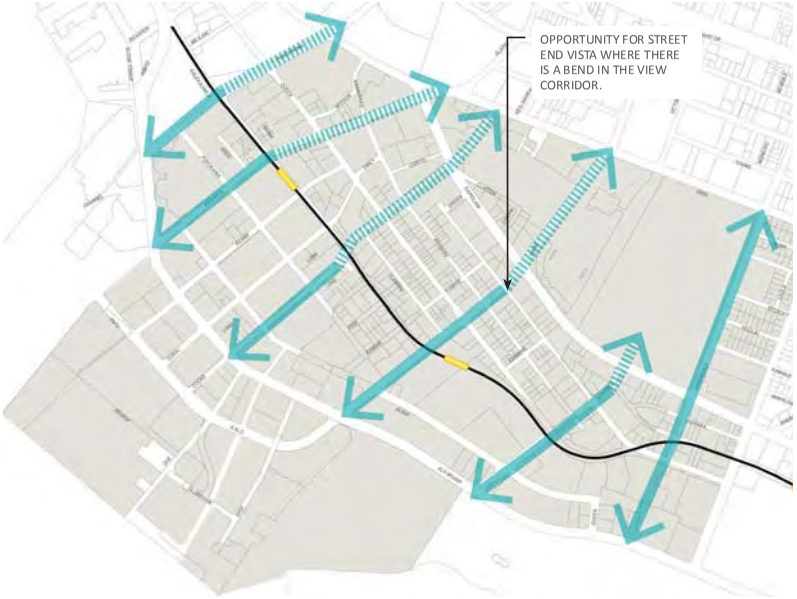
Control	Mauka Rule (2011)	TOD Overlay Recommendation
Mauka – Makai Corridor	Orient towers with long side of axis parallel to mauka-makai corridor. Min. 50' setback above 65' ft. Allows for 20% deviation from the view corridor per HCDA review.	Maintain the principle of short side axis orientation and test mauka-makai corridor in the EIS. Existing corridors may be altered or new corridors introduced. Any identified public views will be clearly defined and mitigating criteria established.
Solar Access	Not explicitly required	Provide guidance to ensure solar access for designated public spaces. Conduct a shade impact study to ensure that shadows from new buildings above 400' in height are minimized on identified parks and key pedestrian areas between 9AM and 3PM.
Tower Floorplate Controls	Towers maximum horizontal plan projection is 150' in one direction, with a maximum of 210' allowed between two farthest points of a tower floor plate. Specific floorplate controls are tied to block size.	High-rise Building Types (4-4) identified on page 4-15 are subject to identified tower floorplate controls. A minimum block size of 40,000 SF is required for all High Rise Building Types designated by the TOD Overlay Plan. Consider the exclusion of balconies from floorplate controls.
Tower Spacing	All towers maintain a spacing of 80'. When any portion of a proposed tower falls within the mauka-makai zone, a minimum of 300' separation between the long parallel sides of neighboring towers is required.	Maintain minimum 80' separation between all towers below 240' . Consider creating new spacing rules on taller tower typologies to allow more towers per block. Additionally, ensure significant separations between the Iconic Towers (with a maximum of three buildings in the Mauka District with heights ranging from 550' - 700').
Building Orientation	65% of one edge of a tower must be flush with a façade of the building or street element.	Add flexibility to street frontage setbacks. Encourage towers to be offset and horizontally staggered within a block. Include strategies to accommodate wind-down draft conditions. Consider guidelines for tower orientation associated with rear laneway and alley conditions.
Design Review	Not required Mauka (Makai only) For projects greater than 20,000 SF, as part of the Mauka Area Development Permit Process a discretionary Design Review committee reviews designs and provides comment within 30 days. Buildings in Makai are also subject to a set of guidelines produced in 2002.	Set thresholds for a design review process for taller buildings (over 240') to ensure quality of design. Principles should ensure that complimentary relationships between buildings are developed and that significant views are preserved. (see Strategy UD3)
Vertical Articulation + Tower Tops	Not required	Rely on design review as a tool to encourage articulation of building forms of taller buildings (>240'), reduction of the mass of upper portions and neighborly transitions in both height and scale between adjacent buildings.
Vertical Transitions	Not required	TOD Overlay provides performance based measures to produce harmonious combinations of varying heights within the same development block. Special rules apply to Iconic Towers.

Figure 4-3 Proposed Build-Out under TOD Overlay Plan

Figure 4-4 Mauka Area Rules Build-Out

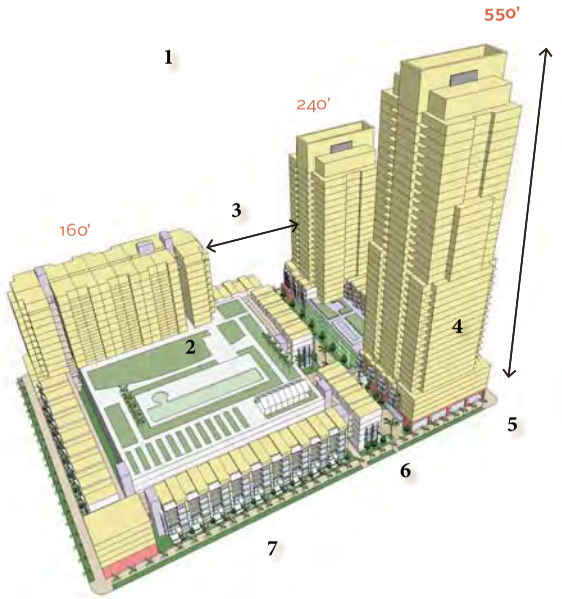


MAUKA-MAKAI CORRIDORS

All structures, even those that are a single story have an impact on pedestrian views, obstructing sight lines to the ridgeline and the ocean. Establishing view corridors that maintain and frame future views is of critical importance. The Mauka-Makai corridor is defined in the PUC Plan and HCDA Mauka Area Rules (see Figure 4-2.). Buildings adjacent to a view corridor street must set all portions of the building above 65' back 50' (transitional height setback). Tower Elements are also required to be aligned parallel to the closest mauka-makai axis. Every development permitted under the Mauka (2011) Rules must submit a view impact study demonstrating that the ideal tower orientation was selected in order to maximize views.

The TOD Overlay Plan will also consider the treatment of streetend vistas on portions of view corridors that shift angles. As noted in Figure 4-2.

Figure 4-5 Designated Mauka Makai View Corridors and Streetend Vistas



Strategy UD1 A high-rise neighborhood with a variety of development types

Design of the built environment is the result of development economics, regulatory design standards and site geometries within the context of complex market realities. To participate in the TOD Overlay High-rise building types, a development block must be at least 40,000 SF or greater. With a potential for increased capacities, the TOD Overlay Plan anticipates a redevelopment pattern that, depending on the size of the parcel, can accommodate multiple, inter-related buildings on a single development block. To avoid monolithic or overly uniform buildings and to encourage a skyline hierarchy that is both interesting and unique, larger-scale TOD developments with multiple tall buildings should be composed of at least two building types with significant height transitions between buildings (6-8 stories), as well as changes in architectural character, volumes and massing. An exploration and analysis of proposed Building Types is included on page 4-14 of this chapter. A prototypical block development is shown below (Figure 4-6).

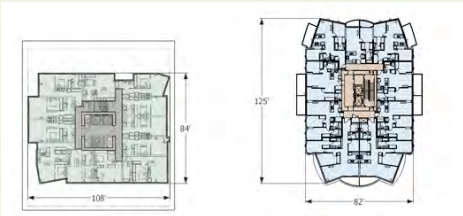


Figure 4-6 Typological Block Development (120,000 SF consolidated lot)

1. MULTIPLE BUILDINGS MAY BE SITED ON A CONSOLIDATED PARCEL. DESIGN REVIEW ENSURES NEIGHBORLY RELATIONSHIPS BETWEEN TOWERS
2. INTERNAL PARKING STRUCTURES ARE EFFICIENT AND SHARED BETWEEN USES. PARKING PODIUMS CONTAIN ACTIVATED PUBLIC SPACE FOR BUILDING USERS
3. DISTANCES BETWEEN BUILDINGS ARE CONTROLLED FOR PRIVACY AND LIVABILITY AND CONSISTENCY WITH MAUKA-MAKAI VIEWS
4. BUILDINGS OF DIFFERENT HEIGHTS AND TENANCIES ANTICIPATE A VARIETY OF CONTEXTS AND CONDITIONS.
5. RETAIL IS PRIORITIZED IN CORNER LOCATIONS AND COMMERCIAL AREAS AND IS DESIGNED TO ENGAGE THE STREET AND ENHANCE THE PEDESTRIAN EXPERIENCE.
6. INTERNAL BLOCK CONNECTION FOR VEHICULAR AND PEDESTRIAN ACCESS ARE ACTIVATED WITH THE INCLUSION OF PEDESTRIAN FRIENDLY DESIGN, LANDSCAPING, AND ACTIVATING USES WHERE POSSIBLE
7. THE GROUND PLANE IS HUMAN SCALED. NON-COMMERCIAL STREETS ARE ACTIVATED WITH TOWNHOUSES, STOOPS, STREETSCAPE AND LANDSCAPING ENHANCEMENTS

BUILDING CODE CONSIDERATIONS

While the City of Vancouver is often cited as a precedent for smaller floor plate towers, these building types result from different building codes, in particular, a more consolidated core of both elevators and exit stairs made possible through the application of a "Scissor Stair." The scissor stair design is set of two intertwined stairs (like a double helix) located within one stairwell enclosure separated by a fire wall. Two adjacent flights connect the same floors in opposite direction, crossing each other like a scissor. In an enclosed scissor stairs it is possible for two people to climb or descend simultaneously without ever having to meet each other.

Typical IBC Tower Core
Alto - Seattle
8,000 SF Floorplate
12 units per floor
672 ave. unit (gross)
551 SF ave. unit (net)
1387 SF Core = 17%

Scissor Stair Innovation
Plaza 88 - Vancouver, BC
8,000 SF Floorplate
9 units per floor
666 ave. unit (gross)
670 ave. unit (net)
1072 SF Core = 13%

The scissor stair innovation provides for more leasable area to offset construction costs, while also allowing for a condensed footprint. Although scissor stairs are used throughout the eastern part of the US and in Vancouver, BC, building codes in the western US and Hawai`i treat them as a single exit for fire and life safety purposes, discouraging their use. Recently however, there has been increased interest in locally modifying building code for the scissor stair, beginning with Portland, Oregon where it has been used in the South Waterfront project.

One of the first projects to use the scissor stair is The Strand (shown below) located on the Willamette River. The scissor stair allowed developers to the reduce floorplates from 14,000SF to a "skinny" 10,000SF with each unit having a view.

The Strand, Portland

Vancouver Tower

Strategy UD2 Encourage climate responsive design

Current Mauka Rules require the base level of US Green Building Council's LEED Certification (or equivalency) on any new building in the Mauka District that increases existing floor area by 25%. With the TOD Overlay, HCDA should explore the incorporation of climate responsive design, sustainability performance measures and subsequent development incentives to encourage exemplary buildings. Green building practices may focus on the following:

- Windows and facade treatments for shading, daylighting and reducing heat gain
- Open air ventilation, and circulation including exterior corridors, stairways, internal gaps between podium liner uses and parking structures
- Arcades and breezeways and outdoor circulation at the street level, in courtyards and on ground floors that maximize access to the outdoors and takes advantage of the Hawaiian climate
- Provision of elegant and integrated shade structures on podiums, such as awnings and porticos and landscaping
- Orient tall buildings to manage the tradewinds through and around structures so that open space elements are comfortable
- Use of solar renewables, geothermal and wind energy, and district cooling opportunities
- Locally sourced and/or renewable materials, and diverting construction materials from the landfill

Outdoor Circulation and green roofs are a core elements in the sustainability guidelines for Vancouver's South East False Creek.

Portland's South Waterfront Ecodistrict, the City's newest high rise neighborhood with Platinum LEED buildings.

Strategy UD3 Provide for sunlight access

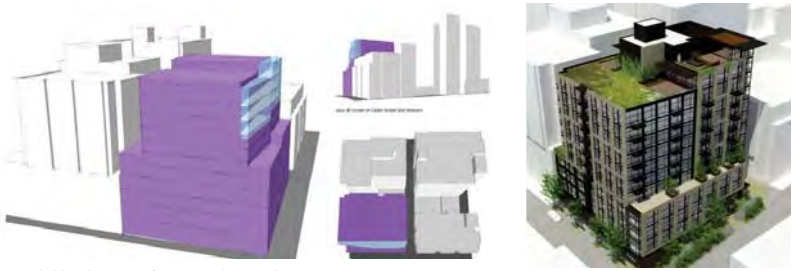
In the tropical yet temperate climate of the central Pacific, shading has both positive and negative qualities in the urban environment. Shade cools the streets, improves comfort of public spaces, and reduces heat island effect. However, access to filtered sunlight and skyviews are also positives, providing air circulation, breathing room and a sense of place. With the TOD Overlay's emphasis on taller buildings, guidelines to understand the impact and influence of shade should be considered. It is advisable that taller buildings (over 400') do not overly shade key pedestrian areas. Solar access can be included as a performance-based measure in the design and placement of tower footprints. The design of tall buildings should seek to reduce shading impact according to the following hierarchy of spaces:

- (i) active public spaces
- (ii) semi-private street edges or open spaces
- (iii) private open spaces

ACTIVE, GREEN PODIUMS

The potential to incorporate landscaped podiums and other green roof elements in Kaka`ako that will help to meet usable public open space requirements is enormous. In addition to providing open space, green roof systems also provide public benefits of absorbing rainfall, reducing storm water loads and with careful plant selection, adding to biodiversity and local wildlife habitat. A successful green roof requires technical expertise and the integration of a considerable number of building and site elements, early design decisions and trade-offs.

To encourage green roofs as a best practice within Kaka`ako, HCDA will consider a green roof policy and provide technical support appropriate to the Hawaiian climate, with resources and guides for developers. HCDA will consider appropriate incentive mechanisms as necessary.



The 55-story Washington Mutual Tower in Seattle has an ASLA Award winning public roof garden (by Philips Farevaag Smallenberg) located on 17th floor. Landscape design was developed to reinterpret a regional "sense of place" with windswept grasses, planting pathways and wood decking. Open to the public, this area also provides an outdoor social space for employees.
Image from Flickr user Rchapman

Strategy UD4 Introduce design review

HCDA has developed a design review process for projects located in both the Mauka and Makai Areas. This Plan expands the Design Review process to cover all projects that meet or exceed the following thresholds:

1. Residential or mixed-use building of 125,000 SF or greater and/or
2. Heights of greater than 240'.

A Design Review Board will be engaged to assist in the design and siting of the three Iconic Towers. The Design Review Board may provide a variety of perspectives on the built environment, such as an architectural professor, a developer, a local architect and a local artist or cultural representative, a landscape architect and a member of the community.

Areas in blue do not conform to zoning envelope

Image from VIA Architecture

EARLY DESIGN GUIDANCE BUILDING MASSING ALTERNATIVES → FINAL DETAILED DESIGN

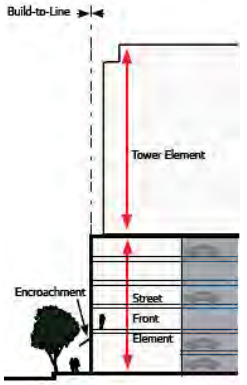
Community Benefits for Design Review

- Reviews and analyzes proposed projects to provide early design guidance
- Provides a forum for public feedback
- Allows developers to respond to unique site conditions

Developer Benefits for Design Review

- Provides relief from prescriptive dimensional requirements such as setbacks and bulk
- Promotes community participation and acceptance of projects
- Encourages more flexible, creative and site specific design solutions

Action UD4.1 Implement a design review program for TOD Supplementary density buildings with guidelines that address site planning and massing, architectural building expression, streetscape, public amenities, and vehicular access/parking.



Action UD4.2 Establish design guideline principles and collect a set of precedent project images, diagrams and/or case studies showcasing of exemplary buildings and solutions for Kaka`ako.

Image from VIA Architecture

Building Elements: Street, Middle and Tower

The Mauka Rules (2011) Regulating Plan establishes a set of Buildings Types ranging from low rise to high rise. These Building Types prescribe setbacks, building envelope and relationship to the street. The Plan includes a description of Street Elements, Mid-rise Elements and Tower Elements. The TOD Overlay is consistent with and builds upon this process.

Mauka Area Rules 1-12 A.

Guiding the Design of Street Elements for Tall buildings

The lower stories of buildings (the Street Element) have the greatest influence on the experience of walking and being in a place. Comfort in the urban realm is provided by the presence of strong edges along the walking path. Whether built form, walls, or terraced green, these elements create 'urban rooms' that reinforce and set the stage for complementary sociable activity in both the public and private realm. Attention to and design of the urban landscape provides the spatial structure that encourages pedestrians to choose to walk along the street.

The Mauka Rules defines a **Street Element** for all buildings as well as specific parameters for allowed building frontages, building placement and orientation and limitations on podium heights. The TOD Overlay maintains these basic guidelines while providing for flexibility in new building types. Generally:

While a walking path and landscaping are provided, a lack of building edge activation makes this location in Kaka`ako undefined and under utilized.

- Podiums of tall buildings align with adjacent building facades. Some strategic setbacks are encouraged, for example at building entrances, at plazas, courtyards or to create architectural interest.
- Characteristics of the podium should relate to the dimensions of the street. In smaller access lanes and internal block connectors, podium height should be reduced, generally no more than 1.5 times the street width is advised.
- Stoops and garden elements help taller residential buildings transition to the street, minimizing the impact of larger buildings above. In these instances, residential front doors should be made visible, whether used as a primary entrance or not. Townhouse frontages that can accommodate families should be encouraged for street level and on green, livable podiums.
- Floor-to-floor heights should be generous, particularly in commercial buildings, to ensure high quality adaptable spaces. Double-height first floors in all commercial buildings are preferred.

- Ground floor facades should maintain a high degree of permeability for both commercial and residential uses.
- Views between ground floor spaces and the street are particularly important to ensure the safety and security of pedestrians. Buildings should open up to the street and create the indoor-outdoor relationships present in plantation era Hawaiian architecture.

Figure 4-7 Street Elements

Control	Mauka Rules	TOD Overlay Recommendation
Building Siting **Regulating Plan Build-to Lines**	Regulating Plan controls building siting and placement by block; i.e. 75% of Street Element façade to be within 5-10' of the build-to line. This provision for property line setbacks requires private sector contributions to public realm improvements such as sidewalks.	Maintain as guideline, but allow deviations that respond to site geometries and context and public realm opportunities such as plazas and courtyards. Set clear characteristics in coordination with street types as defined in the TOD Overlay Plan.
Podium Height	The Mauka Plan generally maintains a maximum height of 65'. Setbacks are designated by building type. Mid-rise Building Types (i.e. Urban Block and Lei Buildings) require significant stepping back of upper storeys.	Alter setback requirements to accommodate additional capacity and allow flexibility to accommodate parking liners with top level uses. Align podium heights to coordinate with internal passages; i.e. podium heights are preferred to be not more than 150% to the street width.
First Floor Uses	Uses are mixed throughout Mauka. Retail uses are required on identified Promenade Streets.	Maintain, coordinate with new TOD Overlay Street Types. Ensure that first floor uses are not over-regulated, producing unmarketable spaces.
First Floor Height	Controls are differentiated by Frontage Types and by Use. Currently, the first floor minimum for retail on Thoroughfare Streets is 12'.	Enhance existing regulations. Generous first floors and high quality architectural treatments should be required for mixed-use and commercially focused TOD buildings with ground level retail. Double height first floors (16-22') should be considered for civic scale and flexibility of use.
Street Level Residential	The Stoop Frontage Type is defined and allowed according to neighborhood. However, the Terrace Frontage type is required for building frontages >100'.	Revise requirements to better encourage the Stoop Frontage type on High Rise buildings, and give livability/ amenity "credit" for setbacks associated with their stoops and semi-public gardens.
Parking Garage Screening / Blank Facades	Requires that the first three stories of parking garages are screened at a depth of 40'-80', with potential for dividing walls every 30'.	Parking must be accessed from an alley where feasible. Add flexibility to screening, consider a 75% screening requirement for all bounding streets, but allow deviations at midblock crossings. Unconcealed portions of garages should have enhanced landscape or other screening treatments.
Transparency	This is controlled according to retail use, i.e. 70% of a retail Thoroughfare Frontage Element to be transparent with views into storefronts.	Ensure that variances allow flexibility for mechanical spaces or where no alley is possible .

New Building Types

The TOD Plan introduces a new set of building types for this urban infill location. Building a comfortable, cosmopolitan, diverse Kaka`ako means that each new building should be context sensitive; is of an appropriate scale; respects adjacent public spaces, buildings and businesses and contributes to an improved pedestrian environment. In particular, with more density, matters of light, sky views and privacy must be resolved to ensure that one building does not negatively impact an adjacent site. In an urban environment, each side of the building is designed to reflect the character and context of its street.

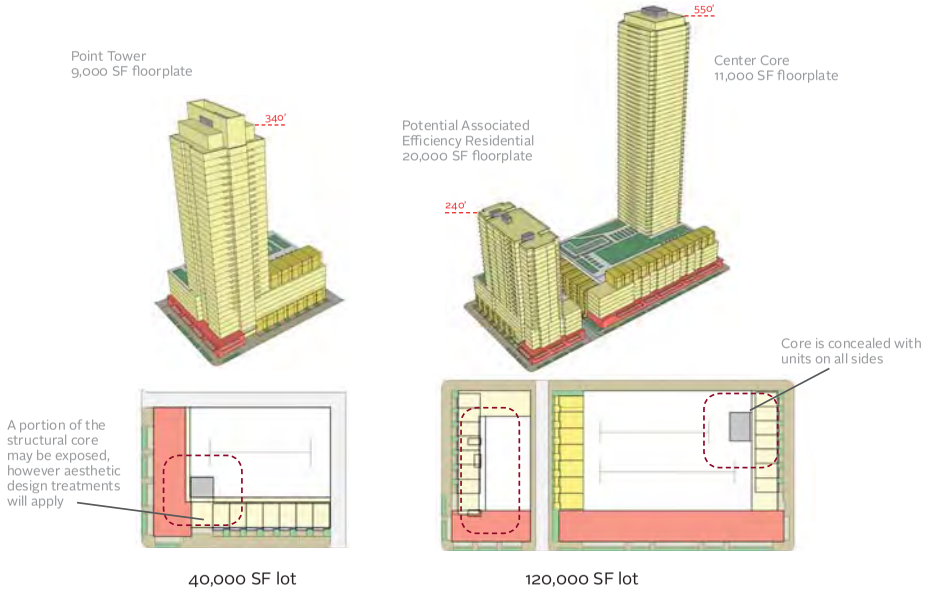
The following section is intended to guide a set of future implementing rules for high density development and outline building key heights and design attributes. This series of simple massing models examines the application of these types on prototypical lot sizes of 40,000 SF, 80,000 SF and 120,000 SF. The series of diagrams helps to illustrate potential build-out of each lot at a maximum of 12.0 FAR, assuming average unit sizes and parking requirements. Real world geometries and contexts would likely result in reduced FARs of 10-11.

High Rise Commercial/Office (Maximum Height: 160')

A limited number of commercial buildings provide highly desirable, efficient floor plates allowing a developer to accommodate one employer on fewer floors. Including office buildings in the TOD Overlay also ensures activity during the day and evening hours to support street level businesses. Limitations on total GFA of High Rise Employment Buildings in Kaka`ako allows for diversity of use in the district, without overly competing with downtown's commercial core. High Rise Employment buildings are desired within proximity to Civic Center Station, Kapolani Boulevard and on major arterials.

Design Criteria



- Floorplate maximum size 28,000 SF
- Height limit: 160' or approximately 12 stories
- Height limits mitigate impact on the skyline
- Generous ceiling height at the first story

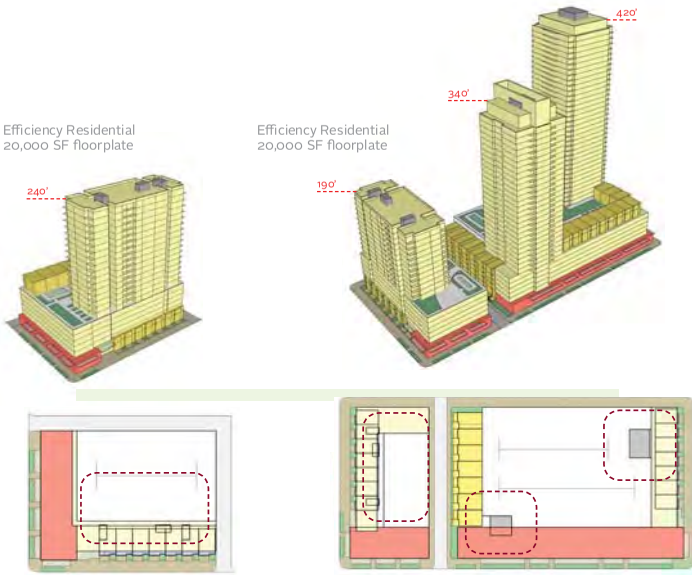
Livability Attributes

- Courtyards and indoor-outdoor spaces for employees
- Introduce passive ventilation for heating and cooling and daylighting of indoor spaces through courtyards or light wells
- Provide access to green roofs on podiums or to landscaped, street-level common areas
- Facilities for bicycles, participation in transit pass programs reduce impact on traffic and parking footprint
- Consider activated first floors that complement the commercial nature of the project and provide useful services for building users and guests.

Center Core/ Point Towers (Maximum Height: 420' - 550')

Center Core and Point Towers help ensure that a building is aesthetically pleasing when viewed from all sides. Center Core Towers house units with high quality façade treatments, concealing the concrete core at the center. Point Towers, while allowed to expose the core must incorporate aesthetic treatments such as glass or high quality skins. Both Building Types ...must have a smaller, must have a smaller, streamlined structure width aligned with the Mauka-Makai Axis. FAR controls balance between taller heights and building volumes on smaller parcels while providing for enough flexibility for multiple towers to be developed on larger lots. Tall heights ensure that revenue from salable area offsets the costs of high-rise construction while maximizing the use of Oahu's limited land area.

Design Criteria



- **Center Core Tower**: 12,000 SF Floorplate Maximum/Structure width 120'/concealed core
- **Point Tower**: 9,000 SF Floorplate Maximum Structure width 100' unconcealed core or concealed core

Livability Attributes

- Design Review protocols for buildings over 240' should provide guidance and requirements for shaping buildings
- Encourage operable windows and balconies
- Podiums are landscaped and provide recreational amenities for tenants
- Relationship between buildings should ensure privacy and livability
- Podiums heights are coordinated to street types; 75' along Boulevards, Avenues, and other streets.

Efficiency Residential (Maximum Height: 240')

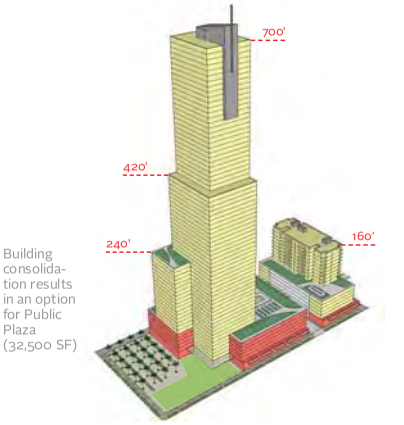
The Efficiency Residential building has a double-loaded corridor (apartments located on both sides of an interior hall) intended to provide for workforce and affordable market rate housing with a range of unit sizes. Whether on a single site, or combined with other towers, this building type allows developers to respond to many conditions. These buildings have an efficient envelope, address context and siting, and integrate with other taller buildings on a development lot.

40,000 SF Lot

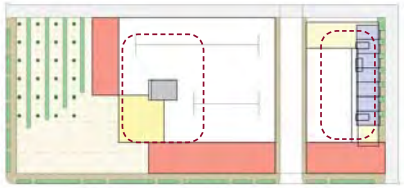
120,000 SF Lot

Design Criteria

- Larger floorplates up to 20,000 SQ FT
- Height 240'
- Maximum length 250'
- Consider measures to reduce apparent bulk and mass from the street level



Livability Attributes



- More affordable construction type reduces overall unit cost
- Larger facade on podium, garden and streetscape enhancements creates opportunities for family-friendly units
- Shorter, more affordable buildings are an optional companion to luxury towers on the same block

Iconic towers (Maximum Height: 700')

The TOD Overlay introduces a limited number of very tall buildings, (up to three) within the District. These buildings are intended to provide for the possibility of iconic buildings that provide a change in scale to the Kaka`ako and Honolulu skyline. Treated as a special case, the Iconic towers will require a process for design review guidance and negotiations for exceptional public benefit. Design guidance should provide flexibility and sufficient allowance for the structural core of tall buildings (taller than 600'), while helping to ensure elegant proportions and iconic architecture. In particular it may be necessary to permit flexibility from design standards, such as the podium scale at the base of tall buildings to provide for place-based design solutions at the street level.

120,000 SF lot

Design Criteria

- Do not limit the floor plate or dimensions of the lower podiums for buildings taller than 550'.
- See diagrams on opposite page for details.

Livability Attributes

- Design ground floors and building bases to welcome the public, and include retail or other uses that welcome the public into the building base. (Should not feel exclusive.)
- All tall buildings > 550' should include publicly accessible retail or other uses on the ground floor as an extension of the sidewalk.
- Provide for public viewing areas on upper stories of very tall buildings (650' – 700') , such as a public observation deck, a lobby or restaurant for public use. (Viewing opportunities may be located on mid-levels not necessarily the top floor).

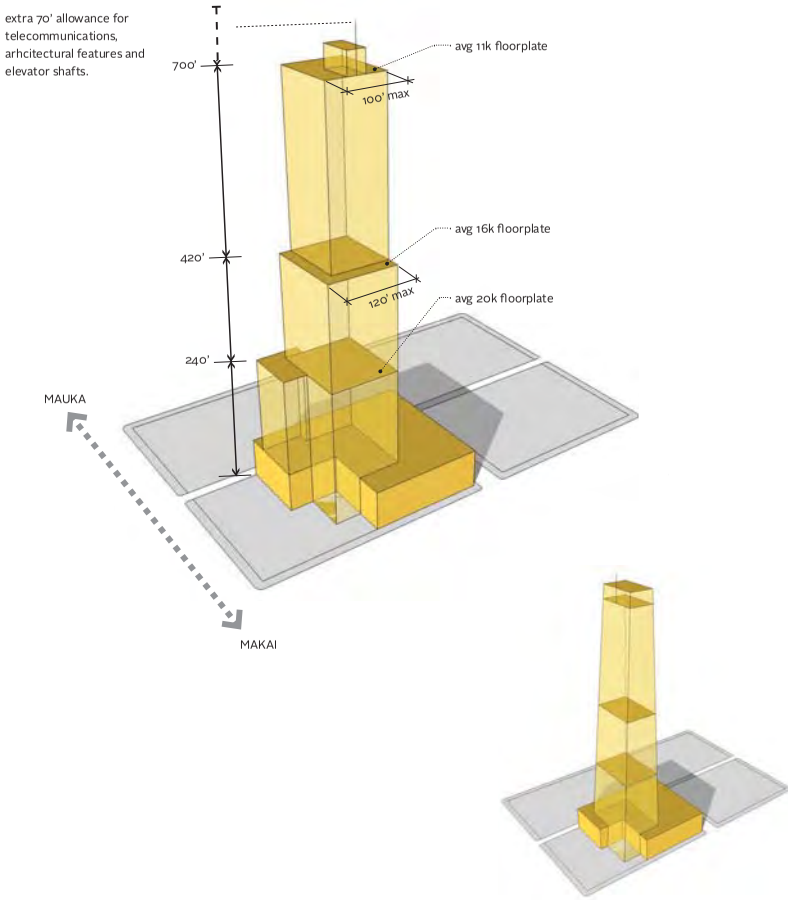


Diagram above shows an acceptable alternative tapering tower form.

DRAFT

TOD OVERLAY PLAN

Parks, Public Realm and Active Space

As Kaka`ako evolves, the provision of legible, accessible, and multi-functional public spaces is essential to neighborhood livability. New community-oriented public spaces will serve many functions. These are outdoor living rooms where social interaction creates a sense of belonging, provides variety in the built environment and respite from city life. Usable green spaces on podiums will be particularly important in this vertically-oriented district, not only for the use of building tenants, but also to preserve and enhance views from other tall buildings.

In high intensity areas such as Kaka`ako, each development may not be able to accommodate adequate public open space on site. In these instances, provisions should be made to allow developers to allocate in-lieu fees for public spaces off-site, and a plan for contributing to a series of coordinated green spaces within the District.

Public Parks

The City of Honolulu Department of Parks and Recreation's Standards and Design Precepts for Future Park Development (2004) provides recommendations and standards for various park types (e.g. two acres of neighborhood parkland per 1,000 residents). In the Kaka`ako District, HCDA will use this standard as a guide, but recognizes that many of the future park lands will be located makai of Ala Moana Boulevard. Kaka`ako Waterfront Park, and any future associated enhancements to the Kewalo Basin Area are within close walking distance for new Mauka residents. In the Mauka area, as associated with the TOD Overlay, assessments will be allocated to improvements for existing District parks and the provision of possible new public spaces, and other identified cultural amenities (see figure 4-8).

Additionally, both Kamehameha Schools and the Ward Neighborhood Master Plan will build new distinctive public open spaces as part of their master plan developments. Negotiated individually with HCDA, both of the Master Plans have applied Public Facilities credits (allocated at 3% commercial and 4% of residential GFA) towards local improvements. The Kamehameha Schools Master Plan has also proposed lands for a Gateway Park in the Makai area (Cooke and Ala Moana Boulevard) as a significant linear greenway as part of Cooke Street's beautification.

Figure 4-8 Public Open Spaces in KCDD

1. Green landscaped park associated with a Blaisdell redevelopment
2. HECO Site public open space option associated with redevelopment
3. Transit Plaza Associated With Civic Center Station
4. Kewalo Basin Area waterfront public space improvements
5. Kaka`ako Waterfront Park and planned extensions
6. Kolowalu Park (existing)
7. Mother Waldron Park (existing)
8. Gateway Park (existing)
9. Cooke Street beautification park to park connection (Proposed in KS Master Plan)
10. Public open space and linear park (Proposed in Ward Center Neighborhood Plan)

Public spaces associated with redevelopment

Major planned or existing public spaces

Public space improvements associated with major Master Plans

DRAFT

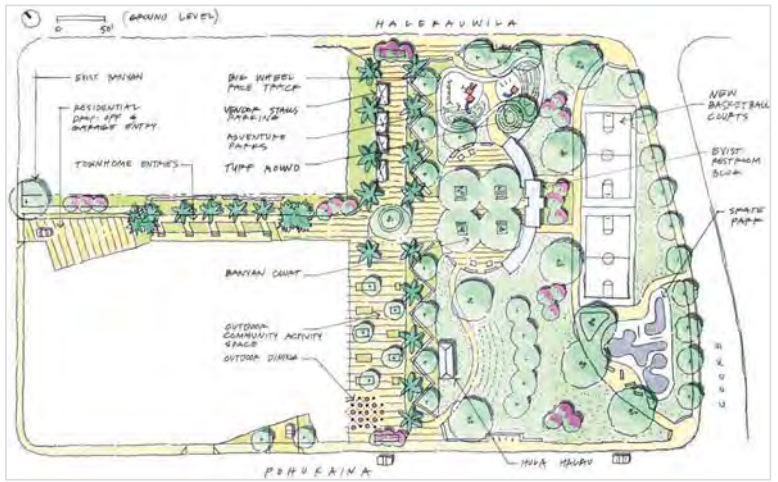
The Howard Hughes Corporation, Ward Neighborhood Master Plan includes designs for a new linear greenway and park ending with a street connection to Ala Moana Boulevard. Designs connect these Mauka area active spaces to the Ala Moana Regional Park.

In addition to the above, HCDA envisions two additional coordinated park spaces in the Mauka District that could be established with TOD Overlay associated redevelopment:

a) Additional Public Park on a redeveloped Blaisdell Center Site

- A primarily landscaped park designed to reflect and extend the existing Historic Thomas Square Park (across King Street). This opportunity would create an active public destination adjacent to cultural institutions, the Blaisdell Arena and Performing Arts Center, and create a significant central green space for the area.

b) Small Transit Plaza associated with Civic Center Station



- A small transit plaza (1/4 block) should be developed within one to two blocks of the Civic Center Station to act as a meeting point and destination (to be confirmed by HCDA).

c) Improvements to Mother Waldron Park

- Improvements to Mother Waldron Park are conceptualized as part of the 690 Pohukaina Project

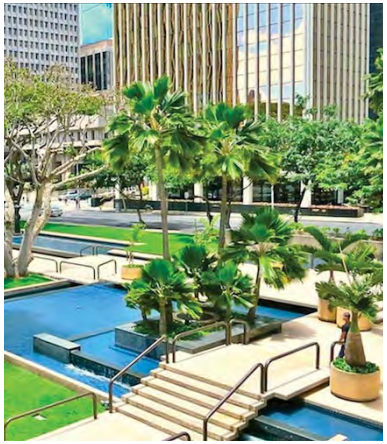
d) Potential linear greenbelt under the transit guideway and pocket park on remnant transit parcels.

Figure 4-9 Conceptual Plans for Mother Waldron Park

Illustrative site plan of potential Mother Waldron Park programming and improvements associated with the 690 Pohukaina project.
Image from Forest City

Spaces for People

As noted, in Kaka`ako it is expected that a majority of new public usable open spaces will be built as part of redevelopment projects. These spaces will be found not only in civic-scaled public parks, but also in small pocket parks on streets (promenades), semi-public courtyards, publicly accessible interior spaces, public viewing plazas, and community gardens. These public spaces that are developed concurrently with individual sites may have full or partial public access (such as a grade-level or elevated courtyard, residential stoops or gardens) and may be either publicly or privately owned. In all instances, public spaces must be usable, neighborly, and provide for multiple functions where feasible.



General Guidelines

This section documents the types of public community spaces encouraged within the Kaka`ako District. New public community spaces should include the following attributes, for more information see Chapter 5 (to be coordinated).

- Provide signage identifying place
- Support sociability by including some or all of the following: moveable seating: tables, chairs, sit walls, shade structures, trees and a balanced blend of hardscape and softscape surfaces.
- Locate public spaces where they will be visible from adjacent units or occupied spaces to ensure safety.
- Locate bike racks at the perimeter of public spaces where feasible and appropriate.
- Water and electrical outlets should be provided to allow for more flexible uses.
- Include shade structures / trees to protect seating and activity areas where feasible. The spacing location and type of required trees may be modified when adjacent to a plaza or other identified community space.
- Manage 75% of stormwater on site in community spaces, through permeable pavers, bio-filtration units or other low impact development features that drain to planted areas.
- Use a blend of both hardscape and softscape features to provide a rich and varied texture.
- Consider any special user groups (such as seniors or children) when designing new community spaces.
- Consider design elements that will extend a community space's hours of use.

Small courtyard, Kaka`ako

Tamarind Square

Public Plazas and Squares

Plazas are tucked between two- or three sides of building facades, while Squares are bounded by streets on all sides. This type of community space may consist of primarily hardscape elements such as pavers or concrete. Including changes in plane are encouraged to add variety and visual interest. Landscape materials and art can be used to both provide texture and make it attractive. A portion of a plaza can also be used for reserved seating for a cafe or restaurant. Permanent structures may also be included within the plaza provided they do not preclude access by the general public. Structures in plazas may be enclosed or open air or potentially leased for commercial use.

Features and attributes for a Public Plaza:

- A variety of seating opportunities including moveable and fixed seating/ Options such as sit walls, boulders and other multi-use objects are also appropriate,
- Design opportunities for special events or small scale gatherings,
- Mounted or suspended lighting, or decorative lit bollards
- Architectural feature that will provide a sense of place

Community Gardens

Community gardens provide valuable space for Kaka`ako dwellers to create urban agriculture. In addition to locations on the ground, parking podiums can also be actively used as rooftop gardens. In these instances, buildings should incorporate load bearing capacity sufficient to allow their intensive utilization including human

Director Park Plaza, Portland

Civic Center's existing public spaces are associated with City historic landmarks

occupancy, gardening and significant landscaping.

Features and attributes for a Community Garden:

- Sited with good sun exposure. Sheds or storage for tools
- Access to water such as hose bibs or rain barrels
- Adequate soil, planters and locations for garden plots
- Electricity
- Lighting over gardens, and pedestrian lamps in gathering areas
- Composting facilities, recycling and rubbish bins
- Rainwater catchment system
- Benches, seating, public art, community gathering or bar-be-que area

Promenades

Promenades are linear public spaces that enhance a circulation facility or internal block pedestrian connection. These areas are urban scaled environments that encourage social interaction and provide amenities for pedestrians including architectural features, water features or fountains, seating, landscaping, and hardscape. Promenades may incorporate low impact development features for water infiltration and detention. (See also Chapter 6 - Promenade - to be coordinated).

Features and attributes for Promenades:

- Pedestrian lighting
- Elements such as bollards, benches, seating or architectural features that provide separation
- Landscaping or planters
- Shade structures or trees
- Drinking fountains and water features
- Stormwater and rain garden enhancements

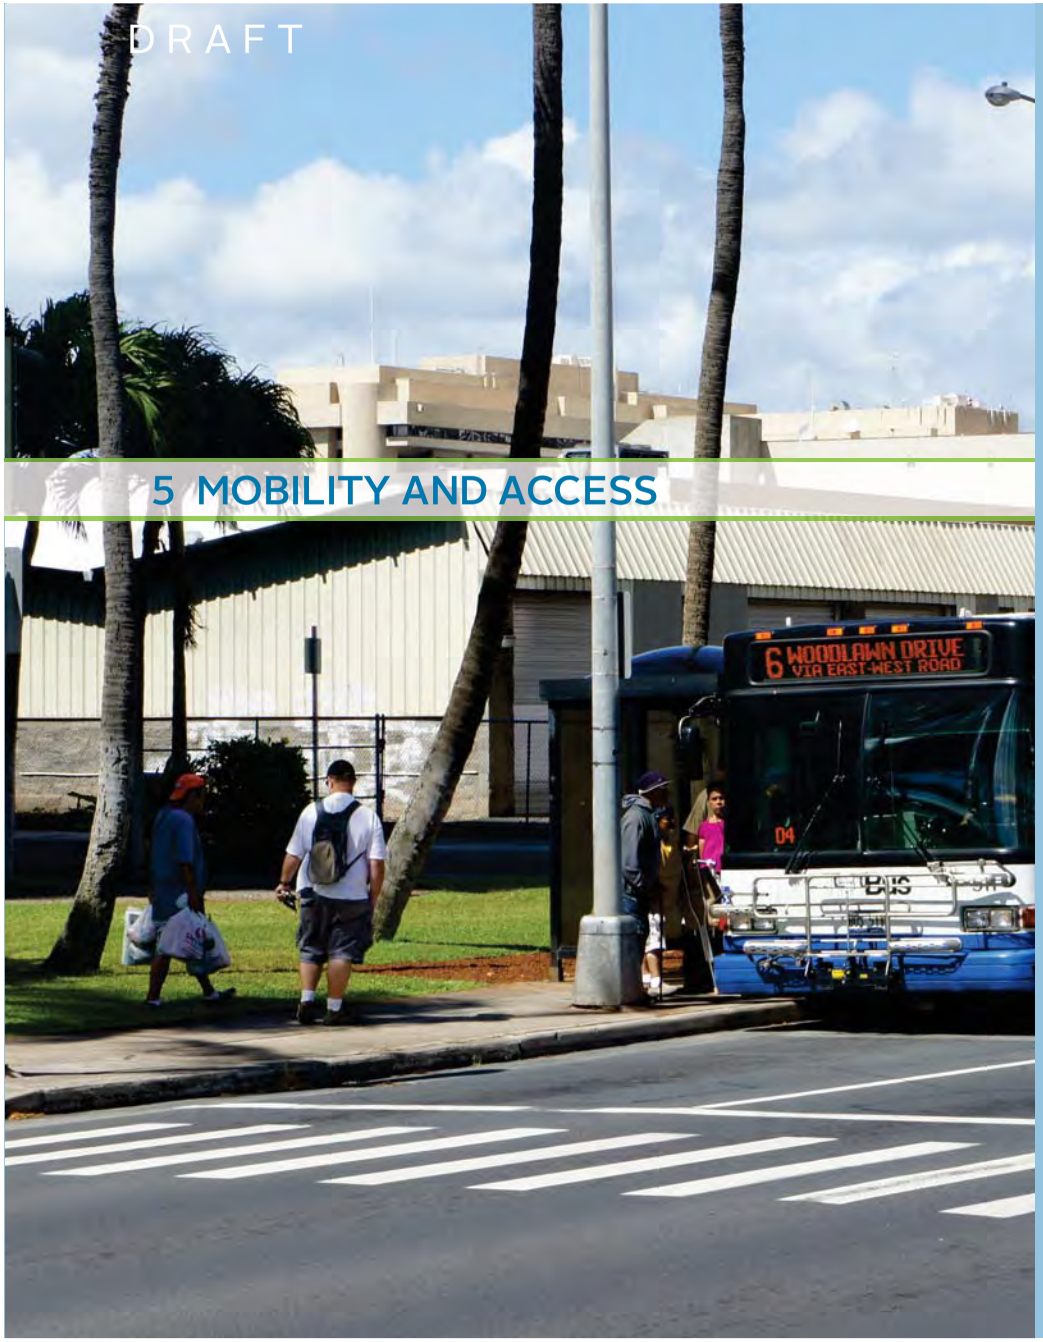
Small pedestrian resting area in South East False Creek, Vancouver

Planter boxes, community garden area

Packard Foundation in Los Altos, CA offices include a courtyard for socializing, and access to light and air. To reduce energy use, the building's offices are daylit with skylights and clerestories.
Image from Jeremy Bitterman, EHDD Architecture

Activity Areas

Activity grounds may be incorporated into other community spaces. These areas include children play areas, outdoor exercise equipment, active dog parks and runs, games such as bocce courts or chess sets. Natural creative play elements for free and unstructured play can also be included. Elements do not have to be designed overtly for play, but should support and encourage play by children, examples include water that can be manipulated, outdoor rooms made from rocks, landscape berms, or hills.



Features and attributes for Activity Grounds:

- Fixed benches facing play activity or game or equipment
- Drinking fountains
- Adequate lighting
- Measures necessary to protect children's safety from vehicular traffic such as low fences or landscaping to provide a physical barrier
- Places where pets can be outdoors and use spaces

Outdoor activities for families

DRAFT

5 MOBILITY AND ACCESS

DRAFT

5 MOBILITY AND ACCESS

How Transportation Supports the KCDD Vision

A community's approach to providing transportation services and designing transportation infrastructure can have a tremendous affect on the quality of day-to-day life and how far a paycheck stretches. For the last 50 years, the single occupant automobile (SOV) has shaped community design and land use decisions. The result has been a diminution of community, cultural integration, and human health.

Rising obesity and disease related to sedentary lifestyles, climate change, rising energy costs, and loss of time for family and cultural exchange have led many to look for alternatives to auto-oriented community design. A new paradigm is taking hold around the nation as people chose to live in vibrant urban communities where walking, biking, and transit are viable alternatives, active transportation is part of daily life, and the cost of fuel does not comprise 20% of household spending. Kaka`ako is in a prime location to benefit from these trends and create a holistic community where residents young and old can find a sense of communal space, vibrant civic life and cultural resources, and help to improve human and environmental health on the island.

In other parts of Honolulu, such as Waikiki, the City and developers have made significant investments to create balanced, walkable urban streets.
Image from Nelson\Nygaard

The Kaka`ako TOD Overlay Plan takes a different approach to transportation. It assumes that mobility and access are not ends in themselves, but means for supporting these community outcomes. This portends future investments in complete streets prioritized to move people efficiently, safely, and comfortably

Walkable, Transit-Oriented Communities

While there are many types of walkable, transit-oriented communities around the world, they share a common characteristic: people can walk, bike, or take transit from their homes to accomplish many of their daily activities including getting to work or school, picking up groceries, or going out to a restaurant or a special event. Transitioning Kaka`ako to a walkable community will require well-coordinated public investment centered on transit stations and nodes.

Modal Priorities

Developing a diverse multimodal transportation network is the only way to achieve the community outcomes discussed above; it is a matter of geometry. To provide sufficient space for civic life, shopping, comfortable sidewalks, and vital commerce, spatially efficient modes of transport must be prioritized. Locating jobs, housing, and services within walkable distances reduces the need for short, inefficient auto trips. The six "D" principles outlined in Chapter 2 describe how land use and transportation integrate to create a walkable, transit-oriented Kaka`ako.

When HART rapid transit comes online, many more people will travel in and out of Kaka`ako each day without a car. Since almost every transit trip is preceded and followed by a walking or bicycling trip, emphasis should be placed on improving conditions for non-motorized mobility and access. The qual-

Great retail streets, like Robson Street in Downtown Vancouver, rely on transit to deliver people to the area and to reduce auto traffic making pedestrians safer and more comfortable.
Image from Nelson\Nygaard

Image from EverybodyWalk!

BENEFITS OF A TRANSIT-ORIENTED KCDD

In addition to accommodating growth, a transit-oriented KCDD is by definition "green" and provides an opportunity to create both a sustainable Honolulu and a healthier planet. A walkable, transit-oriented KCDD will deliver:

Lower Overall Household Costs. Cars are expensive; household costs decrease when people are less dependent on them. In addition to increasing affordability, social equity improves when all citizens have good access to jobs, schools, healthy food, and other critical services. In efficiently designed urban neighborhoods with a range of quality access and mobility options, owning a car can be an option, not a requirement.

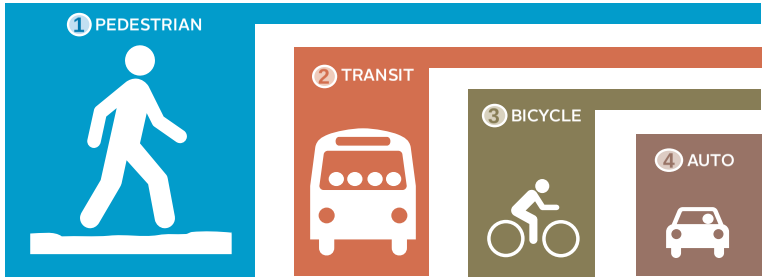
Improve Public Health. Residents of transit-oriented communities walk and bike more than their suburban counterparts, in part because everything is accessible. Recent research shows that people who walk and bike are frequently healthier than those who live in auto-dependent neighborhoods.

Support Diversity. Walkable, transit-oriented communities can support existing communities and businesses by reducing sprawl and keeping cultural assets accessible within a compact area.

Increase Safety. Over the past two decades, the U.S. has averaged approximately 2.5 million people injured on its roadways every year and motor vehicle crashes are the leading cause of teen deaths. Designing streets for pedestrians first makes our communities safer for people of all ages and abilities.

Enhance Local Business Districts. Compact communities with more businesses and residents create vibrant neighborhoods. Business districts thrive as more retail space is available and the people who live nearby evolve into a dependable customer base; residents have a reduced need to leave their communities in order to shop, eat, or play. HCDA will integrate existing light industrial and service businesses into the district.

Reduce Carbon Footprint. Per capita greenhouse gas emissions decrease when people are less dependent on cars. Households within transit-oriented communities also consume less energy per capita than households in auto-dependent communities.



Preserve Regional Open Space and Natural Resource Lands. Compact urban neighborhoods allow farms, forests, and coastline to be spared the intense pressure of development and be preserved for future generations. Reduced sprawl improves the health of the entire region.

Today, there are an increasing number of Honolulu residents who agree with Lewis Mumford's famous statement about cities: "forget the damned motor car and build the cities for lovers and friends." However, if the City and the region continue to accommodate the automobile as they do today, our streets will move fewer people over time, as buses are further slowed to a crawl by congestion and walking and bicycling become less attractive. The result would be a continued downward spiral with a degraded quality of life for everyone and a more vulnerable local economy with fewer economic opportunities.

ity of pedestrian and bicycle access to transit is largely dependent on factors controlled in the public street right-of-way. This plan recommends a policy hierarchy to guide transportation and prioritize transit access investments as the KCDD is redeveloped.

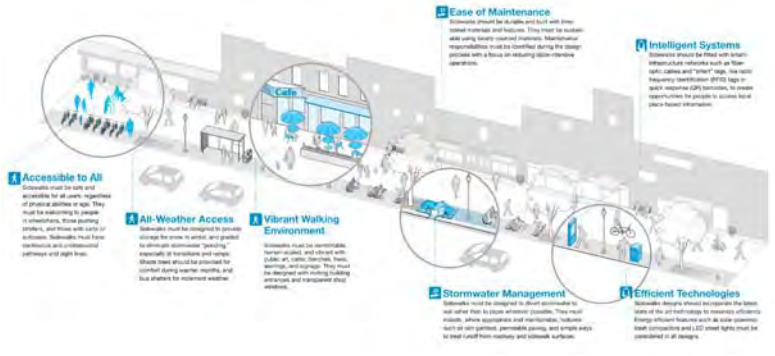
Figure 5-1 illustrates the modal priority that permeates the Kaka`ako TOD Overlay Plan transportation approach and direction on Complete Street design and development. HCDA and City/County investments in Kaka`ako streets should be based on the modal priorities represented in this graphic.

Figure 5-1 Modal Hierarchy

Complete Streets / Safe Streets

Moving forward, HCDA will plan a transportation system that is balanced, safe, efficient and equitable for all users. Of equal importance, the system must support the new development planned for the district and the vital civic life that will emerge with it. To do this, HCDA and its partners must adopt new principles for street design.

> *The safety and convenience of all users of the transportation system including pedestrians, bicyclists, transit users, freight, and motor vehicle drivers shall be accommodated and balanced in all types of transportation and development projects and through all phases of a project so that even the most vulnerable – children, elderly, and persons with disabilities – can travel safely within the public right-of-way.*



Chapter 6 describes in more detail principles, an approach and street types that will deliver on this vision.

Complete Streets Legislation

The State of Hawaii's Complete Streets policy, Act 054, states that, "The department of transportation and the county transportation departments shall adopt a complete streets policy that seeks to reasonably accommodate convenient access and mobility for all users of the public highways—including pedestrians,

Figure 5-2 Pedestrian Elements of a Complete Street

bicyclists, transit users, motorists, and persons of all ages and abilities." This current legislation and the recently approved City and County Bill 26 warrant the design of complete streets in Kaka`ako and will ultimately assist in creating a balanced transportation system as prescribed in the PUC plan so that "streets are engineered to accommodate automobiles along with transit vehicles, bicycles and pedestrians."

Current Transportation Systems and Use

The KCDD is positioned in the heart of urban Honolulu between the Downtown and Ala Moana Center; Waikiki lies just to the east. The district is flat with generally well connected grid of streets. There are three major Ewa-Diamond Head traffic corridors to the makai side of the H1 freeway; the Beretania/King couplet lies on the mauka side of the district, Kapiolani Boulevard runs through the district, and Ala Moana Boulevard, which is a State highway, bisects the district creating the HCDA mauka- and makai-side district designations.

Transportation and access in Kaka`ako is oriented toward automobile travel; however, there is excellent bus transit service operating through and on the outskirts of the district. The Hotel Street Transit Mall, the Alapai Transit Center, and the Punchbowl, King, and Ala Moana transit stops which is served by 13 bus routes, are among the busiest transit boarding locations in Honolulu. Other bus routes operate through the district on Queen Street, South Street, Ala Moana Boulevard, and Ward Avenue.

Walking is more prevalent at the western edge of the district given the proximity to Downtown. Protected bicycle access to the KCDD is limited, with the exception of the multiuse trail that runs on the makai side of Ala Moana Boulevard east of Ala Moana Park Drive.

Viewed through the lens of accessibility, no place in urban Honolulu is better positioned to accommodate dense urban growth while simultaneously enhancing the environmental, cultural, and civic offerings of the City.

Streets in Kaka`ako should not be one-dimensional. Streets should offer multiple user benefits and help to achieve TOD Plan goals.
Image from Nelson\Nygaard

TRANSPORTATION PRINCIPLES

The 10 principles listed below guide the mobility, access, parking, and transit access elements of the KCDD TOD Overlay Plan.

1. Measurement

Transportation is Not an End in Itself. Transportation is a set of investments to help us achieve KCDD community goals, and we should regularly measure how well the transportation system is meeting these goals.

2. Management

Transportation is a Limited Resource. Transportation and parking capacity are valuable assets that must be managed as a limited, renewable resource. We cannot build our way out of congestion. Instead, transportation and parking must be managed like water supplies: by implementing incentives to reduce demand, as well as increase supply, with a focus on the right level of availability at all times.

3. Street Design

Street Design Follows from Place and Function. Streets are designed and managed to support the places and neighborhoods they serve and to balance the needs of everyone who travels along them. While streets serve to accommodate movement, their design should follow first from what kind of place is being created alongside them.

4. Quality

Effective Transportation is More Than "How Far" or "How Fast." KCDD transportation choices are key to creating a high quality of life and a vital business environment, and these choices should be enjoyable for everyone who uses them and should reflect the different needs and desires of Honolulu's diverse population and visitors.

5. Public Space

Streets are Open Space. Streets are a primary component of Honolulu's open space and recreational system. The transportation system supports a vibrant social life. Streets are the largest publicly-owned land use and the biggest component of the City's open space network. In addition to their function as transportation facilities, sidewalks and streets also facilitate socialization and recreation on a neighborhood, community, and regional scale.

6. Energy

Transportation is the Solution to Energy Reduction. Heavily reliant on fossil fuels for its energy supply, Honolulu is looking to reduce its reliance on imported fuels. By focusing new development near transit, investing in TDM and ensuring local services are available within walking distance, KCDD and urban Honolulu can further reduce its impacts on the planet.

7. Public Health

Active Lives Benefit Everyone. Public health experts recognize that the best way for people to get regular exercise is to incorporate physical activity into their daily routines. Increasing the number of people who can safely travel by "active" transportation modes like walking and bicycling can significantly improve public health outcomes for KCDD and Honolulu residents. The health benefits of walking are especially important for seniors and children.

8. Affordability

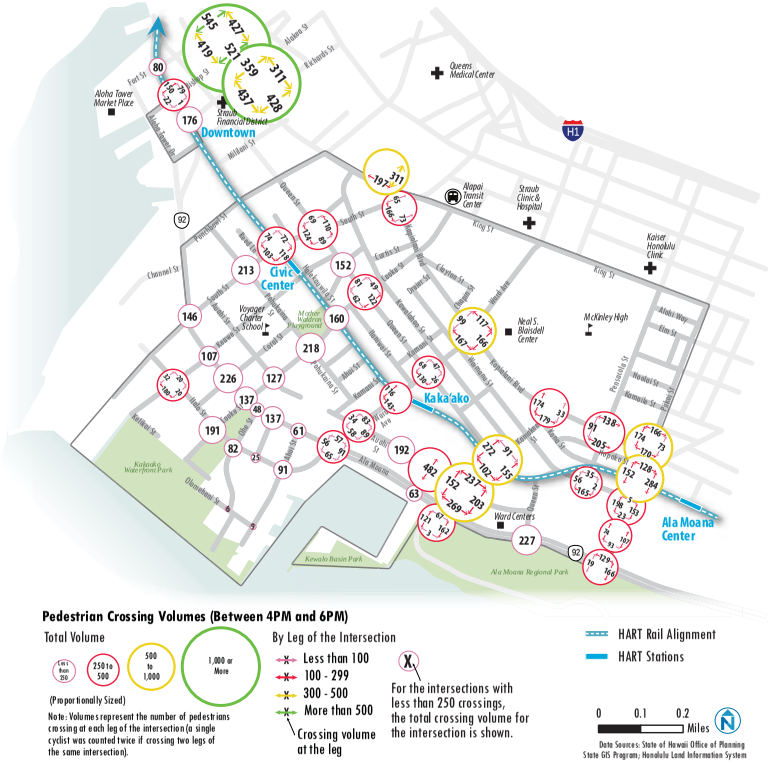
Integration of Housing and Transportation Planning Creates New Opportunities. Reducing household transportation costs can make housing more affordable for everyone—especially by allowing families to eliminate a car by providing attractive alternatives to driving and more housing choices near transit.

9. Economy

Efficient Transportation Supports a Strong Economy. A healthy economy requires an efficient, balanced transportation system that optimizes the movement of people and goods. The transportation system must support KCDD's burgeoning entertainment scene while supporting the base of existing industrial businesses and commercial districts. A key transportation outcome is to place KCDD residents and employees within walking distance of their daily needs.

10. Safety

Safe Movement for Everyone, Everywhere, is Fundamental. The transportation system must be safe for all users at all times of day, regardless of age or ability, so that both *kupuna* and *keiki* feel safe crossing any street. The network also must accommodate the City's emergency response system.



Mobility and Access in Kaka`ako Today

Pedestrian

Pedestrian traffic is low in much of the district, particularly compared to Downtown or Waikiki; many more people travel on foot on the western edge of the district adjacent to downtown and the government office areas. The highest level of pedestrian activity occurs near major transit stops (i.e., on Ward and Kapiloani) and in areas where there are higher concentrations of retail and services.

Figure 5-3 illustrates the level of pedestrian activity at more than 40 major intersections around the district during the afternoon peak period.

Figure 5-3 Pedestrian Volumes in the KCDD (2013 PM Peak Hours)

Transit

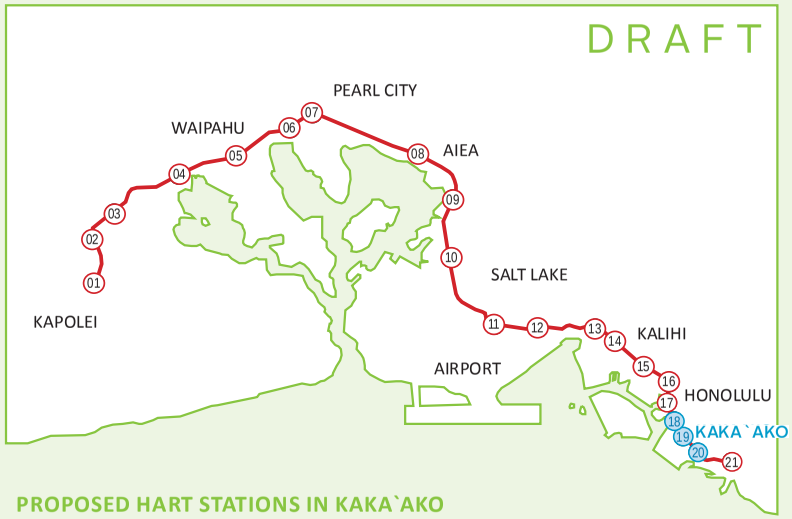


Figure 5-4 illustrates the current bus transit network operating in the KCDD as well as the proposed HART alignment and stations. Actual average daily levels of passenger boarding by stop are indicated by the scaled circles; HART ridership is average daily for the projected year of opening. The map indicates that while Ala Moana Boulevard is an important transit street, the majority of bus transit boardings occur along the northern edge of the district, particularly along King and Kapiolani. The largest boarding locations are at Punchbowl and King and at the Alapai Transit Center.

EXISTING PUBLIC TRANSPORTATION

Kaka`ako and the Greater Honolulu Area is interconnected with one of America's best transit systems. Ridership for The Bus has grown from 30 million passengers per year to approximately 71 million. It ranks in the top twenty for the most utilized transit systems in the nation.

Figure 5-4 Transit Service and Average Daily Boardings in the KCDD (2013)

PROPOSED HART STATIONS IN KAKA`AKO

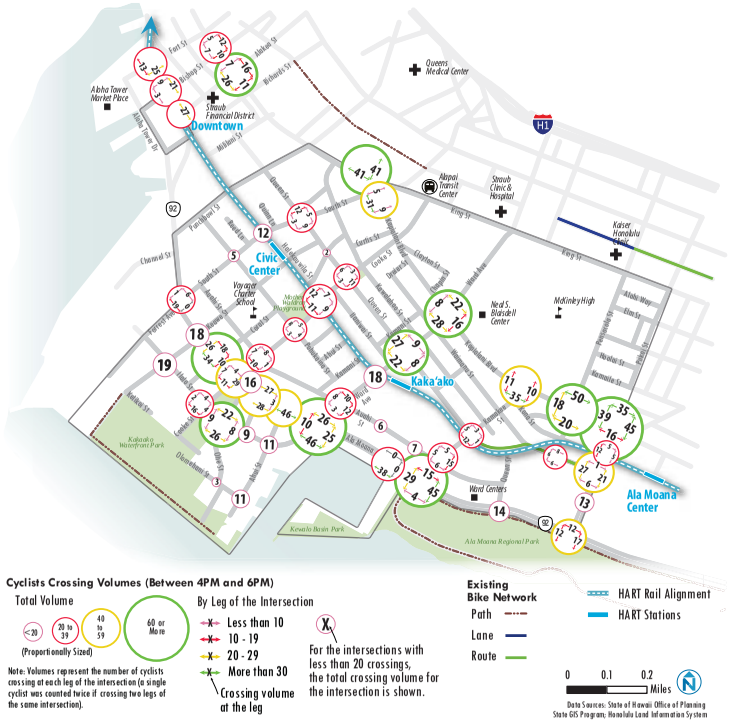
The Honolulu Authority for Rapid Transportation (HART) is in the process of constructing a fixed guideway rail system that stretches from East Kapolei to Ala Moana Center. The three transit stations adjacent to the end of the line (Ala Moana Center station) lie within HCDA development jurisdiction and influence the development of this TOD Overlay.

#18 Downtown Station *(at the Aloha Tower Special District).* This planned HART station is located next to the Aloha Tower Special District including the Hawaiian Electric Company's downtown power station. The station will function as a connection between Aloha Tower and the Central Business District. A pedestrian overpass is part of the design for the station, which will play a significant role in safely moving people over Nimitz Highway.

#19 Civic Center Station. Located on Halekauwila Street between South and Keawe Streets, this station is adjacent to land that is part of Kamehameha School's Kalaulu O Kaka`ako Master Plan. A block away form the station is the historic Mother Waldron Park, which will be the beginning of Kamehameha School's planned park-to-park connection down to the Kaka`ako Waterfront Park and the Pacific Ocean.

#20 Kaka`ako Station. This station is planned to be located on property that is part of the Ward Neighborhood Master Plan. The site is positioned on the corner of Ward Avenue and Queen Street and will operate as the closest stop to Kewalo Basin Harbor, the Ewa side of Ala Moana Beach Park, the Diamond Head side of Kaka`ako waterfront and the Blaisdell Arena, Exhibition and Concert Halls.

Bicycle



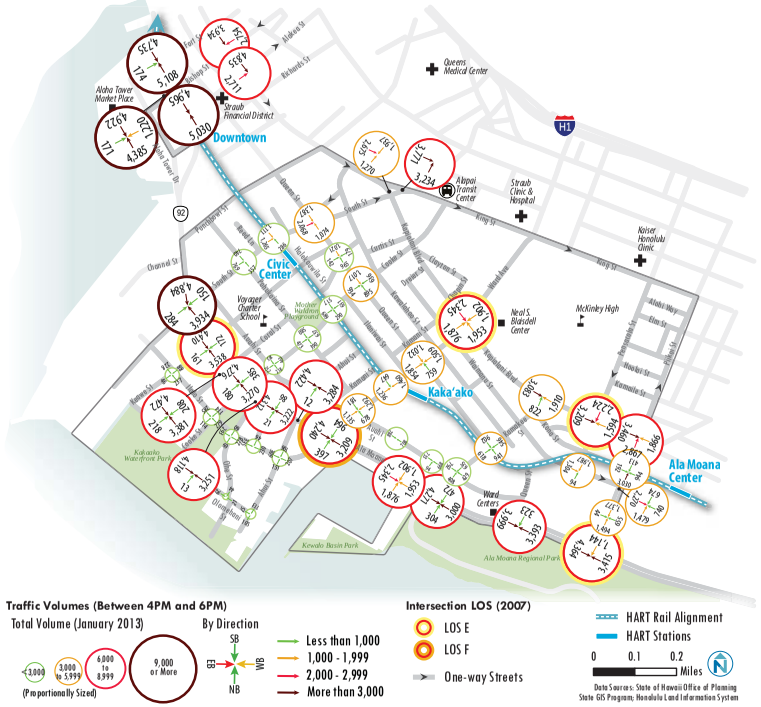
Relative to other U.S. and Canadian cities with well developed bicycle infrastructure, the rate of bicycle travel in the KCDD is relatively low. For example, a single intersection on a bicycle route on the fringe of San Francisco, Seattle, or Vancouver, B.C. downtowns might accommodate 600 to 1000 bicycles in a two hour peak period. Comparatively, the highest volume intersections in the KCDD have just over 100 bicycles entering the intersection between 4 and 6 PM. Bicycle volumes entering major intersections around the district during this time period are illustrated in Figure 5-5.

The highest volume of bicycle traffic occurs at:

- Intersections along Ward Avenue, particularly at Kapiolani, Queen, and Ala Moana
- Intersections along Ala Moana, including Kamakee, Ward and Coral. These are points where cyclists using the trail makai of Ala Moana might chose to cross
- Intersection of Kapiolani and Pensicola and Piikoi

The counts from which this data was derived did not track cyclists' use of the trail through Ala Moana Park, which is a popular cycling route.

Figure 5-5 Bicycle Volumes in the KCDD (2013 PM Peak Hours)

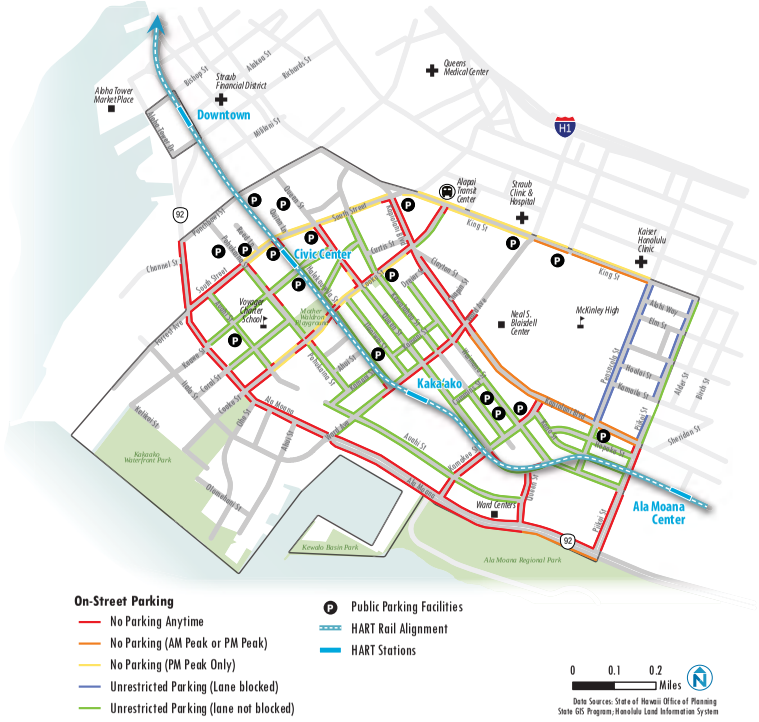


Motor Vehicle

Traffic volumes at over 40 intersections in the KCDD were counted during an average weekday in late January 2013. Figure 5-6 below shows the volume of vehicles entering each intersection during a two-hour period during the afternoon travel peak. The heaviest volumes of traffic occur on Ala Moana and along Kapiolani Boulevards. The map shows intersections where traffic delay is greatest, indicated by vehicle level of service (LOS) of E or F. These ratings indicated significant delay during the peak hours.

Truck traffic was also tracked during these counts showing that Ala Moana is by far the busiest route for large trucks moving through the district. However, even there truck traffic constitutes a low percentage of total vehicular traffic. Truck volumes account for only 2.9% of AM peak and 1.0% of PM peak period motor vehicle volumes on Ala Moana.

Figure 5-6 Traffic Volumes in the KCDD (2013)



Parking

On street parking regulations vary from street to street in Kaka'ko. In some places curb parking is free and unregulated, in others there are time regulations, such as one hour time limits. There are also meters requiring parkers to pay during daytime hours. Several larger through-streets in the district prohibit curb parking entirely, or restrict it to off-peak periods. Figure 5-7 illustrates different curb parking treatments around the district. Unregulated on-street parking often fills to capacity early on typical weekdays by workers arriving to jobs in the district or parking for free in the district and walking to jobs in adjacent areas. There are 17 off-street public parking facilities including a large cluster of garages around the Civic Center area in the north-west side of the district. Under existing regulations, all private development must also provide a specified amount of off-street accessory parking.

Chapter 8 discusses parking management strategies for the KCDD.

Figure 5-7 Parking in the KCDD

Mobility and Access Strategies

As in other urban districts around the nation, Kaka`ako's streets have always served multiple functions. Earlier in the twentieth century, they were the primary component of transportation infrastructure, allowing people and goods arriving by boat to reach local destinations throughout the city. This led to vibrant, busy streets serving pedestrians, bicycles, streetcar transit, autos, and a number of other modes. As vehicle ownership and use increased dramatically in the second half of the twentieth century, the city had to accommodate the trend within the space for streets that had already been established.

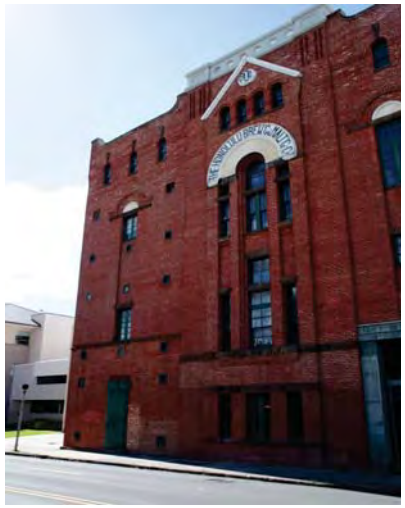
Over time, street design focused primarily on motor vehicle movement, and the emerging disciple of traffic engineering worked to safely integrate cars and trucks into pre–existing urban forms. While there were clear benefits to accommodating the automobile movement through the city, the negative effects have become increasingly evident over the last half century. The focus on automobiles has resulted in different forms of land development, namely emphasizing vehicle access (and not person access) to buildings and property, and has come at the expense of other uses of the street and other transportation choices.

KCDD TOD Overlay Plan builds on the Mauka Area Plan policy framework and proposes a comprehensive approach to the creation of a multi-modal transportation system that allows the Kaka`ako community to choose a different direction for its future and recreate a system of streets that balance mobility needs with the community-serving functions that streets have traditionally provided.

The TOD Overlay Plan treats the entire KCDD in a holistic manner as an integrated transportation management sphere with requirements for trip reduction, transit enhancements, pedestrian and bike improvements, shared parking and enhanced transit. Implemented simultaneously, these elements will result in walkable and bikeable streets, vibrant retail districts and enjoyable access for residents and visitors. In this approach, the KCDD streets are envisioned as verdant recreational corridors that contribute not only to mobility and accessibility, but to the District and City's overall public health.

The following sections identify strategies that will not only operationalize more efficient use of Kaka`ako's streets, but also ensure the district's streets establish a vibrant residential and commercial urban center while achieving broader community goals. Strategies are organized into two components—connectivity and the modal hierarchy established in Figure 5-1, and are supported by implementation-focused actions and regulatory changes.

Many of the strategies presented in the TOD Overlay Plan related to mobility and access are not the direct responsibility of HCDA and may require inter-agency coordination or partnerships to ensure implementation. In these cases, strategies appear as considerations and guidelines, rather than firm requirements.



DRAFT

Kaka`ako's street grid creates long block faces and skewed intersections. Future connectivity improvements will improve safety at intersections and reduce travel time for all modes.
Image from HCDA

CONNECTIVITY

A well-connected street network provides shorter travel distances and makes it possible for people to walk or cycle to transit services quickly and conveniently from the places they live, work, shop, and play, while also supporting walking and cycling as everyday transportation options on their own. When deciding whether to use transit, one of the most important factors people consider is the distance between their origin and a transit passenger facility (stop, exchange, or station) and again to their destination. What matters for the traveler is not the straight-line or 'as the crow flies' distance but, rather, the actual walking distance using the available streets and paths.

The Honolulu Brewery building on Queen Street is one of the few historic buildings surviving in Kaka`ako from the City's streetcar days.
Image from Nelson\Nygaard

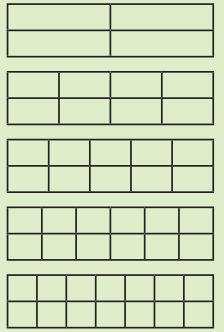
In an area with long blocks and dead-end streets, the walking distance can be much further than the straight-line distance. Some destinations that are physically very close to a transit stop or station may still require a long walk. In contrast, a network that offers many closely-spaced streets with good connections between them shortens the walk to transit by providing more direct routes. While cyclists are not as sensitive to distance as pedestrians because they move more quickly, they are more sensitive than vehicle drivers, and so a well-connected street network also promotes cycling. In combination with a vibrant mix of land uses, a well-connected street network helps to create communities where many of the needs of daily life can be met within walking or cycling distance.

Given its flat terrain and historic platting, Kaka`ako has a relatively intact grid of streets compared with much of urban Honolulu. Mauka to makai block distances in particular are relatively short, enhancing the ease of navigation and walkability of the district. However, there are a number of large parcels and blocks that could benefit from a finer grained street network, or set of pedestrian connections.

Figure 5-8 illustrates intersection density in various parts of the KCDD.

Image from Nelson\Nygaard

INTERSECTION DENSITY – PREDICTOR OF WALKABILITY

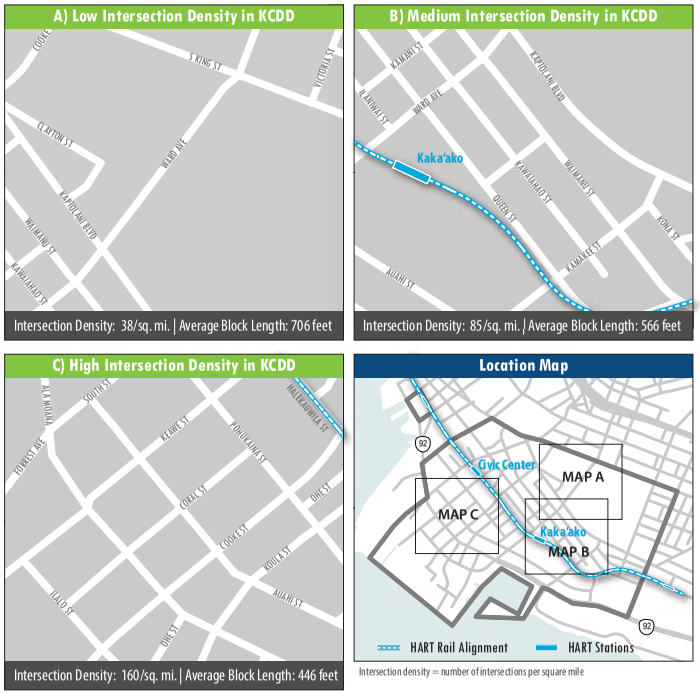


A recent meta-analysis researched and written by Professors Reid Ewing of the University of Utah and Robert Cervero of the University of California at Berkeley evaluated a number of factors thought to be predictive of people's choice to walk and bicycle in an urban setting. The results surprised many experts, pointing to Destination Accessibility as the top predictive factor. Destination Accessibility is the directness with which pedestrians and cyclists can reach destinations within a district or neighborhood.

As Ewing and Cervero put it: **'Almost any development in a central location is likely to generate less automobile travel than the best-designed, compact, mixed-use development in a remote location.'**

One of the best ways to measure this is by evaluating the number of intersections per square mile in an area or the granularity of the pedestrian infrastructure. Intersections are counted as a place where streets or pedestrian accessible paths, lanes, or alleys intersect. Intersection density is one of the measures used by LEED Neighborhood Design to rate neighborhoods and large developments. LEED ND assigns a top score to neighborhoods with 600 intersections per square mile. By comparison parts of Manhattan or Portland, OR have intersection densities over 1000 per square mile and suburban locations often have intersection densities in the range of 100 – 150 per square mile.

Since most people cannot visualize what 200 or 400 intersections per square mile looks like, the following relate these intersection densities in terms of block size:



- 140 intersections per square mile = 400' x 750' average block size
- 200 intersections per square mile = 400' x 350' average block size
- 300 intersections per square mile = 300' x 310' average block size
- 350 intersections per square mile = 300' x 265' average block size
- 400 intersections per square mile = 300' x 230' average block size

Source: Travel and the Built Environment: A Meta-Analysis. Reid Ewing and Robert Cervero. Journal of the American Planning Association, Volume 76, Issue 3, 2010.

Figure 5-8 Intersection Density in KCDD

Note: The following analysis only calculates intersection density for full street connections, not pedestrian and service alleys.

Redevelopment of large parcels within the district will improve network connectivity. Figure 5-9 provides guidance for the HCDA when working with developers to subdivide large redevelopment parcels. This network connectivity concept builds on existing Kamehameha Schools and Ward Neighborhood master plans and suggests modifications and additional connections for autos, service vehicles, and pedestrians. Service streets refer to narrow street connections that provide access to off-street parking, delivery and loading needs, and limited amounts of on-street parking storage.

Figure 5-9 Current KCDD Street Grid and Potential Future Connections

MORE STREET CONNECTIONS PROMOTE WALKING, CYCLING, AND TRANSIT

Many researchers have found that higher levels of intersection density (i.e., more intersections) result in lower levels of overall travel by automobile and higher likelihoods of travel by sustainable modes. Schlossberg et al. (2006) used a student travel mode to school survey to show that higher intersection densities increased students' likelihood of walking by up to five times. Research from Ozbil et al. (2009) highlights the importance of street connectivity for transit users, specifically at the one-quarter mile distance from transit facilities, in increasing the likelihood of transit use.

Ozbil et al. (2009). "The Effects of Street Configuration on Transit Ridership." Proceedings of the 7th International Space Syntax Symposium. www.sss7.org/Proceedings/.../084_Ozbil_Peponis_Bafna.pdf

Schlossberg et al. (2006). "School Trips: Effects of Urban Form and Distance in Travel Mode." Journal of American Planning Association, 72(3), 337-346. www.pages.uoregon.edu/schlossb/articles/schlossberg_school_trips.pdf

The following specific strategies and actions should be implemented to improve street connectivity and the quality of the KCDD street grid.

Strategy MA1 Provide fine-grained street networks

Action MA1.1 Design block patterns to create a connected grid of streets that minimizes travel distances between points

Section 15-217-58-C (Thoroughfare Network) of the Mauka Area Rules regulates the subdivision of large lots to create a permeable network of streets and pedestrian ways. It provides direction on connections that will help to create a fine-grained mobility network in the KCDD.

Action MA1.2 Ensure that large developments provide internal streets and/or pedestrian connections that support the TOD Overlay Plan circulation network and which are permeable for public use by pedestrians, cyclists, and emergency vehicles

Increasing pedestrian connectivity is key opportunity as large industrial and commercial blocks are redeveloped with more urban uses. Section 15-217-58-C (Thoroughfare network) of the Mauka Area Rules regulates the division of large parcels. While the rules are sound they must be strengthened by requiring pedestrian oriented block sizes, encourage connectivity, and encourage mid-block service alleys.

The rules will require new street or pedestrian connections at minimum every 300 feet and by requiring that any new avenue or district street connect to the street grid on both ends (or be designed to provide that connection with further development phases) unless there is a compelling reason not to make the connection.

Both pedestrian streets shown above also provide mid-block access to parking facilities and are carefully designed to minimize the effect of auto access. This treatment eliminated curb cuts on the main street and allows enhanced pedestrian connectivity on these longer development blocks.
Images from Nelson\Nygaard

A pedestrian street in Boulder carries one-way traffic, includes a cycle track, and broad sidewalks. Brick treatment enhances the pedestrian zone.
Images from Nelson\Nygaard

HCDA may require through-block pedestrian connections when a substantial portion of a block is developed with commercial projects or when the ground floor uses are largely commercial. In cases where adequate lot size exists to develop two commercial projects on a block, a through block pedestrian connection should be required. Connections should be required at mid-block and have a minimum clear dimension of 20 feet both horizontally and vertically.

Figure 5-8 provides examples of intersection density in parts of the KCDD. Overall, the district currently has an average intersection density of 134 intersections per square mile (vehicular intersections only).

Requiring Kamehameha Schools, Ward, and major parcel subdivisions to achieve a minimum intersection density of 300 per square mile will ensure that a fine grained street network is developed. Intersection density measures should include well-designed pedestrian ways, shared streets, and service alleys that are adequately designed to provide pedestrian passage through a development.

Action MA1.3 Design surface lots in the interim for efficient and comfortable pedestrian movement

Because redevelopment takes time to occur, existing surface parking lots should be designed to include dedicated provisions for safe and direct pedestrian circulation, including adequate lighting, shade trees, internal walkways, crossing facilities (including raised crossings), and pedestrian priority paving treatments. Where larger areas of surface parking exist, introduce a street and block pattern within parking lots to enhance pedestrian access and enable the introduction of streetscape treatments.

Strategy MA2 Plan for coordinated, multimodal transportation networks

Action MA2.1 Classify streets by their level of priority for vehicle, transit, and goods movement, and also for bicycle and pedestrian travel, and apply street design and performance standards to match these levels of priority

The remainder of this chapter describes the priority street network and linkages for each major mobility mode. These priorities are not street classifications in themselves, but a method to consider how network needs for each mode within the proposed street grid and how those interact with other

CLASSIFYING MULTIMODAL STREETS

Under the conventional approach, or functional classification, streets are defined by the degree to which they emphasize through-movement versus local access. Arterial streets are designed primarily for through-movement, local streets are used primarily for local access to property, and collectors are used to connect them.

In cities that take a more multimodal, 'complete streets' approach, streets have a bigger role than just moving traffic. In addition to providing for the movement of all road users – including pedestrians, bicycles, transit vehicles, and goods – such streets provide access to adjacent land uses, accommodate utilities, and serve as a vital part of the neighborhood by offering open space for socializing and recreation.

There are four key elements of street design that are useful to understand and consider when classifying streets:

- Land use context
- Priority for the movement of each mode
- Relationship to other streets in the network
- Available right-of-way

In places where the functional classification system still dominates, a simple way to transition toward a more multi-modal classification system is to identify how street types fit in with land uses. This approach can help to break down rigid street types such as arterials into the types of urban environments they are likely to pass through, and consideration can be given to customized treatment of the roads (e.g., through special overlay designations) within those particular contexts.

More detail about street design and performance is provided in Chapter 6 – Complete Streets.

modal priorities and adjacent land uses. Chapter 6 – Complete Streets – considers these priorities in assigning KCDD street classifications and providing design guidance.

Strategy MA3 Manage delivery and parking access to reduce conflicts with pedestrians and optimize the efficiency of the street network

The existing Mauka Area Rules provide a good regulatory structure for reducing the impact of parking access, loading, and other service uses on the quality of the pedestrian environment and the functionality of district streets. The following proposed actions support and enhance the existing rules.

The shared street that evolved through the development of an older warehouse district in NW Portland became a favorite of locals, so much so, that the street character was replicated for new development fronting the street. These photos show a historic area in the neighborhood and more recent development.
Images from Nelson\Nygaard

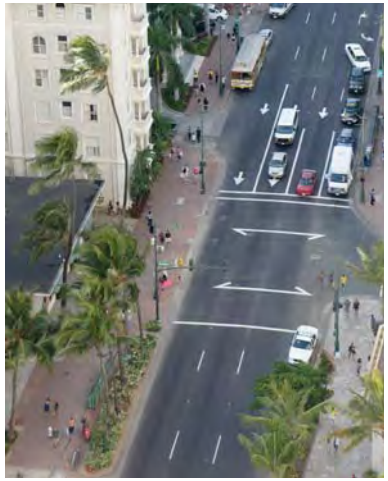
Action MA3.1 Designate parking access and loading streets and require developers to provide ingress and egress from minor local streets

Section 15-217-63-B (Parking Access) of the Mauka rules requires parking access be located in the following priority order if feasible:

- From an alley
- From a designated parking access street
- From any available alternative parking access street

The rules provide developers an opportunity to submit an alternative access plan. As part of the alternative access plan allowed in the rules, cross-over easements should be allowed to expanded access to parking. These rules should be applied throughout the district and alley or parking access street entry/egress should be required on development sites large enough to require new alley/service streets.

Section 15-217-63-L (Loading Access) restricts loading zones on thoroughfares and promenade streets. This Plan recommends that these restrictions be updated to include boulevards and avenues (as defined in Chapter 6), particularly those designated for bicycle or high frequency transit uses.



See Chapter 6 for proposed locations and design guidelines for parking access and service streets.

Action MA3.2 Encourage design that minimizes curb-cuts on all streets, particularly for high volume uses such as parking garages

HCDA can limit the number of curb cuts that provide driveway access on Commercial Boulevards, Commercial Avenues, and District Streets (conceptual street types; see Chapter 6). This will ensure access to off-street parking lots and structures is focused on lower speed Local Streets, whose main function is to provide access to parking. This strategy will reduce conflicts with pedestrians and cyclists and strategically and efficiently focus search-for-parking traffic. On top of the safety benefits of managing driveway access, this strategy will have ancillary capacity benefits for Commercial Boulevards and Avenues as well as District Streets by reducing delay from vehicles slowing to enter or exit a driveway.

- Establish maximum curb cut widths for driveways and parking facility entrances to minimize the impacts to the pedestrian realm and to create more consistent walking paths.
- Orient parking garage access points toward side streets or alleys to reduce the potential for conflict between cars and pedestrians on busy streets.
- Restrict the frequency of curb cuts by establishing maximum driveway density standards.

Section 15-217-63-C (Curb Cuts) of the existing Mauka Area Rules requires developers to minimize curb cuts to the minimum practical extent. Prohibitions on curb cuts for drive through facilities such as banks and gas stations should be set for all boulevards and avenues. No driveways used to approach or queue for such facilities will be allowed.

On Kalakaua Avenue in Waikiki, limited curb cuts and wide sidewalks help create a world-class pedestrian environment.
Image from Nelson\Nygaard

Strategy MA4 Make walking and cycling access to frequent transit as direct as possible

The distances people are willing to walk to transit vary depending on length and purpose of the trip and quality of the pedestrian environment, as well as on weather, topography, and demographics. Generally, people will walk further to access limited-stop transit services than local service and further still for rapid transit services. Paths of travel to and from transit passenger facilities must be as direct as possible, both to minimize the distance people are required to walk to transit and to maximize the number of people who have convenient access to it.

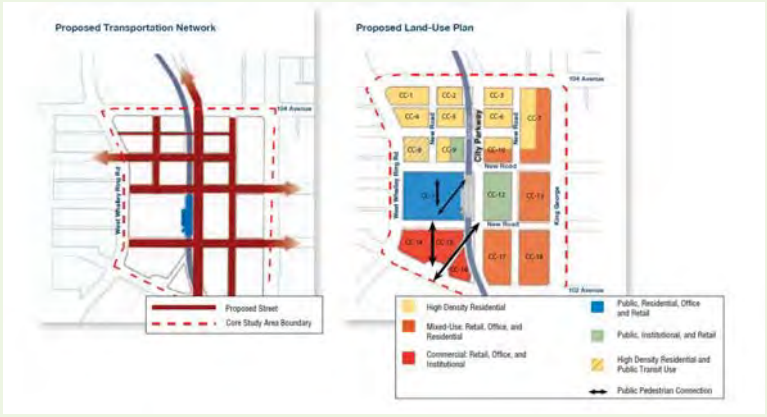
The network walk distance map on page 5-8 illustrates the network walk times for pedestrians using sidewalks to access stations in the KCDD and adjacent neighborhoods.

More detail policies and actions are included in Chapter 7 HART Stations and Access.

Strategy MA5 Implement a coordinated multimodal wayfinding program

Wayfinding strategies seek to efficiently coordinate movement within the district, pointing users of all modes of travel to the best access routes for their destination. Wayfinding can direct visitors, shoppers and residents to parking facilities, retail establishments, pedestrian and bicycle access routes, and other important destinations. Wayfinding represents an important part of a comprehensive circulation and parking management strategy, improving the customer-friendliness and expanding connectivity by improving network legibility.

> Kaka`ako can be a more competitive and attractive locale if spatial information depicted in wayfinding systems can accurately represent the image of the district to residents, workers, and visitors.



HCDA will establish a coordinated multimodal wayfinding program for the district using a single brand for all modal wayfinding signs. This program will help to orient visitors, highlighting key destinations

PROVIDING FINE-GRAINED CONNECTIONS IN SURREY CITY CENTER, VANCOUVER BC METRO AREA

Surrey City Center is a major urban development area in the Vancouver British Columbia metro area and is expected to attract significant amounts of new development over the coming decades. The City of Surrey has been redeveloping their City Center as a more pedestrian- and transit-oriented urban community that acts as a hub of activity south of the Fraser River. A key aspect of the planning framework is breaking down the current 'superblock' street pattern into a more fine-grained grid and reducing the average block size in the area from 1300 feet to a more pedestrian-oriented 300 – 500 feet. This change will be accomplished by adding three new east-west streets and two new north-south streets, providing significant enhancements to pedestrian, cyclist, and vehicle circulation while also creating efficient and practical development parcels.

New streets will be designed to have downtown-scaled sidewalks to support pedestrian movement. New signalized crosswalks will be added at existing and proposed intersections, and a minimum of one additional crossing of King George Boulevard will be added to improve access to retail services located on the east side of the main arterial. Bicycle access will be provided through the City Centre by way of a greenway, which will connect to the existing bicycle network, rapid transit stations, and local destinations.

The City Centre Plan focuses growth and development around the Surrey Central SkyTrain Station and civic plaza to optimize door-to-door travel times and provide a focal point for transportation and community activity. The orientation of a City Hall and public library toward transit – in combination with the integration of signage, public art, and distinctive public realm design in the plaza – will contribute to reducing perceived distance to transit.

and paths of travel for all modes of transportation. A key to success will be consistent signage and symbology across modes and throughout the district. A wayfinding program can be tailored to specific groups depending on contextual factors and desired outcomes; however, these tools are most relevant and important for those unfamiliar with the area. Wayfinding informs people of the best way to reach key destinations and transportation nodes/facilities, depending on their mode of travel, using factors like time, comfort, destination access, and even pedestrian cut-throughs.

A well-designed wayfinding sign in Portland, OR.
Image from Nelson\Nygaard

Action MA5.1 Establish a wayfinding program and study needs

The district will establish a formal wayfinding program, with staff time dedicated to the effort. It should begin by undertaking a detailed study of current wayfinding needs in the district and outlining a comprehensive program to meet these needs, addressing all modes of transportation. The needs assessment and overall strategy must be updated on a regular basis as development occurs.

Action MA5.2 Implement a wayfinding strategy

Once needs are understood, the district can implement a comprehensive wayfinding strategy that addresses all modes of transportation. This strategy may include both static elements, including signs and maps, and, where needed dynamic elements, such as real-time transit arrival and/or parking availability information. In addition to providing information signage should be designed to support a sense of place in the district, including design elements that are culturally relevant to Kaka`ako. The strategy must also take care to provide relevant information to people of all abilities, including those with mobility and visual impairments.

- **Bicycle and Pedestrian wayfinding: Maps, directional signs, and other elements should be provided highlighting safe bicycle and pedestrian paths of travel to key destinations.** Signs for pedestrians and bicyclists can direct those on foot or on bike to the safest bicycle and pedestrian routes, as well as the location of bicycle parking spaces, showers, changing facilities, and other bicycle and pedestrian amenities.
- **Transit: Sign and maps should be provided, particularly at and around stations and key stops.** Real-time transit arrival information should also be provided at the highest-demand stations and stops.
- **Parking: Parking signs can direct motorists to underutilized off-street facilities, freeing up the most convenient "front-door" curbside spaces, and maximizing the efficiency of a parking system.** Where needed, dynamic parking signage can also display real-time availability data, pointing motorists to facilities with available spaces.

MAKING CITIES LEGIBLE WITH MULTIMODAL, INFORMATION-RICH WAYFINDING

Cities around the world are investing in high quality multimodal wayfinding programs to remain competitive as tourist locations and make their streets more legible for residents and visitors, alike. Transport for London's (TfL) *Legible London* is a map-based multi-user information system to help people navigate the city on foot and by bicycle and to improve walk time to transit and local destinations. It includes continuously updated, scaled, digital base maps and signs, which replace often inconsistent and redundant signs. Research found that people were relying on the tube map, which is out of scale, so it seemed destinations were farther by foot than they actually are. *Legible London* was developed by Transport for London in collaboration with the Central London Partnership, the Greater London Authority Walking Advisory Panel, local borough councils, and the New West End Company – a partnership of businesses in London's West End shopping neighborhood. Legible London includes a continuously updated digital base map, made available for many uses and to developers and others for installing anywhere. The maps and signs are intended to replace inconsistent and redundant signs installed by various entities across London. The program had five primary objectives: (1) increase the number of people walking in the city; (2) build confidence among pedestrians; (3) reduce the amount of clutter in the pedestrian environment; (4) improve the perception of walking in the city; (5) and reduce journey times.

Image from Transport for London

Image from NYC DOT

New York City's new wayfinding system (near implementation) takes *Legible London* a step further by reinforcing the multimodal, and often intermodal, nature of the city and the need to accommodate directional information to different street users. The NYC system offers different directional sign types for different users (including people walking to transit or destinations within the neighborhood as well as people bicycling between destinations and neighborhoods) and layers multimodal and destination-based figures into information rich maps.

RULE CHANGES FOR KAKA`AKO

Create a Fine-Grained Street Network

- **Regulation MA1.1:** Related to internal connections for large developments, require pedestrian connections or service street between buildings where block lengths exceed 300 ft.
- **Regulation MA1.2:** Related to internal connections for large developments, require through-block pedestrian connections when a substantial portion of a block is developed with commercial projects or when the ground floor uses are largely commercial. In cases where adequate lot size exists to develop two commercial projects on a block, a through block pedestrian connection is required. Connections are required at mid-block and have a minimum clear dimension of 20 feet both horizontally and vertically.
- **Regulation MA1.3:** Require master plans and large developments to achieve an intersection density of 300 intersections per square mile or better, including shared streets, pedestrian ways of 20' or greater, and service alleys designed with adequate space for pedestrian movement.

Plan for Coordinated, Multimodal Transportation Networks

- **See Chapter 6**

Manage Delivery and Parking Access to Reduce Conflicts with Pedestrians and Optimize the Efficiency of the Street Network

- **Regulation MA3.1(a):** Apply Section 15-217-63-B (Parking Access) requiring parking access from an alley or service/parking access street to all parts of the KCDD. Require parking access from alley or service/parking access street for all development sites where 300' minimum street spacing requirements apply.
- **Regulation MA3.1(b):** Expand Section 15-217-63-L (Loading Access) of the Mauka Area Rules requiring on loading zones on thoroughfares and promenade streets to include avenues, particularly those designated for bicycle or high frequency transit uses; Include an exception process if the development site is not sufficient in size to allow an internal alley.
- **Regulation MA3.2:** Restrict curb cuts for drive-through on Commercial Boulevards and Avenues where reasonable alternative access is available; For drive-through uses, prohibit curb cuts and driveways used to approach and exit drive-through facilities, stacking areas for waiting vehicles, and the facility itself, such as a drive-up window or gas pump island.

Make Walking and Cycling Access to Frequent Transit as Direct as Possible

- **See Chapter 7**

Implement a Coordinated Multimodal Wayfinding Program

- **Regulation MA5.1:** Ensure wayfinding placement provisions in Figures PZ1-7 and FT1-12.
- **Regulation MA5.2:** Establish an additional general figure after Figure 1.16 in the Mauka Rules that identifies prospective wayfinding sign locations by type of sign.

PEDESTRIAN

Walking

The Role of Walking

From walking the dog, to strolling to the beach, to getting to work or school, to running to the corner store for that last ingredient for a recipe, walking is the foundation of the transportation and civic life in KCDD. Walking is important for many reasons:

- **Walking supports the whole transportation system.** Every trip begins or ends as a pedestrian trip, whether it's getting from the bus stop to the office or from the store to the parking lot. A complete, high-quality pedestrian network is necessary to make all aspects of the transportation system function well. In particular, the success of the transit system is dependent upon high-quality walking routes to and from transit stops and stations.
- **Walking provides active recreation and promotes healthy lifestyles.** Walking is the most common recreation activity among Honolulu residents and visitors. This is especially true for children and seniors. Providing spacious sidewalks and pedestrian promenades lined with landscaping, public art, and interpretive design can encourage recreational walking in Kaka'ako, attracting visitors to the district and promoting active, healthy lifestyles for residents.
- **Walking provides a no-cost transportation choice.** Walking is the lowest cost form of transportation. Combined with a mixed-use pattern of development, better walking conditions accommodative of all ages and abilities can improve opportunities for disadvantaged populations by reducing the share of household income that must be spent on auto ownership and operation.
- **Walking promotes a vibrant economy and supports local retail.** Although less than one-quarter of KCDD's land use will be retail, providing connected, walkable and pleasant streets can catalyze and support lively retail streets. Compact, accessible, and mixed use districts foster employment, economic productivity, and tax revenues.[1] Property values begin to rise as neighborhoods become more pedestrian-friendly and increase access to goods and services.[2] Pedestrian-friendly design also strengthens the retail market. Studies have shown increases in sales tax revenue up to 30% in commercial areas retrofitted into pedestrian-oriented districts.[3]

> "There comes a time when people listen to their hearts and feet, getting back to the fundamentals leading to the basic qualities of health, vitality, security and life. All good towns—towns people are in love with—are based on walkability. Everything else comes second. Everything."
>
> —*Dan Burden*

Despite the importance of walking for the life of the District, Kaka`ako today lacks many of the basic elements of pedestrian infrastructure and amenities necessary to unlock the benefits detailed above. Developing a high-quality pedestrian environment in the KCDD is critical to meeting the goals of a lively, active, and transit-oriented community.

The Pedestrian Network

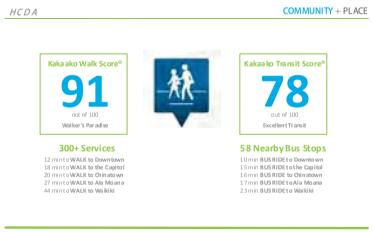
Every street in Kaka`ako must be a pedestrian street, first and foremost. Different types of streets play different roles in the district. Figure 5-10 illustrates where pedestrian design and investment are prioritized as the district develops and the TOD land use alternative is realized.

- **Primary** pedestrian priority streets are those that connect key destinations in or adjacent to the district, including HART rail stations, and that will ultimately support active street front uses such as retail stores,

What is missing from this Kaka`ako scene? People. A great walking district will bring life to the streets.
Image from Nelson\Nygaard

Figure 5-10 Pedestrian Priority Streets in the KCDD

public plazas, and entertainment venues. These streets require spacious sidewalks and a high level of pedestrian amenity.



- **Secondary** pedestrian priority streets are those that do not provide direct connections to major destinations or have very high traffic volumes. While these streets may never be ideal for walking along for long distances, they must still be safe enough to accommodate walking, and they should be easy and safe enough to cross that they do not serve as a barrier to pedestrians.
- **Low speed** streets are generally service streets that may have narrow widths and where pedestrians and traffic may even be asked to mix in a shared right-of-way. Note that the term "low speed streets" should not be interpreted to suggest that high-speeds are promoted anywhere in the KCDD.
- **Greenway** connections are streets where there is opportunity to connect parks, greenspace, and public plazas with well-landscaped, shaded, and interesting walking routes.

The following strategies, in addition to those presented in Chapter 6 – Complete Streets - support the development of the KCDD as a highly walkable urban district.

Strategy MA6 Create a well-connect pedestrian network

Walkability begins with a well-connected street network. Short blocks and more intersections allow pedestrians to reasonably direct paths. Because people walking move much more slowly than people driving or riding bicycles, direct paths of travel are essential for allowing walking to be a viable mode of transportation. Street network connectivity is addressed in detail in the Connectivity section of this chapter.

Strategy MA7 Ensure that walking is safe and comfortable for everyone, everywhere in KCDD

Streets in Kaka`ako should be built and managed to prioritize the safety and comfort of pedestrians. The following actions will be necessary to create such an environment. HCDA will elaborate on these actions when it develops a set of Complete Streets Design standards.

Action MA7.1 Develop standards for safe and comfortable sidewalks and pedestrian crossings

HCDA will establish standards for high-quality pedestrian facilities in Kaka`ako. Important elements to consider will include:

- **Sidewalks and pathways: HCDA will build into its future Complete Streets Design Standards a set of standards for gracious sidewalks that invite pedestrian travel.** Attention to detail is vital in the design of the pedestrian environment: The most comfortable and functional sidewalks have five zones that vary according to the street's land uses and pedestrian volumes: frontage, throughway, furnishing, edge, and extension zones. Each of these zones should be sized appropriately, according to land use context. When considering sidewalk width, standards should be set with attention to both forecasts density and land use context, so that sidewalks to accommodate existing and expected future pedestrian volumes.
- **Street crossings: Most pedestrian collisions occur when pedestrians are crossing a road.** To minimize the risk of collision and encourage walking by people of all ages and abilities, design standards should address signal timing and design; crosswalk placement and visibility; curb ramps; curb radii; sight lines; traffic calming, and illumination. Design standards should ensure that pedestrian crossings are also frequent and well-located relative to pedestrian desire lines, reducing the incentives for pedestrians to cross elsewhere.

Chapter 6 provides additional guidance on the basic principles of pedestrian design along and across the street.

Action MA7.2 Apply Universal Design principles to ensure that Kaka`ako is accessible to people of all ages and abilities

The public realm in Kaka`ako must be accessible to people of all ages and abilities. In designing streets, HCDA must take steps to ensure that all pedestrian facilities are fully accessible to people with limited mobility (including those using mobility devices), as well as people with visual, hearing, and intellectual impairments. Accessibility in public facilities is a requirement of the Americans with Disabilities Act. In addition, with an aging population, providing for people with disabilities will be increasingly important, both to providing for the needs of local residents, and for accommodating visitors to Kaka`ako. In Kaka`ako, providing for Universal Access will require the following steps:

- **Encode the principles of Universal Design into KCDD streets when HCDA develops**

An urban street alive with pedestrians in Chicago, IL.
Image from Nelson\Nygaard

Pedestrian countdown signals can assist help make crossing safer.
Image from Nelson\Nygaard

Complete Streets Design Standards. Standards should consider issues such as curb ramp design and placement; minimum widths for sidewalk throughway zones; accessible bus stop design; signage placement and design; and time signal time allotted for pedestrian crossings.

- **Inventory the district and prioritize the highest-priority areas for remedial treatment of accessibility problems.** Development of street design standards will ensure accessible sidewalks are provided with future development. However, the district currently has many areas where accessibility is lacking, including missing curb ramps and sidewalks. Focusing on maintaining paths to transit and other important destinations, HCDA should create a prioritized list and funding plan for addressing accessibility issues in the near term.

Accessible curb ramp.
Image from San Francisco Department of Public Works.

Action MA7.3 Develop a district-wide traffic calming plan

Slower vehicle speeds lead to fewer and less severe collisions with pedestrians. Generally, when a vehicle is traveling less than 18 mph, it is very unlikely to cause a fatality in the event of a collision. Slower vehicle speeds also improve the feeling of comfort and safety for pedestrians. When it develops Complete Streets Design Standards, HCDA will develop and implement a traffic calming program to slow vehicles in strategic locations to speeds that are consistent with pedestrian comfort and safety. Elements of the program should:

- Encode into street standards a set of approved traffic calming treatments that are appropriate for each street type in the district, with variations depending on context. Traffic calming strategies can include elements like narrowed travel lanes and tight turning radii at corner; curb bulb-outs to visually narrow the roadway; chicanes; speed tables, and other elements.
- Monitor speeds and prioritize improvements. HCDA and the City must work together to monitor places where vehicle speed consistently exceeds posted speed limits for the street type and/or safe and comfortable speeds for pedestrians. A list of high-priority locations should be maintained, and funding sought to implement needed traffic calming treatments.

Mid-block crossing and "choker" island helps to reduce vehicle speeds (Portland, Oregon).
Image from Nelson\Nygaard

Action MA7.4 Develop criteria to prioritize investment in pedestrian facilities

There are needs for pedestrian facility enhancements throughout the Kaka`ako district. While some new facilities will be provided along with new development, HCDA and the City must set priorities for where investment in improved pedestrian facilities can do the most to create a vital, walkable district.

Key considerations include:

- **High density areas.** Areas with high concentrations of workers, residents, and visitors will have higher volumes of pedestrians. It will be important to ensure that sidewalks, crosswalks, and other facilities have the capacity to support the intended uses. These areas should be prioritized for investment: in many cases, developers may be able to contribute to the cost of needed facilities.
- **Vulnerable residential populations.** Residential areas with large numbers of potentially vulnerable pedestrians, as seniors, people with disabilities, and young children, should be prioritized for pedestrians.
- **High collision streets and intersections.** Streets and intersections with a large number or high severity of vehicle-pedestrian collisions should be prioritized for remediation. Priority pedestrian safety investments will address collision "hot spots" and counteract potentially hazardous street design. Identifying clusters must be based on detailed safety analysis and will require conducting a Pedestrian Safety Action Plan.
- **Routes to transit.** Safe and direct pedestrian paths to transit stations and stops are essential for supporting the transit system as a convenient mode of travel. These routes should be prioritized for investment. Specific recommendations for access to transit stations are provided in Chapter 8.
- **Routes to schools, parks, and community facilities.** Other community facilities serve as important destinations for pedestrians. Many communities have programs for Safe Routes to Schools projects, which have dedicated federal funding. Parks, and important community facilities such as libraries could also be prioritized for investment.

Planters are used to narrow the travel lane and create a tighter corner radius for vehicles (Honolulu, HI).
Image from Nelson\Nygaard

Pedestrian investments should be prioritized in high exposure locations near transit or other community-oriented land uses and experience relatively high incidences of pedestrian collisions.
Image from Nelson\Nygaard

Strategy MA8 Design buildings and public spaces to support a safe and comfortable walking environment in Kaka`ako

Far more than for other modes of transportation, the buildings and public spaces that surround the street are essential to the experience and utility of pedestrian travel. To support walking as a mode of transportation in Kaka`ako, HCDA should make a focused, coordinated effort to ensure that the district's built environment invites walking. Many of these actions below will be carried out through rule changes that are discussed in the Land Use and Urban Design sections of this plan.

Action MA8.1 Facilitate Crime Prevention through Environmental Design (CPTED) principles in the maintenance of landscaping and building design standards

Freedom from the risk of collisions is only one part of the feeling safe as a pedestrian. Also important is personal security. To encourage walking, it is important to reduce both the real and perceived risk of crime in public places.

Good design can help to enhance safety and security through the principles of natural surveillance and territorial reinforcement. This type of design is often referred to as Crime Prevention through Environmental Design (CPTED). Key principles of CPTED include:

- **Natural surveillance.** This is the principle that when there are many "eyes on the street," the public realm naturally becomes safer and feels more secure. Steps to encourage eyes on the street can include orienting building windows toward streets and public spaces; maximizing active uses like retail on the ground floor of street-facing buildings; designing lighting that eliminates blind spots and dead zones; and maximizing visibility between streets, sidewalks, and buildings by encouraging windows on the ground floor of street facing buildings.
- **Territorial reinforcement.** This is the principle that clear boundaries and transitions between public, semi-public, and private spaces can help establish the sense of ownership and indicate what activities are appropriate in which locations. Strategies can include using seating and other amenities to attract people and establish public 'ownership' of public spaces; using trees and landscaping to define the transition between public and private space; using fencing types to define the character of an area; and ensuring basic upkeep of buildings, lighting, landscaping, and other streetscape amenities, demonstrating to users that a space is being maintained.

LED lighting has high up front costs, but provides substantial safety benefits from its illumination levels and can help created 18-hour activity centers
Image from John Bamber

HCDA must seek to encode these principles throughout its design standards, including rules for private development; design standards for public spaces; and maintenance plans for public spaces.

Action MA8.2 Integrate high quality pedestrian design into the interim use of surface parking lots

In the long-term, this plan envisions significant new compact development in Kaka`ako, with few surface parking lots remaining. However, surface parking will remain part of the district's streetscape for a significant period of time.

Any development on a parcel that includes a surface parking lot will be required to make accommodations for pedestrians. Lots should cater to pedestrian desire lines (direct, optimal walking routes), providing dedicated sidewalks, path connections, and crossing facilities where needed. Trees, landscaping, shade, and other design features should be added to help integrate surface parking fully into a pedestrian-oriented streetscape.

An accessible pathway through a parking lot in Sausalito, CA.
Image from Greg Pasquali

Action MA8.3 Minimize curb cuts

Driveways across the sidewalk interrupt pedestrian paths of travel, and should be minimized whenever possible. Where possible, vehicle driveways should not interrupt the sidewalk's grade and should be made of the same material as the sidewalk so it is clear to drivers that they are crossing a pedestrian zone. Entrances designed to require cars to make right angle turns help force traffic to slow down before entering. Where garage exits are present, visual contact and awareness between pedestrians and drivers should be supported through mirrors, pavement treatments, and noise signals. Mauka and Makai Area Plan rules already support limitations on curb cuts.

Strategy MA9 Provide a beautiful and lively pedestrian environment throughout the KCDD

In great cities, pedestrian travel is not just accommodated: it is welcomed, invited, and celebrated. Besides the design of sidewalks and buildings, the HCDA should carefully plan elements to improve the beauty and liveliness of public spaces in the district.

Action MA9.1 Encourage active sidewalks and transparent building facades

Buildings and streetscapes that activate the environment, such as sidewalk cafes and parks, build community and stimulate the desire to walk to reach destinations. Transparent building facades with windows at street level create interest and also open up the pedestrian realm, so people are not forced to walk beside an imposing blank wall.

Action MA9.2 Make alleyways and other public spaces district-wide "programmable"

The District's alleyways and designated Local Streets are a resource that can be used to provide space for community activities while bringing energy and vitality to the public realm. Alleyways should be made available for activities such as farmer's markets, bazaars, food truck sites, street festivals, and other events in order to activate these spaces. When alleys are built anew or altered as part of a development project, they should be designed specifically to accommodate these types of uses.

Children enjoying a public promenade (Burlington, VT)
Image from Nelson\Nygaard

Action MA9.3 Provide street trees, weather protection, and other amenities

Providing a range of amenities such as seating, public art, landscaping, pedestrian-scale lighting, and protection from the elements can help create an inviting and comfortable space where people can stop and linger. Amenities may include:

- **Public Art.** Integrate public art where feasible to enhance people's journeys, to bring a sense of liveliness to public space, and to express the unique character or cultural history of a place.
- **Lighting.** Place pedestrian-scale lighting in areas with high pedestrian volumes, retail and commercial corridors, and elevated transit corridors.
- **Street trees and landscaping.** Use street trees and landscaping to offer shade, improve air quality, alleviate heat island effects, provide natural stormwater management; and create a visual buffer between the roadway and the sidewalk, providing a sense of enclosure and comfort for pedestrians.

- **Other amenities.** In very high-volume pedestrian areas, dedicate public space to amenities such as restrooms, drinking fountains, food vendors, and others as appropriate to the context.

Active use of an urban alleyway in Boston.
Image from Nelson\Nygaard

RULE CHANGES FOR KAKA`AKO

The following additions or modifications to the rules for pedestrian quality will govern new development:

- **Regulation MA6.1:** On commercial or mixed-use corridors, buildings are required to have entry points every 60 feet so that pedestrians have numerous opportunities to interact with semi-public spaces.
- **Regulation MA6.2:** Amend §15-217-63-B to encourage street life and to make sure shared parking is viable, parking garages are required to have pedestrian entrances and exits to the street.
- **Regulation MA7.1:** Per §15-217-63-B-1 and 2, parking garage access points must be oriented toward side streets or alleys (Local Streets) to reduce conflict between cars and pedestrians on busy streets.
- **Regulation MA7.2:** In commercial and mixed-use corridors, buildings are required to have at least 70% transparency for ground level frontages to create visual interest for people walking along commercial or mixed-use corridors per §15-217-55-M-6.
- **Regulation MA7.3:** Per §15-217-55-M-6, buildings are required to locate primary entrances along front façades, and locate loading docks or service entries off of street-facing façades.
- **Regulation MA8.1:** Amend §15-217-63-C to define maximum driveway density. Curb cuts and parking garages portals should be restricted to one every tenth of a mile (rounding down). This means some block will not include driveways. Parking garage entrances must be located at the rear or side of buildings accessible by Local Streets (per Chapter 6).
- **Regulation MA8.2:** §15-217-63-C-2 should be revised so that residential curb cuts may be no more than 10 feet wide per lane (two lane maximum at 20 feet) and 12 feet wide per lane (two lane maximum at 24 feet) for commercial curb cuts. This is intended to minimize the impacts to the pedestrian realm and to create more consistent walking paths.
- **Regulation MA8.3:** Amend §15-217-63-I to state that surface parking lots must be screened along the street with landscaping or architectural elements to reduce their visual impact.
- **Regulation MA9.1:** Amend §15-217-39-D-1-7 to include placements standards for bike parking in Figures PZ.1 though PZ.7
- **Regulation MA9.2:** In §15-217-39-D-1-7, change Figures 1.14 (pedestrian zone treatment) and 1.15 (pedestrian zone fixtures) to include acceptable applications, dimensions of bike share stations in the furniture zone and in the frontage zone where property owners integrate bike share stations into the design of setbacks.
- **Regulation MA9.3:** Amend §15-217-63-I to state that multi-story parking in active retail or commercial areas must be wrapped in active uses such as retail to screen parking from the street and to increase street-level activity.

TRANSIT

Transit Circulation

The Role of Transit

The City and County Honolulu operates one of the most highly used (per capita) public bus systems of any city in the nation. The City/County seeks to improve public transit by increasing reliability, decreasing travel times, and ensuring rider safety and comfort along all legs of the journey, although like many transit providers budget challenges prevent service from reaching optimal levels. HCDA can continue to advance its status as a transit-rich district by working with the Department of Transportation Services (DTS) to ensure streets operate efficiently for transit, that passenger access to transit is excellent, and by advocating for greater investment in regional transit.

The most important improvement in regional transit currently underway is the development of the HART rapid transit line, which will have three stations in the KCDD. These stations will provide a previously unattainable level of connectivity and convenience in travel for those moving between KCDD and many other parts of the Honolulu metro area. A key goal of this plan is to ensure that value of the new HART stations in Kaka`ako will be optimized toward the end of creating the vibrant, culturally rich, and walkable urban neighborhoods desired by the community.

High-quality public transit can lead to greater social integration and mobility choice for members of the community who are unable or prefer not to drive. It can provide increased access to quality employment, educational opportunities, social opportunities and the many natural and cultural resources of the Honolulu area. Using public transit can save money for riders to spend on housing, education, and other essentials. Public transit vehicles produce fewer GHG emissions than auto trips, making it an important contributor to achieving Honolulu's environmental sustainability goals and ensuring that lands remain available for civic and cultural amenities.

The Transit Network

As the City and County of Honolulu continues to enhance public transit, it will be important to coordinate these investments with improvements in street design, establishing clear priority for transit on important routes. Some transit routes are more important than others, and different types of service require different strategies for integration with other modes. Designing streets to be sensitive to the needs of transit will require HCDA to develop clear, site-specific guidance for the different routes throughout KCDD.

Figure 5-11 illustrates streets where it is critical to consider transit operations in the design and allocation of right-of-way. The dark blue, or primary, corridors are those that carry high-frequency bus service and where dedicated rights-of-way or higher levels of investment in intersection priority treatments may be needed.

DRAFT

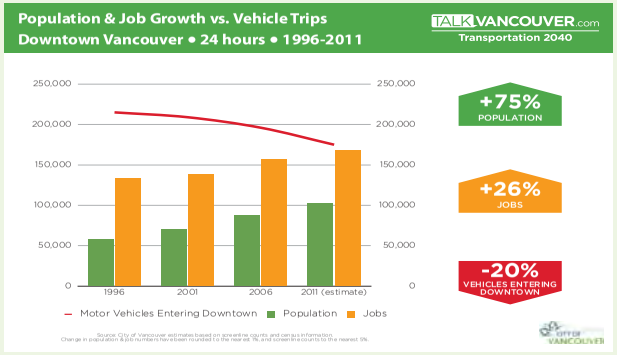
Figure 5-11 Transit Priority Streets

The introduction of rapid transit to the KCDD will significantly change the dynamic for access to the district and mobility between the district and adjacent areas on the line. Figure 5-12 illustrates the approximate walk time to a HART station from different parts of the district. It also shows how new street and pedestrian connections proposed in this plan extend the amount of people and places within a 15 minute walk of a future HART station. This analysis uses a network approach to mapping the shortest possible walk to a station using the grid of streets and pedestrian ways, not simply the "as the crow flies" distance, which does not realistically represent how people move through urban space.

Figure 5-12 HART Rapid Transit Stations and Approximate Network Walk Times

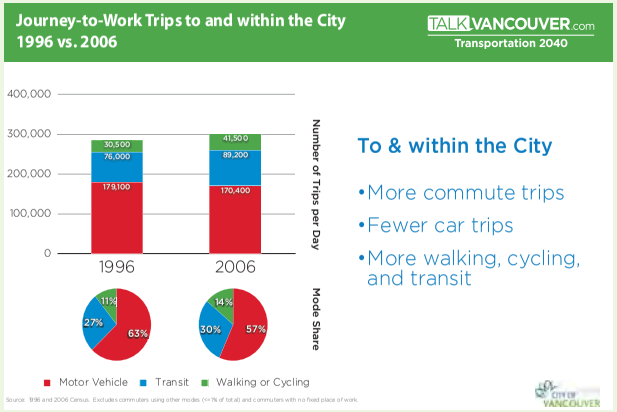
The following strategies are recommended to ensure that transit investments are optimized to meet the KCDD vision.

Strategy MA10 Maximize the value of HART rapid transit by providing high quality access to the line/stations



HCDA will continue to work with HART on station access strategies that maximize ridership and total transit revenue, including parking pricing programs that ensure a few spaces are available to passengers at all times, shared parking, and access programs that deliver more riders at less cost than parking, such as feeder buses and new development.

A number of additional strategies for managing auto traffic demand and increasing transit use are detailed in Chapter 8 – Parking and Transportation Demand Management.



Excellent regional rapid transit and quality urban design have allowed neighborhoods in Downtown Vancouver, B.C. to double their populations and create Thriving business districts while decreasing total auto trips.
Image from Nelson\Nygaard

RAPID TRANSIT KEY TO WALKABLE URBAN DISTRICTS

Between 1996 and 2011 the population of Downtown Vancouver grew 75%; during the same period vehicles entering the downtown dropped by 75% due to increased use of transit as well as walking and biking.
Source: City of Vancouver, B.C.

This graphic from Vancouver's 2040 Transportation Plan shows a demonstrable increase in walking trips created by the development of mixed-use urban neighborhoods where residents can walk to transit and all their daily retail and service needs.
Source: City of Vancouver, B.C.

Action MA10.1 Continue to collaborate with regional transit partners to ensure transit stops, stations and facilities are designed to ensure seamless transitions between transit modes and quality pedestrian-oriented places. This should include incorporation of guidelines for passenger facilities.

The influence of transit facilities does not stop at a station platform or bus stop. Systematically integrating facility design guidelines is a critical exercise for improving the quality of transit access and building transit-oriented neighborhoods. Transit facilities represent the public's interface with transit service in the KCDD; incorporating elements of thoughtful design to improve the transit experience sends the message that transit is a priority. Likewise, transit facilities are loci of intermodal connections, thus facility design plays a critical role in ensuring transfers are seamless and effortless.

Placemaking should be integrated into every design choice to ensure the transit experience is synonymous with navigating through great places. Transit facilities in the KCDD should create a safe, comfortable, inviting, and interesting space at each trip end. Transit facilities and their surrounding environs should be thought of as urban living rooms that fully integrate land use and urban design, encouraging people to stay.

Design guidelines provide the values and strategic vision for multimodal investment in transit environments. As the Honolulu transit network develops and matures, transit facilities must represent the needs of all transit users. Whether it is a transfer to another mode or route, or a last-mile connection on foot or by bicycle, transit facilities must ensure these movements are clear, tactile, secure, and protected from the weather. Chapter 7 provides detailed actions and regulatory changes that support:

- Creating seamless transitions between pedestrian, bicycle, and transit modes
- Providing clear, simple, and universal wayfinding and passenger information
- Creating highly-functional legible places around transit
- Ensuring spatial dynamics around transit stations create comfortable, not crowded, places
- Applying principles of Universal Design to make sure transit is accessible to all
- Focusing on passenger comfort at and around transit stations
- Ensuring transit stations and places are safe and comfortable at all times of day.

Action MA10.2 Fund and implement a Downtown/Kaka`ako/Ala Moana circulator that enhances access to HART stations and key KCDD destinations and those in adjacent districts

While the KCDD has excellent local and regional bus service at its perimeter, parts of the district have limited transit service, such as the makai side of Ala Moana Boulevard. HCDA should pursue the funding of a district circulator route designed to connect major destinations in the KCDD, future HART stations, major bus transit centers (Hotel Street and Punchbowl and King) and adjacent districts such as Ala Moana.

While the HART alignment will create new opportunities for circulation between Kaka`ako neighborhoods, Downtown and Ala Moana, the implementation of rapid transit is likely to increase, not decrease, the need for local transit circulation in the area. HART will bring thousands of additional transit passengers each day to the four stations between Downtown and Ala Moana, including the KCDD stations. Regional passengers arriving at these stations will seek last mile solutions to reach their final destinations, many of which will be more than a comfortable walking distance from the station.

Figure 5-13 shows a proposed route for a KCDD district circulator. The district circulator could expand its relevance if linked with a circulator connection between Ala Moana and Waikiki.

Developing a stable funding source to operate such a shuttle would be a potential challenge given stretched budgets at DTS. Other cities use local improvement districts, business districts, sale of advertising, station sponsorships, parking revenues, private business contributions and fares as funding mechanisms to operate downtown or district circulators. Future on-street parking revenue (see recommendations in Chapter 8) could be explored as a source of operating revenue for a local circulator.

Figure 5-13 Local Circulator Options

Action MA10.3 Develop a longer-term plan for a higher capacity street-level circulator system

Figure 5-13 shows a potential streetcar circulator route that would connect key KCDD destinations and neighborhoods with Downtown, the Civic Center, Ala Moana, and potentially with Waikiki. As stated above, introduction of rapid transit in Kaka`ako and adjoining districts is likely to increase overall demand for bus and surface transit, as more people come to the area without a personal

vehicle. New, compact and mixed-use development will create significant demand for short circulation trips, particularly as local services such as grocery stores come on line to support an increased residential population.

Pending the results of the Waikiki Regional Circulator Study (results not available at time of writing of this draft), HCDA should consider opportunities to extend or connect to the preferred mode and alignment of that study. This might require further study to determine how to accommodate transit on local streets, to integrate operations, and to develop a viable capital and operating plan.

Today there are privately operated trolley bus circulators operating in Downtown, Ala Moana, and Waikiki that carry close to one million passengers annually, even though they run limited hours.[1] These services are largely designed for and almost exclusively used by tourists. Fare options and stops are designed to cater to visitors making leisure tours of urban Honolulu. TheBus routes operating in the central area of Honolulu are more common means of circulation for local residents and workers (as well as more intrepid visitors). However, many local buses are highly crowded, particularly between Waikiki and Downtown where longer regional trips overlap with the need for short-distance circulation.

Several other U.S. cities have added local streetcar circulators in downtown areas to help address need for local circulation trips, reduce demand on regional systems, and improve last mile connections to regional rapid or high capacity transit stations. For example, the Portland Streetcar carries 4 million annual passengers on a route system that previously had no bus transit and that serves two of the city's major master planned neighborhoods – the Pearl District and South Waterfront. As a point of comparison, both districts have allowable floor area ratios within 3 blocks of the alignment that are lower than those allowed by the existing Mauka area rules.

Implementation of a streetcar would require additional study of routing options, capital costs

1 Estimated based on Waikiki Trolley website information regarding historic ridership.

LOS ANGELES DASH DOWNTOWN CIRCULATOR

Los Angeles DOT operates a system of local bus circulators, with five routes operating in the downtown area at 15 minute headways during the day and early evening hours (6 am to 7 pm). The DASH system includes a number of other routes operating in neighborhoods and business districts around the City. In all, the system carries almost 7 million passengers each year. The downtown routes are among the highest ridership routes in the system. The City is currently developing a modern streetcar route that would replace part of the DASH system with a high frequency rail circulator.

The planned Los Angeles Downtown Streetcar would connect South Park, the Fashion District, the Jewelry District, the Historic Downtown, Bunker Hill and the Civic Center as well as making ties to the Red/Purple, Blue, Gold, and Expo regional rail lines.

Figure 5-14 Roadway and Intersection Treatments for Transit Reliability

HCDA and the City and County of Honolulu will work to implement some of the following transit reliability measures on transit streets like Kapiolani Boulevard, Punchbowl Street, South Street, and Queen Street.

ROADWAY TREATMENTS

Transit Signal Priority (TSP)

Definition

At traffic signals, buses communicate with the traffic signal system to provide a green signal indication to an approaching bus. Delay for buses may be reduced at intersections as a result.

Constraints / Applicability

Less effective when signals are operating at capacity (i.e., Ala Moana Blvd.).

Effectiveness

Up to 10% reduction in signal delay.

Queue Jump Lanes

Definition

At signalized intersections, a bus is provided with a lane, adjacent to general-purpose traffic, and an advanced green signal indication to bypass congested areas. Buses "jump" the queue of waiting cars.

Constraints / Applicability

Lane must be as long as the typical queues.

TSP makes these much more effective, particularly if there is no far-side receiving lane.

May increase pedestrian crossing times.

Effectiveness

5-25% reduction in travel times at a signal.

Dedicated Bus Lanes (Business Access and Transit or BAT Lanes)

Definition

A lane is reserved for exclusive use by buses. It may also be used for general-purpose traffic right-turn movements onto cross streets and for access to adjacent properties. This treatment would speed bus travel times.

Constraints / Applicability

Conflicts with right-turn and delivery vehicles.

Often opposition from businesses that may lose on-street parking.

Effectiveness

5-25% reduction in travel times.

Note: The measures of effectiveness are derived from data found in the Transit Capacity Quality of Service Manual, unless a specific local measure is cited.

ROADWAY TREATMENTS (continued)

Limited or Time Prohibited General Public (GP) Turning Movements:

Definition

GP turning movements are restricted at all times or during peak periods. May be implemented with queue jump or dedicated bus curb lanes.

Constraints / Applicability

Impacts on other roadways from diversion of GP traffic/ turning movements.

Effectiveness

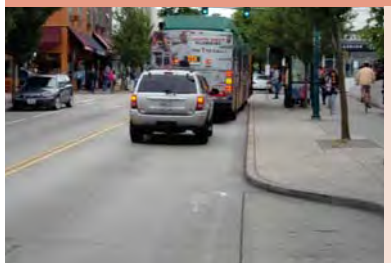
Highly effective means to implement peak period queue jump lanes or transit only lanes.

Innovative Bus-Bike Treatments

Definition

Treatments to provide bicycles with safe routes along high-volume transit corridors, manage bicycle-transit vehicle interactions, and allow bicycles to share transit lanes. Examples include shared lane markings, colored pavement, and bicycle-only signals.

Constraints / Applicability



Highly contextual and must be considered within balance of person travel delay/benefit for specific street or corridor conditions.

Effectiveness

Difficult to measure impacts on transit, but can reduce transit delay on busy bicycle corridors and improve bicycling experience.

STOP TREATMENTS

Curb Extensions/ Bus Bulbs/Boarding Platforms

Definition

Sidewalks are extended into the street so that buses would stop in the lane of traffic. This prevents buses from getting trapped by passing vehicles, unable to return to the flow of traffic. The delays from merging back into lane may be minimized as a result.

Constraints

Only applicable where an on-street parking lane exists. Impacts to traffic flow must be taken into accounted.

Effectiveness

Depends on traffic. 8 seconds per stop is an average assumption.

Note: The measures of effectiveness are derived from data found in the Transit Capacity Quality of Service Manual, unless a specific local measure is cited.

New glass and steel transit shelters and covered bicycle facilities on the Portland Transit Mall provide weather protection while creating an open, inviting and safe pedestrian environment

Image

PLACEMAKING: TURNING TRANSIT STREETS INTO ACTIVE ENVIRONMENTS

Increasing transit mode share to and through the KCDD will require building high-quality transit facilities that integrate seamlessly with the street environment. Along with the transit stop, the streetscapes that characterize transit priority streets are the user interface for transit. Thus, the importance of placemaking cannot be overstated. Urban placemaking for seven major center city nodes or intersections was the foundational element of the redesign of Portland's Downtown Transit Mall. The desire for 24-hour active streets that support retail and activities helped drive decisions to retain a general purpose traffic lane and to reduce bus volumes by routing key services perpendicular to the transit mall and to provide a high-frequency rail circulator. In addition to the transit priority features in place, Portland's Transit Mall incorporates wide sidewalks with distinctive paving, a variety of seating options, well-lit and covered bus and light rail stations, and public art. Similarly, Minneapolis' Nicollet Mall provides wide sidewalks with café seating, pedestrian lighting, park benches, and continuous retail activity.

Denver has taken a unique approach to designing a primary transit street. Sixteenth Street is a transit and pedestrian-only street that elevates the transit experience by turning the street into the destination. This mixed-use pedestrian street bisects the core of Denver's Center City and offers a bevy of street activity, restaurants, and cultural events. The 16th Street Mall FREE MallRide runs every two minutes during peak hours, allowing customers to look up the street and see a vehicle approaching at all times.

In each case, these linear transit corridors offer some level of tactility from increased accessible design and detectable warnings to textured pavement design and installation of brick pavers. As is the case in Minneapolis, Denver, and Portland, the most pedestrian-friendly corridors are synonymous with access to frequent transit service. Below is a list of components that transform transit corridors into great places:

- Active retail frontage
- Expansive sidewalks (in the range of 15 to 30 feet)
- Continuous and themed lighting schemes
- Pedestrian buffers such as trees and landscaping
- Space for café seating
- Coordinated public art program
- Curb extensions and pedestrian crossing features
- Level boarding features
- Enhanced bus shelters and stop amenities
- Wayfinding signage

DRAFT

and funding, operating scenarios and methods for funding ongoing operations, traffic and transportation impacts and benefits, and integration with major developer master plans.

Strategy MA11 Support reliable bus operations in the KCDD

Action MA11.1 To the extent practical and based on funding availability, work with DTS to eliminate transit delay and improve transit reliability on regional and connecting transit streets through physical and policy improvements.

Transit priority treatments are relatively inexpensive improvements (when compared to major corridor transit projects) that reduce delay and increase speed of transit services. Effective transit priority treatments optimize management of city streets to increase transit speeds while minimizing impacts on other users of the street. This section describes some intersection and roadway treatments that can help to keep bus transit operating reliably, even as urban congestion increases. These tools should be considered in conjunction with other street design and operations considerations detailed in Chapter 6.

BUS PRIORITY LANE IN SYDNEY AUSTRALIA

Sydney, Australia applied a continuous red color overlay to bus lanes that were previously marked by pole-mounted "Bus Lane" signs and "Bus Lane" pavement markings. Surveys were conducted at three locations along the bus route after the red overlay was applied to the full lane. Results indicated that lane violations were reduced between 4% and 17%.

Image from Flickr user Scotticus

Like many U.S. cities, streetcars were a staple of local mobility in urban Honolulu until the 1930s. This scene shows a streetcar operating on King Street in 1925.
Image from Everyday Life in 20th Century Honolulu by Tiffany Hill, Michael Keany and A. Kam Napier in Honolulu Magazine

The Seattle South Lake Union Streetcar has been a key mobility component of the district's redevelopment. Private companies such as Amazon have contributed financially to its operation to increase service and provide employees and residents better connections to regional light rail and services in the adjacent downtown retail and entertainment districts.
Image from Nelson\Nygaard

Strategy MA12 Increase transit ridership for all types of trips

Action MA12.1 Around rapid transit stations and major bus transfer points, prioritize land uses and patterns that generate high transit ridership

With plans to more than double its residential population in just a few decades, the KCDD will need to focus on walkable, compact land uses to reduce vehicular travel demand. To gracefully accommodate planned growth, HCDA will need to carefully link land use planning and transportation system development. In particular, planners must agree that land use cannot be shaped by transportation, rather land use and urban form must be recognized as the most powerful tool for shaping people's decisions about where they live and how this affects their travel patterns.

The Vancouver, B.C. story is very instructive and worth telling. The sidebar describes Vancouver's unique success in coordinating transportation and land use.

Action MA12.2 Provide developer incentives to improve bus facilities adjacent to new development: Improvements could include new bus shelters, wider sidewalks, concrete bus pads, benches, changeable message signs, secure bike parking, bike-share stations (where appropriate), and trash receptacles.

Too often the development of high quality curb-side bus stops is ignored in the development review and developer negotiation process. In a dense urban district, the placement of bus facilities in the sidewalk space and the spatial planning and design for passenger queuing and pedestrian throughput is critical.

- Bus stops should be placed to assure customer convenience and provide for the safety of pedestrians and vehicles. Stops shall be visible, near crosswalks and well lit.
- Bus stops should be clearly and consistently identifiable with up-to-date information for riders about services at the bus stop.
- The design of bus stops should be sensitive to the community setting and where possible incorporate features that identify the stop with the community (such as art, bus stop naming or inclusion of a community bulletin board).
- Where reasonable, bus stops should be accessible and meet Americans with Disabilities Act (ADA) requirements.
- Bus stops should be located in support of institutions and with clients having special needs, large employers and community centers.
- Bus stops should be spaced to maximize the efficient operation of transit service while not requiring riders to walk more than a quarter mile to the bus stop.

Good bus stop design requires local jurisdictions, community partners, and land developers to work together in creating a functional and aesthetically pleasing deign.

TriMet, the public transit provider in the Portland Metro Region, has an excellent set of bus placement and design standards available on line: http://trimet.org/pdfs/publications/bus-stop-guidelines.pdf. Bus stop design will be specified when HCDA develops its Complete Streets Design Standards.

Action MA 12.3 Encourage schools and major employers to provide prepaid access on the TheBus and HART systems for all of their students and employees.

When an employer or institution purchases free transit passes for all employees—or when an employee or student ID card is also valid as a regional transit pass—the transit ridership impact is greater

COORDINATED LAND USE AND TRANSPORTATION PLANNING IN VANCOUVER, B.C.

The broad strokes of the so-called "Vancouver model" are well known to American planners: develop dense, mixed-use and walkable neighborhoods in and around downtown. Many of the details of Vancouver's approach to land use, however, are less understood—including the relationship between land use and transportation policy.

Vancouver's "Living First" policy, adopted in 1991 as part of the Central Area Plan, rezoned 8 million square feet of space from commercial to residential use; since the policy was implemented, the population of the downtown peninsula has risen from 47,000 to 88,000 (in the 2006 census). However, former planning director Larry Beasley has explained that the policy's success "is not just the result of favoring housing and changing the zoning to allow it to happen. Nor is it just the result of a vibrant market...The first principle has been to limit commuter access into downtown and let congestion be an ally in a household's profound first decision to live downtown or in the suburbs. Walking, biking, and transit get priority for both space and spending."*

The growth of the SkyTrain system has helped Vancouver's downtown peninsula—which is connected to the rest of the city only by a narrow bottleneck that might otherwise be choked with traffic—to remain a major civic and commercial center, with 10% growth in employment between 1991 and 2001, even as outlying areas have continued to grow. (Downtown growth may have mitigated suburban sprawl, but the entire region is growing rapidly.) The share of downtown trips made by car has remained relatively constant and even declined: from 46% of all trips in 1994, auto mode split had fallen to 40% by 1999 and continued to decline through 2011. In 1999, transit accounted for 28% of all trips and walking accounted for 31%.

With so much residential growth downtown, trips into and out of the core are increasingly less important than trips within the downtown peninsula. Morning peak trips entirely within downtown increased from 18% of all downtown trips in 1974 to 21% by 1996; these trips were expected to reach 27% by 2021. While trips to downtown destinations from outside downtown were expected to grow by 18% by 2021, trips within downtown were expected to grow by 64%.

To accommodate the continued growth of downtown, the city's 2002 Downtown Transportation Plan built on the 1997 City of Vancouver Transportation Plan, which made explicit the following hierarchy of transportation priorities: pedestrians, bicycling, transit, goods movement, and private automobiles. The 1997 plan also made clear that "(o)verall road capacity to the downtown will not be increased above the present level." In the 2002 plan, a "Pedestrians First" policy was established, and it was further noted that:

"Over the next 20 years, the total number of trips to downtown will grow by 30%. Some kinds of trips will increase more than others. Commuter trips on foot and bike are expected to double. Rush hour transit use will rise by 50 to 60%. Car and truck trips are projected to stay about the same."

The city has doubled the total length of bike lanes downtown, on top of a twofold increase between 1994 and 1999. It projected an 85% increase in transit trips within downtown during the morning rush hour, accommodated by local bus routes. It also projected that rail would accommodate 90% of all new non-walk and bike trips into downtown. The total number of commercial parking spaces per employee, meanwhile, was expected to drop from 0.44 in 1990 to 0.32 by 2021.

With congestion declining, the plan projected a 3% increase in average vehicle speeds, with average transit speeds increasing by 14%.

Criticisms of Vancouver's downtown transportation policy have focused on its land use policy: with housing prioritized over offices and limited remaining space for commercial growth, downtown is becoming something of a "bedroom community" with increasing numbers of commute trips from downtown to outlying jobs.

Since the 2002 plan, the city has taken additional steps toward a sustainable long-term transportation policy. In 2006, the South Coast British Columbia Transportation Authority, or TransLink, implemented a parking tax on all non-residential properties of $0.78 per square meter (since repealed). A "demonstration" streetcar line between the Olympic Village Canada Line subway station and the popular Granville Island shopping area opened in time for the 2010 Winter Olympics; it is the first phase of a greater downtown network. The Canada Line, the latest installment of TransLink's driverless metro system, opened between the airport and downtown just before the Olympic Games. The Olympic Village area itself is now being redeveloped into a neighborhood and will be the first community in Canada to offer car-share vehicles throughout its entirety. The Southeast False Creek Plan forecasts that 60% of all trips in the area will be made without a car and that the neighborhood will generate 25 to 50% less greenhouse gas emissions than similar urban districts.

* "Living First" in Vancouver, American Planning Association's Zoning News April 2000

than merely providing free or discount passes to regular transit users. Pass programs available to all employees encourage those who have never taken transit to try it, and this way, they may become regular riders. To be most effective, transit passes should cover both TheBus and future rapid transit service. Such transit pass programs have been shown to reduce employee commute trips by 5 to 10 percent or more and can be adopted for residential buildings or neighborhoods.

Universal transit passes could be provided to residential developments or neighborhoods through resident associations or assessments. Examples of places this has been implemented include Santa Clara, California and Boulder, Colorado.

More detail on these strategies is included in Chapter 8.

RULE CHANGES FOR KAKA`AKO

HCDA does not have a direct role in delivering transit services or designing street rights-of-way to accommodate transit operations and passenger loading. However, as the KCDD redevelops, HCDA and its local developer partners will work closely with TheBus (City/County) and HART to ensure transit access and operational considerations are addressed early and throughout the development review process.

- **Regulation MA12.1:** Require developers to construct transit passenger facilities on public right of way where designated/or where there is an existing stop that will require replacement as new public facilities are constructed.

UNIVERSITY OF HAWAI`I AT MANOA, SEATTLE, AND BOULDER UNIVERSAL TRANSIT PASS PROGRAMS

The UPass is a University-issued bus pass available to enrolled students at UH Manoa on a semester basis. UH Manoa has plans to expand the successful UPass program to employees starting in 2013. HCDA will coordinate with the City and County of Honolulu to establish a similar district based pass program. Employer, district, and institutional UPass programs have proven to be very effective at reducing vehicle trips. For example, the University of Colorado at Boulder instituted free ridership for students, faculty, and staff in 1991. Between 1991 and 1998, ridership increased a marked 400%. In Seattle, the Downtown Seattle Association buys bulk passes from the transit agency at a discount and provides small employers an opportunity to purchase an unlimited ride pass for all their employees at a significant discount. Unlimited access transit pass programs are estimated to reduce vehicle trips (in VMT) up to 15% on average.

Image from Nelson\Nygaard

BICYCLE

Bicycle (Routes and Facilities)

The Bicycle Network

The flat terrain, short distances between destinations, and mild climate of Kaka`ako are ideal to make cycling a healthy, convenient and pleasant way to meet everyday transportation needs in the district and surrounding neighborhoods for residents and visitors of all ages and abilities.

Many people already bicycle in Honolulu for recreational and utilitarian purposes. An active and passionate cycling community has emerged, increasingly reminding decision makers that there is more to be done to improve connections, create a safer environment and increase cycling as an alternative to driving. HCDA is a strong supporter of an improved cycling environment and has been active in this conversation.

Cycling Supports HCDA's TOD Overlay Plan Vision

Bicycling has a clear role to play in achieving the goals of the TOD Overlay Plan; new development can be gracefully accommodated by ensuring residents and workers have a broad range of mobility options including spatially efficient modes such as biking and walking. An increased rate of bicycling can help ease congestion, free up auto parking capacity and reduce air pollution and noise levels. Bicycles are a tried and tested, simple, cheap and zero-emission technology.

A desired outcome of the HCDA TOD Overlay Plan is to make Kaka`ako the most bicycle friendly district in Honolulu.

Strategy MA13 Create a complete network of high-quality bicycle facilities, including a minimum of one new mauka - makai and one Ewa - Diamond Head protected bicycle facility, with the aim of increasing the number of people who use bicycles for everyday transportation

Providing efficient mobility and access is a key challenge for the HCDA in realizing its goals to develop a compact, walkable, vibrant urban district that is well connected to adjacent districts. Cycling can play a key role in ensuring that short- and mid-distant trips are made by spatially efficient and environmentally friendly means.

Action MA13.1 Develop a complete network of cycling facilities in KCDD, including at least one Ewa – Diamond Head and one mauka – makai direction protected bicycling facility (see Figure 5-15)

A top priority for KCDD is the development of high-quality bicycle facilities that allow residents, workers and visitors to travel to and through Kaka`ako safely and comfortably. The HCDA should work with the City/County of Honolulu DTS to implement a complete network of bicycle facilities.

Figure 5-15 illustrates where cycling facilities should be prioritized. Primary streets are those where fully separated facilities (i.e., cycle tracks or buffered bike lanes) or on-street bike lanes should be considered. Secondary streets are those that should be signed and marked for bicyclists, but where cyclists would share the lane with traffic. Low speed streets are those that have design features

DRAFT

Cycling is a normal part of daily like in Copenhagen, CK, and helped make the city one of the most livable in the world.
Image from Nelson\Nygaard

CYCLING SUPPORTS THE KCDD VISION

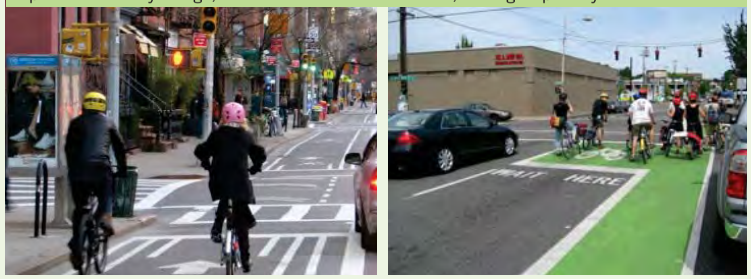
- Connects People with Destinations. Planned facilities connect the KCDD and neighboring commercial districts, schools, and recreational amenities, facilitating resident and visitor access to daily needs and destinations. In the strategic areas near transit where new complete mixed-use neighborhoods are encouraged, bicycle facilities are introduced and enhanced to encourage access for all. New mauka-makai and Ewa – Diamond Head backbone connections tie the KCDD to the City.
- Supports Bicycling as an Alternative to Driving. For many trips, the bicycle provides more convenient access than a car, often allowing you to park closer to your destination, bypass congested intersections and arrive in a timely manner. Most of the KCDD can be reached within a ten minute ride as can many neighboring districts and destinations.
- Improves District Streets. District streets are great places for bicycling, and improvements like sharrows, bike lanes and calming features support the slower local-serving character of the places along these streets. Increasing bicycling in the neighborhoods encourages using the public streets as recreational and open space that encourages social interaction.
- Preserves and Enhances the KCDD's Community Character. Bicycles fit well with the KCDD's growing reputation as Honolulu's creative core and emerging home of environmental organizations. The TOD Overlay Plan recommends innovative bicycling facilities and programs that encourage residents and visitors to celebrate Kaka`ako's history, beautiful climate and setting. Whether carrying a surfboard or a briefcase, the TOD Overlay Plan aims for all people to feel comfortable riding their bike in the KCDD.
- Balances Roadway Use. The TOD Overlay Plan recognizes that streets serve many roles and users. The bicycle is the most space-efficient personal mobility device, taking up a minimum of roadway and parking space. Introducing a network of varied bicycle routes, paths, lanes, cycletracks, and other facilities will encourages cyclists of all types, and roadway users of all modes, to share the road.
- Supports Transit Connections. The bicycle is a perfect "last mile" connection between other modes and destinations. For people using transit, bicycles are a great tool to get to and from the stop, expanding transit's effective reach throughout the City. Bikes can help motorists get to and from their parking spaces, expanding the reach of surplus parking locations. For pedestrians, bike-sharing facilities can bridge longer distances, allowing quick movements between different walking destinations.
- Capture Tourist Business. Few tourists chose a destination so they can use a car, but increasingly active tourism is an important consideration. Honolulu is among the most visited cities in the world, but relatively few visitors seek out destinations in Kaka`ako. Creating a district that is accessible and comfortable for cyclists and connected to places such as Waikiki and Aloha Tower with high quality facilities is a promising way to increase tourist traffic in the District.

which calm traffic and require motorists to drive at speeds that allow cyclists to easily integrate with traffic.

Figure 5-15 Cycling Priority Streets

While it may take many years to complete the cycling network illustrated in Figure 5-15, there are specific projects that the HCDA should consider prioritizing based on their importance in completing the network and coordination with upcoming projects.

An active partnership with DTS and local bicycling groups will be needed to realize this plan.



DRAFT

WHAT ARE THE GLOBAL CYCLING LEADERS DOING?

Surging interest in bicycle transportation is sparking U.S. and North American transportation agencies to institute innovative bikeway designs, new and more effective programs, and monitoring technology that can help communicate the value of cycling investments. Looking to global cycling leaders can inform HCDA of potential opportunities to advance innovative infrastructure improvements in the KCDD. A sample of these leading practices are presented below.

Examples of Leading Cycling Practices And Trends

Separated bikeway design, intersection countermeasures, and signal priority

Cyclists in many great cycling cities are afforded priority signals and greater visibility at intersections as well as separation from motor vehicle traffic along key travel corridors.
Images from: Flickr user Kyle Gradinger (left) and Flickr user Cheryl & Rich (right)

Full service end-of-trip facilities and public bike share

Bikestations (left) offer cyclists a space to change and store their bikes and clothing. Bike sharing (right) provide bicycles on-demand to cover the last-mile connection for transit trips and support quick trips in dense locations.

DRAFT

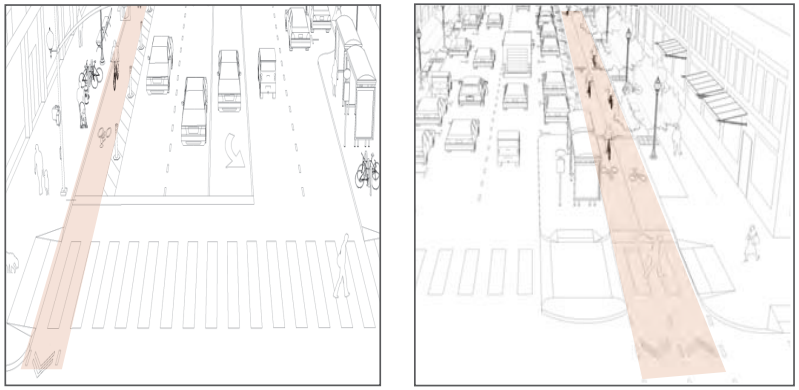
Figure 5-16 Potential Cycle Track on Halekauwila

The guideway column for HART highlighted in blue in this illustration presents a concept for use of the HART guideway to create a shaded cycle track
Image from Nelson\Nygaard



- **Halekauwila Street cycle track:** The development of the rapid transit guideway Ewa-Diamond Head through the district presents an opportunity for dramatic transformation of this street. This relatively low traffic volume street will become a major mover of people through the district. Eliminating Ewa-bound traffic would allow for the development of a 2-way cycle track perfectly positioned to provide bike access to HART stations and with excellent shading from the sub (created by the guideway). Figure 5-16 provides an illustration of how the street could operate with one-way traffic, a center parking lane, and a protected two-way bicycle facility.
- **Ward Avenue bicycle lanes:** Ward Avenue provides a critical mauka-makai connection through the KCDD and given its modest traffic volumes is well positioned to be a pilot Complete Street redesign project for HCDA. A redesign of the street could include standard 6-foot bike lanes with on-street parking or protected bicycle lanes. Connections to the Kaka`ako station from mauka and makai could be supported by this facility.
- **Auahi/Pohukaina Streets shared lanes:** The proposed connection of Auahi to Pohukaina as part of the Howard Hughes development presents an opportunity to

For Ward Avenue, bike lanes like these on a commercial street in Santa Monica, CA could be implemented.
Image from City of Santa Monica

Shared lanes for Auahi/Pohukaina Streets could be similar to these green sharrow lanes on a commercial street in Long Beach, CA
Image from Dan Burden

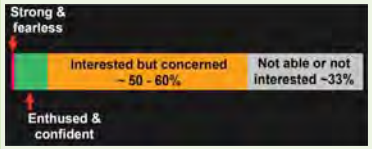
For South/Punchbowl Streets, one-way or two-way cycle track design could be implemented.
Image from Nelson\Nygaard

create a pedestrian-oriented commercial street. This street would provide a secondary bicycle connection allowing local bike traffic to access retail and services from this corridor. A standard sharrow treatment and bicycle wayfinding signage would be appropriate for this corridor.

- **South/Punchbowl Streets protected bicycle lanes:** On the Ewa side of the KCDD, the South and Punchbowl couplet provides an opportunity for new bicycle facilities. Both streets are wide and could be redesigned to accommodate protected bike facilities in the major flow direction. Alternatively, South could be reconfigured to accommodate a two-way cycle track.

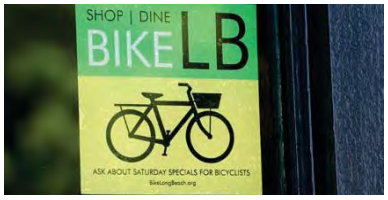
Each of these projects would require more detailed engineering and design review.

Other KCDD area bicycle facility projects included in the O`ahu Bike Plan, such as Ala Moana bicycle lanes, are supported by the TOD Overlay Plan.



Action MA13.2 Promote HCDA as a cycling district

There is a small segment of the population in any city that will chose to cycle no matter the quality of the bicycle facilities, weather, or availability of parking and storage. Far more people fall into the category that has been named by bicycle planners as the "interested, but concerned." These are people that would like to bike more, but have reservations, fears, or uncertainties that keep them from cycling regularly (see sidebar).



HCDA can sponsor community cycling events that bring cycling into the mainstream and promote the KCDD as a hub for cycling and bicycle oriented businesses.

CYCLING MARKETS

Research in cities around North America and beyond shows that the majority of residents rate themselves as interested in cycling, but unlikely to cycle due to safety, weather concerns, or lack of quality bike storage and trip end facilities. This "interested but concerned" market should be the target for bike planners in Honolulu.

Approach developed by the City of Portland, OR

Bike friendly businesses in Long Beach receive stickers to show cyclists consumer benefits
Image from BikeableCommunities.org

BICYCLES FOR BUSINESS AND JOB CREATION

BUSINESS ACCESS

In the age of Amazon, urban storefront retailers are struggling. As people buy less from bricks and mortar establishments, retail spaces are increasingly occupied by lifestyle establishments – bakeries, coffee shops, flexible work spaces, independent specialty retailers, and places where people can congregate and find community lost in the age of internet retail. In bike friendly cities, like Portland, Vancouver, and Boulder, CO, retailers are finding that bike lanes and sufficient bike parking are a great way to bring people to their front doors. In Portland, developers are increasingly looking to build along bikeways, as small retailers and restaurateurs will pay a premium for that space.1

JOB CREATION

A study by the University of Massachusetts Political Economy Research Institute found that building bike lanes created more jobs than any other type of transportation investment — 11.4 to be exact for every $1 million spent on design, construction and materials. That compares to 10 jobs per $1 million spent for pedestrian projects and 7.8 jobs per $1 million for road-building projects.

A 2008 report on the affects of the cycling industry in Portland, OR estimated that cycling businesses bring $90 million in annual revenue to the local economy. The report only estimates direct bicycle-related business activity (gross revenues and incidental expenditures by event participants) in Portland, and does not include bicycle-related benefits to residents' health, traffic congestion, air quality, or quality of life.2

In Portland, these developers chose to build along one of the city's busiest bike lanes. Neither development provide parking (for cars) and both cater to bicycle friendly businesses and residents whose primary mobility choice is a bicycle. The residential building has bike parking on each floor and parking for large utility bikes and trailers.
Images from Nelson\Nygaard

2 http://www.altaplanning.com/App_Content/files/fp_docs/2008%20Portland%20Bicycle-Related%20Economy%20Report.pdf

KCDD as Bicycle Business District

As an emerging business district, the KCDD could develop a program to promote local businesses as bike friendly and accessible. Adaptive reuse projects such as the Salt Blocks could benefit from such a district designation that cements Kaka`ako as Honolulu's creative core.

Long Beach, California is emerging as a leading cycling city. It has invested heavily in cycling to meet health, environmental and economic development goals.

In June 2011, Long Beach launched its "Bike Saturdays" program to encourage people to shop by bike—the first of its kind in the U.S. The City of Long Beach worked with area businesses to develop four bicycle-friendly business districts that offer a discount to shoppers arriving by bike on Saturdays.

The initiative encourages local residents to take short trips by bike instead of car, and ensures that dollars are being kept in the local economy instead of driven out of the community and spent elsewhere.

The program is funded by a $72,000 grant from the Los Angeles County Department of Public Health through Project RENEW[1] (Renew Environments for Nutrition, Exercise, and Wellness).

Open Street Events

HCDA could work with community organizations to sponsor one or more annual open streets events in the KCDD. As described in the call-out below, such events help encourage walking and cycling by taking over space from autos and will promote the value of Complete Streets in Kaka`ako.

Action MA13.3 Work with local partners to develop a bike share system in Kaka`ako and adjacent districts of Honolulu

Miami's Deco Bike is one of the world's most successful warm weather bike share systems; it has the highest ridership per bike of any system in the U.S.
Image from Deco Bike

Providing publicly accessible bicycles around the KCDD and adjacent districts will give more people the opportunity to ride, even for just one trip leg. Public bike share bikes will encourage visitors to choose Honolulu and the KCDD over other destinations, and to feel welcome in the area without a car. Bike sharing will facilitate connections to rapid transit and bus transit and replace short auto trips to local retail.

HCDA and many other community partners share a goal to create a comprehensive system of bike share stations in visible, on-street and off-street locations dispersed throughout the District and the City. An early system in KCDD could include 20 or more stations and 150-200 bicycles and would be most effective combined with a city system that also served Aloha Tower, Downtown, Ala Moana Center, Waikiki, University of Hawai`i and Honolulu's many popular parks and beaches.

Providing helmets and transit subsidy incentives to new users to incentivize trial use of both bike sharing and transit should be explored.

Demand for Bikeshare

Successful bike share systems are dependent on a variety of factors including population and employment density, proximity to schools, colleges, universities, proximity to transit, availability of bicycle infrastructure, and proximity to tourist-based destinations. KCDD is well positioned to be a central destination in a future regional bike sharing system. Bike share also has potential to provide local mobility as the area grows and services and destinations diversify.

Bike sharing in Kaka`ako, and the broader urban Honolulu area, will attract a variety of riders making trips for many different purposes. Bike share programs in other U.S. cities, particularly those operating in warmer climates and cities with high levels of tourism, are instructive as to the likely users markets in Kaka`ako and Honolulu as a whole. The following are some key markets and considerations for where each will create demand for bike share stations:

1 Project RENEW is a 2-year grant funded from Federal American Recovery and Reinvestment Act in partnership with the Centers for Disease Control and Prevention. Project RENEW consists of 10 health-related initiatives in the Los Angeles area.

CicLAvia in Los Angeles, CA reconnects this auto-centric city to the street and offers `perspective on bikeable distances.
Image from Flickr user Gary Leonard/CicLAvia

OPEN STREETS EVENTS

The open streets movement was founded largely in Bogota, Columbia when Ciclovia was established back in the 1960s. Ciclovia Bogata is held every Sunday; it closes over 100 km of city streets to cars and provides a network of open streets for pedestrians, cyclists, and all types of human-powered transportation modes. Open streets events invite and encourage people to enjoy the streets car-free, connect with new parts of the city, interact with neighbors and people from different walks of life, and try active modes of transportation in a safe environment. The community benefits from an environmental, economic, social, and cultural standpoint.

Modeled largely after Bogota's Ciclovia car-free Sunday movement, cities in the U.S.—from Tucson, Arizona to Baltimore, Maryland—are temporarily closing off city streets to encourage cyclists and pedestrians to enjoy the city's streets without the threat the of cars. Although open streets events are seen as costly due to road closures and police traffic control, studies show that the health, retail, and mode shift benefits outweighs the monetary cost. In May 2013, Kaka`ako will host its first open street event.

SUNDAY PARKWAYS, CITY OF PORTLAND, OREGON

Image from Nelson\Nygaard

Portland Sunday Parkways promotes healthy active living through a series of free events that open the city's streets to walkers, bikers, and roller skaters. The goal of this program is to significantly increase the community's awareness of active transportation, foster civic pride, and stimulate local retail sales.

Since 2008, the City of Portland has sponsored the events. One Sunday a month during the summer between 10 and 13 kilometres of streets in rotating neighborhoods are opened up for people, not cars. Sunday Parkways aims to reach a large cross section of the community by rotating the location of the event each Sunday. In 2011, over 100,000 people came out to enjoy Portland's streets.

Funding for Sunday Parkways originally came from a combination of City of Portland, Regional Travel Options funding from the Metro regional government, and donations from area businesses and organizations, such as local bike shops and health insurance providers. In recent years, the Sunday Parkways event has been so successful that the Metro Regional Travel Options program has expanded its funding to other jurisdictions in the Portland region.

CICLAVIA, LOS ANGELES, CALIFORNIA

CicLAvia began in 2010 and closes roughly 16 kilometres of Los Angeles' streets on several Sundays throughout the summer months. The most recent CicLAvia event attracted an estimated 130,000 participants, the majority being bicycle riders. CicLAvia is a non-profit organization whose mission is to encourage safe, vibrant public spaces, sustainable transportation, and public health through car-free street events.

Beyond the mission of opening the streets for active transportation, CicLAvia partners with area businesses and artists-that provide entertainment and programming along the route. In October 2011, the CicLAvia Walks initiative began, which allows participants to discover the many architectural, cultural, and culinary destinations along the route.

CicLAvia's events are funded by both private and public partners. Sixty percent of funding comes from individual and corporate donations; 40% of funding comes from the City of Los Angeles to cover traffic operations, sanitation, and public safety efforts. The event costs the City of Los Angeles roughly $219,000—under $2 per participant. The City supports the event largely because they see it as a transit ridership strategy as participants are encouraged to come via public transit. The goal of CicLAvia is to eventually spread and interconnect the region.

- **Tourists and visitors:** Station demand near hotels, points of attraction, recreational amenities, visitors services, and transit hubs
- **Residential customers:** Station demand near dense concentrations of housing, condo/apartment towers, transit hubs and stations
- **Workers and students:** Station demand on institutional campuses, large employment centers, downtown, and at transit hubs and stations
- **Local residents with limited transportation options:** Station demand along high frequency bus routes, retail and general employment centers, medical and social services opportunities, low-income housing and dense apartment concentrations

In Honolulu, significant and growing tourist and visitors populations have potential to generate high levels of year-round patronage for a bike share system. Trips originating in Kaka`ako are likely to be oriented to residential users, local workers making circulation trips, and commuters connecting to regional transit lines including future HART stations. Figure 5-17 presents a draft list of evaluation criteria that can be used for the purpose of determining initial areas to be served by a bike share system, where stations should be located, and to set targets that help determine when to expand the system.

Figure 5-17 Evaluation Criteria for Analyzing Bike Share Market Potential

Criteria	Bike Share Goals	Measures
Population, Employment, and Retail Density	Productivity, Mobility, Amenity	Higher score if located in a high density residential areas or employment center. Density of human activity matters most, but density of tourist oriented activities is of high importance. More activity will be generated from mixed land uses that generate trips throughout the day (i.e., university).
Proximity to rapid transit or other frequent transit service	Productivity, Mobility	Proximity to (for station a location within 200 yards from the entrance/exit of) a rapid transit stop or other frequent transit service bus stop. In many urban markets, proximity to long-haul transit stops is given a higher value as these customers are often seeking "last-mile" connections. In Honolulu, overcrowding on core urban bus routes should make bike sharing a competitive alternative for short urban trips as well as provide last mile connections.
Likely use by casual riders	Productivity, Revenue, Mobility	Higher score if more than 60% of trips are projected to be taken by casual subscribers (non-members). Proximity to local trip generators, retail, restaurant districts, institutions and other uses that create varied and occasional uses.
Prevalence of tourist/visitor destinations or lodging	Productivity, Revenue, Mobility, Amenity	Higher score for areas within 200 yards of a major tourist destination, recreational destination, or hotel.
Ability to serve low-income and/or transit dependent customers	Transportation system equity, Mobility	Higher score if 15% of neighborhood is below the federal poverty line OR 15% of residents fall below the median household income level. Rates of car ownership is also a measure of transit dependence.
Neighborhoods/areas underserved by transit	Transportation system equity, Mobility	Higher score for areas with poor transit level of service (greater than 30 minute frequency)
Neighborhoods/areas lacking basic services and amenities	Transportation system equity, Mobility	Higher score for areas with limited retail/commercial services within walking distance (minimum 1/4 mile)

Once key market areas are determined, more detailed analysis is needed to determine optimal station siting locations. Ultimately, station siting is a delicate balance between finding locations with available space (or developing them), matching sites with demand propensity (see above), balancing design

with local regulations, siting stations near quality bike facilities, and a host of other considerations. Figure 5-18 provides some important propensity-based station siting criteria and Figure 5-19 provides an interim understanding of which parts of the KCDD could support bike share stations. Additional iterations of analysis must be conducted using station siting criteria to understand the spatial needs bike share stations. Potential criteria could include sidewalk capacity, on-street parking bay availability, redevelopment opportunities, park/public space integration, and pedestrian junctures/intersection density.

If HCDA and/or its partners contract with a turnkey bike share operator, there is an opportunity to leverage further station citing analysis as part of the contract for services.

Figure 5-18 Criteria for Siting Bike Share Stations

Criteria	Bike share Goal	Measure
Bikeway/bike facility availability	Propensity	Higher scores for areas within 1/4 mile of a dedicated bicycle facility. Hierarchy of score based on class of facility (off-street path, cycle track, lane, share facility, etc.)
Low speed streets	Propensity	Higher scores for areas located along streets with posted speeds of 30 mph or less
Low volume streets	Propensity	Higher scores for areas located along streets with posted speeds of 30 mph or less
Job Housing Mix	Propensity	Higher scores for block faces that achieve URBEMIS' land use mix credit*
Topography	Propensity	Lower scores for areas with grades of 2 to 4% or higher
Sidewalk capacity	Spatial needs	Higher scores if sidewalk widths are greater than 15 feet (allowing for 6-8 feet station depths, 4 feet of clear zone, and 4+ feet of pedestrian through zone). These standards need to be balanced with adjacent land use forms and other user needs (e.g., a 4 foot pedestrian through zone is insufficient in high volume pedestrian areas)
On-street parking bay availability	Spatial needs	Higher scores if block faces have on-street parking with low peak demand (e.g. less than 40% occupancy) or with a convertible use (e.g., underutilized loading zone
Redevelopment opportunities	Spatial needs	Higher scores for block faces that are likely to redevelop allowing opportunity 'to integrate stations/amenities into setbacks without reducing sidewalk capacity
Park/public space integration	Spatial needs	Higher score if park space or public space (e.g. plaza at government building) could be used to site a station
Pedestrian junctures	Spatial needs	Higher scores for areas located near pedestrian connection points including intersection corners (with marked crossings preferably) and mid-block crossings

* URBEMIS is a tool for measuring air quality and transportation impacts of new developments (block level or district). It is being used to estimate trip generation impacts of development alternatives being evaluated in the KCDD TOD Plan.

Use Bike Share as an Economic Development Tool for KCDD

In addition to providing new mobility and access options, bike share can help achieve the KCDD's economic development objectives. A bike share system with stations in Waikiki, Ala Moana Center, Aloha Tower, and Downtown/Civic Center would put Kaka`ako at the nexus of many leisurely tourist trips. Combine with improved bicycle facilities and connections to regional greenway trails, bikeshare could present a powerful economic development tool, providing tourists and their spending power access to Kaka`ako and its emerging businesses.

FUTURE OF BIKE SHARING

In Copenhagen, a leading world cycling city, architects from RAFFA Architecture have developed a new bike sharing concept for the city of Copenhagen. The system features real-time GPS tracking, an online reservation system, and attractive bikes that can be stored anywhere. The new design takes on the challenge of limiting valuable urban space consumed by bike share and creating a highly attractive product designed to attract style conscious riders. This high-tech, space saving system is not being built, but is an example of the increased attention being given to cycling and public realm design.

All images from RAFFA Architecture

Bike share will likely be considered a value added amenity for prospective residents and employers looking to site their homes and businesses. For developers looking to attract customers interested in compact, transit-oriented, walkable communities, bike share is an added amenity.

Tying into the Bicycle Business District opportunity described in this chapter, bike share users could be given discounts to Kaka`ako businesses increasing the likelihood of one-time and long-term patronage.

Figure 5-19 Bike Share Propensity and Potential Generators

Roughly 95% of all beach-climate bike share use consists of tourist access via credit card

WARM WEATHER BIKE SHARE SYSTEMS

Bike share is a particularly effective mobility tool for tourist-oriented, warm weather cities. In beach climate cities that have implemented bike share, over 90% of recorded use comes from visitors. Visitors tend to spend more time on bike share and be less sensitive to price and warm climate allow consistent year-round use, so financial stability for warm-weather systems is less of a concern.

Miami's system is one of the few privately operated bike share systems. Interestingly, DecoBike, the company that operates Miami's system has expanded to Surfside and Bay Harbor Florida and is soon to open in San Diego – all warm weather climates. This bodes well for a Honolulu system to be able to recover operating cost through rental revenues. Because the Miami system is able to cover operating costs with user revenue, it has provided the opportunity to use sponsorships and advertising to expand the system. Having opened with station spacing of 500 meters, the system is working to reduce spacing to a mere 200 meters, providing a much higher level of convenience and accessibility that most other US bike share systems.

The City of Miami has come to see bike share as a critical congestion alleviation strategy and has supported the system by investing in new bike lanes and on-street facilities where use is highest.

WHERE HAS BIKE SHARING BEEN DONE?

NICE RIDE, MINNEAPOLIS, MINNESOTA

Minneapolis' bike share system, Nice Ride, has been a major success with over 100,000 trips in its first 6 months of operation—19% of which replaced auto trips. The system launched in June 10, 2010 with 65 stations and 700 bikes. Due to the popularity of the program, Nice Ride is currently expanding its station and bicycle unit network to 51 more stations and 500 more bicycles.

NiceRide MN docking station
Image from NiceRide MN

CAPITAL BIKESHARE, WASHINGTON, DC

Capital Bikeshare (CB) is a prime example how bike sharing can simultaneously complement transit and improve transit efficiency and overcrowding. Bikeshare members substantially reduced their use of Metrorail and bus since joining CB. Nearly half (47%) ride Metrorail less often and 39% ride a bus less often. Since the average trip was two miles, bike share catered to trips previously being made by transit. On the other hand, CB enabled multimodal trip-making as seven percent of members increased use of Metrorail and six percent increased bus use.

DecoBike docking station
Image from DecoBikes

DECOBIKE, MIAMI, FL

The Miami bike share system provided by DecoBike (DecoBike will soon operate bike share in San Diego) is a privately operated system, which started operations in Miami Beach. DecoBike features a network of 100 solar-powered bike rental & sharing stations with a fleet of 1,000 custom DecoBike accessible from dozens of locations. With 1,290,606 rides logged in 2012 alone, the Miami system is the busiest fleet per-bike of any US bikeshare program. Its success is due in part to warm year-round weather and high rate of tourism, two attributes shared with Honolulu.

Image from DecoBikes

Partner with Honolulu Bike Share Group

In order for bike share to successfully operate in Kaka`ako, any future system should operate and provide connectivity to adjacent districts in urban Honolulu. HCDA will partner with the Honolulu Bike Share Group to determine a preferred governance and funding structure, system feasibility, identify system sponsors, and integrate rules that accommodate bike share in Kaka`ako. A critical first step is to work with partners to identify an organizational, operating and funding structure that best matches local goals operating conditions, and funding opportunities.

While bike share as an amenity will help attract residential customers to the district, its greater value is to bring visitors, workers, and residents from elsewhere to emerging cultural amenities, restaurants, and activities in the KCDD. Creating a bike share network that connects many Honolulu neighborhoods and destinations benefits HCDA and the KCDD community.

Encourage Developers to Consider Bike Share in New Development

Bike share demand in Kaka`ako will vary dramatically based on land use types and land use intensity will fluctuate over time as the district redevelops. Setting up a development program that triggers investment in new stations when new buildings or developments come online is a necessary approach. HCDA should provide further incentives and requirements to ensure sufficient space is provided for bike share stations and to provide the opportunity for developer to integrate bike share stations into the design of their buildings and public spaces. This could come in the form of reduced permit fees and density bonus without additional parking requirements.'

Encouraging new development to incorporate bike share and even fund capital purchases of equipment will help reduce the cost of system development and ensure that bike share is not consuming valuable space in the public rights-of-way.

Action MA13.4 Improve access to bicycle parking and require new development to include bicycle storage

Every bicycle trip begins and ends with parking. It is important to provide easy to use, secure, and convenient parking that is visible and close to popular destinations. Secure parking with commuter amenities (such as shower facilities) are also needed near transit stations and employment centers. Although bicycle parking is already required in the Mauka area rules, the three KCDD HART stations and all new parking facilities should include long-term secure bicycle parking, and where possible, air pumps and repair stands should be provided with bicycle parking at these major facilities.

Standard staple or U-racks on a commercial street are aligned to provide clear path for pedestrians.
Image from Nelson\Nygaard

The number and location of bike parking spaces should be enough to meet observed needs, or to accommodate a shift of 15-25% from current auto parking rates, whichever is greater. As necessary, HCDA should retrofit auto parking facilities and commercial areas to meet bicycle parking needs. HCDA should develop a program that helps to fund installation of basic bike parking and to honor cyclist and merchant requests for rack installations whenever possible.

Private property developers and new KCDD projects should be required to build bicycle parking. Bicycle parking and facility requirements should be revised and enhanced.

Create a Process to Allow On-Street Bike Corrals

Bicycle corrals remove one to two on-street auto parking bays in exchange for 6-12 bicycle racks that can park between 12 and 24 bicycles.

A standard bike corral located to provide cyclist easy access to a local restaurant
Image from Nelson\Nygaard

Anecdotal evidence suggests that ample bicycle parking is good for business. A 2010 Portland study concluded that businesses close to bicycle corrals perceive that their customers are increasingly arriving by bike.[2] This study reported that 84% of businesses with a bicycle corral in front of their business reported that the bicycle corral enhanced the street. Surveyed business owners reported that an estimated 25% of their customers were arriving by bike.[3] Moreover, a long waiting list for bicycle corrals in Portland suggests that these corrals are in high demand and desired by businesses. The City of Vancouver, B.C. has installed a pilot bike corral with plans to expand the program.

Since 2004, the City of Portland has offered an on-street bicycle parking corral program where local businesses apply for the City to install a bicycle corral in front of their business. To date, this program has installed almost 100 bicycle corrals across the city to accommodate the growing demand for bicycle parking.

HCDA should work with the City and County of Honolulu DTS to establish a business-supported program for permitting bicycle corrals. The program could be business-initiated and should require buy-in from the major businesses fronting a block face. An application process should be established and a fee could be established to help offset costs. (The City of Portland application can be viewed at: http://www.portlandoregon.gov/transportation/34813?a=270766).

Action MA13.5 Work with the City and County to fund and construct the Kaka`ako element of the citywide bicycle network (O`ahu Bicycle Plan)

HCDA's ability to make Kaka`ako a bike friendly area is interdependent with the rest of the city. A great cycling environment allows users to go most places, at most times of day without concern for safety or comfort. A commuter may chose not to bike to work if she knows that her midday trip to the doctor is not on a cycling route that is safe and comfortable.

As HCDA works to develop complete, bicycle friendly streets within its District, it can also advocate for and partner with DTS and other local groups to make urban Honolulu a great place to cycle.

Strategy MA14 Create a safe, comfortable cycling environment in Kaka`ako through facility design and public education

Action MA14.1 Create a destination-oriented bikeway signage and wayfinding system to direct riders to bikeways and major destinations such as hospitals, schools, shopping districts, bike parking, and bike share/rental and repair locations

2 Drew Meisel, "Bike Corrals: Local Business Impacts, Benefits, and Attitudes," (Portland: Portland State University School of Urban Studies and Planning, 2010).
3 Ibid

A successful cycling system is one that is easy and straightforward to navigate. Wayfinding is a critical strategy to help orient cyclists unfamiliar with an area to the safest bicycle access routes and amenities, such as bicycle parking, showers, locker facilities, and other amenities. District wayfinding is addressed in the street connectivity section of this chapter.

HCDA could require developers to include bicycle wayfinding when development parcels are large enough to require internal circulation streets or pedestrian ways. Wayfinding should direct cyclist to bicycle parking, nearby on-street bicycle facilities, and regional multi-use trails.

Action MA14.2 Fund, construct and ensure operation of bicycle-transit centers at rapid transit stations (e.g., Bikestation model), which provide amenities such as secure bike parking, bike repair, and transit information

In addition to installing a variety of bicycle parking types for different time requirements, several major U.S. cities have located full service bike stations at or near transit hubs. The non-profit organization, Bikestation®, operates seven locations. Full service bike stations include bike parking, maintenance and repairs, education centers (at select locations), retail shops, showers, lockers, and changing rooms. According to recent before-after evaluations, bike stations have proven to be effective at shifting motorists to cycling. An average of 33%, and up to 65%, of Bikestation® members who previously drove are now using the Bikestation® facility for the same trip.[4] Instead of simply creating a bike storage room, bike cage, or short-term bike rack, these facilities are successful because they also provide value-added services, such as tire repair and tune-ups, geared toward new riders.

Interior and exterior of a Bikestation® in Washington DC
Image from Bikestation®

Likewise, transit agencies are now realizing the bike station concept's value added to the transit experience. Bay Area Rapid Transit in the San Francisco Bay Area owns and operates four bike stations, including the second largest of its kind in the nation.

Bicyclists accessing Kaka`ako station areas will be offered world class end-of-trip amenities. Offering high caliber end-of-trip amenities will not only increase bicycling rates, but also draw people and business to Kaka`ako. HCDA should work with HART during the design process for the Downtown, Civic Center, and Kaka`ako rapid transit stations to incorporate an enclosed, full service bicycle center.

4 Email correspondence with Andrea White-Kjoss, Executive Director of Bikestation®.

RULE CHANGES FOR KAKA`AKO

- **Regulation MA13.1:** New residential developments: secure, well-lit, visible, indoor ground-floor or below-grade bicycle parking for residents, as well as secure bicycle parking for guests.
- **Regulation MA13.2:** New non-residential development: secure, well-lit, visible, indoor ground-floor or below-grade bicycle parking for employees, ground-floor or below-grade commuter change room with showers and lockers; secure bicycle parking for visitors; prohibit building restrictions on bringing bicycles into buildings.
- **Regulation MA13.3:** Bike parking should be provided at a rate that accommodates a 10% mode share for the building.
- **Regulation MA13.4:** Encourage inclusion of lockers and showers

  All new mixed use and commercial developments above 500,000 square feet should require lockers and showers in the buildings' design. The proposed requirement is as follows:

  - At least 500,000 sq. ft = 4 showers/15 lockers
  - At least 750,000 sq. ft = 5 showers/22 lockers
  - At least 1,000,000 sq. ft = 6 showers/30 lockers
  - At least 1,250,000 sq. ft = 7 showers/37 lockers
  - At least 1,500,000 sq. ft = 8 showers/45 lockers
- **Regulation MA13.5:** Incent inclusion of bike share facilities

The potential for significant new development in the KCDD provides excellent opportunity to design streets, private building exterior spaces, and parking areas to effectively accommodate the spatial requirements of a bike share station. HCDA should build into Mauka/Makai Rules development incentives, reduced permitting fees, and additional TDM related incentives as a reward for establishing public benefits. Mauka/Makai Rules also need to integrate the spatial needs of bike stations into their pedestrian design standards (established in Figures PZ1-7 and FT1-12).

- **Regulation MA13.6:** Amend the Mauka/Makai sign code rules to allow for bike share advertising.

  Advertising will likely figure as a key revenue source that sustains bike share operations. The existing sign code needs to tolerate this type of signage while balancing the parameters for sign size and placement to ensure the public realm remains attractive.
- **Regulation MA14.1:** Require bicycle wayfinding signage

  As part of the district specific multimodal wayfinding with consistent branding, all bikeways and that the routes that lead into them should be furnished with wayfinding signage. Explain rationale and specific changes to existing Rules, if necessary.

DRAFT

AUTO

Automobile Network

The Role of the Automobile

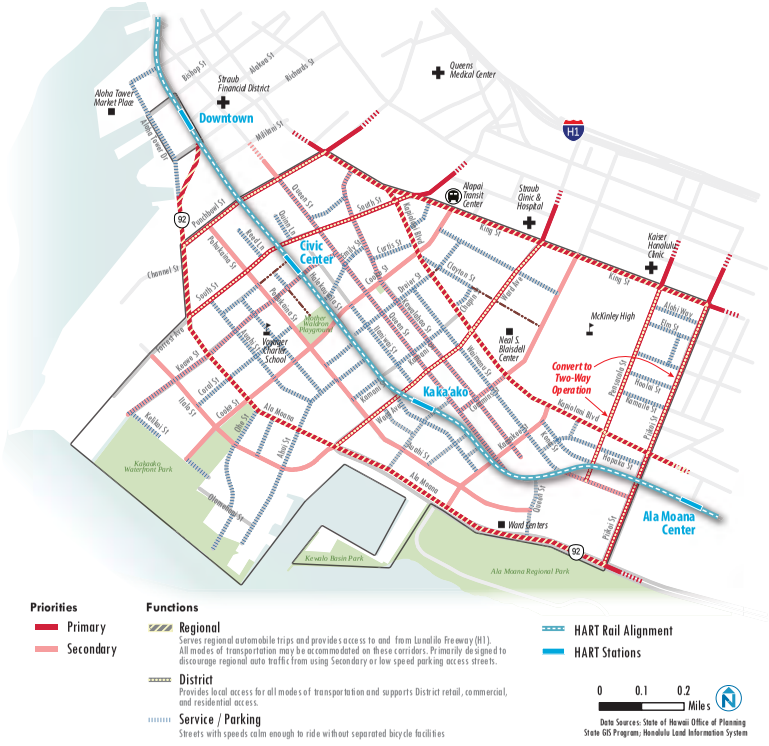
At its best, the automobile provides speed, comfort, privacy and an extraordinary degree of personal mobility. When overused, however, automobiles quickly eliminate all of these advantages, trapping their drivers in congestion along polluted, featureless arterials and highways. To fulfill their promise, automobiles are dependent upon the success of other modes. Paradoxically, it is only by making walking, bicycling and transit more attractive than driving that we can make driving efficient and pleasurable. Even in the most congested corridors, we need only shift 10 percent of motorists to other modes in order for congested streets to flow freely.

The Automobile Network

The automobile network provides guidance for how trips should be distributed across the street system, and how streets should be managed so that they function well according to their purpose. Commercial boulevards that serve a whole region should be operated so that they serve regional trips more time competitively than district avenues and district streets. District streets, on the other hand, should be designed for local traffic and for speeds low enough that bicyclists and pedestrians can mix safely with cars.

HCDA proposes conceptual modifications to the street designations established in the Mauka and Makai Area Plans. These are described in Chapter 6 along with guidance on how different streets should be designed and managed to accommodate automobiles. Recognizing that one function of streets is to carry automobile traffic, Figure 5-8 shows the priority given to autos on various district streets, including future street connections. These are not meant as official street designations, which are addressed in Chapter 6, but rather an illustration of the role each street plays in local and regional auto mobility and for providing access to parking and loading for trucks.

Strategy MA15 Manage traffic to allow regional mobility and local access while limiting impacts to livability in the KCDD



Honolulu is consistently rated as one of the worst cities in the nation for traffic congestion and driver delay. Traffic analysis conducted for the Mauka Area Plan indicated that build out of the preferred land use scenario would lead to more traffic congestion on district streets. Traffic is unavoidable and congestion in the KCDD is likely to worsen. This plan recognizes that urban congestion is inevitable and the successful realization of land use, urban form and placemaking, economic, and cultural goals will lead to greater travel demand. Continuing to use traditional vehicle level of service measures as the benchmark for transportation success will require sacrificing other critical goals.

Many regional through trips are made on Kapiolani
Image from Nelson\Nygaard

DRAFT

Figure 5-20 Street Priorities for Vehicular Travel

Building on the philosophy that transportation is only a means to support the broader social, economic, and environmental goals of the Kaka`ako community, HCDA adopts an approach that recognizes congestion will occur and is a integral component of a vibrant and bustling urban district, that transition to multimodal mobility and access is the only means to support KCDD land use goals, and that through-traffic can be managed to minimize impacts on the KCDD community.

Action MA15.1 Strive to maximize the efficiency of the existing automobile infrastructure and manage major boulevards and commercial avenues so that they provide shorter travel times than parallel residential avenues or mixed use streets

Chapter 6 (Complete Streets) details design strategies to ensure that streets within the KCDD that carry major regional through traffic – both autos and freight – are designed to balance access to the district with the need for efficient through movement. Local district streets that parallel major

regional through streets should be designed to provide local access and prioritize pedestrian quality, ensuring that through travel is more convenient on regional streets.

Action MA15.2 Develop a network of local access streets to promote delivery, parking, and loading off primary mobility streets

Kaka`ako's boulevards, avenues, and district streets will be required to carry more people as the district grows. Managing uses that require curb space and driveway accesses that cross bicycle facilities and sidewalks is a key strategy to ensure key mobility streets can be maximized for the purpose of moving people to and through key locations in the KCDD. HCDA will work with developers to encourage new local access streets, alleys, or shared streets that allow critical delivery and loading functions to occur internal to development blocks or on streets designated for local access and delivery (see Chapter 6 street designations).

Local delivery and parking access streets like Koula Street should be designed to accommodate large vehicles while respecting the walkable design of KCDD.
Image from Nelson\Nygaard

Strategy MA16 Provide a safe environment for all road users

Ensuring our streets are safe should start with a consideration of our most vulnerable users. If an keiki or kupuna can't walk safely on a street, is that the type of facility we want to support and continue to build? If a 60 year old doesn't feel as comfortable riding a bicycle as a 25 year old, have we provide a fair and equitable opportunity for community mobility?

Research is increasingly showing that city's with streets design for pedestrians and bicyclists, as well as motorists are safer overall. A 2011 study by Wesley Marshall and Norm Garrick (*Evidence on Why Bike-Friendly Cities Are Safer for All Road Users*) evaluated bicycle and pedestrian safety in 24 cities that varied significantly in their level of bicycle infrastructure investment. They found that those with higher levels investment had less pedestrian and bicycle fatalities per capita. This is attributable to a number of interrelated factors, including increased driver alertness to non-motorized travelers, better visibility of pedestrians and bicyclists traveling in large numbers, slower automobile speeds, lane width reductions from added bicycle facilities, higher intersection/traffic control density, and the effect of bicycle and pedestrian infrastructure as traffic calming.

AGING POPULATIONS & PEDESTRIAN SAFETY

According to the FHWA, the rate of pedestrian deaths is almost 1.7 as higher for people 70 and older combined than for those younger than 70 combined.

In short, complete streets within well connected networks that are carefully designed for pedestrians and bicycles as well as vehicles increase safety and enhance community livability. Chapter 6 provides design guidance how to design safer streets for all roadway users

Action MA16.1 Use traffic controls and design features to encourage motorists to drive appropriately for the type of streets they are using

More detail on complete street strategies that promote user safety are provided in Chapter 6 – Complete Streets.

Action MA16.2 Manage automobile speeds on major boulevards and district avenues to ensure comfort and safety for other roadway users

More detail on complete street strategies that promote user safety are provided in Chapter 6 – Complete Streets.

Strategy MA 17 Encourage a more sustainable transportation system

Since autos and buses will continue to move the majority of trips in and out of Kaka`ako for years to come, improving the efficiency and reducing emissions from those vehicles is important. Hawai`i and the Kaka`ako community are well positioned to be national leaders in low-emissions transportation technology. This move is of heightened importance in Hawai`i given its high level of reliance on imported fossil fuels for all mobile and stationary energy needs. To help make the shift from petroleum-based fuel, the state partnered in 2008 with the U.S. Department of Energy to create the Hawai`i Clean Energy Initiative (HCEI). A goal under this initiative is to reduce oil consumption by 70 percent by 2030 (30% from energy efficiency, and 40% from renewable energy). HCEI estimates that attainment of these goals will keep a substantial amount of the nearly $6 billion spent annually on imported oil here in the islands, creating jobs and benefiting the economy.[1]

Locally, HCDA can work with its partners to help realize these goals.

Action MA17.1 Promote public and private efforts to transition to clean vehicle fuels and technologies—especially emissions-free electric power

HCDA can provide necessary political support (infrastructure, policy, planning, etc.) for private electric vehicle adoption, adoption of next generation biofuels, and development of the supportive infrastructure.

Since Hawai`i's electric generation is largely from fossil fuels, optimizing the environmental value of increased electric vehicle use will require renewable energy powered charging stations. While most public Electric Vehicle (EV) charging stations operate from the power grid, there are solar powered stations on the market. SolarCity is marketing its solar energy systems along with electric car charging installations.

Solar powered charging station in Rio De Janiero
Image from Andricos

HCDA can also support the development and local adoption of biofuels, including aggressive near-term adoption of the best first-generation biofuels (sugar ethanol and equivalents), and development of second-generation bio fuels such as cellulosic ethanol (which may have life-cycle GHG emissions that are 70% lower than petroleum).

1 http://energy.Hawai`i.gov/wp-content/uploads/2011/09/updated-EV-Guidebook_FINAL_Sep-25_2012.pdf

The KCDD is home to the Hawai`i Center for Advanced Transportation Technologies (HCATT). HCATT has organized public/private partnerships between the federal government and private industry to develop advanced low emission and zero emission vehicles centered on electric drive technologies. Over the years, HCATT has been awarded more than $40 million in federal funds, which was matched by another $23 million from private partners. It is a national leader in the development of electric and hydrogen fuel powered vehicles.

The City of Honolulu installed public EV charging stations include one in at the Neil Blaisdell Center.
Image from City of Honolulu

ELECTRIC VEHICLE CHARGING STATION REGULATIONS

Hawai`i has among the most aggressive laws requiring EV charging stations in publicly available parking facilities. All parking facilities that are available for use by the general public and include at least one hundred parking spaces must designate at least one parking space specifically for PEVs by July 1, 2012, provided that no parking spaces required by the Americans with Disabilities Act Accessibility Guidelines are reduced or displaced. Spaces must be clearly marked and equipped with electric vehicle supply equipment (EVSE). Owners of multiple parking lots may designate and install EVSE in fewer parking spaces than required in one parking lot, as long as the total number of aggregate spaces for all parking lots is met. (Reference Senate Bill 2747, 2012, and Hawai`i Revised Statutes 291-71 and 291-72)

Action MA17.2 Develop "plug-in" electric vehicle charging stations throughout Kaka`ako

Hawai`i is a national leader in adoption of EV technology. Several groups have targeted Hawai`i for early ventures in EV charging due to excellent conditions for EV operations. The Hawai`i Department of Business, Economic Development and Tourism operates the Hawai`i EV Ready Grant program to help support electric vehicles infrastructure development. This program helped fund a public available charging station at the Neil Blaisdell Center in the KCDD among other locations around the City.

To spur the adoption of EV in the Honolulu metro area, Honolulu Clean Cities developed a Guidebook for Commercial Electric Vehicle Charging Station Installation that provides a comprehensive guide to planning, permitting, installing, and operating EV charging stations.

RULE CHANGE FOR KAKA`AKO

HCDA does not currently regulate the design of traffic facilities in the public right-of-way. Regulatory changes are focused on encouraging developers to provide infrastructure that would help private consumers transition to more sustainable vehicle types.

- **Regulation MA17.1:** Related to the inclusion of EV stations, HCDA will develop rules to support HRS 291 requirements to include at least one EV charging station in publicly accessible parking garages over 100 stalls.

DRAFT

6 COMPLETE STREETS IN KAKA`AKO

Standard Street Elements

Planters and street trees

Bike parking

High visibility crosswalk markings

ADA-compliant curb ramps

Curb extensions (with parking)

Far-side transit stops (on transit streets)

Street furniture

Pedestrian-scaled lighting

Clearly defined sidewalk zones *(using paving techniques, special materials, etc.)*

Interpretive design and public art

Pedestrian countdown signals

Redevelopment setbacks

Transit-bicycle integration features (on priority transit and bicycle streets)

Optional Street Elements

DRAFT

Pedestrian priority signalization (Barnes Dance)

Pedestrian refuge island

Raised median/Center turn lane

Bike Share Stations

Rapid flashing beacons

Bus bulb out

In-street bicycle corral

Transit stop-building integration

Dedicated bicycle facilities (bike lanes)

On-street parking

Guideway column

Dedicated bicycle facilities (cycle track)

Stormwater management

Bollards

Bicycle facilities (sharrows)

Mid-block crossing

Dedicated loading zones

Vertical deflection (e.g., speed humps)

Transit lanes

Pro-time parking/ Peak hour bus lanes

Transit lanes

6 COMPLETE STREETS IN KAKA`AKO

CREATING MULTI-PURPOSE STREETS

As the famous urbanist, Jane Jacobs reminds us, "nobody enjoys sitting on a stoop or looking out a window at an empty street. Almost nobody does such a thing. Large numbers of people entertain themselves, off and on, by watching street activity." Streets are the lifeblood of an urban community. They don't simply provide a way to travel, but are our largest public space, providing the "living room" of any neighborhood–a place to socialize, recreate, and to move about.

The relationship between buildings and the street is the essential linkage between residents and their community. Done well, this linkage creates a vibrancy that will encourage engagement, health and quality of life in Kaka`ako. Streets designed primarily for the private automobile deliver monotonous, and unsecure public spaces that discourage public interaction. Most streets in Kaka`ako are currently auto-oriented – the types of places a pedestrian would hurry to pass through rather than linger and enjoy.

This chapter provides a framework and principles to develop a more balanced, vital, and community-serving street system in the KCDD.

King Street in 1930 accommodated pedestrians, streetcar, automobiles, and even bicycles. This corridor once operated as a slow, pedestrian-oriented street.

DESTINATION-BASED COMPLETE STREETS

Streets are the backdrop of daily life and commerce in Kaka`ako. Today, people use the District's streets to get to work, park, walk to the bus, or to make a delivery. Few people chose to walk the streets for non-utilitarian purposes. When the HCDA TOD Overlay Plan is realized, a key measure of success will be the number of people that come to Kaka'ako to enjoy its streets. Making KCDD streets livable will require providing opportunities for social interaction and commerce, developing spaces for leisure and recreation, as well as improved functionality for all users. Below are some examples of exemplary destination streets that expand the traditional definition of "street."

Kalakaua Avenue, Waikiki, HI

WHY COMPLETE STREETS FOR THE KCDD?

At the most practical level, Complete Streets in the KCDD are necessary to accommodate much greater number of residents, workers, and visitors to the District as surface parking lots and one-story commercial buildings are transformed to residential towers, retail, and busy civic uses. Viewed more broadly, the streets of Kaka`ako are the connective tissue that, if designed well, will make a mere collection of buildings into a vital urban community.

Complete streets in the KCDD will:

Ensure safety. Streets that manage auto speeds, and provide sidewalks, medians, well-designed crossings, amenities for mobility impaired users, separated bicycle facilities are proven to be safer for pedestrians, motorists, and bicyclists alike.

A calmed street in Vancouver, B.C.
Image from Dan Burden

Encourage active lifestyles. Complete Streets in the KCDD can help support a healthy citizenry and reduce health care related costs. Building streets that support pedestrian and bicycle travel both enables *and encourages* greater levels of physical activity and active transportation.

Extend transportation choice. Providing safe and convenient transportation choices to citizens is an important goal for all communities. Complete Streets is a democratic design and policy framework that ultimately extends resident and employee mobility options. Doing so means KCDD can to meet the needs of different types of users and provide alternatives to traffic congestion and costly trips to the gas pump. Providing a diverse range of time-competitive travel options is particularly important for the large inclusionary housing market planned for the KCDD.

A shared street in San Francisco, CA.
Image from Nelson\Nygaard

Stimulate and support the local economy. Complete Streets not only expand opportunities to access local retail and employment sites, but also nurture the local economy. Often referred to the "green dividend", enabling walking, bicycling, and transit use can redistribute roughly $9,000 of a person's annual disposable income from operating and maintaining a car to local retail, entertainment, and restaurant expenses.

A main street in Santa Barbara, CA.
Image from Nelson\Nygaard

Create places and destinations. Complete Streets reorganize underutilized roadway space toward economic and social uses. The TOD Overlay Plan envisions a Kaka`ako that is a major destination in Honolulu, not just as a point between downtown and destinations Diamond Head of the district (Ala Moana and Waikiki). Complete Streets provide the gateway to Kaka`ako, but are also the attraction.

Lower the cost of street maintenance and construction. Building new streets or reconstructing existing streets using Complete Streets principles is more economical than constructing auto-centric roads. Complete Streets move more people with less space, thereby limiting the need for future roadway expansion and ensuring more space is dedicated to civic uses. Increased walking and bicycling reduces wear-and-tear on roads, which can extend the lifetime of Kaka`ako's streets and reduce annual preventative maintenance costs.

Improve transportation efficiency & network capacity. Complete Streets improve roadway efficiency and capacity for all users by moving more people in the same amount of space. More informed metrics of success that measure person carrying capacity rather than traditional vehicle-oriented performance measures are often used to determine successful use of limited roadway space.

Automobiles require much greater capacity to move the same amount of people than buses, bicyclists, and pedestrians.
Image from City of Muenster, Germany

Building Community, Not Auto-Capacity

The street network serving Kaka`ako includes both highly congested regional arterials such as Ala Moana Boulevard, Kapiolani Boulevard, and King Street. On the other hand, local district streets like Queen Street, Cooke Street, and Ward Avenue are underutilized, with more pavement width than is necessary to carry current traffic volumes. As currently designed, they don't support active retail uses, or an active and healthy street life.

Many streets designed in the last 50 years were designed around a single principle – the need to minimize auto traffic congestion. It is important to understand that congestion is not simply the result of a road that does not have enough capacity for cars, but is also a result of overreliance on one mode (auto travel) over other modes (walking, bicycling, and transit use). A more important measure of the success of a street grid is the person-moving capacity, considering all modes of travel. Moreover, as roadway capacity is added to address congestion, space is taken away from bicycling, walking and fast moving transit. Adding roadway capacity may reduce traffic congestion in the short term, but ultimately, new capacity attracts new auto demand, and the cycle begins again.

Focusing entirely on auto capacity is counter-productive to HCDA's efforts to develop a vibrant, pedestrian-oriented, urban district—even as Kaka`ako faces exceptional population and employment growth. A multimodal approach to street design and operation is the solution to simultaneously

address congestion, maximize use of existing right-of-way, help build a transit-oriented community, and facilitate district access.

To implement this multimodal approach, HCDA will adopt a Complete Streets framework and rethink how street performance is measured. Doing so will ensure the KCDD:

- Becomes a mixed-use district that allows residents to meet their needs locally, reducing the need to make cross-island or inter-neighborhood trips by car. This requires an integrated land use strategy (see Chapter 3).
- Makes the most efficient modes of transportation – walking, biking, transit, carpooling, and car-sharing – more attractive than driving alone. Making these modes more competitive allows the street network to move more people and unlock transit efficiencies.

Vanderbilt Avenue in New York City is a true multimodal street that expands person capacity while strengthening the retail corridor.
Image from Paul Carlos

- Influences mode choice by reducing or eliminating parking subsidies (see Chapter 8 for more information on parking management).
- Allows roads to be congested during peak demand hours even as the district increases density. Alleviating congestion with roadway widening negatively impacts all other modes, as well as impacting downstream signals or internal neighborhood streets. Adding capacity typically encourages "latent demand"[1] for roadway space, resulting in increased and prolonged congestion issues.

1 New vehicle trips enabled by the temporary lessening of delay.

RETHINKING CONGESTION

Congestion is an inevitable reality of urban redevelopment in the KCDD, and catering to more auto trips will only degrade the multimodal transportation system, reduce user safety, and—perhaps most salient to HCDA—limit the district's quality of redevelopment.

What may be seen as counter-intuitive, congestion is a necessary component of a strong, dynamic economy where people move between their home and job site, residents and visitors access retail to spend their discretionary income, and freight facilitates commerce. Traffic congestion is merely a sign of economic success. In fact, the only successful cases where congestion was eliminated through increasing roadway capacity are Rust Belt cities facing economic decline and population loss.

Image from Flicker Casey Serin

Strategy CS1 Preserve current levels of auto mobility on major regional thoroughfares

The KCDD can accommodate substantial amounts of residential and commercial growth over the next 25 years and still provide streets that comfortably move people between district destinations. To achieve the optimal balance between growth and people movement, two key actions must be achieved.

Action CS1.1 Increase district access using spatially efficient modes such as walk, bike, and transit

With the addition of new street and pedestrian connections proposed in Chapter 5, Kaka`ako's street network contains the necessary person capacity to keep the KCDD moving and bustling with life. In order to achieve this, clear street design principles and multimodal street types should be established to guide design decisions and strategically reprioritize KCDD streets for the movement of people on foot, on bicycles, and on transit.

Most destinations in the KCDD are within a walkable distance from each other. Kaka`ako should be designed to be a true pedestrian district.
Image from Nelson\Nygaard

Action CS1.2 Focus on the right kind of development, in the right locations, with the right system, parking, and demand management tools in place

Redevelopment of TOD sites, master planned sites, and other areas of KCDD must simultaneously employ strategies that reduce auto trip demand, while establishing district streets that are walkable and complete. The end result should be to maintain or slightly increase auto access compared with current levels while accommodating most new trips on foot, by bicycle, on transit, or other sustainable travel options.

Strategy CS2 Limit right-of-way expansion to new street connections, redevelopment setbacks, and additional dedications for special pedestrian realm uses

For the most part, existing KCDD streets are built out. Limited land exists to widen roads to accommodate single-occupant vehicle demand, transit only lanes, or dedicated bicycle facilities. Thus, roadway improvements should generally occur within the existing right of-way and should never narrow the existing pedestrian realm, *even to accommodate turn lanes*. Depending on the corridor, new modal facilities may have to come at the expense of a travel lane or parking based on a particular street's land use context and function.

COMPLETE STREETS: A PRIMER

WHAT ARE COMPLETE STREETS?

Complete Streets is a shorthand term for streets that have been planned, designed and operated with consideration to needs of all travelers including people of all ages and abilities whether they are walking, riding a bicycle, taking public transportation, or driving. Complete Streets offer an overarching strategy for communities to meet their economic, social, and environmental goals. Every street, the land uses it supports, and topographic context differ; actual implementation of Complete Streets principles will change in the local context. The only constant tenet of Complete Streets is the provision of safe facilities for all users.

Complete Streets should never be formulaic. There is no one size fits all design.

The term Complete Streets in the context of the KCDD TOD Overlay Plan means both a process and a product. The process is the steps and decisions that lead to a specific street or intersection design; the product being the on-the-ground result of this process and the range of street designs that can be used on similar street types in Kaka`ako.

Most importantly, Complete Streets are a partnership between the agencies that plan, design and maintain them – including the HCDA, the City and County of Honolulu DTS, and HDOT – and the communities and businesses that they serve.

Complete Streets are not:

- Focused solely on auto mobility
- Focused solely on one street—a Complete Network is as important as a Complete Street!
- A specific design prescription
- A mandate for an immediate retrofit
- A silver bullet solution for all transportation issues

When should Complete Street designs and principles be applied?

- New street construction
- Street or sidewalk reconstruction
- Street or sidewalk rehabilitation
- Street resurfacing
- Maintenance
- Operations
- When new development is required to build street and pedestrian facilities
- Public-private ventures

Most Complete Streets projects in KCDD will be retrofits of existing roadways, like this bikeway retrofit of Third Street in Long Beach, CA.
Image from LA Streetsblog

Exceptions to this rule include use of redevelopment tools such as setbacks or dedications for specific uses like bike share stations and new narrow street or pedestrian only connections.

INTEGRATING LAND USE AND STREET DESIGN

The many benefits of locating new development near high capacity transit are described in Chapter 3 of the TOD Overlay Plan. Based on transit-oriented development literature, by locating development near future HART stations and other frequent transit service hubs, the KCDD's peak period vehicle trips can be cut by roughly 20-40%, compared to the traffic it would generate elsewhere.

Portland's Pearl District integrates a mix of dense commercial and residential land uses with narrow streets, wide sidewalks, and frequent transit service (streetcar and bus).
Image from Nelson\Nygaard

The TOD Overlay Plan concentrates future growth in the KCDD neighborhoods that are within comfortable walking and bicycle distance of HART stations, destinations, and services. In addition, the plan establishes strategies to improve pedestrian and bicycle connectivity and safety, thus making walking and bicycling attractive, safe, and efficient modes of travel. The combined effect of rail proximity, integrated land use development, a high quality active transportation network, a wealth of local businesses proving needed personal services, and mobility alternative to the private auto (i.e., bicycle sharing, car sharing, etc.) will reduce per capita vehicle trip making.

Strategy CS3 Integrate Land Use and Building Form with Street Design and Programming

Designing Complete Streets requires attention to context of the street and the land uses it serves. Street design must integrate the needs of the surrounding environment, built or natural. Main streets often feature on-street parking to support street retail uses and accommodate business access for driving customers. Dense, urban streets feature expansive sidewalks with street furniture to accommodate high pedestrian volumes, workers seeking lunchtime or post-work repose on a bench, and even space for food carts or other uses that make a district street lively and active.

Each KCDD street should be designed and operated to support the land uses it immediately serves. Land uses are defined in Chapter 3 of this plan. Take Commercial Avenues as an example. Commercial Avenues, such as Ward Avenue, Pensacola Street, and Piikoi Street, need to attract and accommodate a customer base by providing reliable vehicle access, but ensuring that priority is given to the pedestrian. This become particularly important as new retail orients to the street, rather than being setback behind surface parking. Commercial avenues provide access by a variety of modes and benefit from on-street parking to provide access for short-stay customers and to buffer busy sidewalks from traffic. Busy commercial areas in Kaka`ako should prioritize transit and pedestrians.

STREET DESIGN PRINCIPLES

A two-part process was used to establish a conceptual Complete Street typology:

- Establish a balance between four basic design principles or factors – livability, access and mobility, demand, and safety, described below
- Determine modal priorities to allocate limited right-of-way

The four principal design factors used to develop the Complete Streets typology include **Livability**, **Access and Mobility**, **Demand**, and **Safety**. These factors ensure the Complete Streets typology organizes a calculated design response to the specific, local context of each street. Future work by the HCDA will develop detailed design guidance and local application of the Complete Street types defined in this plan.

Livability. Livability is a central theme of the KCDD Overlay Plan and it is interconnected with the three other design principles. Livability requires that the broadest possible array of users are being served: motorists, pedestrians, bicyclists and the auxiliary needs of land uses that may extend into the street right-of-way. Livable street design uses lane configurations and dimensions that balance different street uses and ensures aesthetics, plantings, and furnishings which transform a streetscape into a usable public space.

Demand. The demands that redevelopment will have on KCDD streets must be addressed in the design of district streets. Neighborhoods within the district that will experience the largest increases in residential and commercial growth need to be supported by streets that can move the most people, rather than the most cars. Assuming that the right-of-way of streets will remain constant, the combination of redesigned multimodal streets and new street connections will need to carry the load of additional travel demand within and through the KCDD.

Access and Mobility. The City's current functional classification typology is based on defining different streets with respect to their general function in the transportation system—consisting of minor arterials, collector streets, and local streets. This remains important for the street types defined in this chapter, with cross sections designed to meet access and mobility needs.

Safety. Safety is the most important factor when designing streets. Some streets in particular feature adjacent uses or have certain user needs that require special safety accommodations. Accommodating mobility as described above does not require designing for high speed traffic; keeping pedestrians and bicyclists safe often requires slowing traffic down. Transit facilities (including bus stops and future HART stations), schools, hospitals, religious sites, and other community-oriented land uses that generate pedestrian traffic often require special treatments or even a cross section design that emphasizes narrower lanes and design elements that further reduce vehicle speeds. This is most critical at intersections and mid-block crossings, where conflicts between pedestrians, bicyclists and motorists are at their highest concentration.

Designing for Multiple Modes

Designing a complete, truly multimodal street requires proper allocation of street space and investment for different modes in the KCDD. Figure 6-1 reaffirms the "Pedestrian First" hierarchy described in Chapter 5.

This hierarchy represents a major change in thinking in Honolulu. While such change is often met with frustration at first, motorists who drive sensibly, slowly, safely, and respectfully are rewarded in a Complete Streets approach. A Pedestrian First hierarchy adheres to the performance standard of optimizing streets to move people, rather than vehicles. The following section provides basic street design principles for each mode in the Pedestrian First hierarchy.

Figure 6-1 KCDD Modal Hierarchy

Pedestrians First

People make cities great. Success of the TOD Overlay Plan will mean a major increase in pedestrian traffic in the KCDD. Most trips begin and end on foot; in dense mixed-use urban neighborhoods many trips are made solely on foot. The TOD Overlay Plan envisions a KCDD filled with residential and commercial life. Developing a world-class pedestrian environment is a key to the implementing this vision.

A pedestrian-first design is a safety-first design, designed with the intent of keeping pedestrians of all ages and abilities feeling safe and comfortable on the street. Pedestrians, particularly those that are old, adolescent, or experiencing a mobility impairment are vulnerable to injury and death by vehicles. Be it a sidewalk, crosswalk, pedestrian signal, or transit passenger facility, all pedestrian facilities must comply and exceed design requirements established by the Americans with Disabilities Act (ADA) as HCDA strives to retrofit Kaka`ako's streets as universally accessible.

BALANCING THE DESIGN FACTORS

The four design factors on the left guide the development of representative cross section options for each street type (displayed in street type sheets later in this chapter). One of the four design factors will serve as the predominant consideration for each cross section.

This is not to suggest that this is the only factor that should be considered in street design, but it does emphasize this one factor as the reason a given type of street is distinct from others (and therefore why a variety of cross sections is necessary to respond to the complex land use environments in the KCDD).

	Primary Factor	Ancillary Factor
Livability		X
Access & Mobility	X	
Demand		X
Safety	X	

Note: Safety is a primary design factor for all streets.
Source: Nelson\Nygaard

Image from Nelson\Nygaard

The Pedestrian First focus of the KCDD is particularly supportive of our island culture. There is a strong focus on multi-generational family living on O`ahu. The ability of the KCDD to support multi-generational families to live comfortably in an urban environment is paramount and must be reflected in the design of Kaka`ako's streets and public spaces.

Image from Nelson\Nygaard

Transit-Oriented

Buses and, eventually, rail rapid transit will extend the range of activity for Kaka`ako's residents and vastly improve the speed and quality of access to and from the KCDD. Premier access to transit is and will increasingly be a selling point for people relocating to the KCDD. Bus operations and access to transit must be considered in the design of the travelway—for bus/rail access, as well as for those that walk, bike or get dropped off at the station. Transit's influence on street design include lane width, intersection design (corner radius), transit-priority lanes (and queue jump lanes), signal timing (often adjusted to give transit an advantage, transit-signal priority), pedestrian access (street crossings at bus stops), sidewalk design (making room for bus shelters and large passenger queues), and bus stop placement and design (farside/nearside at intersections, bus pullouts, or bulb outs). Access and volumes at HART stations must interface well with street design, especially where there are large volumes of pedestrians. These considerations are detailed in Chapter 7.

Image from Nelson\Nygaard

Bicycle Streets for Different Bicyclists

Bicycling is a critical element of fostering safe and livable streets in Kaka`ako. Bicyclists, along with pedestrians, are vulnerable users who benefit from reduced traffic speed and dedicated facilities. Because bicyclists vary in skill level, age, and comfort levels (as they relate to speed and operating behavior), KCDD must provide a broad variety of facility options to allow the range of current and future bicyclists to comfortably reach their destinations in the district and beyond. This includes shared lanes, bike lanes, buffered bike lanes, cycle tracks, off-street multi-use paths, and the assortment of intersection treatments that enhance safety at major and minor junctures.

In addition to the traditional notion of bicycles as a transportation and recreational tool, bicycling is a social activity, and people often ride side-by-side or in groups. Likewise, bicycles are increasingly being used in urban environments to make local deliveries, possibly addressing a missing link in Kaka`ako's freight network. The design must take into account the diversity of activities and potentially types of bicycles being used in Kaka`ako (e.g. a standard road bike is distinguished by vastly different spatial needs than a larger cargo bike).

In the end, bicycle facility selection must consider street conditions including available right of way, parking availability and turnover, bicycle volumes, auto volumes and speeds, and freight and transit volumes and routes, among others. Refer to the North American City Transportation Official's (NACTO) Urban Bikeway Design Guide for specific criteria.

Image from Nelson\Nygaard

Sensible and Balanced Private Auto Accommodation

Private autos are an integral part of both the regional and central Honolulu circulation system. Even though private autos are considered the lowest priority in KCDD's modal hierarchy, they still must be accommodated, albeit within the constraints of lower speeds and safer, more observant driving. More flexibility is given to large delivery trucks, as the efficient delivery of goods is paramount to supporting a healthy economy and meeting needs of KCDD's current and future businesses.

FREIGHT AND DELIVERIES

Freight and goods delivery is vital component part of any urban city's street network. Freight is not in the modal hierarchy because goods movement may be carried out by a variety of modes, including:

- Trucks (auto)
- Bike trailer or cargo bike (bicycle)
- Delivery person (pedestrian via auto)

Currently, most freight movement is delivered by medium- and large-sized trucks. Thus, mode priorities established for specific streets in Chapter 5, especially those within light industrial areas and along streets that carry regional through traffic, consider larger truck vehicles, which suggest slightly higher priority for automobiles.

As a working district with many light industrial uses, light-freight and delivery functions will continue to be of critical importance and considered in design and street priority.

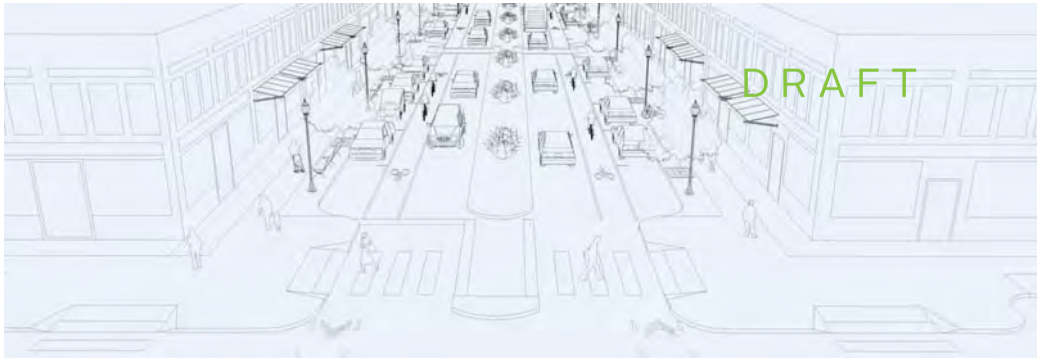

Image from Peter Hvizdak

GENERAL MULTIMODAL DESIGN PARAMETERS

The table below presents basic design considerations that are applied contextually when developing Complete Streets. Additional detail beyond these considerations will be established in KCDD Complete Street Design Guidelines to be developed through a future process.

Element	Design Consideration/Parameter
General purpose travel lanes	Ten to twelve foot travel lanes can safely and effectively accommodate vehicle travel. A travel lane on truck or bus route should be 11-12 feet wide in the travel lane typically used by buses and large trucks (almost always the outside or curb-tight travel lane).
On-street bicycle dedicated facilities and buffering	The widths of dedicated bicycle facilities depend entirely on street conditions such as travel speeds and volumes as well as the anticipated level of demand for each particular facility. Generally, bike lanes should be no less than 6 feet wide. Striped buffers are strongly recommended to be paired with bike lanes, particularly on high speed/volume streets (necessitating a 2-3 foot buffer between the bike facility and the adjacent travel lane) or with on-street parking (necessitating a 1-2 foot buffer from the center of the parking lane stripe). Cycle tracks should range between 6-7 feet in width (not including a 3-foot minimum raised median or bollard-protected striped buffer). If the cycle track is to operate bi-directionally the width could range between 10 and 14 feet with a minimum 3-foot raised or striped buffer.
Parking	Generally, parallel parking stall widths are recommended to range between 7.5 and 8 feet. Seven-foot parking stalls are acceptable in low density residential environments. The combination of travel and parking lane next to one another should be no less than 18 feet in width (11-foot travel and 7-foot parking or 10-foot travel and 8-foot parking).
Shared lanes	Shared auto/bike lanes should be targeted for widths of 12 feet, but may be as low as 10 feet wide. Placement of shared lane markings should be located appropriately to allow for safe passing movements by motorists and to locate cyclists outside of the door zone along streets with on-street parallel parking.
Transit stop accommodations	Street design should optimize operational efficiency, rider convenience, multimodal safety. Street types that accommodate on-street parking should integrate bus bulb outs—large curb extensions that house bus stops in order to extend passenger comfort, expand pedestrian capacity, and allow for inline boarding. In general, bus pull-out lanes are not recommended here as they are expensive (additional right-of-way costs), infringe on the pedestrian realm, and are inefficient for bus operations. Buses experience greater difficulty and delay re-entering traffic when required to use pull-outs. Establishing stops at the far side of intersections is also recommended so that street and intersection design can be consistent throughout Kaka`ako. Far-side stops: • Reduce intersection delay for right turn movements • Minimizes operational delay for buses by allowing a bus accelerating after making a stop to continue moving and not have to wait through a signal cycle. • Eliminate the chance of multiple threat collisions with passengers departing the bus and crossing the street.
Bicycle-bus facility integration	Where bicycles and transit vehicles interact at transit stops, dedicated bicycle facilities should wrap around transit shelters or transit shelters should extend into the parking lane. This configuration should only occur at far-side transit stop locations, never at near-side stops. Mixing zones (behind the transit shelter) should be designed with continental crosswalk markings and/or special paving features. Signs should warn pedestrians and bicyclist of these mixing zones. In addition, transit shelters should be transparent to enhance visibility between pedestrians and bicyclists passing around the shelter.
Curb extensions at intersections and mid-block locations	Any street with on-street parking should include curb extensions at intersections. A curb extension should be 1-2 feet less the width of the parking lane. Where a curb extension opportunity exists on a street with a cycle track, pedestrian refuge islands will serve as the "extension". Where the curb extension occurs at a mid-block location (to facilitate mid-block crossings), the facility should extend one foot past the parking lane to preserve sightlines for pedestrians and motorists.

DRAFT

COMPLETE STREET TYPES

Streets in Kaka`ako serve many purposes. Kaka`ako streets move pedestrians of all ages and abilities, transport and store bicycles, keep transit flowing and provide comfortable places for passengers to wait and board, transport freight and provide space for deliveries, and move and store autos. Streets are an integral component of the district's urban fabric. They make up large portions of the neighborhood serving as open space for socializing and recreation as well as civic and economic space. A Complete Street typology will help balance competing demands on Kaka`ako streets and will ensure that the design of streets builds on and supports the TOD Overlay Plan's goals for livability and neighborhood quality of life.

Strategy CS5 Establish a Complete Streets Typology and Design Guide

This strategy suggests a framework for KCDD street and intersection types and supports further development of specific Complete Steets guidelines for the various streets in our district. Street types should be developed based on the relationship of adjacent land uses to the street (see Chapter 5 for more information on street priorities). This typology offers detailed guidance for the needs of each mode, including walking, bicycling, transit and automobiles. Some streets, like Kapiolani Boulevard, must allow transit to maintain reliable, competitive operations and to allow vehicles to progress at a rate that ensures through-trips are not diverted to internal district streets and commercial avenues. While all street types must accommodate pedestrians comfortably, some streets will require a great level of concentrated investment to ensure pedestrian safety and comfort along and across the street can be achieved.

The street types described below establish the basis for setting design parameters by land use context (summarized in Figure 6-3) and provide guidelines for managing difficult multimodal trade-off decisions. Future street design guidelines should identify the specific

STREET TYPES IN THE KCDD

The street types listed below frame the design of KCDD streets and should be used to determine which design elements are appropriate for the district various land use contexts.

- **COMMERCIAL BOULEVARDS AND AVENUES**
  - Regional Boulevard
  - Transit Boulevard
  - Commercial Avenue
- **DISTRICT STREETS**
  - Residential Street
  - Commercial/Light Industrial Street
- **LOCAL STREET**
- **DISTINGUISHED STREETS**
  - Rapid Transit Street

design treatments that will be applied to these street types. Figure 6-2 designates a conceptual street type on each KCDD street.

Further development of the KCDD Complete Street typology and specific design guidance will consider roadway design standards and the existing system of functional classifications upheld by the City and County of Honolulu Department of Transportation Services (DTS). The development of Complete Street design guidance will be completed in close coordination with the DTS, Hawai`i DOT, emergency service providers, and other district and regional stakeholders to ensure balanced, context-sensitive design is achieved.

Figure 6-2 KCDD Complete Street Typology

Figure 6-3 KCDD Street Type – Land Use Relationship

STREET TYPE BY LAND USE	GENERAL LAND USE CONTEXT	
Commercial Boulevards & Avenues		
	Regional Boulevard	**Primary:** Civil support, Civic, Office, Goods & Services **Secondary:** Automotive, Residential
	Transit Boulevard	**Primary:** Civil support, Civic, Office, Goods & Services **Secondary:** Residential
	Commercial Avenue	**Primary:** Office, Goods & Services **Secondary:** Residential
District Streets		
	Residential Street	**Primary:** Residential **Secondary:** Educational, Civic, Goods & Services
	Commercial/Light Industrial Street	**Primary:** Office, Goods & Services, Industrial **Secondary:** Civic, Residential
Local Streets		
	Local Street	**Primary:** Residential, Automotive (parking only; no drive-thrus, auto sales, etc.) **Secondary:** Civic, Office, Goods & Services, Educational, Civil support
Distinguished Streets		
	Rapid Transit Street	**Primary:** Residential, Office, Goods & Services **Secondary:** Educational, Civil Support
	Promenade	**Primary:** Goods & Services **Secondary:** Residential, Office

Note: Land use mix will vary by neighborhood.

INTERSECTION DESIGN PRINCIPLES

To make streets accommodative, comfortable, and safe for all users, attention also needs to be given to the places where streets intersect. Since these are the places where users meet, interact, and cross, intersections are the points of greatest conflict and the places where users are most likely to feel threatened. Intersections exhibit several common elements regardless of their type or category. Figure 6-4 on the following page offers a basic summary of these elements.

This section offers basic principles of complete intersection and crossing design. It also suggests intersection and crossing types for which HCDA will develop more detail design guidance in the future.

Strategy CS6 Establish Intersection Design Guidance

When designing and retrofitting intersections, the pedestrian should not be characterized as a single individual but rather a range of users—children, seniors, people pushing or pulling strollers and delivery carts, people using a wheelchair or scooter, or those traveling with a cane or a service animal. The street and pedestrian environment at intersections must function effectively for each of these "pedestrian" types while accommodating throughput for other modes.

One simple tenet
of intersection design should be adhered to in any case: Intersections should be designed and operated as simply and as compact as possible.

The following principles help to achieve complete, accessible, functional, and safe intersections.

- All corners follow universal design principles and match state of the practice accessibility standards (PROWAG)
- Signals are responsive to needs of visually-impaired pedestrians
- Movement of each mode is predictable to all users
- Intersection geometry is compact as feasible
- The number of approach and receiving through lanes are equal and align with no skew
- Perpendicular intersections are better than skewed
- 3-4 approaches are better than 5 or more
- Vehicle speeds are managed, especially for turn movements
- Crossing distances are minimized by reducing pavement and including pedestrian refuges
- Crossings match pedestrian desire lines, whether at intersections or mid-block locations
- Crossings and pedestrian staging areas are located within sight triangles
- Transit stops are organized to limit transfer distances and facilitate safe crossings
- Far-side transit stops are better than near-side transit stops
- Bicycle movements are made as visible and predictable as possible
- Priority is given to cyclists over turning autos
- Signal phasing is predictable and prioritizes pedestrians, bicyclists, and transit (in that order)
- Person delay is minimized
- Signal timing safely accommodates harried and leisurely walkers
- Non-auto or bicycle space is reallocated to sidewalk or refuge islands by default

- Landscaping, street trees, and furniture are integrated, but never restrict sight lines between modes
- All intersections are illuminated per Crime Prevention through Environmental Design (CPTED) guidance

Figure 6-4 shows common intersection elements and Figure 6-5 illustrates common urban intersection types.

Figure 6-4 Common Intersection Elements

Source: Nelson\Nygaard

Figure 6-5 Common Intersection and Crossing Types

Signal	All-way stop
3 or 4-way traffic signal controlled intersections	3 or 4-way intersections where all legs of the intersection are controlled by stop signs
Features	**Features**
Complete signals address all modes and are ADA compliant. Left-turns should include permitted phases (not permissive) and pedestrian, bicycle, and transit signal priority phases should be integrated, where necessary.	Stop signs are typically installed to manage auto traffic, which may have an impact on bicycle travel. Stop signs should be limited on secondary bikeways. Advanced stop bars should provide a comfortable space between pedestrians and waiting vehicles.
	

Two-way stop	Uncontrolled
One-way or two-way intersections where the major street is uncontrolled, but the minor street is controlled by a stop or yield sign	Intersections without traffic control devices (stop sign, signal)
Features	**Features**
Without dedicated stops controlling major streets, these locations may act as a barrier to some cyclists. Additional provisions may be necessary to facilitate bicycle/pedestrian crossings, such as half signals or median barriers with pedestrian refuges. Advanced stop bars should provide a comfortable space between pedestrians and waiting vehicles.	Uncontrolled intersections often at low volume, low speed locations. Efforts need to be made to ensure speeds are slow (through traffic calming) and bicycle and pedestrian crossings are clearly marked and visible.
	

Mid-block crossing	Enhanced bicycle and pedestrian crossing	Driveways
Formal street crossing between intersections.	A signal or stop-controlled overlay intersection with bicycle/pedestrian priority features	An accessway offering motor vehicle access to public or private property Accesses to private property are considered an intersection as auto traffic intersects the sidewalk and dedicated bikeways.
Features	**Features**	**Features**
People generally cross at the most convenient location. Mid-block crossings help to facilitate pedestrian desire lines. Mid-block crossings should include designated crossing facilities like crosswalk markings and pedestrian refuges. Traffic control devices may or may not be used depending on the number of travel lanes, volumes, speeds, and a variety of other factors.	Intersections that include design or operational features to enhance and/or prioritize bicycle and pedestrian crossing movements. Features may include rapid flashing beacons, priority signalization phases, bike boxes, two-stage turn boxes, median barriers with pedestrian refuges, among others. See Figure 6-8 for proposed enhanced bicycle and pedestrian crossing overlay locations.	These include signal controlled driveway accesses into major destinations like Ala Moana Center. Driveways should always be designed as subservient to the sidewalk. Keep the driveway as small as possible, including width and corner radii. Driveways should be designed for 10 mph and oriented 90 degrees to the Street. Intersection bicycle crossing treatments appropriate for street intersections may apply.
		

DRAFT

ELEMENTS OF THE COMPLETE STREET CROSS SECTIONS

Complete Street design considers two main "environments: the Throughway (between the curbs) and the Pedestrian Zone (from the curb to lot line/building front).

THE THROUGHWAY

The principal part of the street for vehicles is the throughway, consisting of all space between the curbs of the street. It is composed of up to six main elements: the general purpose travel lanes/priority lanes, the center turn lanes/medians, buffers, bicycle space, parking, and drainage. Not all throughway elements are used in each cross section. The graphic representation of an all-inclusive throughway pictured below helps to distinguish the role that each element plays and to point out primary concerns that a street designer should keep in mind.

- General purpose travel lanes/priority lanes are the primary area for vehicle traffic circulation and refer to the lanes for through movement. Their design should incorporate a consideration of the primary vehicles that will be using a street: if this is larger vehicles, the dimensions of these lanes need to reflect that vehicle type. If the primary user of the street is passenger automobiles, the dimensions of these lanes can be narrowed to allow other components of the throughway and the street in general to serve a greater range of functions.

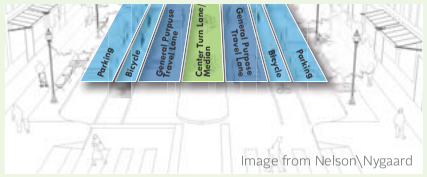

Image from Nelson\Nygaard

- Center turn lane/median is the auxiliary space separating general purpose lanes in each travel direction to allow the storage of turning vehicles. The general principle used in this guide is that either a median or a turn lane will constitute this space, if it is used, but not both.
- Buffers refer to the non-operable space that provides added separation between bicycles and adjacent travel lanes or parking. As shown below, not all dedicated bicycle facilities include buffers.
- Bicycle space refers to any dedicated space for bicycles including bike lanes, bike lane buffers. In shared lane environments, bicycles operate in general purpose travel lanes.
- Parking is provided as storage for cars that are not in operation and unloading/loading zones for delivery trucks and other private autos (e.g. taxis). Not all streets in KCDD provide for on-street parking, but is generally provided along streets serving commercial land uses or where private properties do not provide substantial space for off-street parking.

PEDESTRIAN ZONE

The fundamental organization of the space between the curb and the lot line, or pedestrian zone, is essential to a Complete Street. The pedestrian zone includes the following five elements or zones:

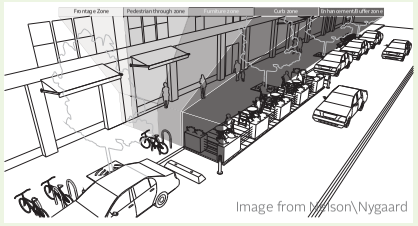

Image from Nelson\Nygaard

- Frontage zone: Area between the property line and pedestrian through zone that provides opportunities for temporary signs, planters, business-maintained plantings, and café seating.
- Pedestrian through zone: The primary passing and circulating area for pedestrians. This zone should be completely clear of permanent objectives (street furniture, utilities, street trees, etc.).
- Furniture zone: The first line of buffering between pedestrians and adjacent travel lanes. This is the appropriate areas to locate transit passenger facilities, street trees, utilities, planters/landscaping, sign poles, and additional street furniture (including bike share docking stations).
- Curb zone: A 6-inch wide curb.
- Enhancement/Buffer zone: Any instance where a parking lane may be flexibly used for expanded transit passenger facilities, in-street bicycle parking or bike share docking stations, landscaping/stormwater features, parklets, and curb extensions. Curb extensions effectively serves as additional furniture zone.

DRAFT

QUALITY OF SERVICE PERFORMANCE STANDARDS

KCDD's tools for measuring the success of its transportation system should follow from the larger goal and objectives of the TOD Overlay Plan. The TOD Overlay Plan, and the decision to pursue Complete Streets in Kaka`ako, recognizes that transportation is a means to ensure HCDA and the community realize quality of life, health, economic, and various other principles and objectives established in Chapter 2 of the Plan. It is imperative that Kaka`ako's Complete Streets strategy measures the various ways the network of district streets supports broader KCDD goals and objectives. Using traditional measures of auto delay is counter-intuitive for urban Complete Streets and does not address the goals of the TOD Overlay Plan to accommodate more people and jobs in a dense urban district where people can walk, bike, and use transit. Success of this plan will decrease per capita demand for auto travel and put priority on the quality of service in the pedestrian and bicycle realms. Traditional vehicle level of service models were developed for application in suburban areas where auto was the assumed mode of access for all land uses.

The KCDD TOD Overlay Plan emphasizes quality of service for all modes in addition to level of service (delay) for vehicles.

Strategy CS7 Establish performance measures/standards and decision tools that will incorporate Complete Streets

In conjunction with future work to develop a comprehensive set of Complete Streets design standards, the HCDA will work with our partners (particularly DTS and HDOT) to establish a process that combines existing tools for measuring transportation performance (largely oriented toward measuring vehicle delay, volume, and capacity) with multimodal analysis tools. This performance measurement framework should balance quantitative tools with qualitative tools that reflect transportation outcomes and ensure that transportation investments contribute to vibrant, healthy, and economically productive streets.

A number of alternative performance measurement tools exist as a supplement or replacement to vehicle level of service (VLOS). Responsibility for setting performance standards should be a joint process between HCDA and the City and County of Honolulu. Examples of potential decision tools include:

- Site/project level performance measures (Multimodal Level of Service, checklists, crash and injury data)
- Transportation system level measures (annual counts, including miles of bicycle lanes added or repainted, blocks of new or repaired sidewalks, number of new or reconstructed accessible curb cuts, number of new street trees per year)
- Measurement (post-performance measure such as % reduction in crashes or reduced vehicle speeds in residential neighborhoods)
- Community-wide, long-term measures (mode shift, satisfaction surveys, health outcomes)

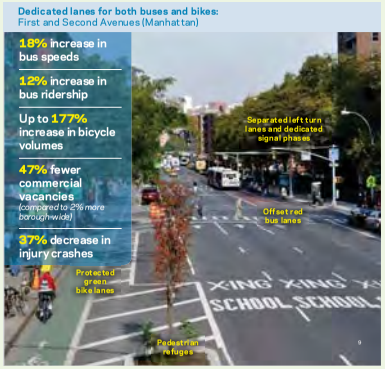
Action CS7.1 Work with DTS to adopt transportation quality and level of service metrics that reflect the development of a walkable, multimodal transportation network

VLOS standards historically are focused solely on vehicle delay times and may therefore have a detrimental effect on the implementation of safe, vibrant, walkable, community-oriented streets. Often, improvements or additions of non-vehicle capacity projects (such as widening sidewalks by reducing curb-to-curb width) may trigger a potential decline in modeled VLOS. If improvements that encourage people to travel in ways other than driving are always rejected because they will slow down motorists, then it will not be possible to encourage people to get out of their cars and HCDA may not

New York City is building Complete Streets that serve a variety of roadway users and provide measurable community benefits.
Image from Nelson\Nygaard

NEW YORK CITY DOT:
MEASURING THE STREET: NEW METRICS FOR 21ST CENTURY STREETS

New York City's current DOT has gained a reputation for the most innovate and successful repositioning of its transportation infrastructure to vibrant, economically successful, and safe urban streets and public spaces. And if New York City DOT can successfully reprioritize space on Manhattan streets for pedestrians, bicycles, parklets, and street cafes, the rest of the nation's cities have to ask – "can't we do the same?"



Part of the New York success story is the adoption of a radically new way of viewing performance, based not just on how autos move and operated, but on how transportation investments affect users of all modes and the businesses and property owners that front city streets. Measuring the Street: New Metrics for 21st Century Streets categorizes strategies and metrics under goals to:

- Design for safety
- Design for all users of the street
- Design great public spaces

Metrics to measure success include public health benefits and economic return on investment for retail users in commercial corridors.

The full report can be found at: http://www.smartgrowthamerica.org/documents/cs/impl/ny-nyc-measuring.pdf

Images from NYC DOT

achieve its land use and economic goals for the KCDD. For example, the nation's most successful retail streets are often congested. This is both a sign of success – people want to be there – and a benefit to retailers since people in slow moving cars can better view shopping opportunities.

National practice in measuring transportation performance is evolving. The most recent Highway Capacity Manual (HCM) has made significant changes from previous editions, including a chapter dedicated to urban street facilities that couples level of service standards for automobiles, pedestrians, bicycles and transit users. Increasingly cities are looking to measure *quality* of the pedestrian and cycling experience and to measure street performance by capacity and delay for *people*, not vehicles.

Among the most important actions that many jurisdictions are now taking is to simply exempt development within dense, mixed-use districts from compliance to minimum vehicular level of service standards. In some cases, additional multimodal level of service standards are developed, in others an impact fee is assessed based on the size and/or trip generation from that development. These fees are then put toward completing the city or district's transportation plan. This strategy has the benefit of ensuring that a single, coordinated approach to managing transportation is taken and that capital projects are implemented in the most beneficial order of priority.

Heavy traffic on 5th Avenue in New York City does not deter shoppers from around the world

MEASURING MULTIMODAL STREET PERFORMANCE

The San Francisco County Transportation Authority (SFCTA) proposed replacing the current LOS measure with a measure based on the net automobile trips generated (ATG) by a project, paired with a transportation impact mitigation fee (TIMF) program designed to mitigate the systemwide impacts of added vehicle trips. This methodology offers a citywide approach to measuring and mitigating traffic impacts, rather than looking at one project and one intersection at a time. Because there is traffic congestion throughout San Francisco's street network, any project that adds a single vehicle trip would be determined to have a significant traffic impact.

Projects that do not add vehicle trips, like a rail line, bike lane or sidewalk widening, would not be considered to have any traffic impact, even if the project reduced vehicle capacity in a specific location or corridor. The ATG methodology is currently under evaluation and it is unclear if and when it will be implemented. The proposed methodology and fee structure would need to be adopted by the Planning Commission through an ordinance that replaces auto LOS as a measure of environmental impacts with the ATG measure, coupled to the TIMF program.

Other places that have relaxed minimum standards for VLOS or adopted multimodal level of service standards include:

- Livermore, CA
- Redwood City, CA
- San Jose, CA
- San Francisco, CA
- Fort Collins, CO
- Montgomery County, MD
- Fairfax County, VD
- Cambridge, MA
- Massachusetts DOT
- Oregon DOT
- Florida DOT

The table on the following page describes other measures of transportation performance being used to measure performance of our streets and transportation networks.

MULTIMODAL TRANSPORTATION PERFORMANCE MEASURES

Feature	Definition	Indicators
Delay	Consider person delay rather than vehicular delay	▪ Aggregate delay of all transportation users in a corridor or corridor segment during a set time period
Capacity	Capacity for a street to move people or intersection to accommodate person throughput	▪ Capacity of a street cross section in terms of persons moved per hour (can exclude pedestrians) ▪ Intersection person throughput at a peak hour (can exclude pedestrians)
Network continuity and connectivity	Whether sidewalks and paths exist, and connect throughout an area	▪ Portion of streets with non-motorized facilities ▪ Length of path/non-motorized facility per capita ▪ Network connectivity and density (intersections per square mile)
Network quality	Whether sidewalks and paths are properly designed and maintained	▪ Sidewalk and path functional width ▪ Portion of sidewalks and paths that meet current design standards/in good repair
Road crossing and intersection design	Safety and speed of road crossings	▪ Road crossing widths ▪ Motor vehicle traffic volumes and intersection design speeds ▪ Average pedestrian crossing time ▪ Quantity and quality of crosswalks, signals and crossing guards
Pedestrian and bicycle protection from traffic	Separation of non-motorized traffic from motorized traffic, particularly high traffic volumes and speeds	▪ Distance between traffic lanes and sidewalks or paths ▪ Presence of physical separators, such as trees and bollards ▪ Speed control
Congestion and user conflicts	Whether sidewalks and paths are crowded or experience other conflicts	▪ Functional width of sidewalk and non-motorized paths ▪ Peak-period density (people per square foot) ▪ Clearance from hazards, such as street furniture and performers within the right-of-way ▪ Number of reported conflicts among users ▪ Facility management to minimize user conflicts
Sense of Security	Perceived threats of accidents, assault, theft or abuse	▪ Reported security incidents ▪ Quality of visibility and lighting ▪ Hours of street activity and/or retail establishments
Wayfinding	Guidance for navigating within the station and to nearby destinations	▪ Availability and quality of signs, maps and visitor information services
Weather protection	User protected from sun, wind, and rain	▪ Presence of shade trees and awnings ▪ Frequency and design of waiting and resting places
Cleanliness	Cleanliness of facilities and nearby areas	▪ Litter, particularly potentially dangerous objects ▪ Graffiti on facilities and nearby areas ▪ Effectiveness of sidewalk and path cleaning programs
Attractiveness	The attractiveness of the facility, nearby areas and destinations	▪ Quality of facility design ▪ Quality of nearby buildings and landscaping ▪ Air and noise pollution experienced by cyclists and pedestrians ▪ Community cohesion (quantity and quality of positive interactions among people in an area) ▪ Number of parks and recreational areas accessible by non-motorized facilities
Economic vitality	Ability to retain, support, and advance retail and commercial performance	▪ Retail sales per square foot ▪ Sales tax revenue generated ▪ Commercial vacancies ▪ Number of visitors
Public health	Health benefits achieve from increased physical activity (active transportation), safety improvements, and reduced emissions	▪ Collisions and injuries to motorists and other vehicle occupants, pedestrians, cyclists, and motorcyclists ▪ Number of ADA compliance projects constructed annually ▪ Worker absenteeism, efficiency, and productivity (obtained through employer surveys) ▪ Increased walking and bicycling levels ▪ Air quality monitoring

Adapted from multiple sources including: NYCDOT's Measuring the Street: New Metrics for 21st Century Streets (2012) and Victoria Transport Policy Institute's Multi-Modal Level-of-Service Indicators Tools For Evaluating the Quality of Transport Services and Facilities (December 2012)

STRATEGIES AND TOOLS TO IMPLEMENT COMPLETE STREETS AND INTERSECTIONS

Strategy CS8 Reallocate street space to better move people and activate KCDD pedestrian spaces

The success for the TOD Overlay Plan relies on an effective partnership between HCDA and DTS to identify and implement projects that reallocate street space for more multimodal and livable uses. Several street design tools should be considered to achieve Complete Street design objectives in Kaka`ako, including road diets/lane reconfiguration, shared street design, and repurposed parking lanes. The effectiveness of these tools will be evaluated in appropriate contexts in future transportation analysis in the KCDD.

ROAD DIETS

Case Study: Along St. Louis' South Grand Blvd., traffic volumes ranged between 19,500-29,000vpd prior to a road diet and streetscape project. Before and after analysis of traffic showed very little change in volume, but noticeable speed and noise reductions.
Image from Nelson\Nygaard

Focusing on existing infrastructure, road diets, or lane reconfiguration projects, suggests the idea that some roads carry more 'weight,' or vehicular capacity, than they need to be functional and livable. Road diets improve multimodal safety by converting underutilized vehicle space in a fixed right-of-way to space serving other users of the street, such as parking vehicles, bicyclists, and pedestrians. Road diets typically convert four-lane cross sections (i.e. four lanes with no median between the two directions of travel) to three lane sections (one travel lane in each direction with bike lanes and either a two-way left turn lane or a similar amount of space to provide left turn storage lanes as needed).

Not all Kaka`ako streets should be considered as road diet candidates. The 4-to-3 conversion is most effective on roads with average daily traffic of up 15,000-20,000 vehicles per day (vpd) and those that have a high potential to induce vehicular travel. This threshold is increased to 25,000 (vpd) for 5-lane cross sections. Based on existing volumes and the anticipated function and demand of KCDD streets, Ward Avenue and potentially Auahi Street (Diamond Head of Ward Avenue) should be considered for lane reallocation.

SHARED STREET DESIGN

Image from Nelson\Nygaard

Shared streets, also referred to as woonerfs, slow zones, or home zones, are narrow, often curbless street connections that reduce or remove segregation between pedestrians, bicyclists, cars, and delivery trucks. Vehicular traffic is calmed to low speeds (10mph speeds or less) by placing trees, planters, parking areas, and other obstacles in the street's common space. HCDA should implement shared street designs on streets serving delivery and parking access traffic and in areas of the district where heavy pedestrian volumes are expected and auto traffic is de-emphasized. The TOD Overlay Plan suggests this approach on many of the Local Streets, particularly on new streets serving mixed use developments.

ACTIVATED ENHANCEMENT/BUFFER ZONES

Image from Flickr user Shelley Mags

The parking lane provides opportunities to expand the pedestrian realm, especially streets that will not be rebuilt or extensively landscaped. At strategic locations, use of the parking lane for parklets, seating, landscaping, restaurant use, bike share docking stations or in-street bicycle parking corrals can be used to provide visual interest, resting areas for pedestrians, and additional transportation-related storage. HCDA will work with DTS to reprogram a limited number of parking stalls with more active uses.

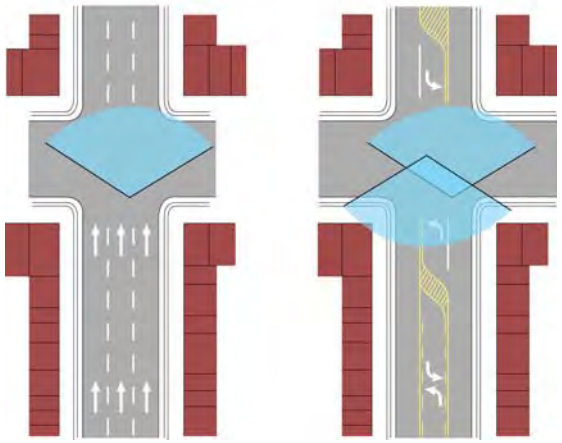
SAN FRANCISCO'S PARKLET PROGRAM

Since 2010, the City of San Francisco's Pavement to Parks Program has pioneered the conversion of parking lane space to "parklets". A parklet repurposes part of the street into a space for people, making the street more beautiful and provide public space, even when permanently widening sidewalks is not an option. They can provide space for seating, landscaping, public art and other amenities. They are typically paid for and maintained by nearby residents, businesses, or community organizations.

Goals of the program include:

- Providing a fast and cost-effective way to beautify the streetscape and improve the public realm
- Encourage walking by enhancing the pedestrian environment
- Providing space to sit, relax, and plan
- Supporting local business

More information on the Parklet Program is available in the San Francisco Pavement to Parks Program Parklet Manual and the Business/Resident Application to Request a New Parklet



Two examples of parklets in San Francisco's Mission District. Parklets extend the pedestrian realm and help to enliven communities and their retail spaces.
Images from Nelson\Nygaard

Strategy CS9 Strategically convert key multimodal streets from one-way to two-way operation

Converting vehicular flow of one-way streets to two-way operations is another method of designing streets to be safer and offer improved access to destinations in Kaka`ako. Historically, two-way streets were converted to one-way operations to increase vehicle-moving capacity—particularly during peak travel periods. The primary modal beneficiary of this approach is auto movement at the expense of other modes and uses. For 20-22 hours of the day, the need to move large traffic volumes is not as urgent; yet one-way streets continue with one-way flow and only allow one direction of visibility, as illustrated in Figure 6-6. One-way streets are less conducive to successful business corridors, largely because they limit visibility to a single direction and at a given time of day offer less exposure to businesses. One-way streets tend to have faster vehicle traffic speeds, which means motorists spend less time observing the environment around them and more time "zipping by" the retail corridor. Conversion is desirable from a safety standpoint, as well, as two-way streets operate at appropriate speeds for urban environments where there are higher volumes of bicyclists and pedestrians—especially along segments of Kaka`ako streets that will experience substantial residential growth.

To achieve roadway facilities that offer a balance of mobility, access, and accommodations that establish more attractive, safe and livable conditions, HCDA will coordinate with DTS to evaluate the viability of converting certain one-way streets to two-way operations. For example, the Pensacola/Piikoi couplet is identified as a possible corridor for future conversion pending an in depth evaluation.

Figure 6-6 Visibility Impacts of One-Way and Two-Way Roadway Operation

One-way streets allow only one principal direction of visibility for motorists on a street (left), meaning that businesses will not be seen from an opposite direction as they would on two-way streets (right).
Image from Nelson\Nygaard

Strategy CS10 Redesign and operate intersections to accommodate all modes and reduce conflicts

Action CS10.1 Design intersections to be compact and limited in complexity, where possible.

As shown in Figure 6-7, intersections in Kaka`ako range between in size and complexity. In a complete streets environment, compact intersections with tight geometries are preferable to complex intersections, to reduce conflicts between pedestrians, bicyclists and auto drivers. Ideally intersections should have three or four approaches (or legs), each generally forming a right angle with the street it connects into. Complex intersections might have raised medians and turn lanes, but the defining features of that make complex intersections less attractive from a safety and operations standpoint are multiple legs (over 4) and skewed angles.

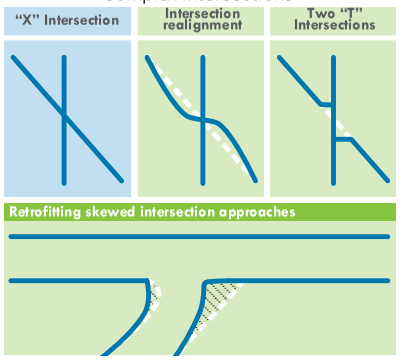


Figure 6-7 Range of Intersection Size in Kaka`ako

Examples of the range of intersection geometries in the KCDD at Punchbowl/Kapiolani (left) and Coral/Auahi (right).
Image from Google

Intersections should be easily negotiated by pedestrians and bicycles, and traffic approach speeds should be managed, where possible. Complex intersections are not unalterable, and more complete intersection designs can be achieved throughout Kaka`ako. A mixture of pedestrian refuge islands, curb extensions, signal improvements, and signs can help to break up crossing distances and limit the number of possible concurrent conflicts. Skewed intersections like Auahi and Ward can be realigned or re-networked into simplified junctures or a series of T-intersections. Y-junctions can also be squared off into a T-intersection as well. These techniques are summarized in Figure 6-8.

Figure 6-8 Different Approaches to Simplifying Complex Intersections

Source: Nelson\Nygaard

Action CS10.2 Ensure crossings throughout the KCDD are as short, direct, and level as possible.

Whether at an intersection or a mid-block location, crossings should be as short and as direct as possible. Human nature will result in pedestrians taking the shortest and most direct route across an intersection, regardless of the traffic engineer's intent – it is therefore essential that the direct path be made the safest path in intersection design. Curb extensions, mid-block crossings, pedestrian refuge islands and any other facilities that break crossings into more manageable crossing distances will improve the pedestrian experience.

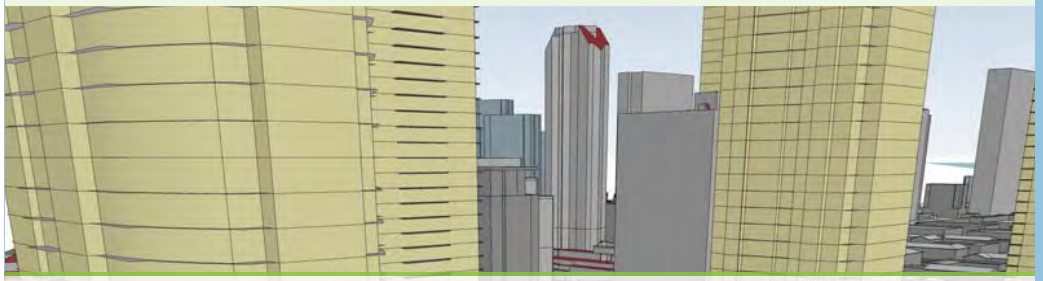
Pedestrian crossings in Kaka`ako should be made at grade wherever possible. Grade-separated crossings are almost always unsuccessful at moving people across the street in the most direct path, except under one of four conditions:

- Crossing over or under a freeway or divided highway
- Connecting directly to specific land uses
- Providing a trail crossing where the trail is roughly perpendicular to the road
- Connecting on at least one side to a location where people want to be at the elevation of the structure (e.g. where one end is an elevated rail station)

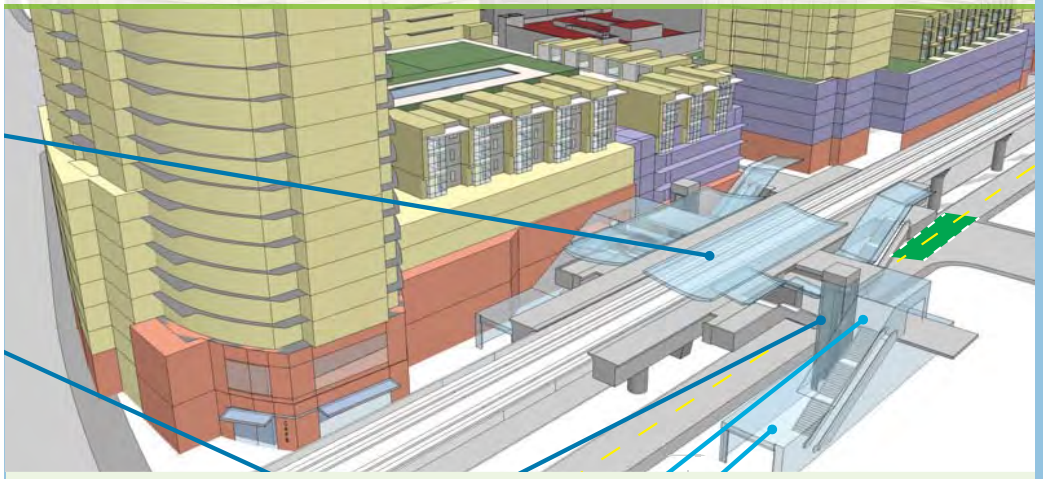
Unless they specifically satisfy one of these four conditions, bridges and underpasses simply do not work to get people from the sidewalk on one side of the street to the sidewalk on the other side of the street. Fences and barricades can improve behavior, but are often ignored or modified to maintain the most direct route to a destination.

Action CS10.3 Apply principles of universal design to ensure street environments and junctures are legibly and comfortably designed for pedestrians of all ages and abilities.

Universal design is a design that is comfortable for users of all ages and abilities, including persons with disabilities. Universal design principles applied to street design include street crossings that can be comfortably navigated by older and slower walkers, curb cuts that can accommodate baby strollers, rolling suitcases, and a variety of mobility devices, and wayfinding that is clear and intuitive to all users. All streets in Kaka`ako will be designed with principles of universal design. Additional detail on universal accessibility is discussed in Chapter 5.

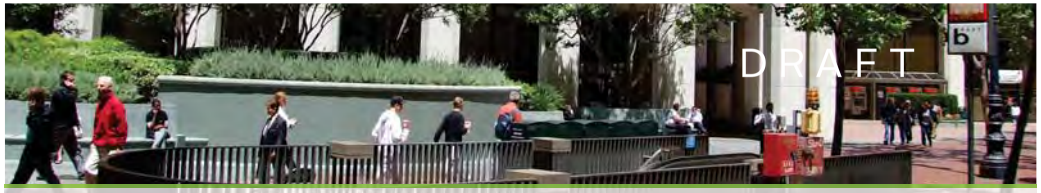


RECOMMENDED RULE CHANGES FOR KAKA`AKO



The following rules changes are recommended for various roadway and pedestrian design elements of the Mauka/Makai Rules. Additional rule changes will be proposed upon completion of HCDA's forthcoming Complete Streets Design Standards.

- **Regulation CS5.1:** Incorporate the Complete Street types as part of §15-217-38 through 39: The Thoroughfare Plan rules currently focus heavily on the pedestrian realm, so the rules should reflect street types design options, modal trade-offs, and general design guidelines.
- **Regulation CS5.2:** §15-217-39-D-1-7 updated to include allowances and design guidance for the "shared street" designs as part of the Local Streets street type (completed following completion of future HCDA Complete Streets design guide).
- **Regulation CS5.3:** To ensure predictable traffic movement and limit conflicts with pedestrians, parking access lanes, alley or any other Local Street types should be permitted to operate as one-way connection. Additional language should be added to §15-217-63 to clarify this provision.
- **Regulation CS7.1:** In a new section of the Rules, HCDA and DTS should jointly adopt and implement transportation quality and level of service metrics and data collection processes to track the benefits and impacts of implementing the Complete Streets strategy (completed following development of HCDA Complete Streets design guide)..
- **Regulation CS8.1:** Amend §15-217-39-D-1-7 to include the enhancement/buffer zone as part of the sidewalk zone nomenclature and include design elements and programming such as parklets, bike share docking stations, and in-street bike parking corrals.
- **Regulation CS10.3:** Include a new section in the Rules that specifies universal design guidelines based on the recently completed Public Rights-of-way Accessibility Guidelines (PROWAG).



DRAFT

7 HART STATIONS AND ACCESS

DRAFT

7 HART STATIONS AND ACCESS

Integrating Rapid Transit in the Kaka`ako District

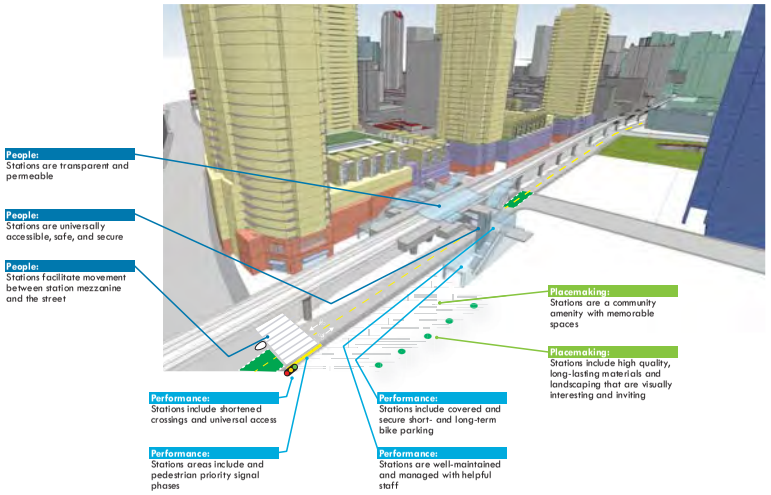
The Honolulu Authority for Rapid Transit project is a piece of civic infrastructure that will cut an elevated swath across the center of Kaka`ako. HART plans to contract for station design of two stations within the Kaka`ako District (Civic Center and Kaka`ako) along with the six other stations that comprise the Diamond Head segment of the HART alignment including Downtown and Ala Moana. This Chapter provides an outline of design strategies, opportunities and overall vision for the two Kaka`ako District Stations (Civic Center Station and Kaka`ako Station) as well as provides opportunities for the Aloha Tower parcel under HCDA jurisdiction (neighboring to the Downtown Station). It also outlines design guidance for preferred future station and alignment design, and a series of access strategies. HCDA will collaborate with HART to ensure that these design principles and strategies are considered during the transit system's implementation process to help make HART a local asset (rather than a encumbrance) in the transitioning Kaka`ako District.

Elements of Station Access

Station access includes the total travel experience from a transit passenger's origin (e.g., home) to his or her final destination (e.g., work, school, entertainment). Access includes the physical act of travelling to the transit station as well as the psychological ease of navigating the route to get there, regardless of the mode taken. Given the relative simplicity of driving a personal car directly from origin to destination, the success of a new transit investment depends on understanding the total transit experience to maximize ridership by making transit competitive and compelling to as many potential riders as possible. To this end, this chapter provides a set of overarching station access principles and specific strategies and actions to ensure Civic Center and Kaka`ako stations are focal points of the KCDD community.

Station Area Principles: Place, People, and Performance

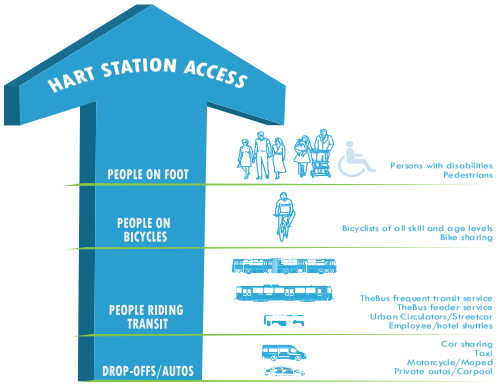
The three major principles that guide the TOD Overlay Plan approach to integrate the HART stations into the neighborhood are *People*, *Performance*, and *Placemaking*. Design objectives for the public realm related to *People* optimize convenience and comfort for all transit users by simplifying travel to/from and within the station area and adding human-scaled design elements. *Performance* objectives foster seamless multimodal connections. Lastly, *Placemaking* principles are tied to creating opportunities for context-sensitive design solutions, complete with active public spaces, and transit-friendly land uses. Principles for the Kaka`ako, Civic Center and Downtown Station locations are presented in Figure 7-1. Figure 7-2 illustrates how selected principles might be considered at the Civic Center Station.



Access Hierarchy

All modes of station access cannot be given equal priority. At every station, there is limited space and scarce funding available for access improvements. Recognizing these constraints, the proposed station access hierarchy illustrated below establishes priorities for access improvements and policies. The station access strategies and actions described in this Chapter are based upon this hierarchy.

Figure 7-1 Station Access Principles and Objectives



Principles	Objectives
PEOPLE 	• Station access should be simple and intuitive, with a legible layout for street-to-train, bus-to-train, and station-to area destinations. • Station siting maximizes pedestrian connectivity to the street and adjacent uses while considering pedestrian safety issues and operational/functional needs. • Public realm designs adjacent to the station provide generous space for pedestrian movement, weather protection, comfortable furnishings and Crime Prevention Through Environmental Design (CPTED) elements. Design includes street-level activation and high quality lighting to make under-guideway environments more comfortable. • The station addresses and balances the needs and hierarchy of all modes, including pedestrians and cyclists, transit, and vehicular travel.
PERFORMANCE 	• The station area eliminates safety conflicts between roadway users and reduces ground transportation collision rates. • Efficient bus transfer locations are developed and kiss-and-ride layout is planned and designed to minimize impacts with other modes. • The station includes secure bicycle parking and storage facilities and convenient bike-on-transit integration. Additionally, all streets in the station area will provide a safe and comfortable space for cyclists.
PLACEMAKING 	• Station sites are community assets designed to enhance local environment. • Station areas integrate with transit-friendly development projects, generous public realm, public gathering areas, sidewalks and activated streetscapes. • Elements to humanize the scale of new infrastructure are included where feasible such as distinctive architectural treatments, public art, and under alignment landscape.

Figure 7-2 Station Access Principles at Civic Center Station

The proposed access hierarchy prioritizes pedestrians above all other modes. Walking to transit is the most cost-effective, environmentally friendly, and equitable form of station access. Furthermore, every transit rider is a pedestrian for at least part of their trip, even if it is only from the bus drop-off to the station platform. Bicycling is the second highest access priority. Similar to walking, its cost and environmental impact is minimal. It remains a highly equitable form of transportation even if it may not be an option for all users. The remaining access modes are prioritized based on their increasing cost, space demands, and environmental footprint. Bus transit access to HART stations will be of critical importance; however, major bus transfer points are planned outside the district to the east and west at the Ala Moana and Downtown Stations.

Figure 7-3 HART Station Access Hierarchy

Access Demand

Station access needs are determined based on station access demand by mode. Opening day ridership projections for the Kaka`ako and Civic Center stations are 3,320 and 3,930 respectively. In both cases, approximately 80% of these transit trips are expected to originate on foot and by bicycle, thereby increasing the importance of adequately designed pedestrian and bicycle facilities. Furthermore, given that both station areas are planned for significant redevelopment, multimodal access demand should be based on future build-out conditions.

An estimate of 2035 ridership is compared to opening day. Both stations are expected to see ridership growth of over 500% in the 20 year time period. These projections do not include any additional growth allowed under the TOD Overlay Plan scenario.

Figure 7-4 Opening Day and 2035 Ridership at KCDD HART Stations

	Civic Center			Kaka`ako		
	2035	Opening	%Change	2035	Opening	%Change
AM and PM Peak Periods	5,878	880	568%	5,348	570	838%
Total Daily	7,168	3,930	82%	7,771	3,320	134%

Note: Peak Period is defined as 4 hour AM and 4 hour PM peak; 2035 projections based on OMPO Modeling for RTP (2035 projection), may differ from official HART ridership forecasting

Overall Access Strategies

Helping passengers get to the rapid transit stations is a shared responsibility: the City/County of Honolulu, HCDA, and HART must work together to ensure that the stations themselves are well-integrated with the surrounding areas, and that passengers using all modes of transportation have safe, comfortable, and convenient paths of travel to and from the station. While HART is responsible for the design of the stations themselves, this section outlines a set of strategies and actions for the areas around the station. Streets, paths, signage, connections to feeder transit, buildings in the station area: these are the elements that tie the station together with the surrounding community.

This section describes strategies that the HCDA can implement, or advocate for, as HART station and adjacent developments and streets are designed. In addition, the specific recommended station area actions listed below should be implemented by the appropriate agency depending on the location and nature of the improvement.

Strategy SA1 Ensure high-quality pedestrian access to transit stations.

Walking to and from transit stations should be safe, comfortable, and inviting. The key strategies for creating a great pedestrian environment are discussed in detail in Chapter 5 (Mobility and Access). In addition, important considerations that apply specifically to transit access include:

- Improve street connectivity in the half mile area around the station to shorten walking distances to and from the transit station and increase the total population within walking distance of the station. More detail is provided in the Walking section of Chapter 5.
- Prioritize pedestrian crossings and minimize conflicts with other modes. Assess intersections and street crossings along preferred routes of pedestrian travel to and from the station and adjust designs to prioritize pedestrian movement. More detail is provided in the Walking section of Chapter 5.
- Provide adequate capacity for passenger flows within and outside the station, focusing on support of development potential. Ensure sidewalks and walkways are sufficient in size to accommodate a number of pedestrian activities including passenger flows, sitting, standing, leaning, and queuing.
- Promote transit-oriented development close to stations, using good design to ensure amenities

for pedestrians, lively street frontages and "eyes on the street." More detail is provided in the Walking section of Chapter 5.

Strategy SA2 Maximize feeder transit connectivity.

High-quality connections between transit routes can dramatically improve the usefulness of the transit system for passengers. The station area should be configured to ensure a seamless connection between feeder bus routes and the rail line. Key considerations include:

- Ensure that roadways in the station area meet geometric design requirements for transit vehicles.
- Ensure adequate transit and shuttle bay space to promote efficient intermodal transfers. Space requirements include both pick-up and drop-off bays and layover and recovery areas for routes that terminate at the station.
- Position bus stops as close as possible to transit station entrances, and ensure safe paths of travel to bus stops and the station.
- Provide a comfortable, safe waiting environment for intermodal transfers, including information about bus routes and schedules.

Pedestrians have direct access to either side of the street from the Metrotown Station on Vancouver's SkyTrain system.
Image from Nelson\Nygaard

Strategy SA3 Provide bicycle connectivity and storage.

Bicycle travel supports transit by extending the reach of the transit system; while few passengers will walk more than half of a mile to reach transit, most bicyclists are willing to travel up to three miles to reach high-frequency transit services. More detail on bicycling accommodated in Kaka`ako is provided in Chapter 5. Listed below are key principles for promoting bicycle access to transit stations:

This high-quality bus stop provides access to bus service immediately adjacent to a SkyTrain station in Vancouver.
Image from Nelson\Nygaard

- Provide direct, safe and well-marked on-street bicycle facilities at HART stations.
- Provide secure, conveniently located bicycle parking facilities to meet demand, including both short-term and long-term bicycle storage. Long-term bike parking should be provided in fully enclosed cages, which also provide visibility from the outside to reduce theft or tampering.
- Provide space for bicycle sharing. Bike sharing programs can be designed to meet these "last mile" connections by providing convenient and affordable access to bicycles for shorter trips.
- Design and build stations to allow bicycle access to trains. Some rail systems allow cyclists to bring their bicycles on board, and others do not. While HART will weigh many factors in determining whether bikes should be allowed on-board trains, stations should be designed to accommodate bicycles in case they are permitted on trains in the future.

Traditional staple racks on the mezzanine level of a BART station are well utilized as they are weather-protected and in sight of security personnel.

CASE STUDY: BAY AREA RAPID TRANSIT BICYCLE ACCESS PLAN

In 2012, BART conducted a comprehensive assessment of bicycle parking at its many stations through the San Francisco Bay Area. The assessment supports a strategy to increase bicycle access mode share from 4% to 8% of all access trips to BART. The agency estimates that bicycle access is a key strategy to increase ridership and provide better access to regional transit at the lowest cost and with the least environmental impacts. The effort determined that bike access is already trending upward – between 1998 and 2008, BART's bicycle access rate increased by 69%, while daily ridership increased by just 27% during the same period. Looking at more detailed analysis, neighborhoods more comparable to Kaka`ako saw increases in bike access of well over 100% in the same period.

The BART inventory found that while there was unused bicycle parking throughout the system, there were shortages of supply for covered, indoor, and secured parking, particularly parking located inside the systems fare gates and in conveniently located lockers. The BART story shows that getting the amount of bike parking right is only half the challenge, making sure it is safe, secure, and conveniently located to the platform is also critical.

Strategy SA4 Provide for and manage vehicle access to transit stations.

A taxi serving Bay Area Rapid Transit's elevated Daly City Station.
Image from Nelson\Nygaard

While the KCDD HART stations will be designed primarily for pedestrian and bicycle access, it must be recognized that some passengers will arrive by automobile. While the stations will not provide dedicated park-and-ride facilities, transit passengers may use taxis, be dropped-off or picked-up at the station by other drivers, or drive themselves and park in private parking facilities or on-street. Key principles for accommodating and managing vehicle access include:

- Provide adequate space for drop-off/pick-up to proceed comfortably and in an orderly manner. More space may be required than is indicated in HART Station Access Plans for the two stations.
- Locate transit passenger drop-off/pick-up and taxi areas so that vehicle movements do not conflict with bus traffic, other traffic, or pedestrian movement in the station area. Ensure passengers arriving by private vehicle are not given "front door access" at the expense of other modes.
- Monitor transit passenger parking on-street in the areas around the stations, taking steps to regulate spillover parking into residential areas when necessary.
- Consider steps to allow transit passengers to use underutilized parking in the station area. This may include conversion of some time-limited parking to longer-term paid parking (as discussed in Chapter 8), or conversion of some private off-street accessory parking to publicly-available shared parking.

Strategy SA5 Ensure clear wayfinding in the station area.

HCDA and HART can work together to ensure a legible station area that includes both clear and consistent signage and easy-to-navigate paths of travel. Wayfinding is discussed in detail in Chapter 5. Key elements of the wayfinding strategy that apply specifically to station access include:

- Design the station area so that passengers can quickly and easily orient themselves during the journey between the fare gates and the bus stop, parking lot, drop-off zone or bicycle racks, or the sidewalk network of the local jurisdiction.
- Coordinate with HART and the City and County of Honolulu to develop station signage consistent with system-wide sign types, locations, colors, fonts, and symbols.
- Expand the traditional scope of transit wayfinding devices by including signage and maps directing passengers to bike facilities, major pedestrian routes and station area attractions such as Blaisdell Center, University of Hawai`i School of Medicine, and Ward 16 Theatres.
- Locate passenger information and maps outside the stream of dominant passenger flows to minimize bottlenecks and pedestrian congestion.

Strategy SA6 Provide for universal access to transit stations.

Transit stations and station areas should be designed to be accessible to people of all abilities. By designing according to principles of universal access, station areas can welcome people with reduced mobility, as well as visual and hearing impairments. They also become easier to access for people with strollers or young children, luggage or large bags, and shopping trolleys or bicycles. More detail on

CASE STUDY: TRANSIT WAYFINDING STANDARDS

TransLink, Vancouver, BC's regional transit provider, adopted its Wayfinding Standards Manual in 2010 to establish a clear and consistent practice for its wayfinding devices and tools. The intent of the Manual is to meet three key objectives:

- Encourage multimodal journeys
- Provide consistent information
- Deliver usable, suitable and manageable information.

To meet these objectives, the standards adhere to the following principles:

- Provide seamless information
- Understand complex journeys
- Be predictable
- Name the places
- Utilize consistent codes
- Progressively disclose information
- Don't make directions complicated
- Provide just the right amount of information
- Ensure information has integrity
- Help riders learn the system
- Use an appropriate tone of voice

Signage directs passengers at Vancouver TransLink's Metrotown Station.
Image from Nelson\Nygaard

accessibility for pedestrian facilities is provided in the Walking section of Chapter 5. Key elements of the universal access that apply specifically to station access include:

- Take special care to ensure that streets and intersections within 0.5 miles of each transit station are fully accessible for pedestrians with disabilities, including adequate curb ramps, clear paths of travel, and safe crossings. Incorporate audible signals into all station area signalized intersections to assist pedestrians who are blind or low vision. All new signals should also include pedestrian countdown timers to assist pedestrians in understanding how much safe time they have to cross the street.
- Reduce barriers and vertical obstructions. Minimize the number of level changes required to complete a trip, and when level changes do occur, provide both elevators and escalators.
- Provide fully accessible bus stops, as defined by the Americans with Disabilities Act, and provide adequate bays for paratransit vehicles.
- Provide information in a variety of media types to cater to the needs of the visual, hearing, developmental, and mobility-impaired.

Station-Specific Access Strategies and Actions

This section includes specific actions that HCDA and the City should undertake to implement the strategies outlined in the previous section for the three HART stations: Kaka`ako Station, Civic Center Station, and Downtown Station at the Aloha Tower Special District.

Strategy SA7 Implement actions specific to the Kaka`ako Station.

Located just off of Ward Avenue, the Kaka`ako Station is the first station after the alignment leaves Halekauwila Street as it begins to veer southeast to meet with Kona Street. It will be embedded within a mixed-use district with an eclectic blend of retail, entertainment, industrial and high-density residential buildings. Key potential transit attractions include the Neal S. Blaisdell Center, University of Hawai`i School of Medicine, Ward Center, and the Kaka`ako Waterfront and Ala Moana Beach Parks. Similar to Civic Center, the attractions are not directly adjacent to the transit station and will require visitors and employees to walk, bike, or transfer to a bus or shuttle to reach their final destinations. Much of the area surrounding the station is planned for major redevelopment by the Ward Neighborhood Master Plan. Existing low-intensity land uses will be replaced by mixed-use residential development with FAR ranging from 9 to 12.

The strategies and actions below are designed to improve these connections and enhance the overall accessibility of the station. They consider the current condition and the transformation of the surrounding blocks of within the TOD Plan horizon.

Figure 7-5 Kaka`ako Station Access and Circulation

Action SA7.1 Increase building setbacks along Ward Avenue to ensure sufficient sidewalk widths as redevelopment occurs

Based on build-out projections and AM peak demands, sidewalks and walkways at, or near, the station will need to be 15 feet wide minimum, 20 feet preferred. In most locations along Ward Avenue, a minimum of 5 feet of additional setback is recommended to achieve the minimum 15 feet sidewalk widths. For a comparison, sidewalks on North America's most iconic, major transit and pedestrian corridors, such as Market Street in San Francisco, are 30 feet or more in width.

Generous sidewalks near a SkyTrain Station in Metro Vancouver.
Image from Nelson\Nygaard

Action SA7.2 Design waiting areas and station plazas to safely accommodate potential crush loads during peak periods of travel and before and large events.

The Kaka`ako Station is likely to be the transit station of choice for visitors to the Blaisdell Center's many annual events. If designed properly, the high capacity transit connection can dramatically reduce the need for parking at such events and mitigate traffic congestion. A full capacity stage event in the arena, for instance, can accommodate 8,800 attendees (up to 17,000 in the arena proposed in the TOD scenario). Assuming even a modest transit mode split of 10% would bring up to 900 passengers to the station, approaching double the peak AM demand. Given the capacity of the two-car train sets, passengers may have to wait through one or two trains before they are able to board. To help ease potential passenger frustration, waiting areas and street-level plazas will be designed to encourage short-term public congregation and dwelling.

Action SA7.3 Introduce pedestrian countdown signals at all signalized intersections along Ward Avenue.

Pedestrian countdown signal heads allow pedestrians to judge if they have sufficient time to cross a street. They are particularly useful to populations requiring additional crossing times including the disabled, elderly, and adults accompanying small children. In addition to reducing pedestrian crossings on red and vehicle-pedestrian collisions, they have been shown to increase driver caution when approaching these intersections.

Action SA7.4 Install a signalized crossing with countdown signal heads on the mauka side of the intersection of Ward Avenue and Halekauwila Street.

The proposed crosswalk will provide a more direct connection from the west to the station entrance plaza for pedestrians and transferring bus passengers.

Action SA7.5 Enhance the pedestrian crossing at the intersection of Ward Avenue and Ilaniwai Street.

The intersection of Ilaniwai Street and Ward Avenue is unsignalized and lacks a crosswalk on the Mauka side of the intersection. Given that a full signal is unlikely warranted, this crossing could be improved with zebra crosswalks on both sides the intersection and pedestrian actuated rectangular rapid flashing beacons (RRFB). In an evaluation conducted by the Federal Highway Administration (FHWA), RRFBs improved vehicle yield/stop rate from under 2% to 85%.

Action SA7.6 Provide new direct pedestrian connections from the Ward Neighborhood Master Plan's Central Plaza to the station.

Since the Ward Neighborhood Master Plan assumed a different location for the station, it has planned building locations that currently block pedestrian access from its Central Plaza to the future station site. As redevelopment occurs, Halekauwila Street should be extended through Ward Avenue to provide direct multimodal access between the station and the Plan's signature open space.

Mid-block pedestrian crossing with rapid flashing beacon in Boulder, CO.
Image from Nelson\Nygaard

Action SA7.7 Minimize pedestrian and vehicle conflicts at ingress and egress points to the bus and kiss-and-ride turnaround facility.

Pedestrians using the sidewalk on the station side of Ward Avenue will be required to cross the entrance and exit to the bus and kiss-and-ride turnaround. To minimize potential conflicts, a pedestrian crossing signal could be installed at this curb cut to allow for a protected pedestrian crossing phase.

Action SA7.8 Integrate a bike share station into the Kaka`ako station design, and provide space for expansion.

The station area should be designed to accommodate a 20 bike station with capacity to expand to 56 bikes by 2035. The approximate spatial requirements for the initial station and a 2035 build-out station are provided in the Figure 7-6 below.

Figure 7-6 Spatial Needs for Bike Share at Kaka`ako HART Station *(Opening Year and 2035)*

Year	Docks	Width	Station Depth	Access Depth	Total Depth
Opening	20	52' - 54'	6' - 8'	4	10' - 12'
2035	56	112'- 114'	6' - 8'	4	10' - 12'

Figure 7-7 Sample Station Dimension for 11 Dock Bike Share Station

Figure 7-8 Sample Double-Sided Bike Share Station

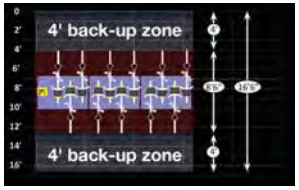

Image from Bike Sharing in the United States: State of the Practice and Guide to Implementation, FHWA (2012)

A design option is to employ two-sided stations, which would require less total width, but require a doubling of total station and access depth (approximately 20' to 24' required).

Action SA7.9 Provide high quality separated bike facilities connecting to the station on Ward Avenue and Halekauwila Street.

Ward Avenue and Halekauwila Street will provide direct bicycle access from each direction to the station. As the primary access routes, they present opportunities for separated bike facilities ranging from traditional and buffered bike lanes to cycle tracks. Given the levels of traffic on Ward Avenue, high quality treatments and vehicle separation will be required to attract a ridership base beyond the most avid and fearless cyclists. Although Halekauwila is a lower traffic street, bi-directional cycle track treatments will help attract higher bicycle ridership and provide a seamless connection between the Civic Center and Kaka`ako stations. The weather protection afforded by the elevated trackway should be supplemented with attractive lighting, signage and a reduction in curb cuts to help draw cyclists to the route.

A two-way cycle track on Hornby Street in downtown Vancouver, BC.
Image from Nelson\Nygaard

See the Bicycle section of Chapter 5 for more detail.

Action SA7.10 Provide high-quality shared bike facilities on Queen and Auahi Streets.

As key parallel facilities to the station and the proposed Halekauwila Street bi-directional cycle track, Queen and Auahi Streets are ideally suited for shared bikeway treatments including sharrows, directional signage and improved crossings. In addition to providing comfortable bike connections to Ward Avenues separated facilities, the features (e.g. traffic calming) associated with the shared bikeways will also help transform the two streets into more pedestrian friendly environments.

Action SA7.11 Increase supply of short- and long-term station bicycle parking at Kaka`ako Station.

Initial plans developed by HART suggest a need for 20 bicycle parking spaces for opening day service, increasing to 30 total in 2030. Based on the access demand estimates, an additional 10 spaces are recommended for opening day service. In 2030, that demand is expected to grow to 120 spaces with the implementation and build-out of planned TOD densities. Additionally, station design should anticipate the need for future growth in station area bike parking. A long-term bicycle storage facility that accommodates 30 bicycles is recommended. This facility should be located as close as possible to or, if possible, inside the fare gate. See call out for description of methods use to calculate bicycle parking.

Since this station is expected to be the destination end of more than 80% of home-based trips to and from the station, bike-share will be a critical strategy to complete last mile connections in the KCDD and adjacent neighborhoods.

Action SA8 Implement actions specific to the Civic Center Station.
