I. INTRODUCTION

The Housing and Community Development Corporation of Hawaii (HCDCH) is in the process of completing the Villages of Kapolei development in the Ewa plain of the island of Oahu. This project was one of the pioneer projects that began the implementation of the second city policy for development of the Ewa plain and provided much needed housing for the affordable residential market. Figure 1 illustrates the general location of the site.

Because plans have changed slightly and because there have been community concerns regarding pedestrian safety, bicycle safety, and school-related safety, HCDCH has commissioned this study to find ways to address these concerns in a manner that is compatible with City and County of Honolulu (City) Subdivision Standards. The compatibility with City standards is important in that HCDCH intends to dedicate the streets and pedestrian facilities to the City.

A. Purpose of Study

The study documents existing conditions, including the conditions related to the community concerns and the projects buildout traffic conditions for the Villages of Kapolei. It also summarizes recommended roadway geometry and traffic control improvements and proposes alternatives to mitigate traffic-related issues related to stated community concerns. This study also relates the proposed improvements to City standards so that City agencies can better assess the acceptability of these measures when evaluating future HCDCH requests for dedication of roadways and pedestrian facilities.

B. Background

Figure 2 illustrates the current conceptual master plan for the Villages of Kapolei. Most of the development has been completed with new development programmed primarily for the parcels along Kapolei Parkway. Kapolei Parkway itself is expected to be connected to the regional transportation system in the 5 to 6 year time frame. School crossing issues connected with the Kapolei Middle School and Kapolei High School need to be resolved by then. The Villages of Kapolei community has also expressed concern about pedestrian and bicycle safety internal to the Villages development. The area surrounding Kapolei Elementary is a key area of concern.

SITE PLAN MAP

Figure
2

II. EXISTING CONDITIONS

A. Existing Roadway System

Interstate H-1, Farrington Highway, and Fort Barrette Road provide regional and sub-regional access to the Villages of Kapolei study area. Within the study area, Kapolei Parkway and Kaiau Avenue provide the primary east-west circulation, while north south circulation is provided by Kealanani Avenue. Kamaaha Avenue does double duty, providing both north-south and east-west circulation. Figure 3 shows the existing roadways configuration within the study area.

1. Fort Barrette Road

Fort Barrette Road is a major north-south arterial roadway providing access to H-1 Freeway and Farrington Highway. North of Farrington Highway, Fort Barrette Road becomes Makakilo Drive providing access to the Makakilo development. From Farrington Highway, Fort Barrette Road continues south until it merges with Enterprise Avenue just makai of F.D. Roosevelt Avenue. Fort Barrette Road within the study area is a two-lane roadway and the posted speed limit is 40 miles per hour (MPH). Fort Barrette Road intersects Farrington Highway as a four-legged, signalized intersection with median left-turn lanes and right-turn lanes at all approaches. At Kamaaha Avenue and Kapolei Parkway, Fort Barrette Road forms T-intersections with median left-turn lanes provided in the makai-bound and Waianae-bound directions. These intersections are currently unsignalized with STOP-sign control on the Kamaaha and on the Kapolei Parkway approaches.

2. Farrington Highway

Farrington Highway is a major arterial roadway providing east-west mobility within the study area. Farrington Highway is a 4-lane divided roadway from Kamokila Boulevard to the Kapolei Golf Course Entrance with curb, gutter and sidewalks. East of Kapolei Golf Course Entrance, Farrington Highway is a two-lane, undivided arterial roadway until a point west of Fort Weaver Road where it transitions back into a four-lane divided roadway. The posted speed limit is 25 MPH in the study area and 35 MPH east of Kapolei Golf Course Driveway.

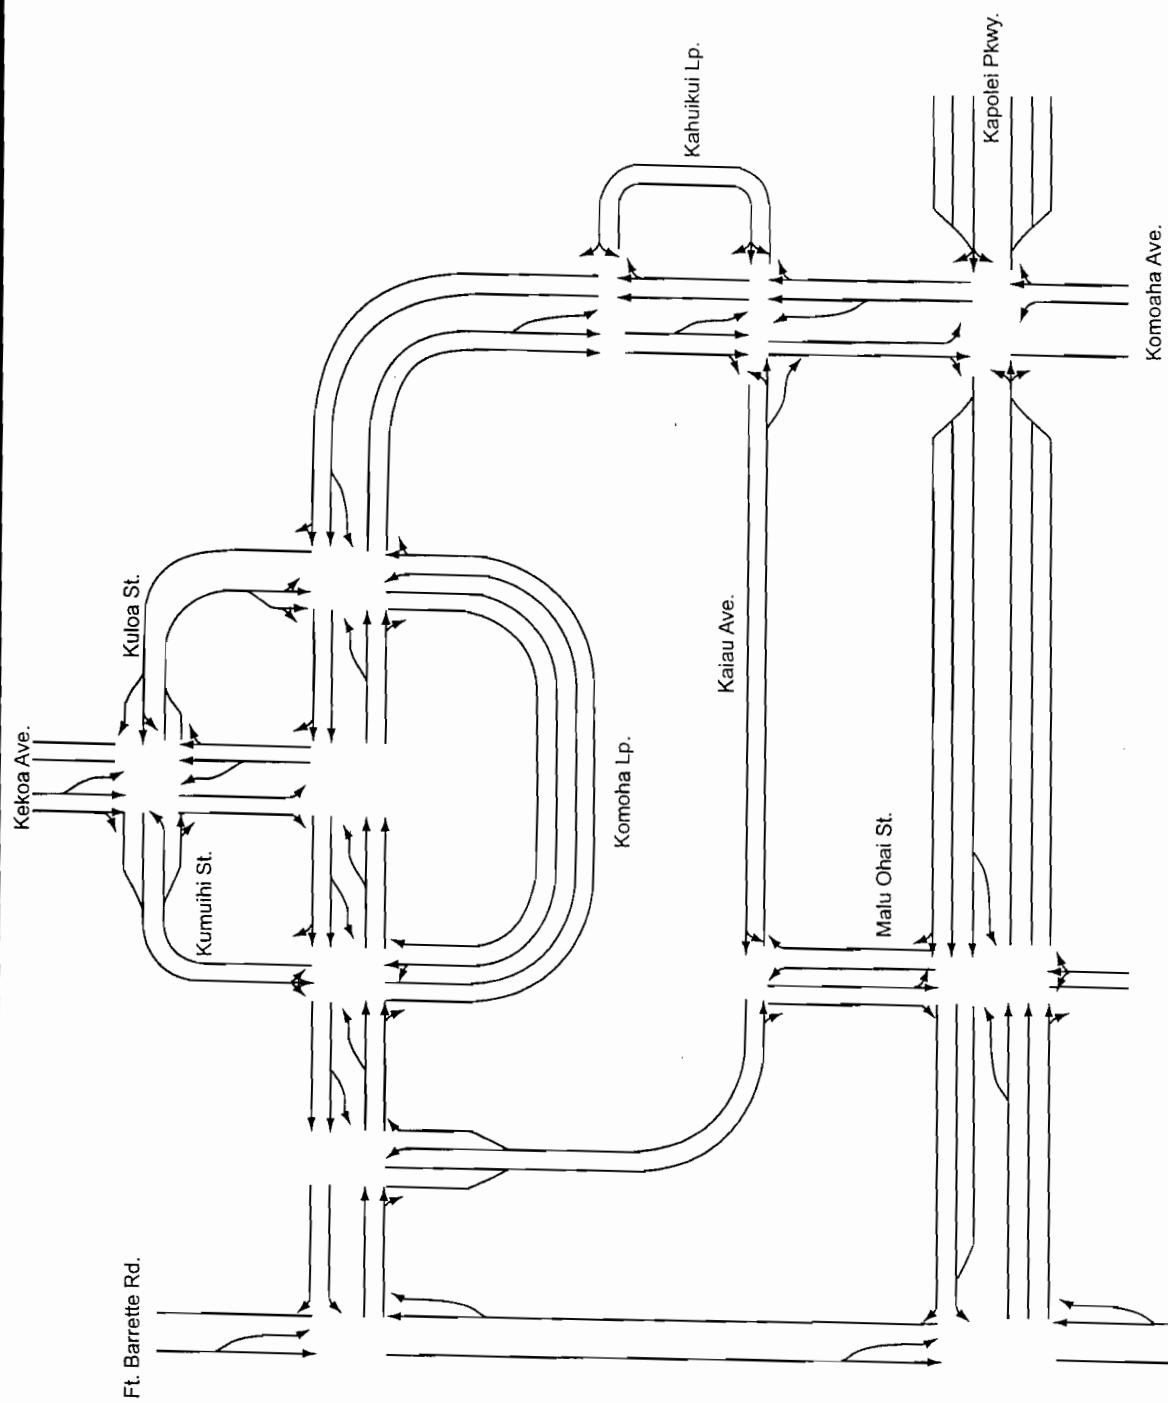

Figure
3

EXISTING ROADWAY CONFIGURATIONS

3. Kapolei Parkway

Kapolei Parkway is a six-lane divided major arterial roadway. Ultimately it will provide east-west mobility between Kapolei and Ewa. Within the Villages of Kapolei, it is currently open to traffic between Fort Barrette Road and a point east of Kapolei Middle School. Within this segment, Kapolei Parkway intersects Fort Barrette Road, Malu Ohai Street, and Kamaaha Avenue at unsignalized intersections. Parking is prohibited along Kapolei Parkway within the study area, and the current posted speed limit is 30 MPH. At Kamaaha Avenue, the middle and curb lanes and the left-turn lanes of Kapolei Parkway are temporarily closed to traffic so that each Kapolei approach has one shared lane serving left-turn, through and right-turn movements. This intersection functions with an all-way STOP control. Malu Ohai Street intersects Kapolei Parkway directly opposite the main driveway for Kapolei High School, forming a four-legged, unsignalized intersection with STOP-sign control on the Malu Ohai and Kapolei High School Driveway approaches. Currently, crossing guards are stationed at Malu Ohai Street and Kamaaha Avenue during the start and end of school during weekdays.

4. Kamaaha Avenue

Kamaaha Avenue is a major collector roadway which provides east-west and north-south circulation within the Villages of Kapolei. Its current termini are Fort Barrette Road to the west and Kapolei Parkway to the east. Ultimately, Kamaaha Avenue is planned to extend west through the City of Kapolei and terminate at Kapolei Parkway east of Kamokila Boulevard. Currently, Kamaaha is a four-lane divided roadway with left turn lanes at intersections and the posted speed limit is 25 MPH. Kaiau Avenue, Kamaaha Loop/Kuloa Avenue, Kealanani Avenue, Kamaaha Loop/Kumuiki Street, Kekuilani Loop, and Kekuilani Loop/Kaiau Avenue are intersections on Kamaaha Avenue. All of these intersections are unsignalized, with STOP-sign control on the non-Kamaaha Avenue approaches.

5. Kealanani Avenue

Kealanani Avenue is a four-lane divided roadway providing mauka-makai circulation within the study area. Kealanani Avenue intersects Kamaaha Avenue and Kuloa Avenue/Kumuiki Street as unsignalized intersections, and it intersects Farrington Highway as a signalized intersection. Left and right-turn lanes are provided at intersection and parking is prohibited

along the entire length of Kealanani Avenue. The posted speed limit on Kealanani Avenue is 25 MPH

6. Kaiau Avenue

Kaiau Avenue is major east-west residential collector within Villages 5 and 6 of The Villages of Kapolei. The western terminus of Kaiau Avenue is Kamaaha Avenue, east of Fort Barrette Road, and the eastern terminus is directly across Kekuilani Loop at Kamaaha Avenue mauka of Kapolei Parkway. Kaiau Avenue is a two-lane roadway with lane channelization at its intersections with Kamaaha Avenue providing left and right-turn lanes. The posted Speed limit is 25 MPH.

C. Existing Traffic Volumes

The evaluation of operations in the Villages of Kapolei Development captured the magnitudes and timings of the AM, mid-day, and PM peaks associated with going to work/school, leaving school, and coming home from work, respectively. Manual traffic volume counts were conducted at the following intersections on Tuesday, October 21, 2003 and Wednesday, October 22, 2003 in order to observe the mid day/PM peaks and AM peak, respectively:

- Fort Barrette Road and Kamaaha Avenue
- Fort Barrette Road and Kapolei Parkway
- Kaiau Avenue and Kamaaha Avenue
- Kumuiki Street/Kamaaha Avenue (West Loop) and Kamaaha Avenue
- Kealanani Avenue and Kamaaha Avenue
- Kuloa Avenue/Kamaaha Avenue (East Loop) and Kamaaha Avenue
- Kekuilani Loop (mauka) and Kamaaha Avenue
- Kekuilani Loop (makai)/Kaiau Avenue and Kamaaha Avenue
- Kapolei Parkway and Kamaaha Avenue

- Kaiau Avenue between Koanimakani Street and Hokeo Street

Additional traffic turning movement counts were conducted at the following intersections on Wednesday, October 22, 2003 and Thursday, October 23, 2003.

- Kealanani Avenue and Farrington Highway
- Kealanani Avenue and Kumuiki Street/Kuloa Avenue
- Kapolei Parkway and Malu Ohai Street

Peak hour volumes at the 13 intersections included in the study can be found in Appendix A. The AM, mid day, and PM peaks were found to occur from 7:00 to 8:00 AM, 1:45 to 2:45 PM, and 4:30 to 5:30 PM, respectively. Figures 4 through 6 show the existing peak hour traffic volumes for the AM, mid-day, and PM peak periods, respectively.

4

Figure

EXISTING AM TRAFFIC VOLUMES

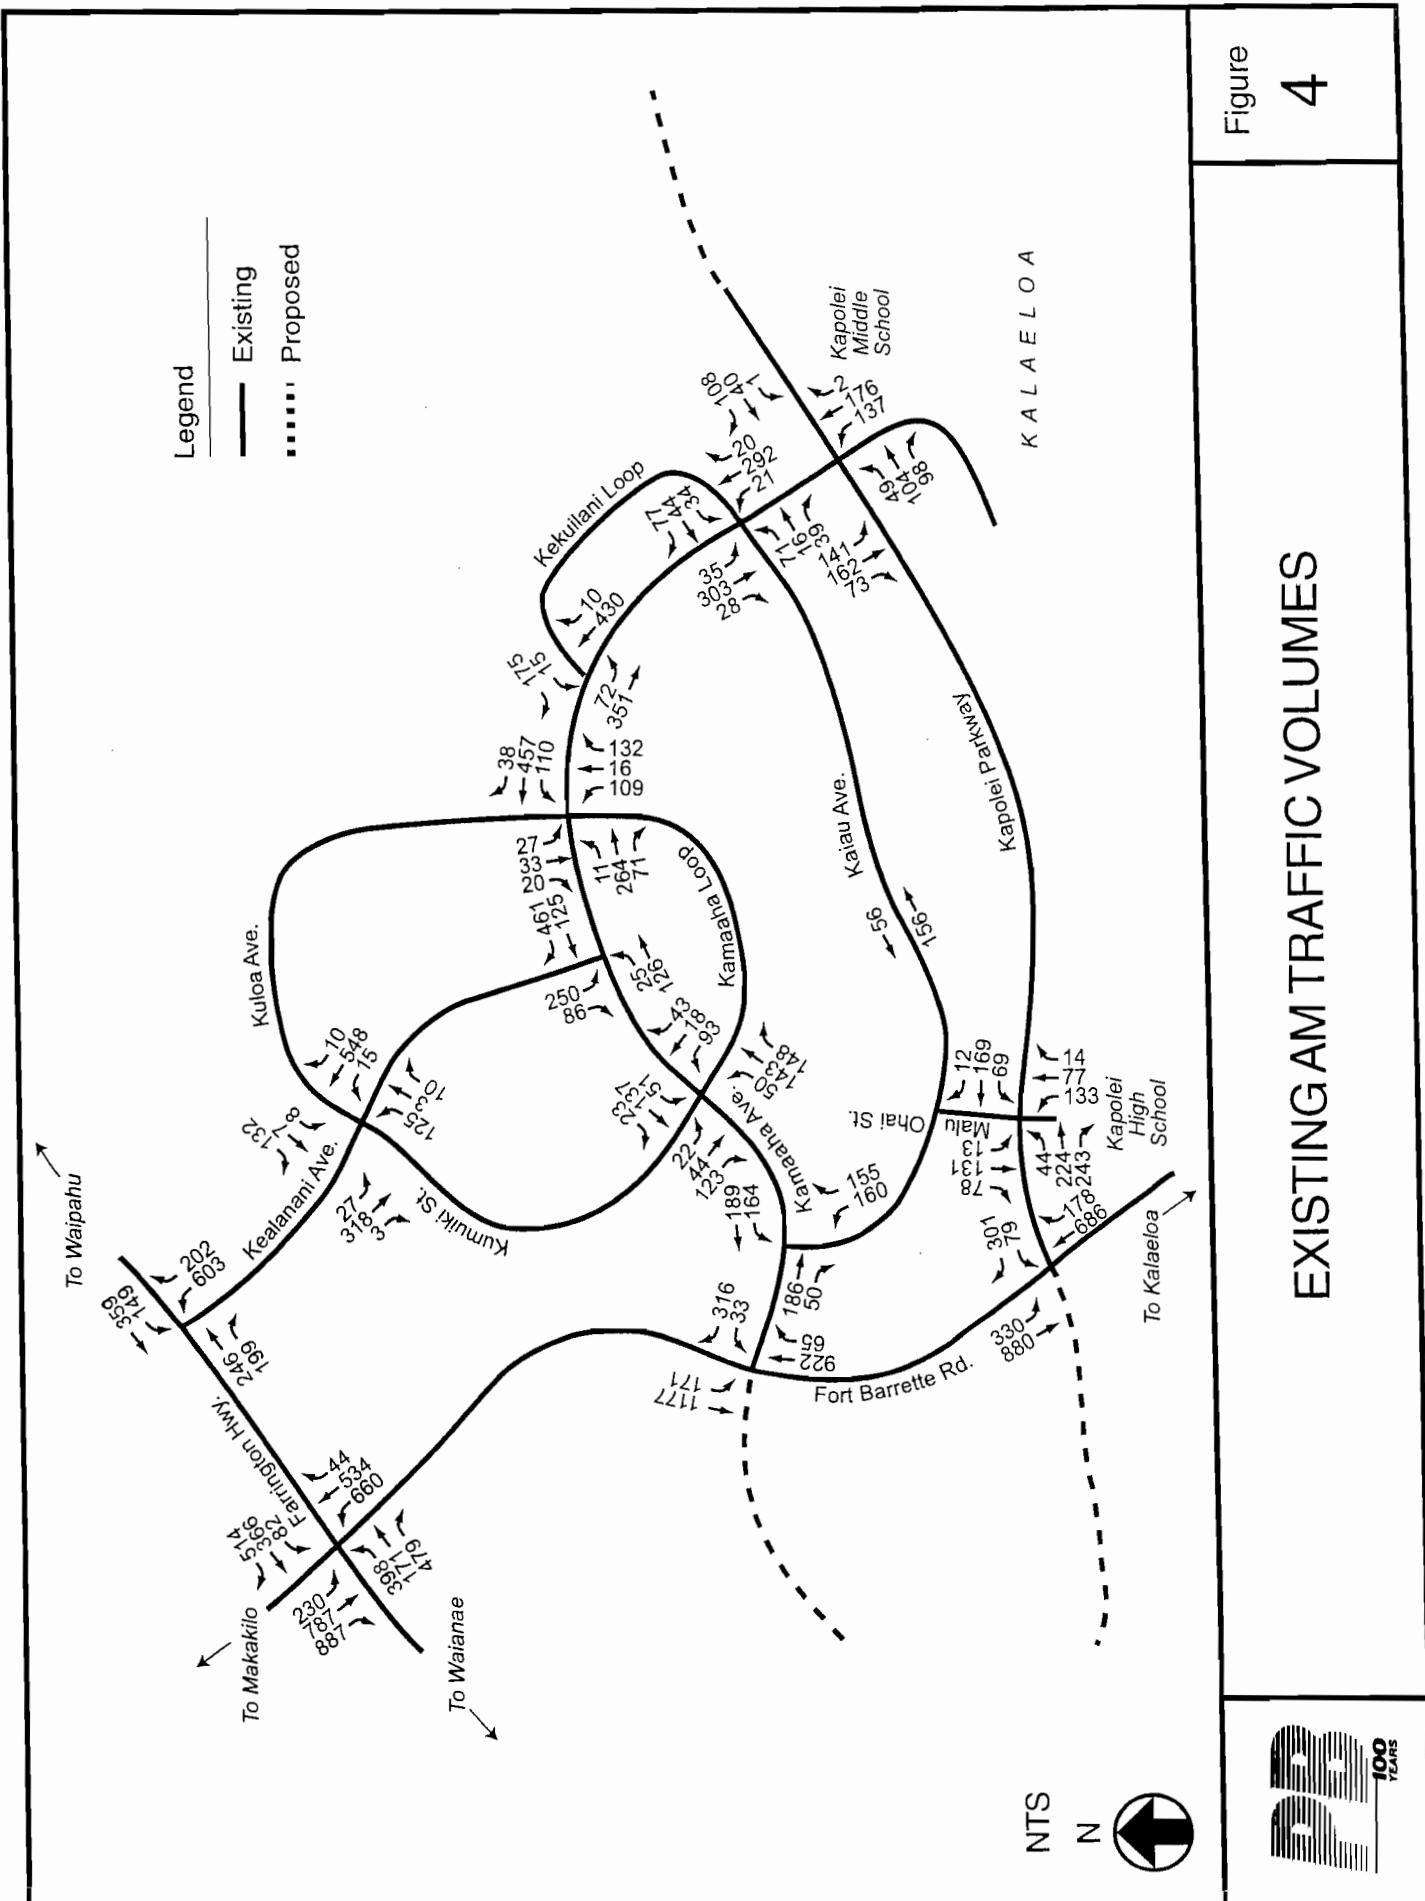

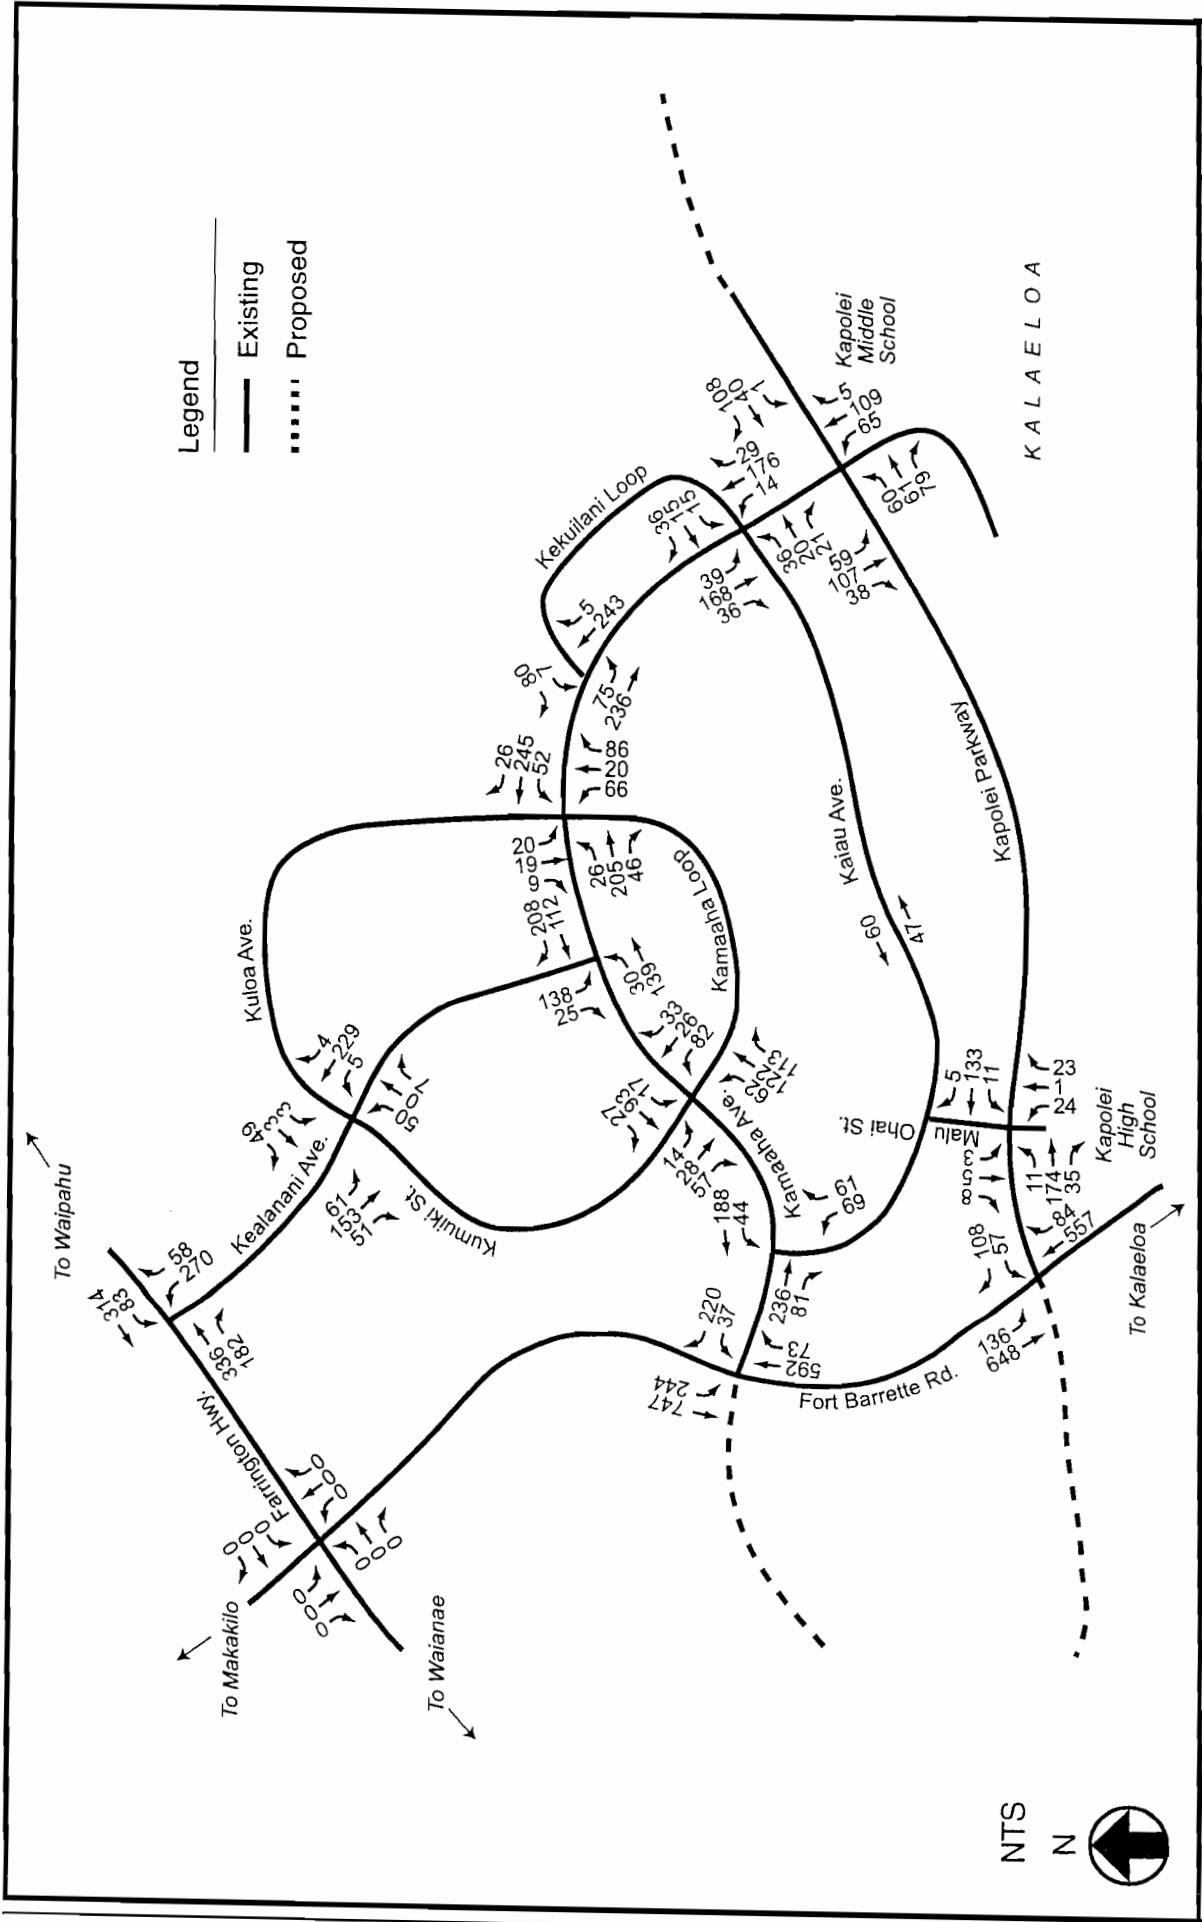

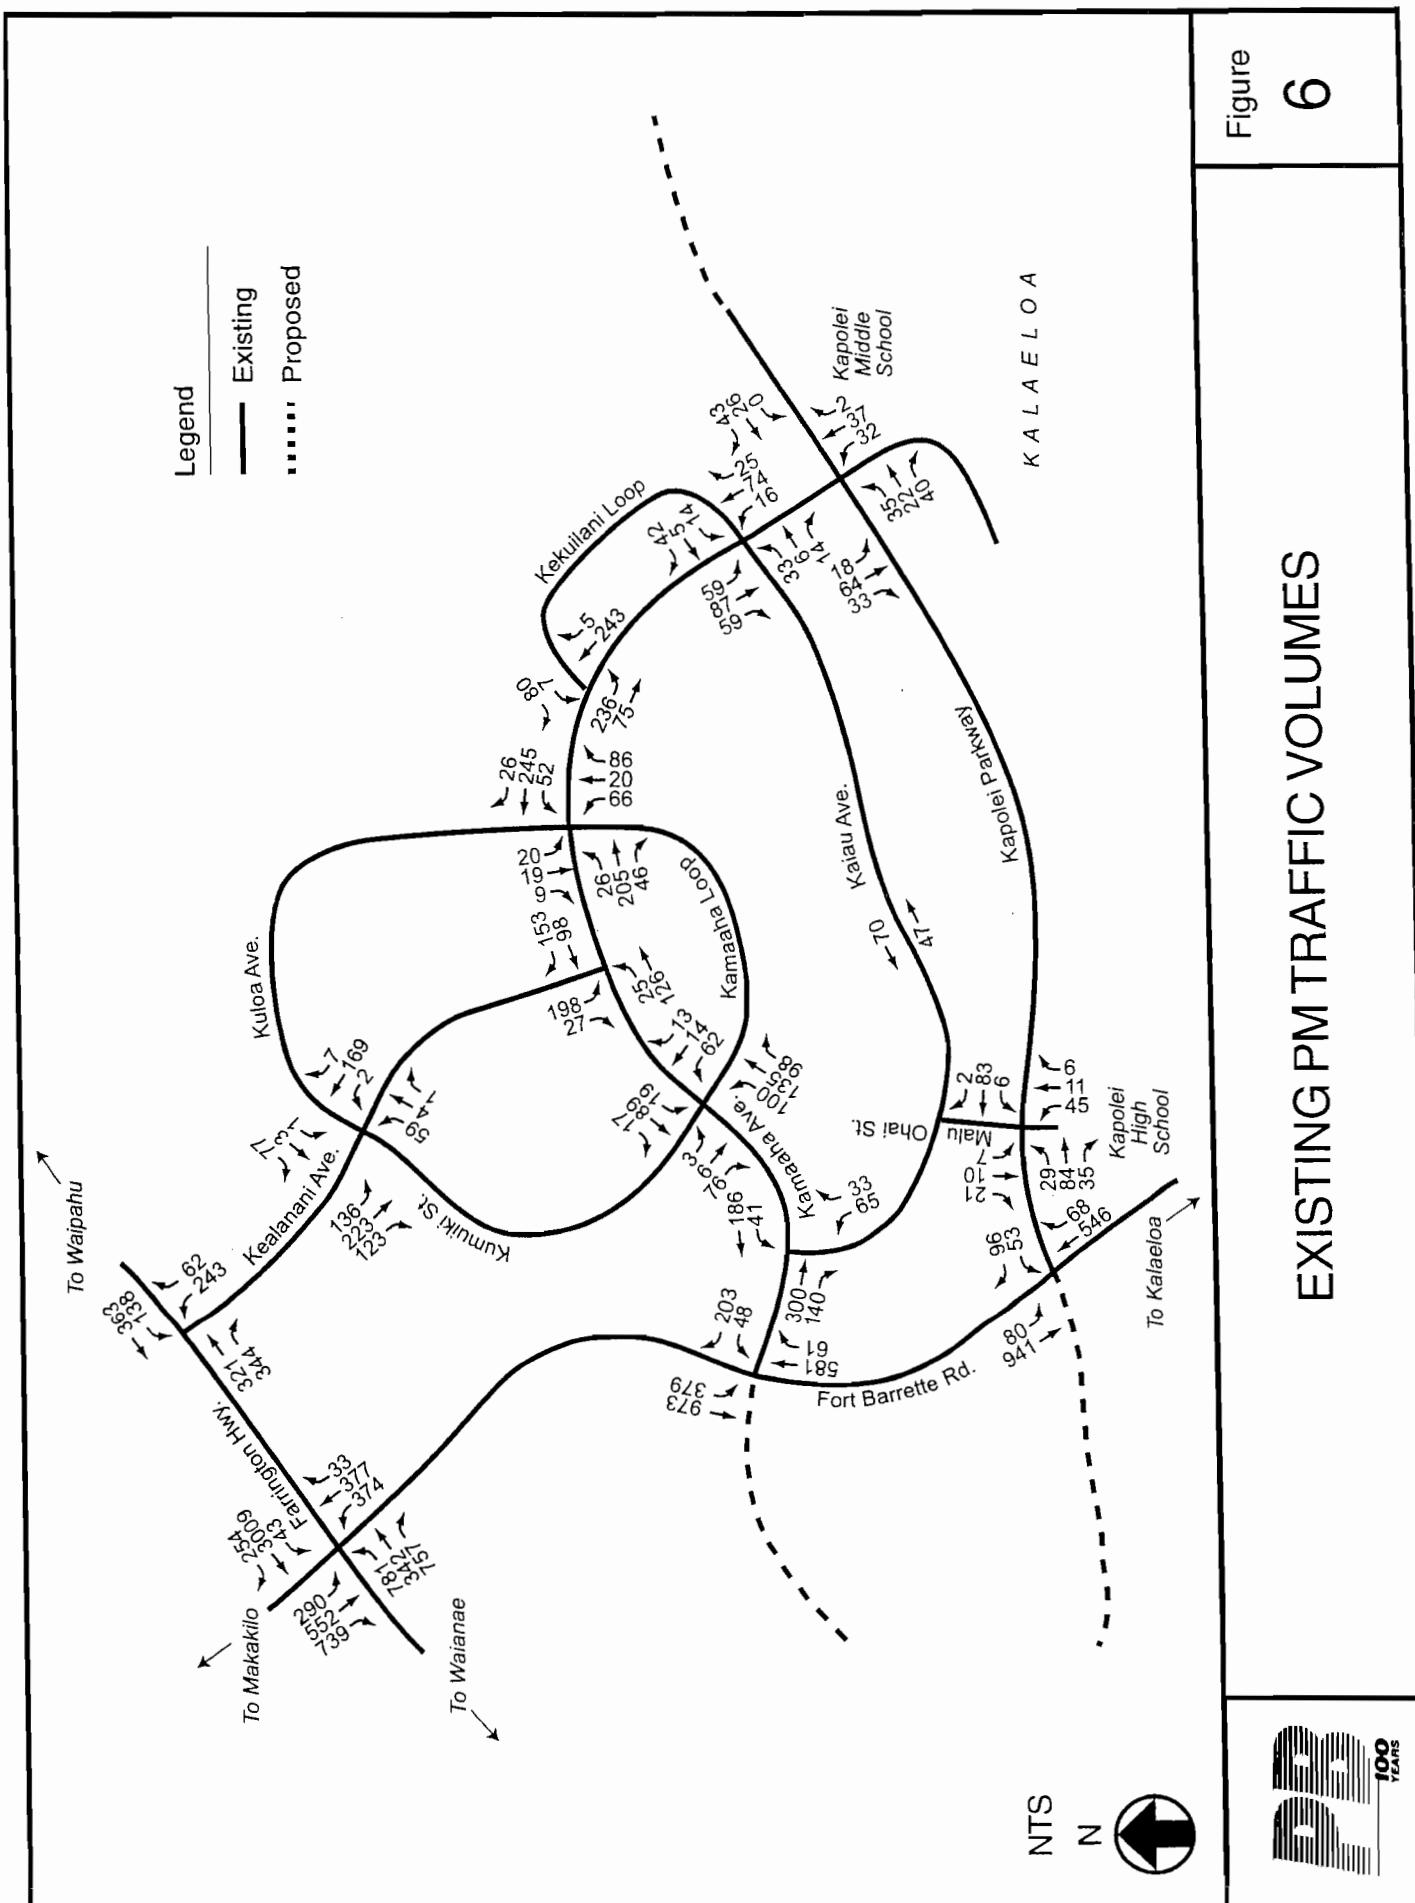

Figure
5

EXISTING MID-DAY TRAFFIC VOLUMES

Pedestrian activities at the previously listed intersections were observed at the same time of the traffic counts. The AM and mid-day peaks were the most significant, which was expected due to the amount of school traffic. Pedestrian volumes were the highest near the Kapolei High School and Kapolei Middle School between the hours of 7:00-8:00 AM and 1:45-2:45 PM. AM, mid-day, and PM pedestrian movement summaries can be seen in figures 7 through 9, respectively. Pedestrian volumes are located in Appendix A.

In addition, 24-hour approach volumes were collected between Monday, December 8, 2003 and Thursday, January 26, 2004 at the 13 previously listed intersections for warrant analyses and can be found in Appendix A of this report.

D. Existing Intersection Operations

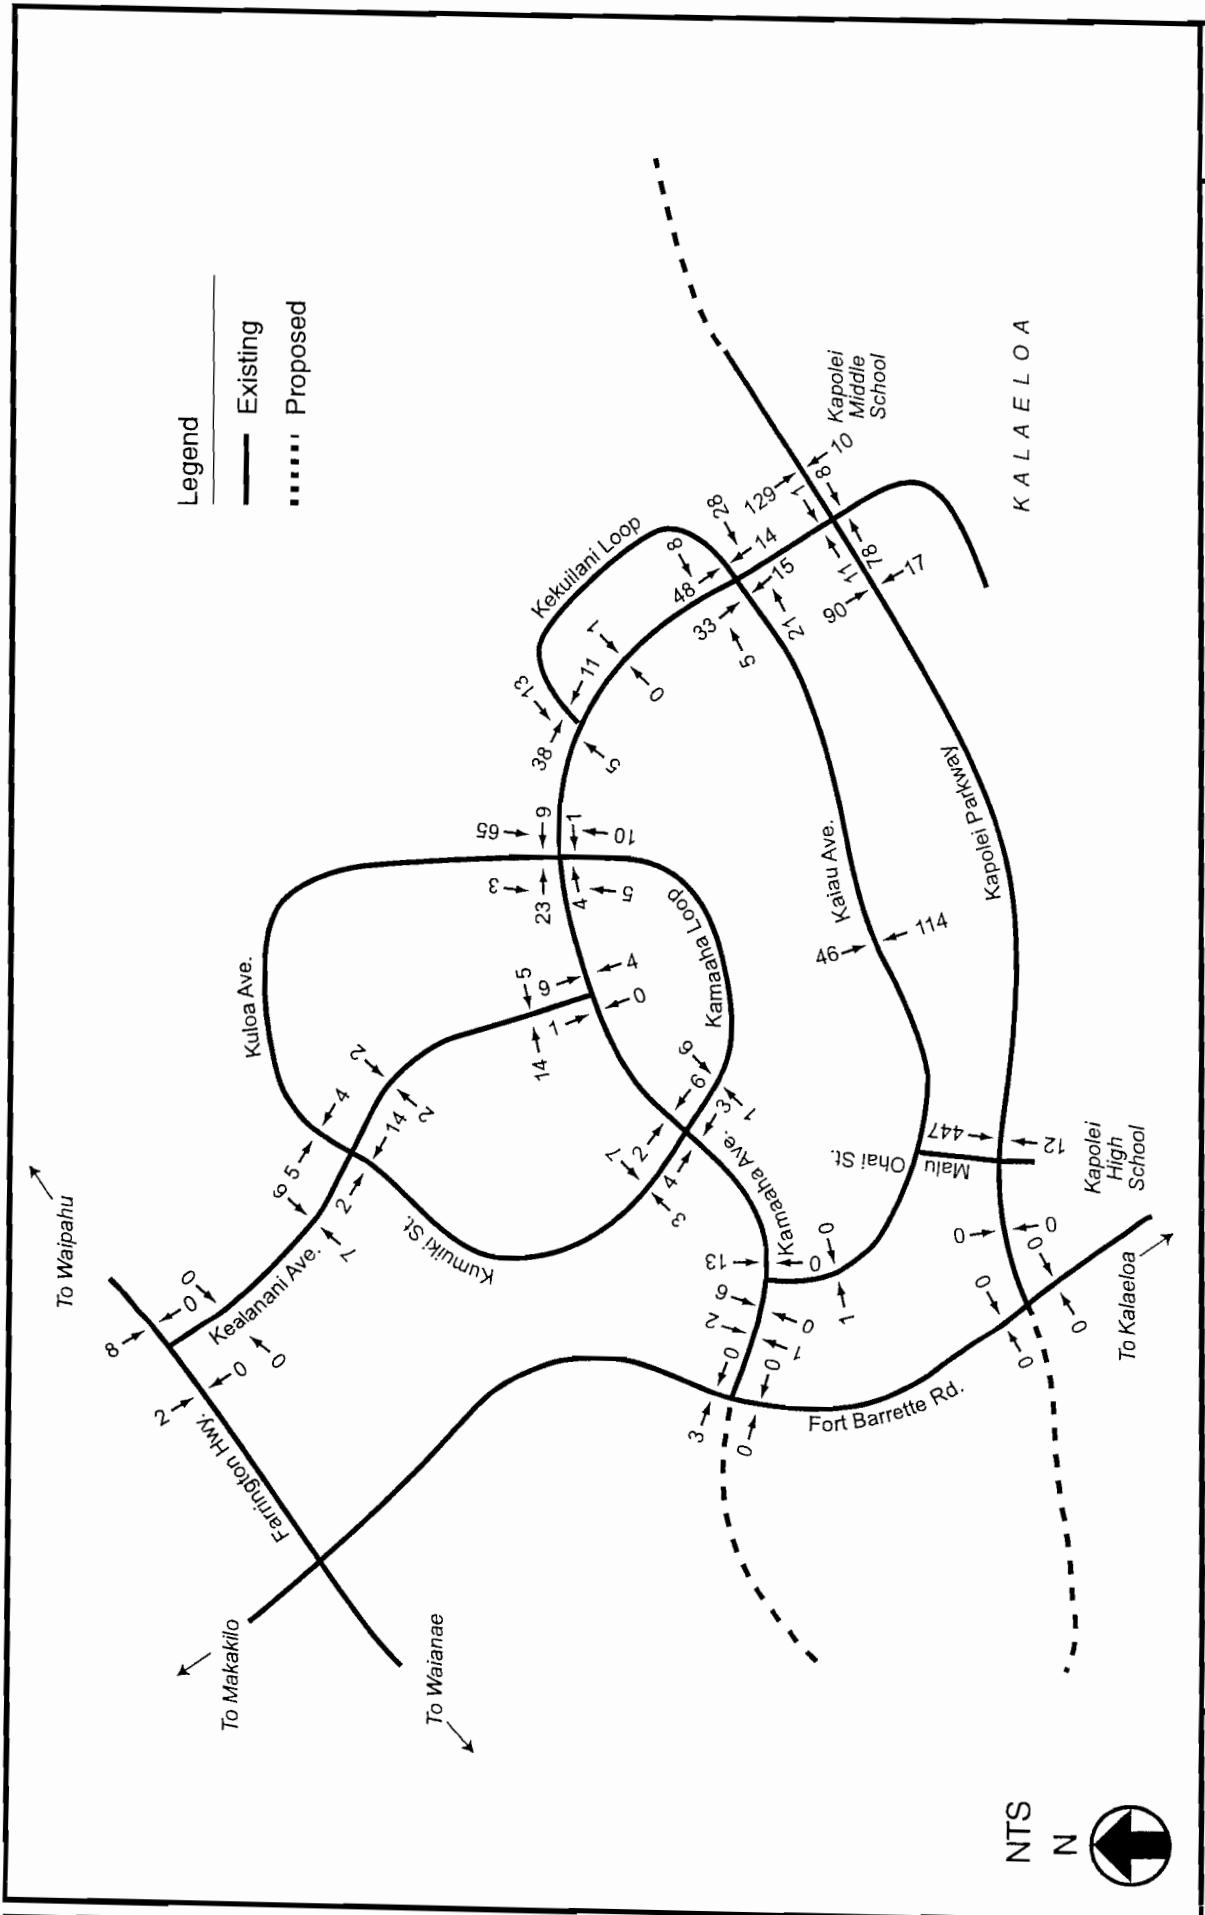

The aforementioned intersections were analyzed using the methodologies for unsignalized and signalized intersections outlined in the *2000 Highway Capacity manual (HCM)*. An intersection's operating conditions can be broken down by approach and expressed as a qualitative measure known as Level-of-Service (LOS) ranging from A to F. LOS A denotes free-flow operations with low delay; conversely, LOS F conditions would be congested with a comparatively higher delay. An intersection's overall LOS is determined by taking a weighted average of the LOS of individual traffic movement groups. Appendix B has more detailed definitions of intersection LOS. Field observations were performed at selected intersections to verify the results of the intersection analysis.

1. Results of Unsignalized Intersections

Table 1 summarizes the existing conditions Level-of-Service (LOS) for each unsignalized intersection. Most movements operate at an acceptable LOS (LOS D or better). For detailed analysis information, Appendix C includes intersection capacity analysis worksheets.

Makai Bound Thru/Right	B	13.49	A	9.93	A	8.28

Note: - indicates that no data was collected during this period or control delays were considered very high.

a) Fort Barrette Road

Both Kamaaha Avenue and Kapolei Parkway Waianae-bound left-turns onto makai-bound Fort Barrette Road experience delays during the observed peak hours due to high through traffic on Fort Barrette Road. Mitigating this condition somewhat are gaps in the makai-bound flow on Fort Barrette Road created by the adjacent traffic signal at Farrington Highway. Although the left-turn volume from Kamaaha Avenue and Kapolei Parkway experience delays, the current demand at each approach is less than 100 vehicles per hour (VPH) during the peak periods. Also, during the AM peak both Kamaaha Avenue and Kapolei Parkway Waianae-bound right-turns onto mauka-bound Fort Weaver Road experience high delays due to high mauka-bound traffic volume on Fort Barrette Road. This through traffic on Fort Barrette Road is comprised of traffic using Roosevelt Avenue through Kalaeloa (former Barber's Point NAS) to travel between Ewa and the City of Kapolei or H-1 Freeway.

b) Kapolei Parkway

The intersections on Kapolei Parkway at Malu Ohai Street and Kamaaha Avenue were observed to experience a pulse of intense pedestrian and vehicular traffic increase before and after school. Currently, there are crossing guards assigned to both intersections during these time periods.

Conflicts between pedestrian and vehicular activity at the Malu Ohai Street intersection affects traffic movements turning out of Malu Ohai Street and the Kapolei High School Driveway during the AM peak hour. At times, vehicles turning out of these approaches were forced to stop in the middle of the intersection as pedestrians crossed Kapolei Parkway, blocking vehicles traveling on Kapolei Parkway. The Malu Ohai Street intersection operates well during the other observed peak periods.

The Kapolei Parkway/Kamaaha Avenue intersection is configured as an all-way STOP, and Kapolei Parkway has been temporarily narrowed to one lane approaches. The narrowed approaches combined with very concentrated school-related traffic demand creates congestion during a portion of the after-school peak hour. During this time period, it was observed that parents and school buses picking up school children travel KKHD-bound on Kapolei Parkway and make a U-turn at the Kapolei Canal Bridge to travel Waianae-bound.

This is due to the lack of a break in the median of Kapolei Parkway at the main driveway to Kapolei Middle School.

c) Kamaaha Avenue

All intersections along Kamaaha Avenue are unsignalized and stop signed controlled at the minor approaches. With the exception of the intersections with Fort Barrette Road and Kapolei Parkway (previously discussed), all movements operate at an acceptable LOS D or better.

d) Kealanani Avenue

Kealanani Avenue/Kumuiki Street/Kuloa Avenue intersection operates at an acceptable LOS C or better during AM, mid-day and PM Peak periods. The adjacent traffic signal at Farrington Highway provide acceptable gaps for KKHD/Waianae-bound left-turn vehicles to complete their movement and the existing median provides storage for left-turn vehicles to complete their turn in two phases: 1) a vehicle crosses the mauka or makai-bound lane on Kealanani Avenue and then stops in the median area; 2) the vehicle then merges into the makai or mauka-bound traffic flow. These steps reduce the delay because the vehicle does not have to wait for an acceptable gap to occur simultaneously in both mauka and makai-bound traffic on Kealanani Avenue.

2. Results of Signalized Intersections

Two signalized intersections are located within the study area: Farrington Highway/Fort Barrette Road/Makakilo Drive intersection and Farrington Highway/Kealanani Avenue intersection. Data from a previous count at Farrington Highway/Fort Barrette Road/Makakilo Drive intersection were used to supplement data for this effort. Cycle lengths, phasing and timing were observed and recorded at both intersections. Table 2 summarizes the existing signalized intersection LOS.

a) Farrington Highway and Fort Barrette Road/Makakilo Drive

The intersection of Farrington Highway and Fort Barrette Road/Makakilo Drive intersection experiences congestion during both AM and PM peak hours (overall LOS E and D respectively). Long cycle lengths contribute to delays experienced at this intersection. Within the City of Kapolei, Farrington Highway is currently the only east-west roadway

carrying all of the traffic west of Fort Barrette Road. As a result, traffic destined for the Villages of Kapolei, Makakilo and H-1 Freeway Koko Head-bound go through this intersection. A large portion of the green time is allocated to the Koko Head-bound left-

Table 2 Existing Signalized Intersection LOS

Intersection	AM Peak		Mid Day Peak		PM Peak	
	LOS	Delay (sec/veh)	LOS	Delay (sec/veh)	LOS	Delay (sec/veh)
Farrington Highway and Fort Barrette Road	E	72.3	-	-	D	50.7
KKHD Bound Left	D	45.5	-	-	D	45.2
KKHD Bound Thru	D	45.5	-	-	C	27.3
KKHD Bound Right	C	27.2	-	-	B	19.5
Waianae Bound Left	E	65.9	-	-	F	80.4
Waianae Bound Thru	F	107.4	-	-	E	71.1
Waianae Bound Right	E	73.8	-	-	D	40.6
Mauka Bound Left	E	74.6	-	-	E	62.0
Mauka Bound Thru	E	62.0	-	-	E	67.7
Mauka Bound Right	C	31.0	-	-	D	47.9
Makai Bound Left	D	53.8	-	-	E	59.5
Makai Bound Thru	F	103.7	-	-	F	95.9
Makai Bound Right	F	82.4	-	-	D	40.9
Farrington Highway and Kealanani Avenue	B	18.6	B	19.9	B	16.6
KKHD Bound Thru/Right	B	15.5	C	30.9	C	21.3
Waianae Bound Left	C	25.1	C	22.5	C	24.2
Waianae Bound Thru	B	10.3	B	10.1	B	10.3
Mauka Bound Left	C	29.1	B	12.6	B	12.3
Mauka Bound Right	A	4.4	A	3.9	A	3.9

turn onto mauka-bound Makakilo Drive. Fort Barrette Road also carries traffic that passes through Kalaeloa (Barber's Point) via F.D. Roosevelt Avenue. A large portion of the green

time is also allocated to the mauka-bound approach to satisfy the mauka-bound through and left-turn demand at this intersection. Field observations at the mauka-bound approach indicate queues in the left-turn lane extend makai blocking traffic headed mauka.

b) Farrington Highway and Kealanani Avenue

The Farrington Highway and Kealanani Avenue intersection operates at an acceptable LOS (LOS C or better) during the AM, mid-day, and PM peak periods. Approximately 50-percent of the existing traffic volume on Farrington Highway turns right from Farrington Highway onto makai-bound Kealanani Avenue making the KKHD-bound curb lane on Farrington Highway a de-facto right-turn lane.

E. Traffic Signal Warrant Analysis

24-hour traffic volumes conducted at the previously discussed intersections were used as input into traffic signal warrant analyses. Supplemental pedestrian data were collected at selected locations where pedestrian activity was observed to be a factor. Table 3 summarizes the results of the warrant analyses at the intersection within the Villages of Kapolei. The traffic signal warrant worksheets are located in Appendix D.

Of the 11 unsignalized intersections included in the study, it was determined that 6 intersections satisfied warrants as defined in the Manual on Uniform Traffic Control Devices, 2003 Edition (MUTCD 2003).

The Fort Barrette Road/Kamaaha Avenue and Fort Barrette Road/Kapolei Parkway intersections satisfied traffic volume warrants for signalization.

In addition, gap studies were conducted at the Kapolei Parkway/Malu Ohai Street and Kapolei Parkway/Kamaaha Avenue intersections to determine if either intersection satisfied the school crossing warrant. These intersections serve as primary accesses to Kapolei High School and Kapolei Middle School, respectively. Data were collected during morning and mid-day peak hours (7:00 AM – 8:00 AM and 1:45 PM – 2:45 PM). It was found that both intersections satisfied the school crossing warrants as specified in the Manual on Uniform Traffic Control Devices, 2003 Edition (MUTCD 2003) during the AM and mid-day peak hours.

Table 3 Traffic Signal Installation Warrants

Location	Peak Hour	4-Hour	8-Hour	School Xing
Farrington Hwy and Kealanani Ave	Signalized	Signalized	Signalized	Signalized
Kealanani Ave and Kumuiki St/Kuloa Ave	No	No	No	-

* Taken from 2000 traffic assessment report by Austin, Tsutsumi & Assoc., Inc.

- Not calculated

Additionally, the two Kamaaha Loop/Kamaaha Avenue intersections, which are used by school children on their way to Kapolei Elementary School, also warrant signalization based on the School Crossing Warrant, based on traffic signal warrant analyses contained in the April 2000 Traffic Assessment Report by Austin, Tsutsumi & Associates, Inc.

F. Existing Traffic Issues

A compilation of existing transportation issues and concerns are identified and discussed in this section of the report. Figure 10 illustrates the existing transportation issues within the Village of Kapolei Development.

VILLAGES OF KAPOLEI EXISTING TRANSPORTATION ISSUES

Figure
10

1. Vehicular Traffic Issues

During the off peak hours of the day, traffic volumes are generally very low within the Villages of Kapolei. There are traffic peaks during AM, mid-day, and PM peak hours. Because of the relatively low level of traffic activity, the surge of traffic volumes associated with Kapolei Elementary, Middle and High Schools is a significant part of the peak period activity. Figure 11 shows the existing 24-hour traffic volume on Kapolei Parkway and Kamaaha Avenue at Fort Barrette Road. As shown in Figure 11, the intense spike in traffic volume coincides with the time school begins and ends. In certain locations, the increase in traffic during the mid-day when school is released is higher than the PM commuter peak. Because much of the vehicular issues are related to school activity, the vehicular issues are related to the pedestrian issues and often overlap.

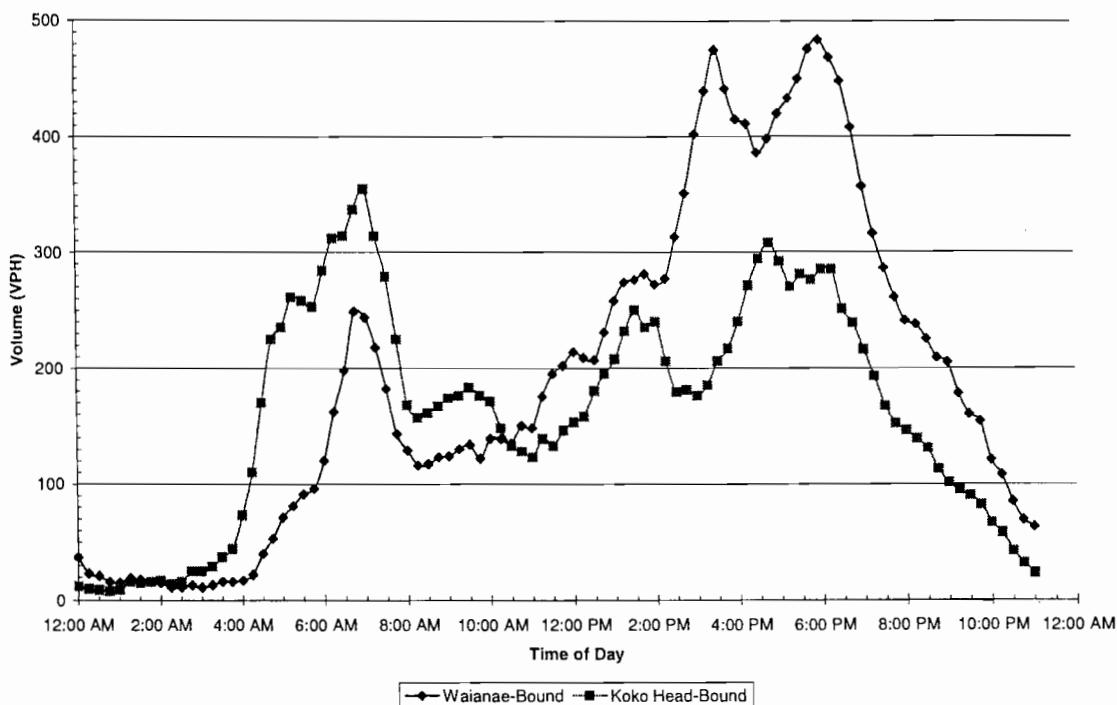

a) Kapolei Parkway and Kamaaha Avenue

During both AM and mid-day peak hours, queuing on the Koko Head and Waianae-bound approaches at the Kapolei Parkway/Kamaaha Avenue intersection has been observed to occur. This queuing is short in duration and appears to consist of parents, school buses, and other school-related vehicles associated with Kapolei Middle School. Figure 12 shows a picture of the Waianae-bound approach on Kapolei Parkway during the mid-day peak. The queue has been observed to reach 16-20 vehicles at times. Similar queuing was observed on the Koko Head-bound approach.

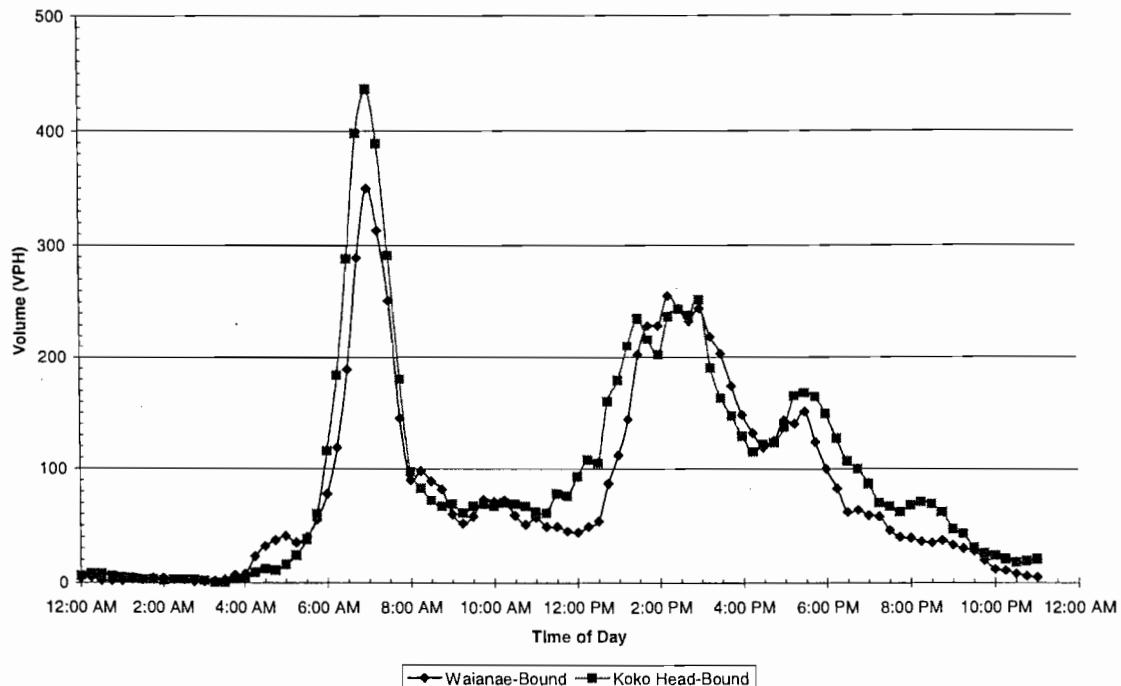

b) Kapolei Parkway and Malu Ohai Street

The Kapolei Parkway/Malu Ohai Street intersection experiences congestion during the AM and mid-day peaks due to Kapolei High School traffic. Traffic patterns during the AM peak show a significant amount of vehicles at this intersection enter Kapolei High School (approximately 45%). More than half of the traffic entering Kapolei High School enters from Koko Head-bound Kapolei Parkway. This increase in traffic volume combined with the increase in pedestrian activity crossing Kapolei Parkway creates delays and queuing for vehicles.

24-HOUR TRAFFIC VOLUMES ON
KAPOLEI PKWY AND KAMAAHA AVE
AT FT BARRETTE RD

Figure
11

Figure 12 Queuing on WB approach of Kapolei Pkwy-Kamaaha Ave

- c) Kapolei Parkway/Fort Barrette Road and Kamaaha Avenue/Fort Barrette Road Intersections

Vehicles wanting to make a left-turn from Kapolei Parkway or Kamaaha Avenue onto makai-bound Fort Barrette Road experience delays during the observed peak periods due to high traffic volume on Fort Barrette Road. Similarly, Traffic turning right from Kapolei Parkway and Kamaaha Avenue onto mauka-bound Fort Barrette Road experience delays during the AM peak. Some gaps in the makai-bound direction are created from the upstream signal at Farrington Highway and Fort Barrette Road/Makakilo Drive intersection. But during the AM Peak, approximately 330 vehicles make a left-turn from makai-bound Fort Weaver Road onto Koko Head-Bound Kapolei Parkway, making it difficult to make a left turn from Kapolei Parkway to makai-bound Fort Barrette Road.

d) Kamaaha Loop

During the mid-day peak, Kamaaha Loop, in front of Kapolei Elementary School, becomes congested with vehicles belonging to people picking up children from the school. Figure 13 shows the effect of school related traffic on Kamaaha Loop during the mid-day peak. Kamaaha Loop essentially becomes a parking lot for approximately 15-20 minutes in the early afternoon period when school lets out. Vehicles have been observed to park along both sides of Kamaaha Loop and in the painted median, creating safety issues as children run to these cars. Additionally, those vehicles that do drive into the drop off area queue out of the Kapolei Elementary School Driveway blocking traffic on Kamaaha Loop.

Figure 13 Parking on Kamaaha Loop During Mid-Day Peak Period

Picture of Parking in median on Kamaaha Loop after school

2. Pedestrian Traffic Issues

Similar to vehicular traffic, pedestrian traffic is generally very low within The Villages of Kapolei except during the peak periods before and after school. Also included in Figure 10 is an illustration of pedestrian traffic issues within The Villages of Kapolei.

a) Areas of Significant Pedestrian Activity

(1) *Kapolei Parkway*

Significant pedestrian traffic was observed within The Villages of Kapolei crossing Kapolei Parkway, Kamaaha Avenue and Kaiau Avenue. Figure 10 shows the locations of significant pedestrian activity and magnitude of pedestrians crossing at each location.

During the AM peak, Kapolei Parkway experience 459 and 225 pedestrians crossing at Malu Ohai Street and Kamaaha Avenue, respectively. These are mostly associated with Kapolei High School and Kapolei Middle School. The mid-day peak is slightly less intense with 341 and 282 pedestrians crossing Kapolei Parkway at Malu Ohai Street and Kamaaha Avenue, respectively.

Pedestrian crossing Kapolei Parkway in front of Kapolei High School occurs in three main locations: at Kapolei Parkway and Malu Ohai Street Intersection, at the pedestrian access through the fence midway between the two driveways, and at the central mauka-makai Villages of Kapolei pedestrian walkway. While most of the pedestrians cross at Malu Ohai Street, a large portion cross at the access through the fence and near the central mauka-makai pedestrian walkway. The component that crosses at the access through the fence is destined for a City bus stop located on the mauka side of Kapolei Parkway directly opposite the access through the fence.

(2) *Kamaaha Avenue*

Kamaaha Avenue has six internal pedestrian crossings. The Kamaaha Avenue/Kaiau Avenue/Kekuilani Loop (makai) intersection has the greatest school-related pedestrian activity. Contributing to this crossing volume is the number of students from Kapolei Elementary School that were observed to exit behind the school via a pedestrian path onto Lanakoi Street. These students then walked to the Kekuilani Loop (makai) intersection on Kamaaha Avenue via Maulihawa Street, Mamaka Street and Kaiau Avenue. Many then

crossed Kamaaha Avenue. On the Koko Head leg of the Kamaaha Avenue/Kaiau Avenue/Kekuilani Loop intersection, students buy snacks from a snack van after school. This activity results in children in the roadway on Kekuilani Loop (Makai) near Kamaaha Avenue.

Another major pedestrian crossing location is the Kamaaha Avenue/Kamaaha Loop (KKHD) intersection. A large share of the Kapolei Elementary School-related pedestrians cross Kamaaha Avenue at this location. There is a crossing guard at this intersection before and after school. A significant number of students riding bikes were observed at this intersection.

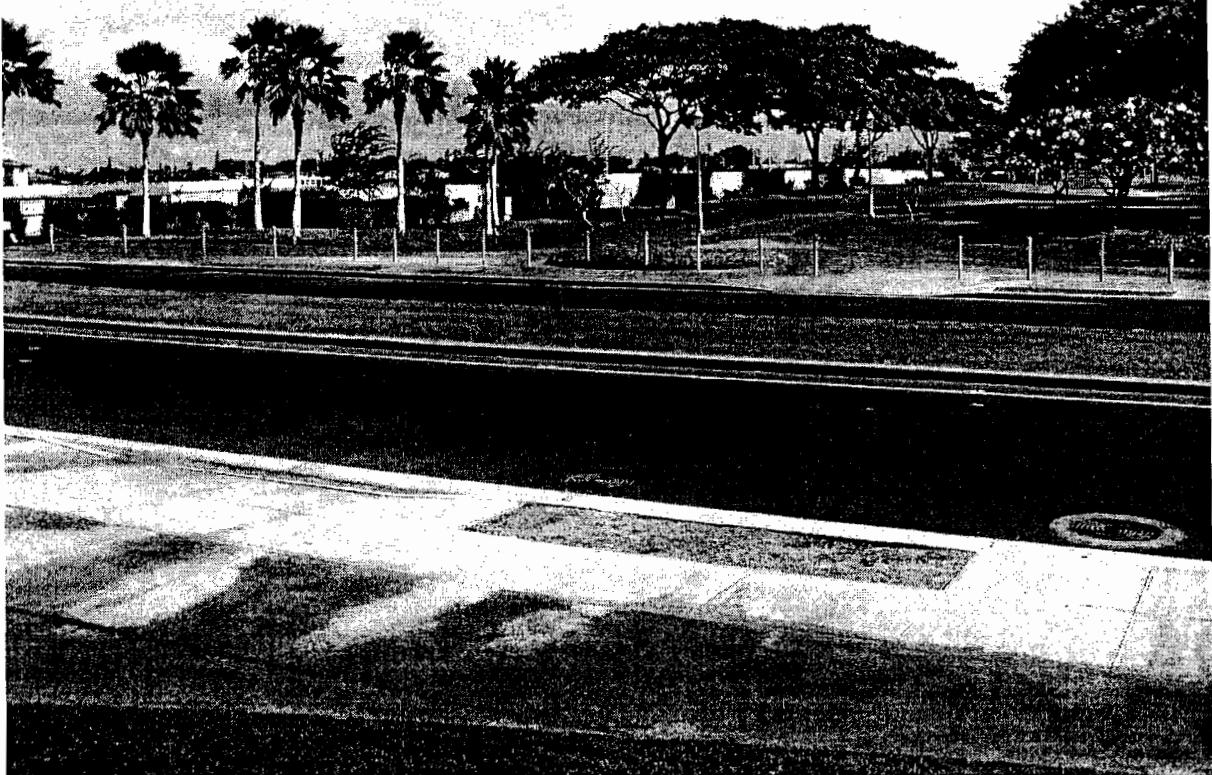

(3) *Kaiau Avenue*

Kaiau Avenue intersects the existing pedestrian path between Koanimakani Street and Hokeo Street. Observations and comments from residents indicate that the speed of vehicles on Kaiau Avenue at this crossing is a concern. Also, although the pedestrian path has handicapped ramps at Kaiau Avenue, there is no break in the raised median to accommodate the crossing. A photo of this crossing is shown in Figure 14.

b) Potential Crosswalk Locations within the Villages of Kapolei

Figure 10 identifies where potential crosswalks could be located within The Villages of Kapolei. Currently, these locations are unmarked.

Figure 14
Kaiau Avenue between Koanimakani Street
and Hokeo Street Looking makai

III. PROJECTED BUILDOUT CONDITIONS

A. Projected Future Roadway Network

Future roadway improvements assumed for the Year 2025 time frame were based on the roadway improvements described in the *Oahu Regional Transportation Plan (ORTP)*, approved April 6, 2001 by the Policy Committee of the Oahu Metropolitan Planning Organization (OMPO). The ORTP is the official long-range planning document for Oahu. The *Ewa Transportation Master Plan* and the *North-South Road Corridor Study* were also consulted when greater specificity was required. Figure 15 illustrates the projected roadway network.

1. Major Roadways

Several improvements will be made to Interstate H-1, Farrington Highway, and Fort Barrette Road, and Kapolei Parkway and North-South Road are planned for completion by the Year 2025.

a) H-1 Freeway

The following Interstate H-1 improvement is assumed to occur by the analysis year:

- North-South Road Interchange - New interchange on H-1 Freeway constructed between Makakilo Interchange and Kunia Interchange.
- Kapolei Interchange – Construct new interchange between Makakilo Interchange and Palailai Interchange
- Makakilo Interchange – Construct new westbound onramp and eastbound off ramp
- Palailai Interchange – Improve existing interchange

b) Fort Barrette Road

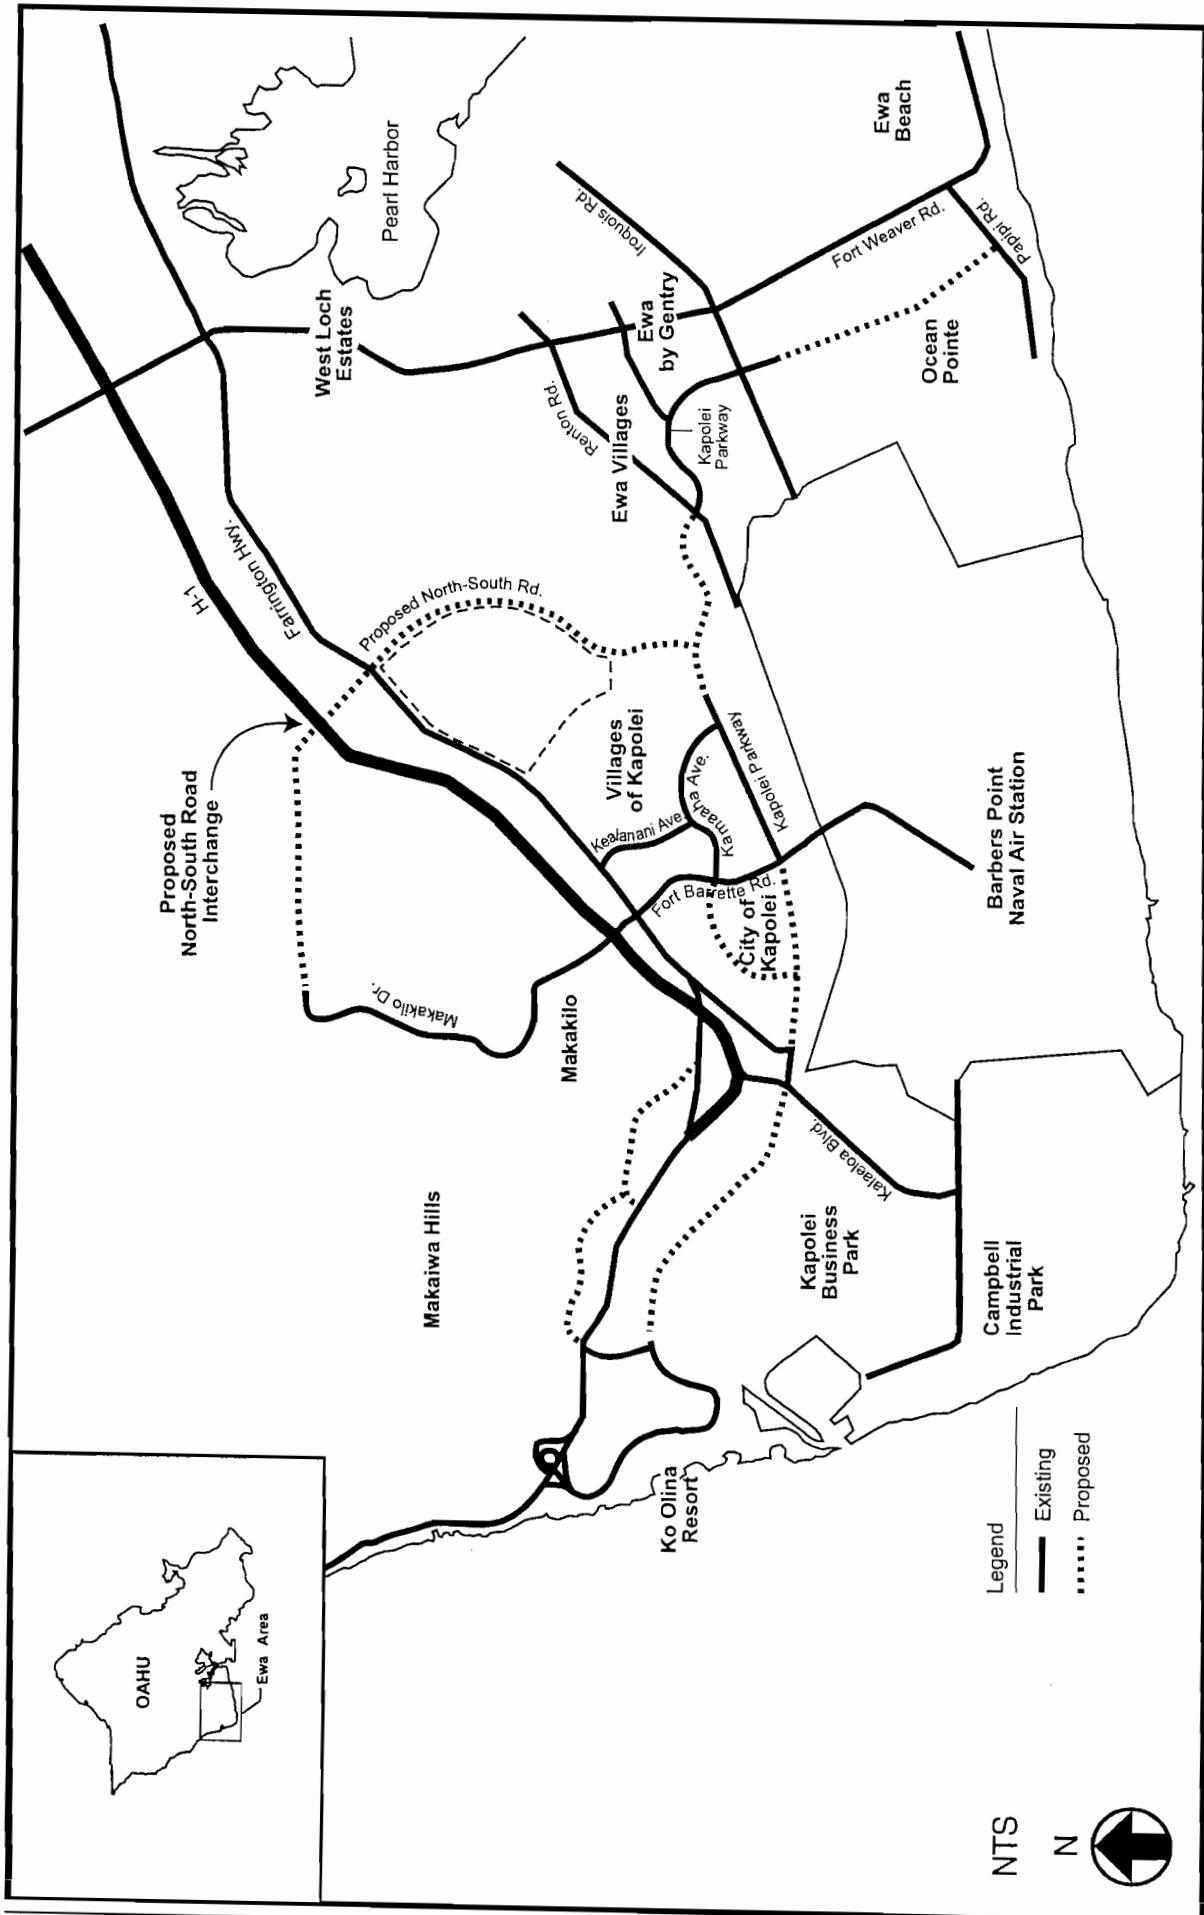

- Widen Fort Barrette Road from 2 to 4-lanes between Farrington Highway and F.D. Roosevelt Avenue

c) North-South Road

New 6-lane arterial roadway constructed between H1 Freeway and Kapolei Parkway. The new North-South Road will provide alternative access to H1 Freeway for the Ewa plain.

Figure
15

PROJECTED FUTURE ROADWAY NETWORK

It is proposed to be implemented in phases starting with an interim 3-lane roadway opening by early 2008 and an expansion to the ultimate 6-lane roadway when warranted by traffic demand.

d) Kapolei Parkway

Kapolei Parkway will ultimately be completed from Papipi Road to Ko Olina Resort. Much of this roadway has already been constructed. Segments of the roadway within Ewa by Gentry, Ocean Pointe, and the Villages of Kapolei are complete. The City and County of Honolulu is currently moving forward on the segment between the OR&L right-of-way and Renton Road. The segment between Renton Road and North-South Road will be constructed within the same time frame as North-South Road. This leaves the segment between North-South Road and the drainage bridge near Kapolei Middle School, the segment between Fort Barrette Road and Kamokila Boulevard, and the segment between Kalaeloa Boulevard and Ko Olina as key links to be finished for Kapolei Parkway to fulfill its regional arterial function within the Ewa plain.

e) Farrington Highway

Farrington Highway will be widened to four lanes from Kapolei Golf Course Access Road to Fort Weaver Road. Farrington Highway is already four lanes from the Kapolei Golf Course Access Road to Kamokila Boulevard.

f) Kamaaha Avenue

Kamaaha Avenue will be extended west into the City of Kapolei terminating at Kapolei Parkway, KKHD of Kamokila Boulevard.

2. Transit Service

The current bus routes reflect a "hub and spoke" system implemented recently. As population grows, the bus fleet is assumed to grow to handle increased transit needs within the Ewa plain. Through the *Primary Corridor Transportation Project*, the City and County of Honolulu is planning improvements that would increase the transit carrying capacity between Kapolei and other major activity areas.

B. Projected Buildout Traffic Volumes

1. Trip Generation

The *Institute of Transportation Engineers (ITE), Trip Generation, 6th edition* (1998) was used to estimate the number of trips generated by the Villages of Kapolei Development based on future development identified in Table 4.

Table 4 Completed and Forecasted Development

Parcel	Total Units	Completed Units	Future Completion			
			Single Family	Multi Family	Elderly Home	Apt
Village 1 - Kumu Iki	519	519				
Village 1 - Northwest Corner (BMX-3)	0	0				
Village 2 - Aeloa	572	432		140		
Village 3 - Malanai	384	384				
Village 4 - Kekuilani	645	609	36			
Village 5 - Iwalani	448	273	31	144		
Village 5 - Kulalani	128	128				
Village 6 - Maluohai	226	181	45			
Village 6 - Pae Ko Gardens	128	128				
Village 7 - Kapolei Kai	204	204				
Village 8 - Future Single Family Residential	446	0	446			
Elderly Mid-Rise Apartments (Multi Family)	500	0			500	
Village Center (Residential) AMX-1	204	0				204
Village Center (Commercial) AMX-1	0	0				
Total	4404	2858			1546	

Table 4 summarizes the total units expected upon completion of The Villages of Kapolei, the total units currently completed and the expected and type of development in each village expected to be completed in the future. The site generated traffic acknowledges only the expected development summarized in Table 4. Table 5 summarizes the trips generated by the future residential and commercial units planned in The Villages of Kapolei

Development. The village number and name correspond with the development plan shown in Figure 2 of this report and the ITE codes are shown for each parcel.

Table 5
Trip Generation Summary
New Village of Kapolei Development

Parcel	ITE Code	Intensity	AM Peak		PM Peak		Afternoon	
			Enter	Exit	Enter	Exit	Enter	Exit
Village 1 - Northwest Corner (BMX-3)	820	26.6 Acre	101	65	319	346	0	0
Village 2 - Aeloa	231	140 Units	23	70	64	49	0	0
Village 4 - Kekuilani	210	36 Units	6	19	21	12	11	9
Village 5 - Iwalani	210	31 Units	6	17	18	10	9	8
Village 5 - Iwalani	231	144 Units	24	72	66	50	0	0
Village 6 - Maluohai	210	45 Units	8	24	26	15	13	11
Village 8 - Future Single Family (Res)	210	446 Units	80	240	259	145	132	113
Elderly Mid-Rise Apartments	253	500 Units	22	13	30	21	0	0
Village Center (Residential)	221	204 Units	20	79	82	42	0	0
Village Center (Commercial)	820	3.4 Acre	13	8	41	44	0	0

2. Trip Distribution and Assignment

The traffic generated by the future Villages of Kapolei development was directionally distributed and assigned to the future roadway network.

A summary of regional travel patterns to and from the Kapolei area was created from the Oahu Metropolitan Planning Organization (OMPO) travel demand model production and attraction trip table. Table 6 summarizes the residential distribution patterns of the generated volumes entering and exiting the Kapolei area. Directions of the generated trips were taken into account by the directional split in the ITE *Trip Generation* 6th edition corresponding with each type of development. Trips associated with the commercial development in The Villages of Kapolei were assumed to service the immediate area and were proportionally distributed to The Villages of Kapolei and Makakilo.

Table 6 Trip Distribution of Villages of Kapolei Residential Trips

Location	Split
Waianae Coast (Campbell Industrial, Ko Olina, etc.)	11%
Makakilo	7%
Kalaeloa (Barbers Point)	3%
The City of Kapolei	1%
The Villages of Kapolei (Internal traffic)	5%
Farrington Highway (UH West Oahu, East Kapolei, etc.)	13%
Kapolei Parkway (Ewa Beach)	21%
H1 Freeway (East Oahu)	39%

Traffic within The Villages of Kapolei was distributed to Villages 1 – 8 by a weighted average of total development. These trips were assigned to the roadway network and are reflected in the projected traffic turning volumes. These trips within The Villages of Kapolei were distributed from Village 1 (BMX-3) commercial development to residential development as summarized in Table 7.

These distributions were applied to the trips generated, and the resulting project-generated trip assignment is shown in Figures 16-17

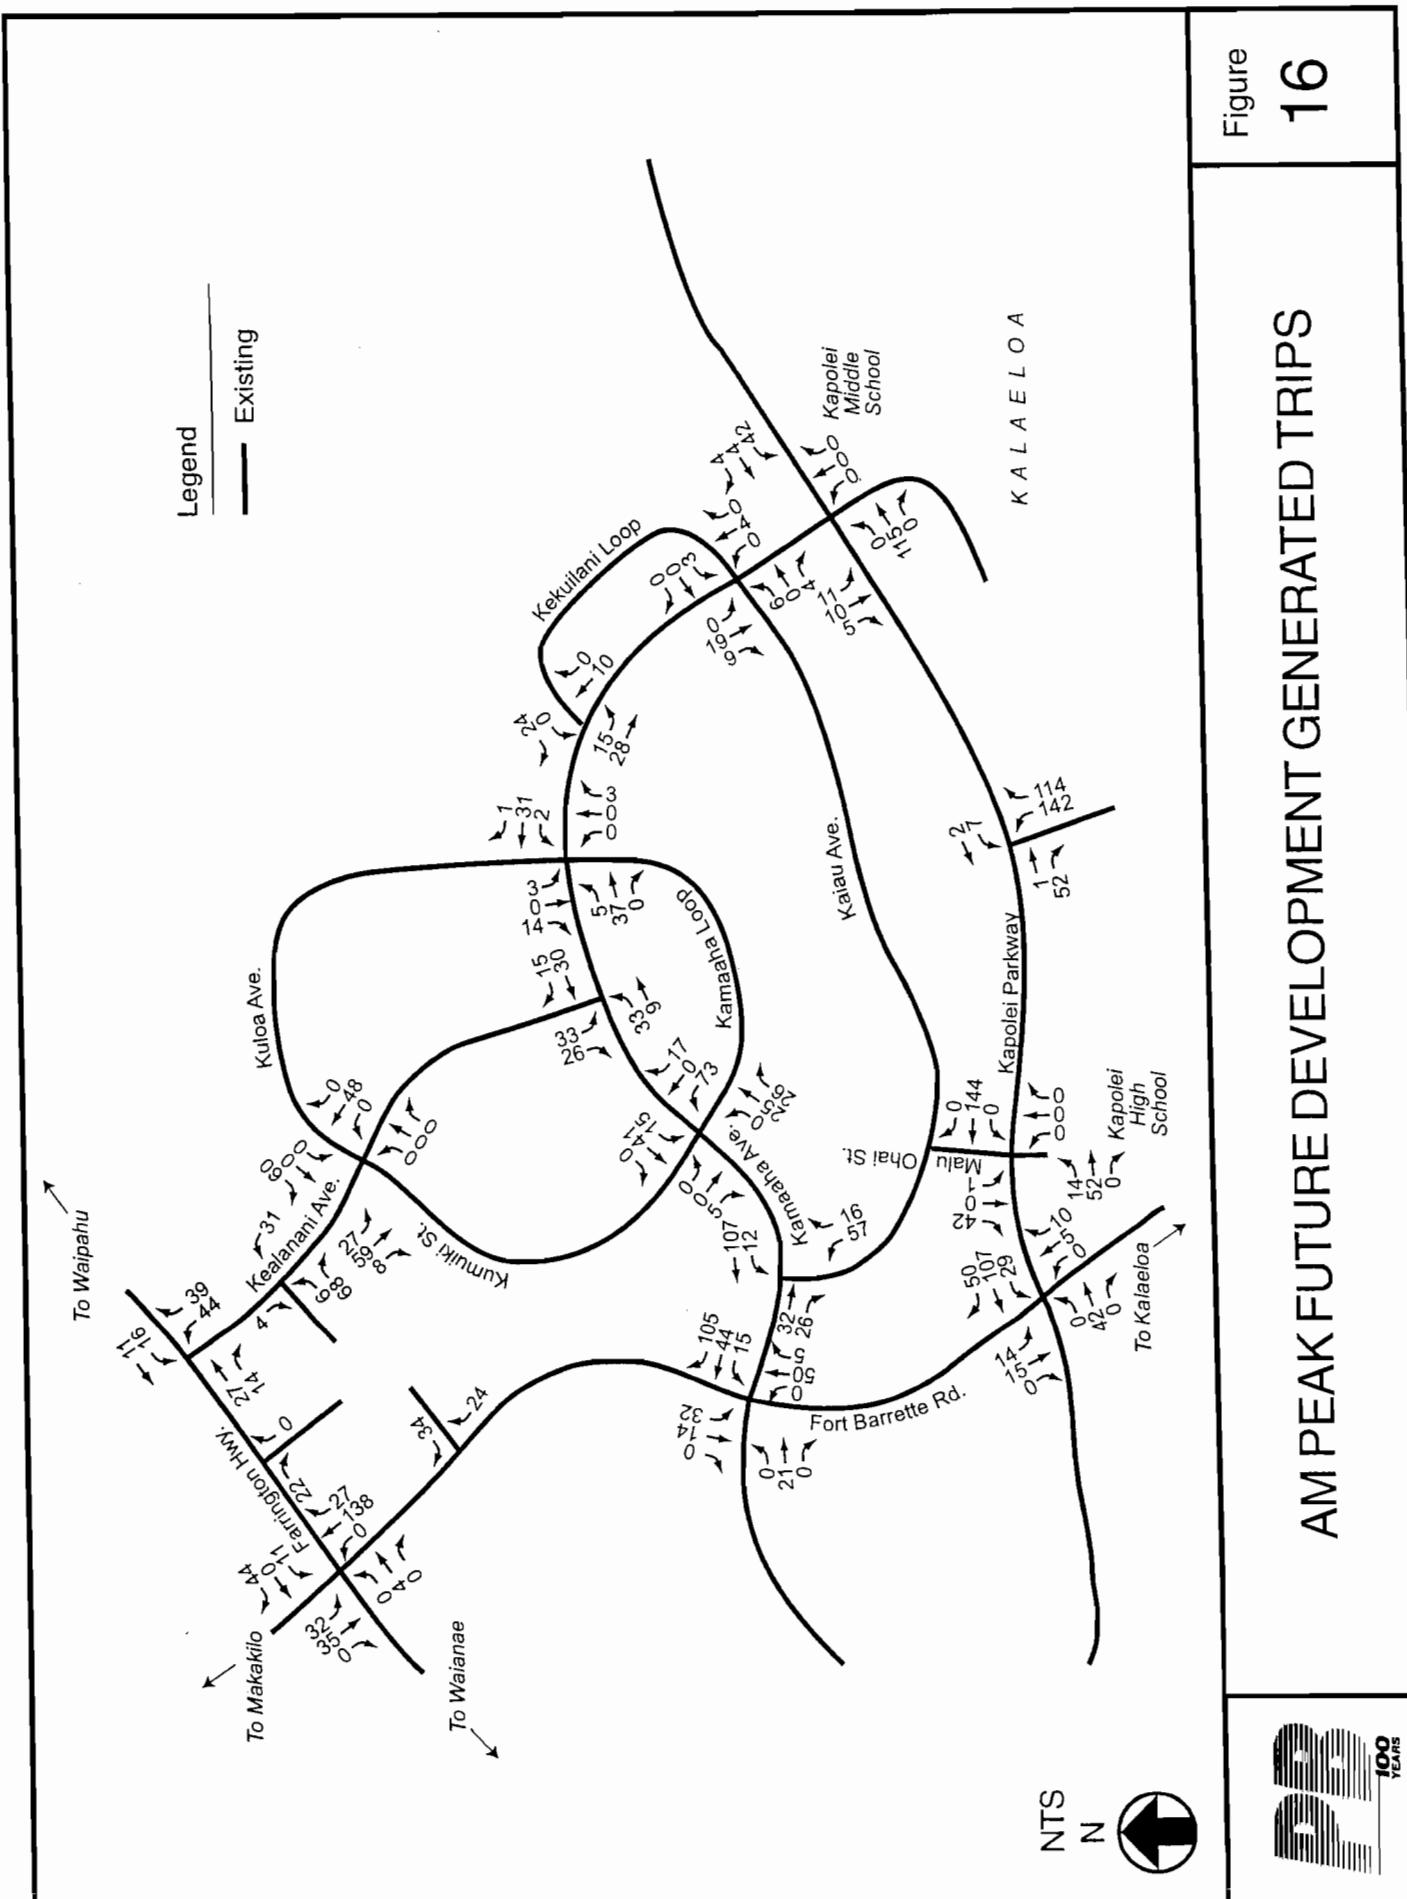

Figure
16

AM PEAK FUTURE DEVELOPMENT GENERATED TRIPS

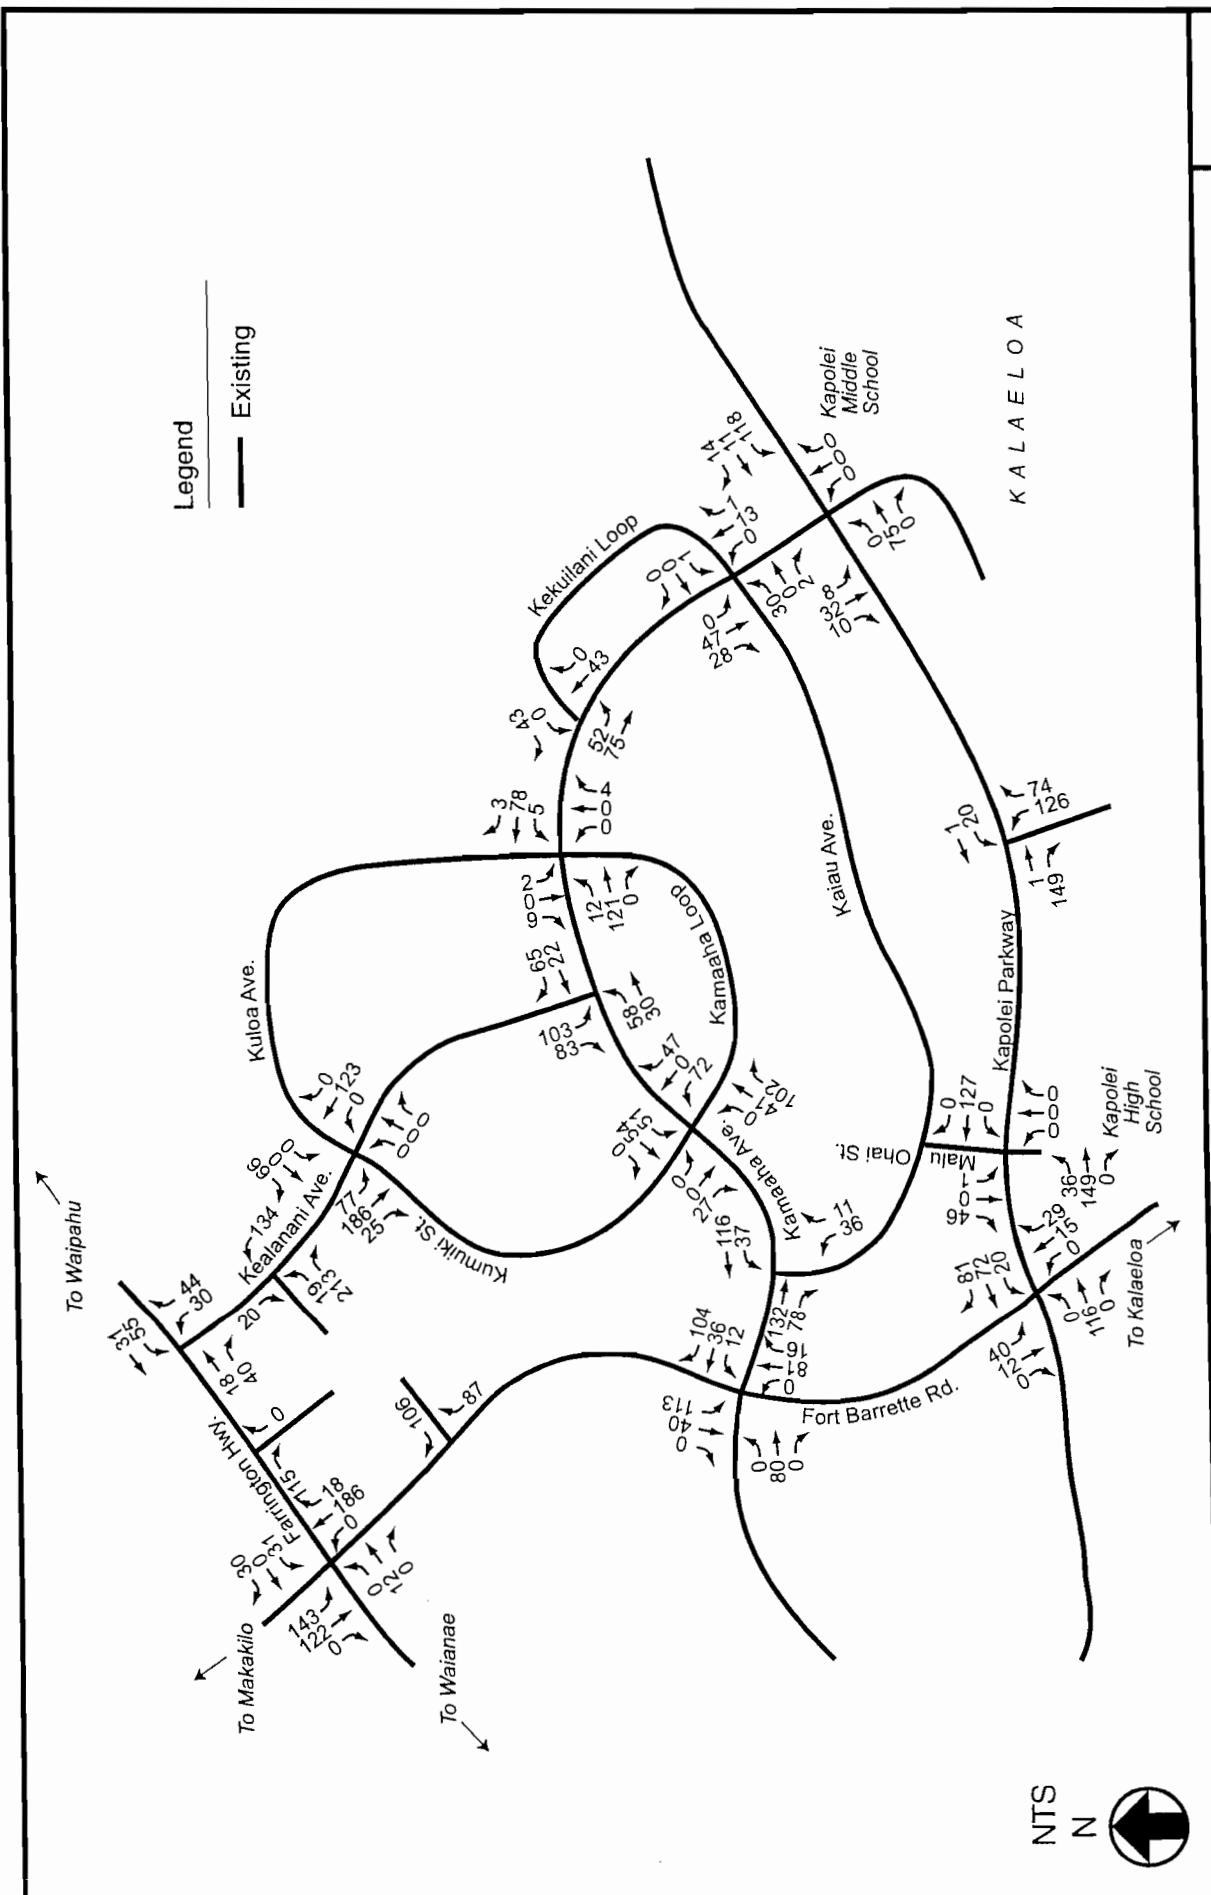

Figure
17

PM PEAK FUTURE DEVELOPMENT GENERATED TRIPS

Table 7 Trip Distribution of Villages of Kapolei Commercial Trips

Location	Traffic Split
Makakilo	33%
Village 1 - Kumu Iki	8%
Village 2 - Aeloa	9%
Village 3 - Malanai	6%
Village 4 - Kekuilani	10%
Village 5 - Iwalani	7%
Village 5 - Kulalani	2%
Village 6 - Maluohai	3%
Village 6 - Pae Ko Gardens	2%
Village 7 - Kapolei Kai	3%
Village 8 - Future Single Family Residential	6%
Elderly Mid-Rise Apartments (Multi Family)	8%
Village Center (Residential) AMX-1	3%

3. Year 2025 Background Traffic

The Year 2025 background traffic were derived from the projected volumes estimated by the Oahu Metropolitan Planning Organization (OMPO) Regional Transportation Plan travel demand model and refined using the travel demand model associated with the Ewa Transportation Master Plan. This background traffic is also consistent with traffic forecasts developed for the *North-South Road and Kapolei Parkway Corridor Study* currently being completed.

The future Year 2025 background traffic assumes appropriate level of buildout for The City of Kapolei, University of Hawaii West Oahu campus, and East Kapolei development parcels. These developments account for the majority of future background traffic generated in the study area. In areas where greater detail was necessary, background traffic was estimated using rates documented in *Trip Generation, 6th Edition*. Traffic

volumes forecasted by the OMPO travel demand model were used as control totals to develop a future Year 2025 peak hour assignment for the study area.

The projected Year 2025 background traffic volumes are shown in Figure 18-19.

4. Total Traffic

The traffic generated by The Villages of Kapolei was added to the projected background traffic to obtain the total peak hour traffic volumes shown in Figures 20-21

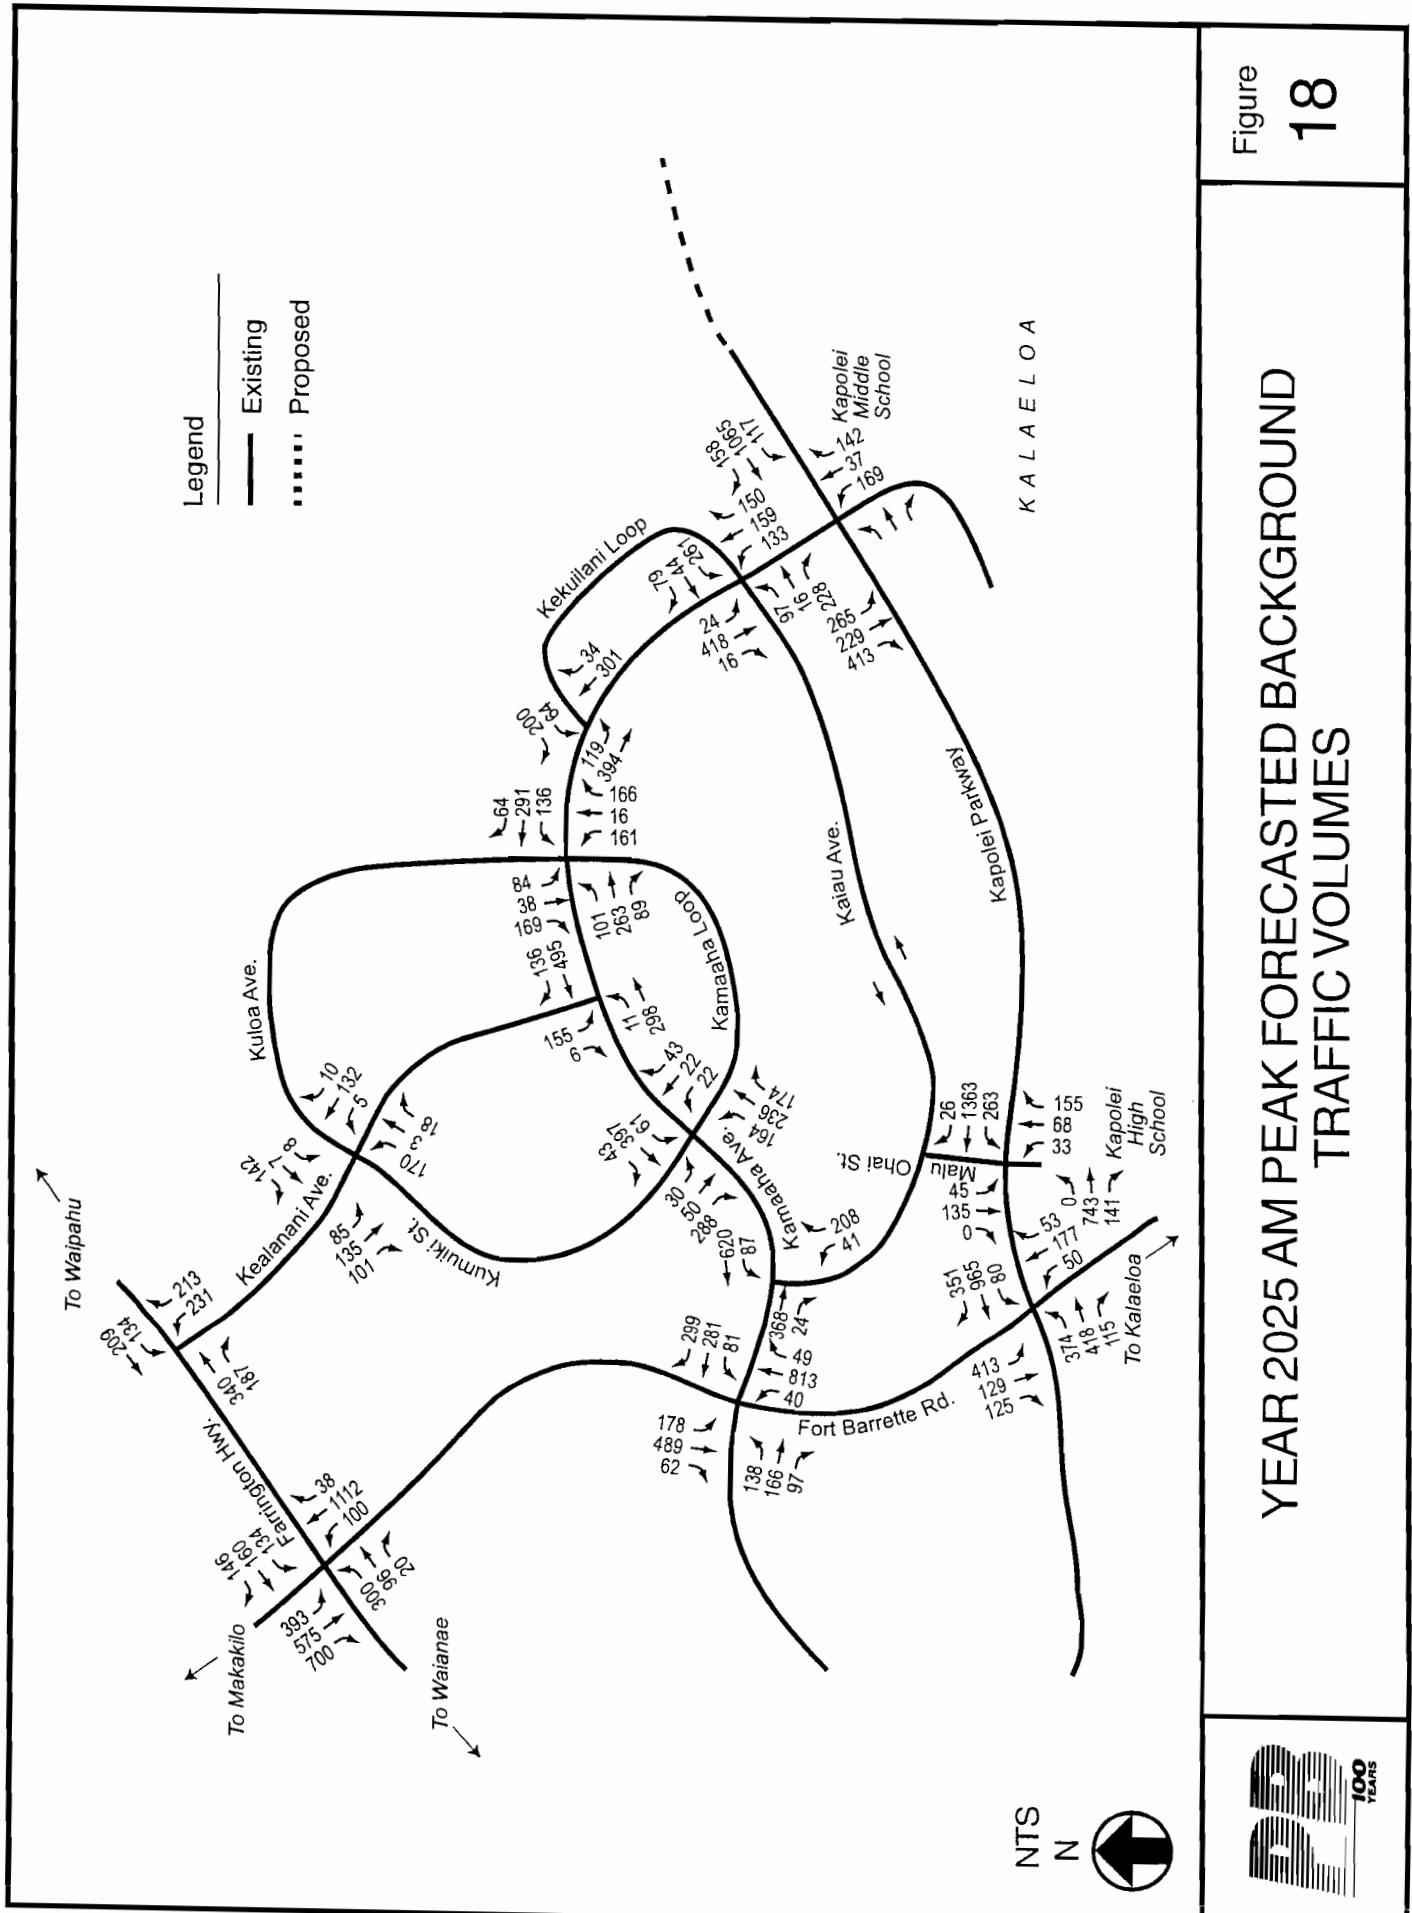

C. Projected Intersection Operations

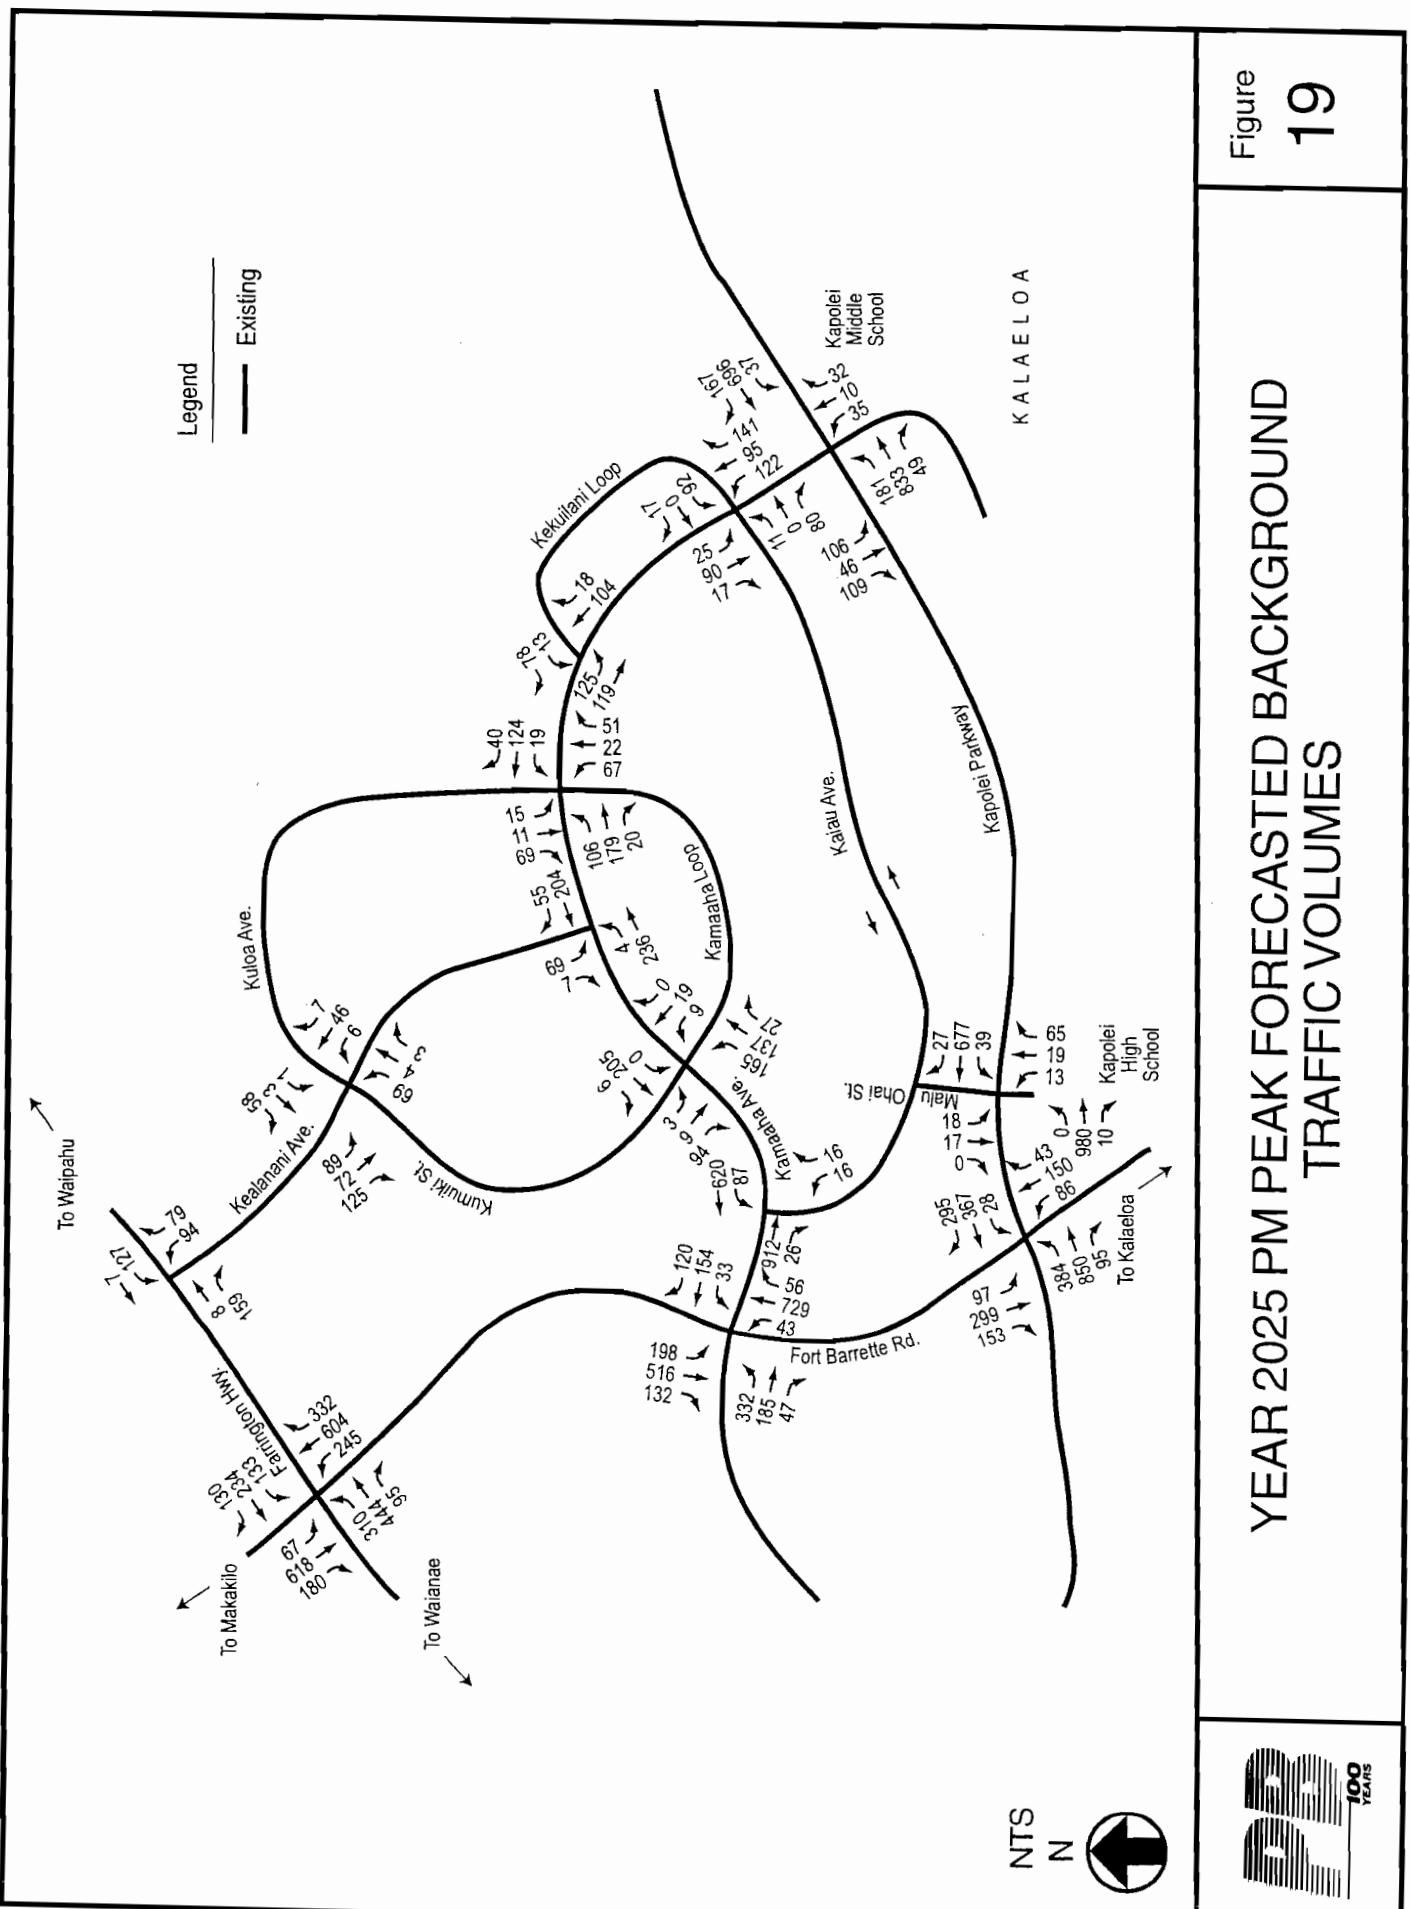

Key intersections were analyzed using the methodologies for unsignalized and signalized intersections outlined in the *2000 Highway Capacity Manual (HCM)*. Operating conditions at an intersection are expressed as qualitative measures known as Level of Service (LOS) ranging from A to F. LOS A represents free-flow operations with low delay, while LOS F represents congested conditions with relatively high delay. The approach LOS is a weighted average of the LOS of individual traffic movement groups. Appendix B has more detailed definitions of intersection LOS. Implicit in these analyses results are specific roadway and intersection configurations, and these are summarized in the following write up and illustrated in Figure 22.

1. Projected Operations at Unsignalized Intersections

Five intersections were analyzed as unsignalized intersection:

- Kealanani Avenue and Entrance B (BMX -3 Parcel KKHD Driveway)
- Kealanani Avenue and Kumuiki Street/Kuloa Avenue
- Kamaaha Avenue and Kaiau Avenue
- Kamaaha Avenue and Kealanani Avenue
- Kamaaha Avenue and Kekuilani Loop (Mauka)

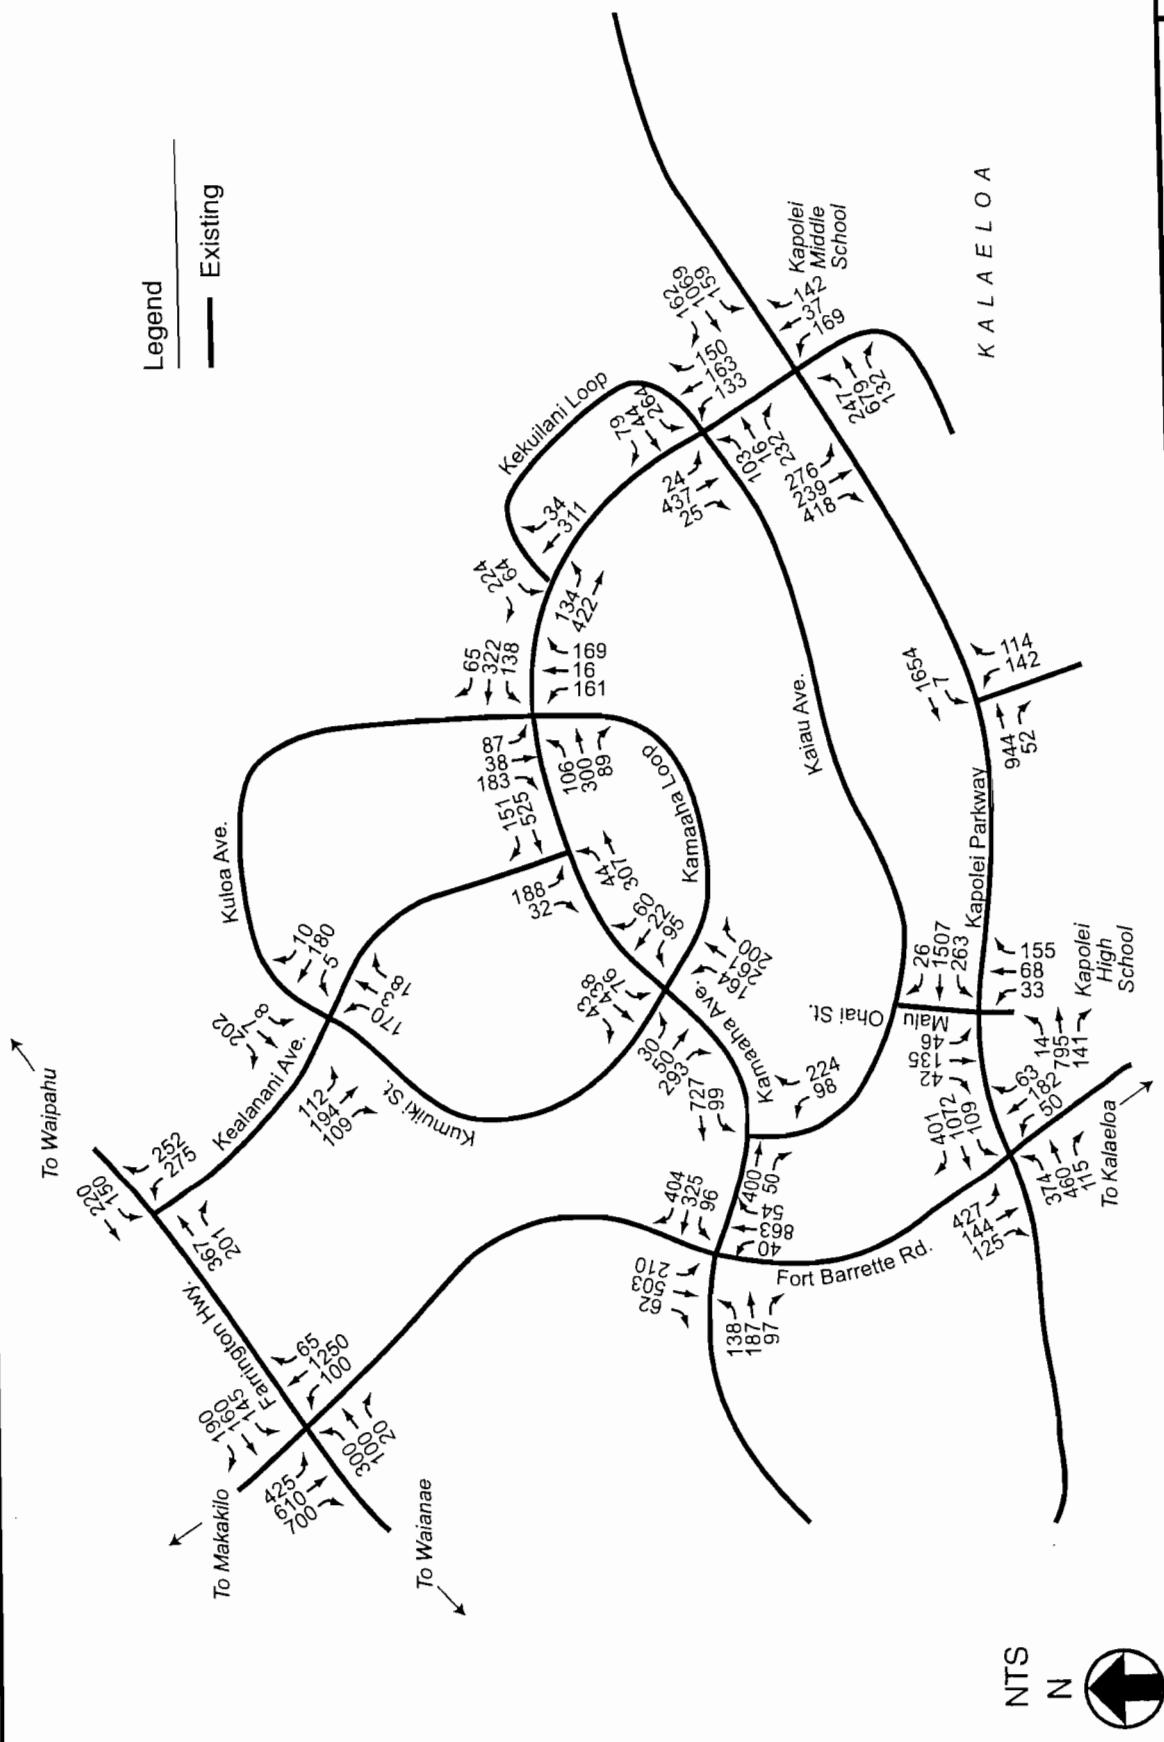

YEAR 2025 PM PEAK FORECASTED BACKGROUND TRAFFIC VOLUMES

Figure
19

Figure
20

**YEAR 2025 AM PEAK FORECASTED
TOTAL TRAFFIC VOLUMES**

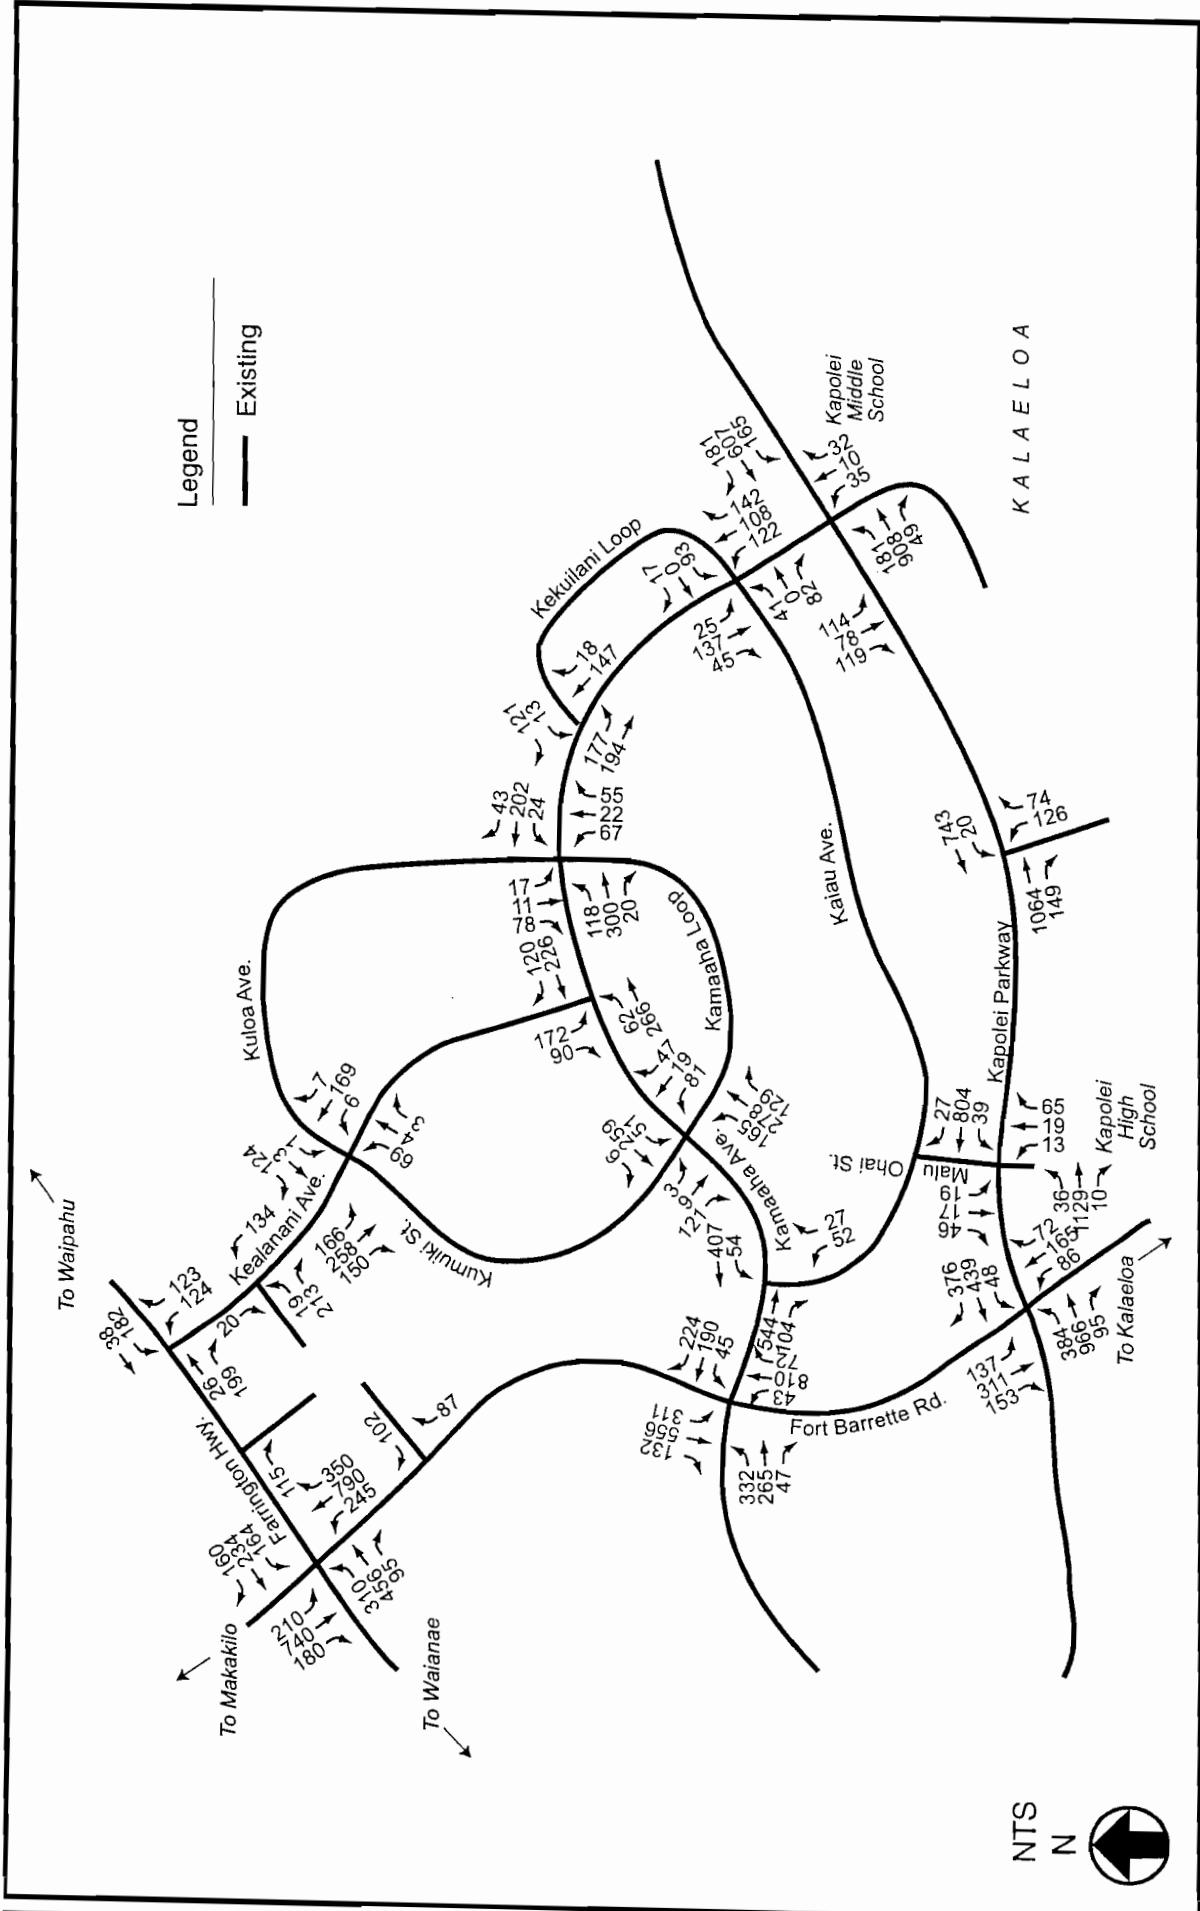

Figure
21

Figure
22

PROJECTED ROADWAY CONFIGURATIONS - VILLAGES OF KAPOLEI AREA

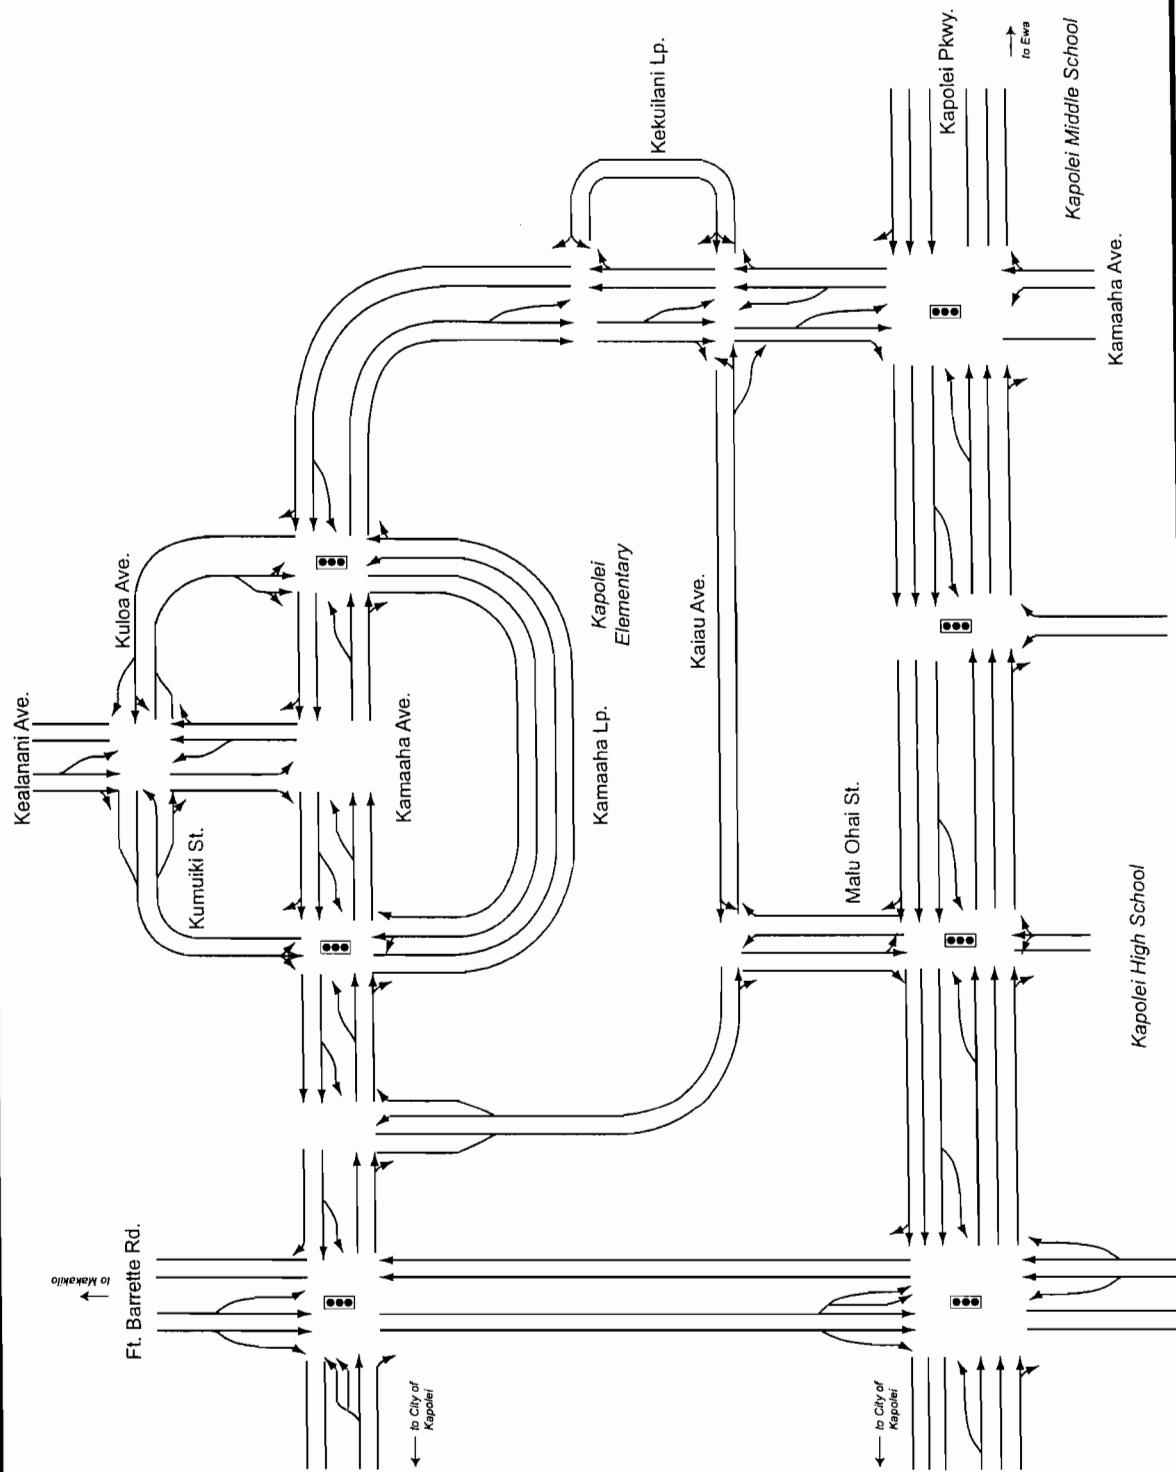

Table 8 summarizes the projected year 2025 peak hour unsignalized intersection level-of-service within The Villages of Kapolei. As shown in Table 8, the unsignalized intersections analyzed are projected to generally operate well at a level-of-service D or better. Kamaaha Avenue and Kealanani Avenue makai bound left-turn and Kealanani Avenue and Kumuiki Street/Kuloa Avenue Koko Head bound left-turn is projected to operate at a LOS D.

The makai bound left-turn movement at Kealanani Avenue and Kamaaha Avenue are projected to experience some delay during morning peak hour time periods. Future adjacent traffic signals at Kumuiki Street and Kuloa Avenue on Kamaaha Avenue would create gaps in traffic on Kamaaha Avenue, providing time for vehicles turning from makai-bound Kealanani Avenue to Koko Head bound Kamaaha Avenue to complete their desired movements.

Table 8 Future Unsignalized Intersections Level-of-Service

Intersection	AM Peak		PM Peak	
	LOS	Delay (sec/veh)	LOS	Delay (sec/veh)
Kamaaha Ave and Kaiau Ave				Unsignalized
Waianae Bound Left-Turn	A	8.7	A	9.3
Mauka Bound Left-Turn	C	22.3	C	17.4
Mauka Bound Right-Turn	B	12.4	B	10.9
Kamaaha Ave and Kealanani Ave				Unsignalized
KKHD Bound Left-Turn	A	9.5	A	8.3
Makai Bound Left-Turn	D	29.5	C	17.1
Makai Bound Right-Turn	B	11.4	B	10.4
Kamaaha Ave and Kekuili Loop (Mauka)				Unsignalized
Makai Bound Left-Turn	A	8.8	A	8.1
Waianae Bound Left/Right-Turn	C	19.1	B	10.7
Kealanani Ave and Kuloa Ave/Kumuiki St				Unsignalized
Mauka Bound Left-Turn	A	7.9	A	8.3
Makai Bound Left-Turn	A	7.9	A	8.1
Waianae Bound Left-Turn	B	14.0	C	17.5
Waianae Bound Right-Turn	B	10.4	A	9.7
KKHD Bound Left-Turn	D	28.5	C	24.3
KKHD Bound Right-Turn	B	10.1	B	14.3
Kealanani Ave and Entrance B				Unsignalized
Mauka Bound Left-Turn	A	8.1	A	8.5
KKHD Bound Left-Turn	B	12.7	B	13.9
KKHD Bound Right-Turn	A	9.8	B	11.3

The Koko Head bound left-turn movement out of Kumuiki Street onto Kealanani Avenue would experience delays due to significant demand in that movement. Kealanani Avenue currently has median storage for left-turn movements out of Kumuiki Street, so that vehicles can accomplish this movement in two steps: 1) Turn out of Kumuiki Street to the median 2) merge from the median with oncoming traffic into mauka bound Kealanani Avenue.

2. Projected Operations at Signalized Intersections

Table 9 summarizes the projected year 2025 peak hour intersection level-of-service for the signalized intersections. As summarized in Table 9, all intersections analyzed are projected to operate at a level-of-service D or better during the peak hours.

Table 9 Future Signalized Intersections Level-of-Service

Intersection	AM Peak		PM Peak	
	LOS	Delay (sec/veh)	LOS	Delay (sec/veh)

Mauka Bound Approach	C	24.1	C	29.5

In these analyses, Fort Barrette Road is assumed to be widened to a four-lane roadway with auxiliary lanes at intersections, Kamaaha Avenue has been extended into the City of Kapolei and Kapolei Parkway has fulfilled its role as the major east-west arterial roadway connecting Ewa Beach and Ko Olina Resort.

All intersections along Kapolei Parkway within the Villages of Kapolei are projected to be signalized and projected to operate acceptably during peak hour conditions. Traffic signal warrants at the Kamaaha and Malu Ohai intersections are currently satisfied based on

school crossing warrants. The intersection for the future Village 8, located opposite the existing mauka-makai pedestrian path is expected to warrant signalization in the future.

Kamaaha Avenue at Kumuiki Street and Kuloa Avenue currently satisfy the school crossing warrant for traffic signalization based on analyses conducted by Austin, Tsutsumi & Associates, Inc.

Kamaaha Avenue and Kekuilani Loop (Makai) is projected to warrant signalization by the analysis year and is analyzed in this study as a signalized intersection. Projected peak traffic volumes show a high demand heading toward Kapolei Parkway in the future and existing data show a significant pedestrian movement at this intersection. It is recommended to monitor and signalize this intersection when warranted to protect the pedestrian movement in this area.

D. Recommended Intersection Improvements

The Housing and Community Development Corporation of Hawaii (HCDCH) has already implemented major roadway improvements as part of the Villages of Kapolei development such as widening Farrington Highway from a two to four-lane roadway between the Kapolei Golf Course Entrance Road and Fort Barrette Road/Makakilo Drive, construction of Kapolei Parkway, a six-lane arterial roadway with landscaping and 20-foot raised median between the drainage canal bridge east of Kapolei Intermediate and Fort Barrette Road, construction of Kamaaha Avenue, a four-lane roadway with landscaping and 20' raised median between Kapolei Parkway and Fort Barrette Road, and signalization of Farrington Highway and Kealanani Avenue intersection.

As HCDCH nears the ultimate completion of the Village of Kapolei Development, they will continue internal roadway and intersection improvements. Additionally, implementation of a traffic impact fee ordinance for the Ewa region and recent commitments by the State of Hawaii Department of Transportation (HDOT) and the City & County of Honolulu Department of Transportation Services for major roadway improvements in the Ewa plain are promising steps in addressing the current regional traffic issues. Improvements covered by the impact fee ordinance include widening Fort Barrette Road between Farrington Highway and Kalaeloa (Barbers Point), completion of Kapolei Parkway between

Papipi Road and Ko Olina, the proposed North-South Road and Interchange and Kapolei Interchange.

This section of the report serves to identify roadway improvements and geometric configuration recommendations based on forecasted Year 2025 traffic patterns. Figure 23 summarizes roadway improvements on adjacent and internal roadways

1. Fort Barrette Road

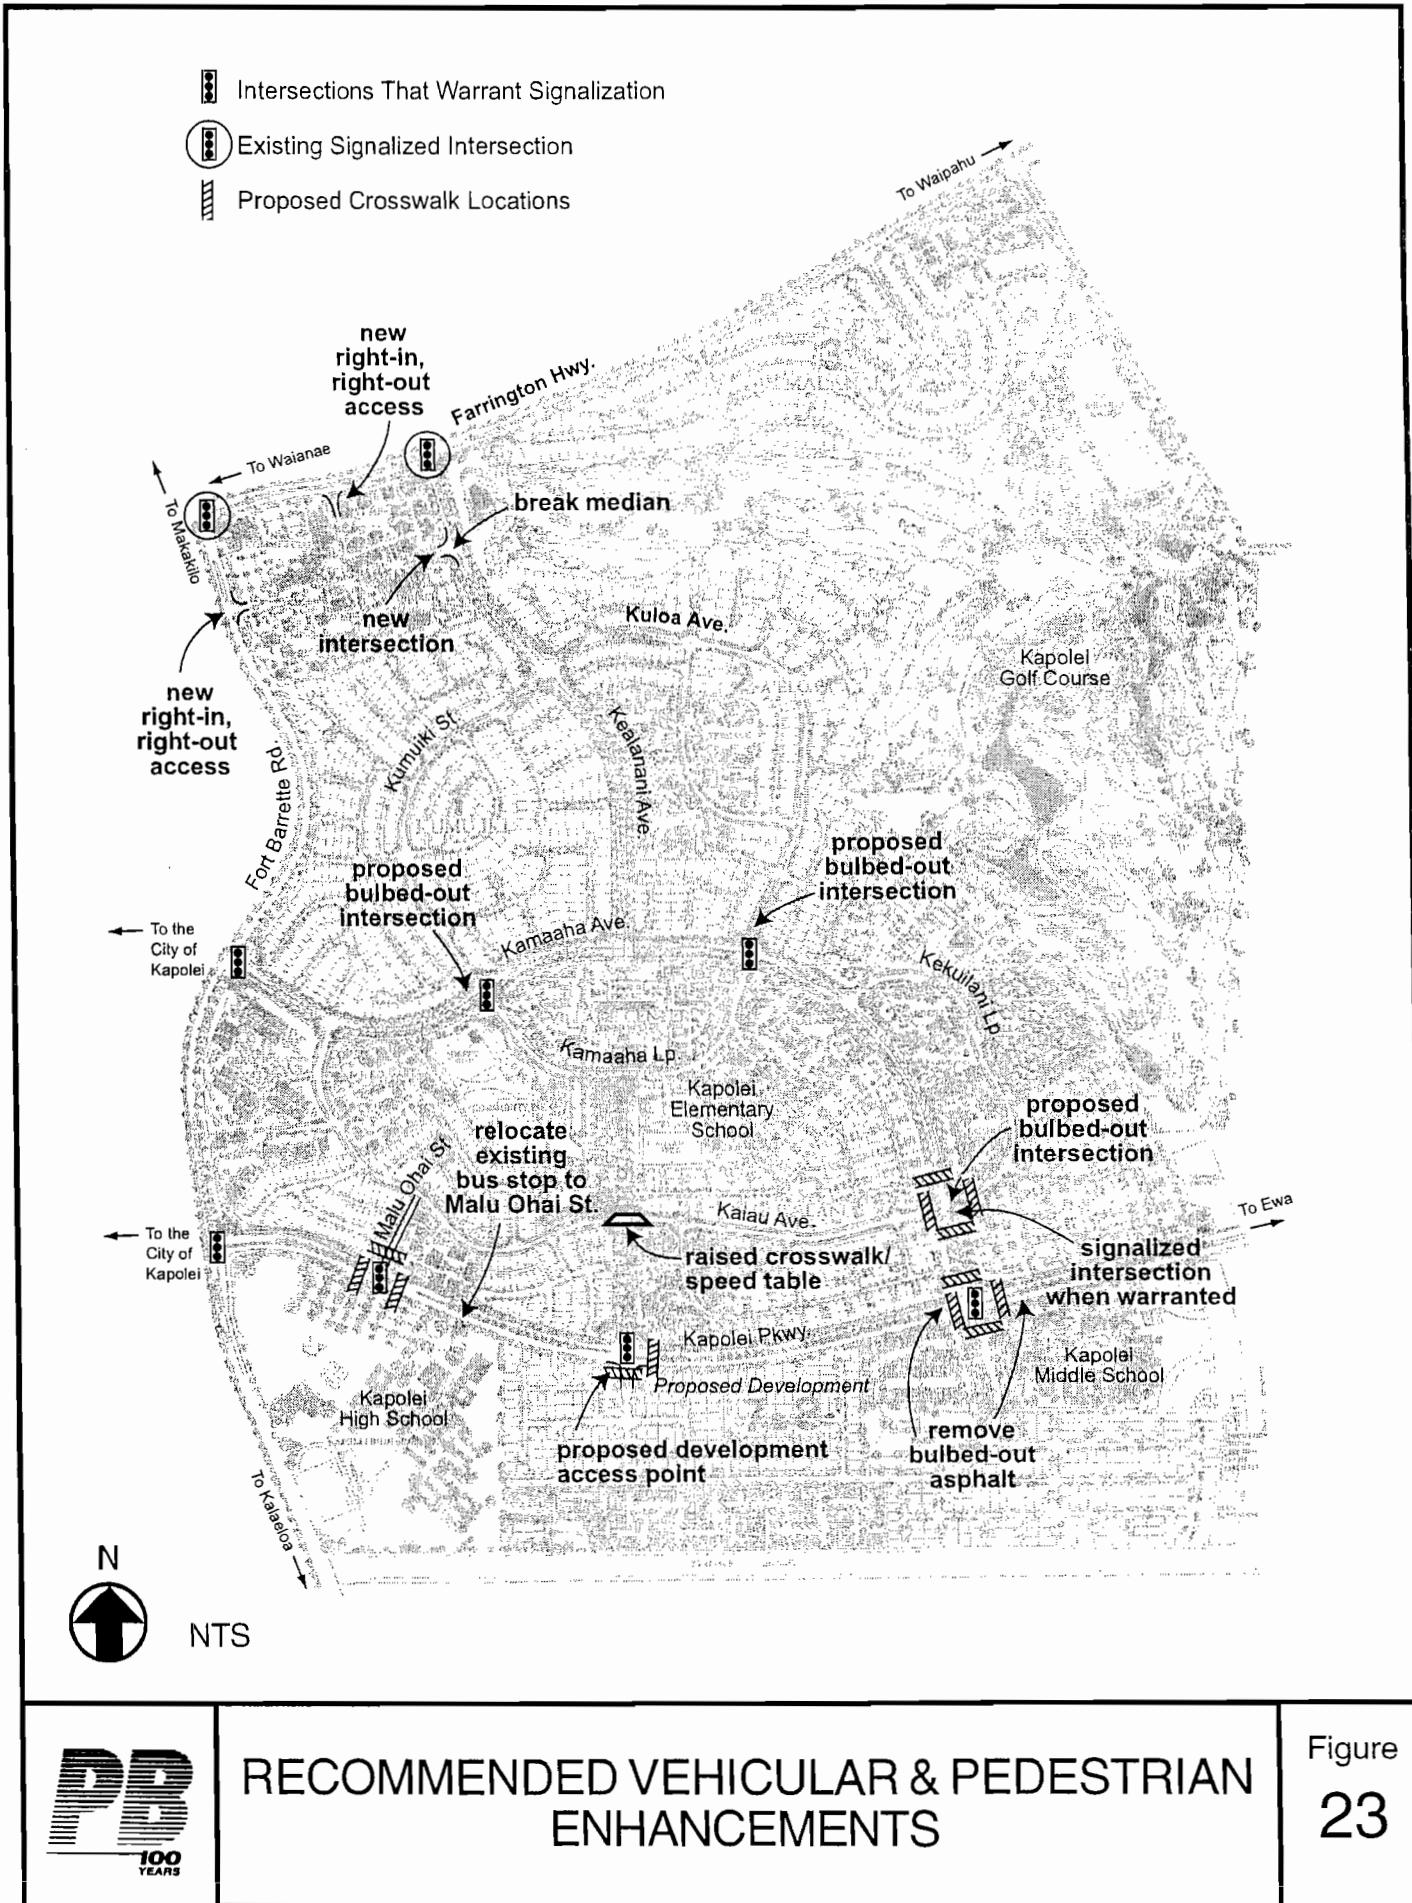

Fort Barrette Road is planned to be widened from a two-lane to a four-lane arterial roadway from Farrington Highway to Kalaeloa (Barbers Point) by the State of Hawaii Department of Transportation (HDOT) in the near future. Environmental clearance and design is scheduled to start this year (2004). It is recommended that the Fort Barrette Road widening project install the appropriate left-turn lanes, and right-turn acceleration and deceleration lanes on Fort Barrette Road.

Traffic conditions at the Kamaaha Avenue and at the Kapolei Parkway intersections currently satisfy the Peak Hour Traffic Signal Warrant, as defined in the *Manual on Uniform Traffic Control Devices (2003 Edition)*, due to high mauka-makai through volume on Fort Barrette Road during peak periods. It is, therefore, recommended that these intersections be signalized as part of the Fort Barrette Road widening project.

At Kapolei Parkway, Fort Barrette Road is forecasted to have a high makai-bound to Koko Head-bound left-turn movement. This can be attributed to development along Kapolei Parkway, including Kapolei High School and Kapolei Middle School. Kapolei Parkway will also function as a sub-regional connection between Kapolei and Ewa Beach. Because of this high left-turn demand, it is recommended to provide a double left-turn lane on makai-bound Fort Barrette Road at Kapolei Parkway.

2. Kapolei Parkway

Kapolei Parkway is currently constructed to its ultimate 6-lane cross-section within the Villages of Kapolei between Fort Barrette Road and the Kapolei Drainage Canal Bridge, located east of Kapolei Middle School. Within this segment of roadway, there are currently two existing intersections: Malu Ohai Street and Kamaaha Avenue. The School Crossing

RECOMMENDED VEHICULAR & PEDESTRIAN ENHANCEMENTS

Figure
23

Warrant as defined in the *Manual on Uniform Traffic Control Devices (2003 Edition)* is currently satisfied for both intersections. Based on the intensity of school-related pedestrians crossing Kapolei Parkway at both intersections, it is recommended to install traffic signals at these intersections. Because there is significant turning movement projected at both intersections, it is recommended to implement the traffic signals with an "all-walk" phase, in which only pedestrians are allowed to move through the intersection. This would reduce vehicle-pedestrian conflicts and provide a safer environment for the students.

The existing Kapolei Parkway is temporarily narrowed to one-lane approaches to the Kamaaha Avenue intersection. As part of the signalization of this intersection, the asphalt curbs used to temporarily narrow Kapolei Parkway are recommended to be removed.

When Village-8 is constructed, it is proposed to provide an access onto Kapolei Parkway via proposed entrance A as shown in figure 22. The proposed access would be located opposite the existing mauka-makai pedestrian path leading to the Kapolei Recreation Center. It is projected that this intersection would be signalized, providing both vehicular access for Village 8 and a protected pedestrian crossing of Kapolei Parkway. It is recommended that an "all-walk" phase be implemented at this location as well, consistent with the phasing schemes recommended for Malu Ohai and Kamaaha intersections.

3. Kamaaha Avenue

At the Fort Barrette Road intersection, it is projected that the Koko Head-bound to mauka-bound left-turn movement will be significant. It is, therefore, recommended that a double left-turn lane for this movement be provided as part of the Fort Barrette Road widening project and the extension of Kamaaha Avenue into the City of Kapolei.

The two intersections of Kamaaha Loop with Kamaaha Avenue satisfy the School Crossing Warrant as defined in the *Manual on Uniform Traffic Control Devices (2003 Edition)*, based on a previous study conducted by Austin, Tsutsumi and Associates, Inc. These intersections are used by students crossing Kamaaha Avenue enroute to Kapolei Elementary School, Kapolei Middle School, and Kapolei High School. It is, therefore, recommended to signalize these intersections. Because of the close proximity to Kapolei

Elementary and the regional park, both intersections of Kamaaha Loop with Kamaaha Avenue are recommended to incorporate an "all walk" phase within the signal phasing.

The Kamaaha Avenue/Kekuilani Loop(Makai)/Kaiau Avenue intersection currently does not warrant signalization but is projected to warrant signalization when the Villages of Kapolei builds out and Kapolei Parkway is connected to the east, providing access to North-South Road and Ewa. It is recommended to monitor this intersection and to install traffic signals when warrants are satisfied.

The Kamaaha Avenue/Kapolei Parkway intersection is projected to have a significant makai bound left-turn to Koko Head bound movement in the future when Kapolei Parkway is connected to the east. It is recommended to construct an exclusive left-turn lane to accommodate this movement and re-stripe the existing makai-bound lanes to a through lane and an exclusive right-turn lane. There is approximately 500 feet between Kapolei Parkway and Kekuilani Loop (Makai)/Kaiau Avenue. Queuing analysis based on a Cumulative Poisson Distribution method indicates 325-feet of storage will be required. A left-turn lane of this length can be accommodated within the existing median but will require relocation of three existing trees located within the median.

E. Traffic Calming Measures at Signalized Intersections

The Villages of Kapolei Association has expressed the desire to reduce the width of Kamaaha Avenue at key intersections as a traffic calming action. One method of achieving this reduction in width is to create "bulb outs" at the intersection approaches. Candidate intersections for this type of action were:

- Kamaaha Ave and Kumuiki St (West Loop)
- Kamaaha Ave and Kuloa Ave (East Loop)
- Kamaaha Ave and Kekuilani Loop (Makai)

These "bulb outs" would decrease the Kamaaha approaches by one lane in each direction. The resulting lane configuration would be an exclusive left-turn lane and a shared through/right-turn lane. In this configuration, the curb lanes of Kamaaha Avenue between the intersections could be used for parking, since these lanes would no longer continue through the intersections. Analyses were conducted to determine if future traffic

could be accommodated by the modified intersections, and the results are summarized in Table 10. As shown in Table 10, slightly higher delay is experienced at the modified intersections and timing adjustments are required for optimization. Overall, intersections appear to be capable of operating at an acceptable level-of-service.

**Table 10 Future Signalized Intersections LOS
With "Bulb Out" Treatment**

Intersection	AM Peak		PM Peak	
	LOS	Delay (sec/veh)	LOS	Delay (sec/veh)
Kamaaha Ave and Kumuiki St (West Loop)	C	30.0	B	18.5
KKHD Bound Approach	C	21.3	B	19.5
Waianae Bound Approach	D	35.0	C	20.3
Mauka Bound Approach	C	21.1	B	13.1
Makai Bound Approach	D	41.5	B	15.7
Kamaaha Ave and Kuloa Ave (East Loop)	C	24.4	B	17.9
KKHD Bound Approach	C	30.4	C	20.0
Waianae Bound Approach	C	30.5	B	18.1
Mauka Bound Approach	B	18.7	B	14.9
Makai Bound Approach	B	10.6	A	8.2
Kamaaha Ave and Kekuilani Loop (Makai)	D	47.8	D	35.9
KKHD Bound Approach	D	48.5	D	39.5
Waianae Bound Approach	D	53.6	D	39.4
Mauka Bound Approach	D	39.3	D	36.1
Makai Bound Approach	D	50.5	C	31.6

Although the intersections could operate acceptably with the "Bulb Out" configurations, other issues such as roadway drainage and traffic safety are issues that must be resolved before such treatments can be recommended.

F. Pedestrian Crossings

1. Unmarked Pedestrian Crossings

With a few exceptions, most intersections within the Villages of Kapolei do not have marked crosswalks. The Village of Kapolei Association has commented on the lack of crosswalks and requested a review of the situation. Currently, the City and County of Honolulu uses

the *Oahu Pedestrian Safety Study, Phase 1 (1993) (OPSS)*, as a reference in deciding where crosswalks will be installed. This reference was applied to the following unsignalized intersections:

- Kealanani Avenue/Kumuiki Street/Kuloa Avenue
- Kamaaha Avenue/Kaiau Avenue
- Kamaaha Avenue/Kekuilani Loop (Mauka)
- Kamaaha Avenue/Kekuilani Loop (Makai)
- Kaiau Avenue/Mauka-Makai Pedestrian Path
- Kapolei Parkway/Mauka-Makai Pedestrian Path

Based on the criteria contained in the OPSS, only the Kaiau Avenue/Mauka-Makai Pedestrian Path crossing would justify installation of crosswalks.

Installing crosswalks at the other intersections may be possible if the City & County of Honolulu Department of Transportation Services (DTS) is willing to review their current criteria for installation of marked crosswalks. A recent study entitled, Safety Effects of Marked vs. Unmarked Crosswalks at Uncontrolled Locations (FHWA-RD-01-075), February 2002, indicates more flexibility in the designation of marked crosswalks.

2. Kaiau Avenue/Mauka-Makai Pedestrian Path Crossing

The Pedestrian Path already has handicapped ramps at Kaiau Avenue, but there is no opening in the existing raised median to allow a wheelchair to continue across Kaiau Avenue. Rather than create an opening in the median, it was decided to incorporate traffic calming measures into this crossing to address the concerns of the Villages of Kapolei community with regard to vehicle speeding along Kaiau Avenue. To discourage potential speeding and to improve the crossing, a raised speed table is recommended to be constructed on Kaiau Avenue at the pedestrian path. Appropriate signing and striping prior to and at the raised speed table is recommended to be installed at that time.

3. Kapolei Parkway/Maka-Makai Pedestrian Path

The Mauka-Makai Pedestrian Path was observed to have significant student pedestrian activity at Kapolei Parkway during the morning and mid-day periods. Many students were observed to "J-walk" across Kapolei Parkway instead of walking to Malu Ohai where crosswalks and a crossing guard exist. The Pedestrian Path location at Kapolei Parkway did not satisfy the School Crossing Warrant for installation of traffic signals. When Village 8 constructs its future access to Kapolei Parkway, it is expected to warrant signalization, and as previously recommended in this report, an "all walk" phase would be desirable to enhance the safety for the students crossing Kapolei Parkway. During the interim time period prior to the construction of the Village 8 access, appropriate signs should be installed to direct pedestrians to utilize the crosswalks at Malu Ohai Street. The Malu Ohai intersection currently warrants signalization, and after the signals are installed, it would be a safer crossing than "J-walking" across Kapolei Parkway.

4. Kapolei Parkway/Kapolei High School Bus Stop Area

Kapolei High School has two driveway accesses on Kapolei Parkway. The Main Driveway is located opposite Malu Ohai Street, and the Secondary Driveway is located approximately 800-feet Koko Head of the Main Driveway. This Secondary Driveway is restricted to right-out movements only. Between the two driveways, approximately 250-feet east of the Kapolei High School main entrance, there are City Bus Stops on the mauka and makai sides of Kapolei Parkway. There is a pedestrian walkway from Kapolei High School that penetrates the fence and attached to the Kapolei Parkway sidewalk at the City Bus Stop.

"J-walking" in front of Kapolei High School was observed during the morning and mid-day peak. Most of the "J-walking" at this location was associated with students catching the City Bus. To discourage "J-walking" along Kapolei Parkway in front of Kapolei High School, it is recommended to relocate the existing City Bus Stop to the Kapolei Parkway/Malu Ohai Street intersection. This would encourage pedestrians to use the crosswalks at Malu Ohai Street where future signals would provide a more protected crossing.

IV. COMPATIBILITY WITH C&C OF HONOLULU STANDARDS

This section of the report is to make apparent any differences or discrepancies between existing roadway cross-sections and City & County of Honolulu Standards.

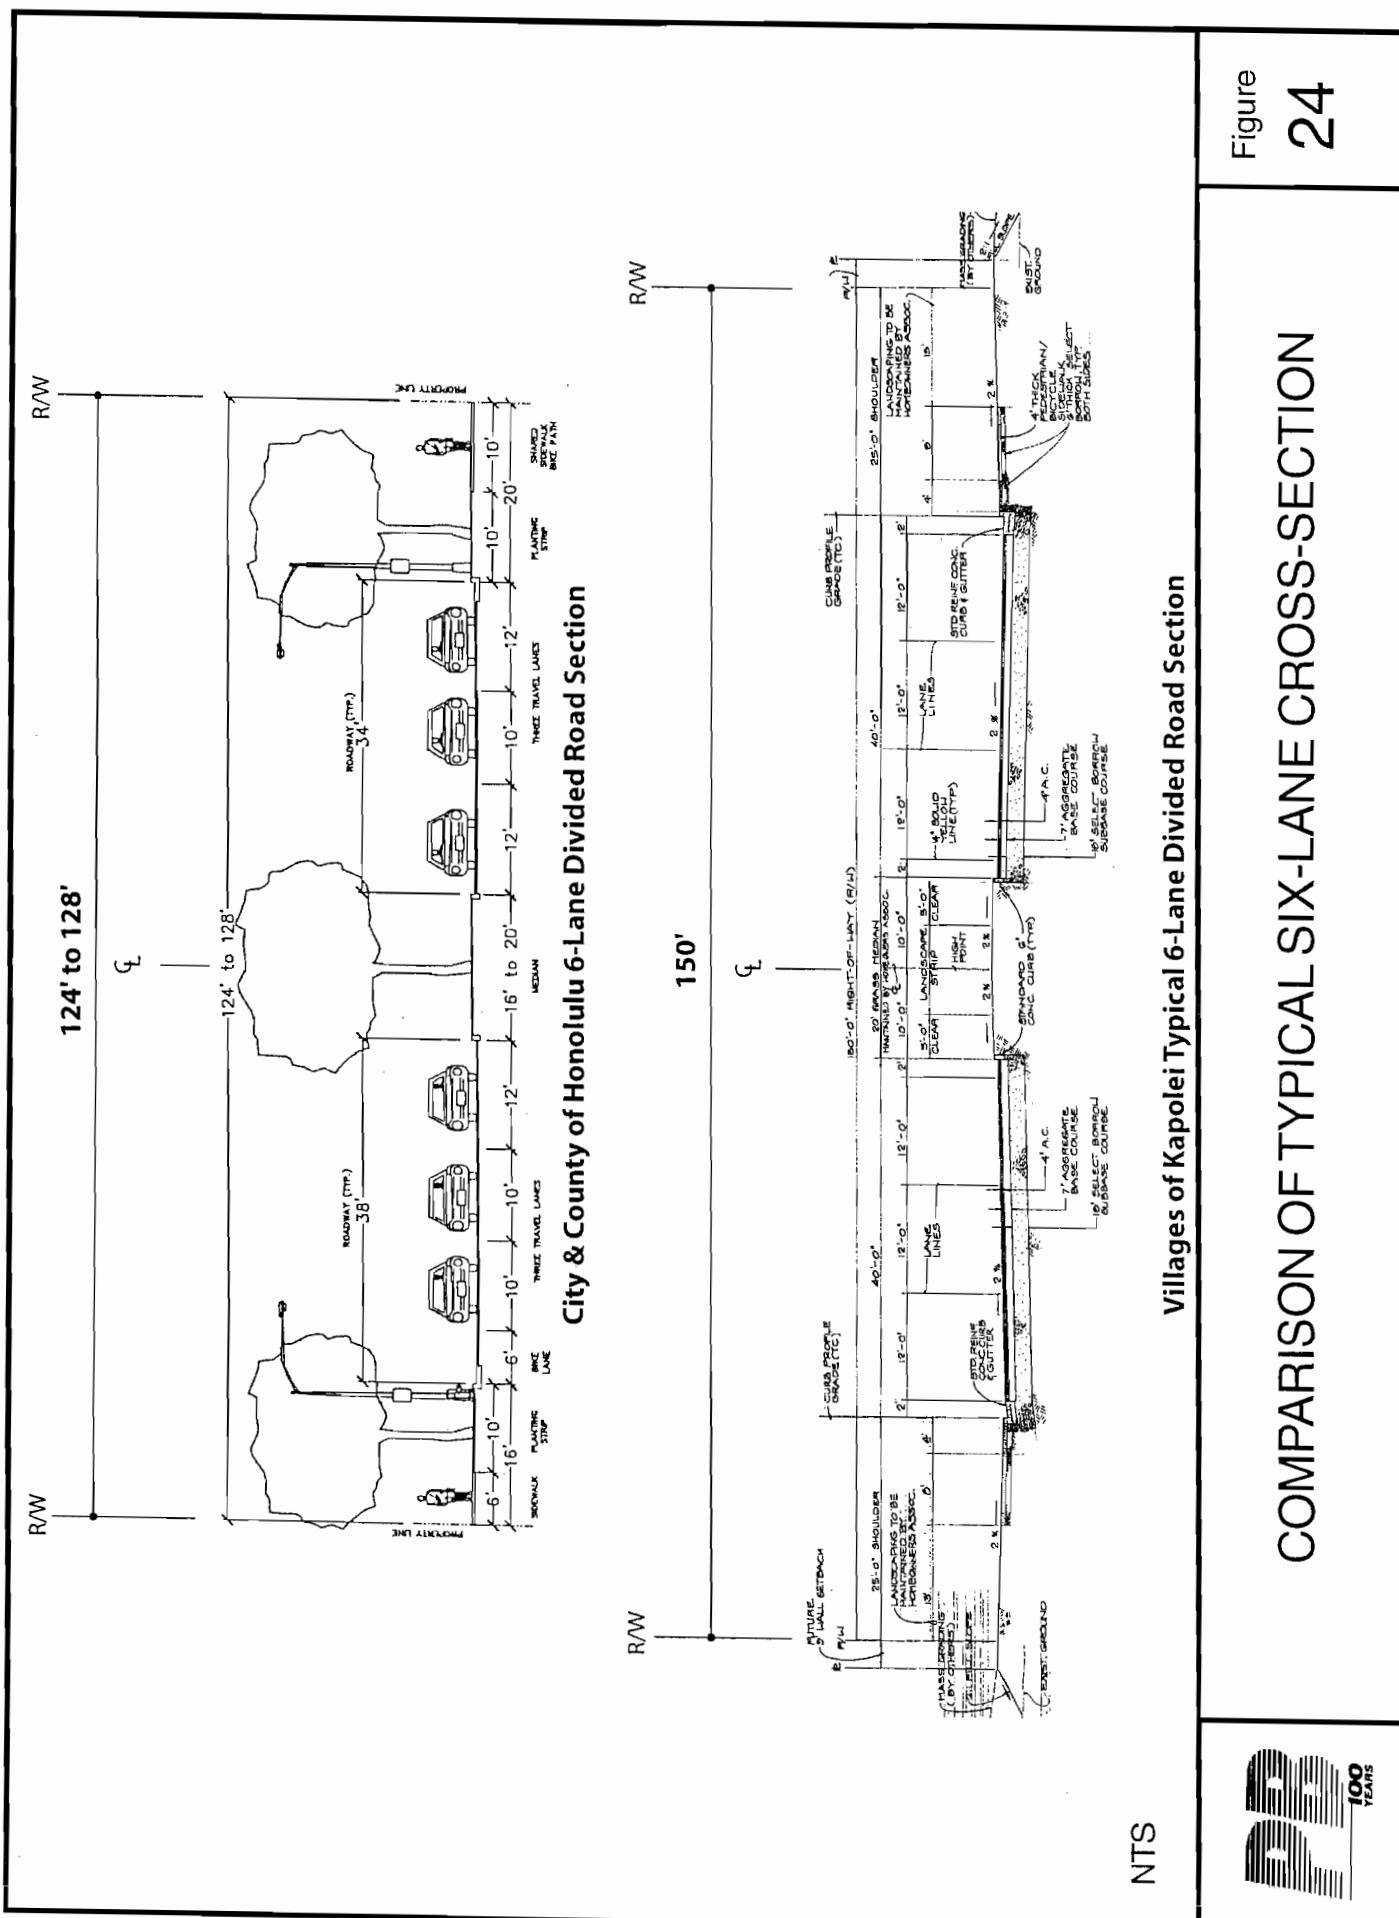

Typical cross-sections for Kapolei Parkway and all other roadways constructed within the Villages of Kapolei were compared with Department of Planning and Permitting *Subdivision Rules and Regulations* adopted June 1, 2001.

A. Roadway Cross-Sections

The Villages of Kapolei began initial construction of Villages 1-3 in the late 1980's. Roadway cross-sections were constructed at that time current City standards. Same Right-of-Way (ROW) was used or more on the more major roadways to allow room for bike lanes and larger landscaping. As of June 1, 2001 the Department of Planning and Permitting (DPP) adopted new revised subdivision street standards for a "Green Honolulu".

1. Six-Lane Divided Roadway Section

Kapolei Parkway is the only six-lane roadway within the Villages of Kapolei development. Figure 24 shows the existing Kapolei Parkway and City standards of 6-lane arterial roadways typical cross-section. As shown in Figure 24, the existing Kapolei Parkway is more generous overall providing 22-feet more ROW than the current City standards. The additional ROW was used to provide wider 12-foot lanes, a large 20-foot median and more landscaping on the outside shoulders of the roadway. The existing sidewalks were constructed larger than the 1984 City standards and was also more generous with landscaping. The State of Hawaii Department of Transportation (HDOT) currently has a bicycle facility master plan to accommodate and promote bicycling within the state of Hawaii. The current *Bike Plan Hawaii*, 2003, proposes to install bicycle lanes in Kapolei Parkway within the Villages of Kapolei. The existing roadway, flow-line to flow-line is wide enough to accommodate future bicycle lanes in the future along this portion of Kapolei Parkway. When the project to implement bicycle lanes along the Kapolei Parkway corridor occurs, it is recommended to re-stripe Kapolei Parkway to accommodate bicycle lanes in each direction.

**Parsons
Brinckerhoff**

2. Four-Lane Divided Roadway Section

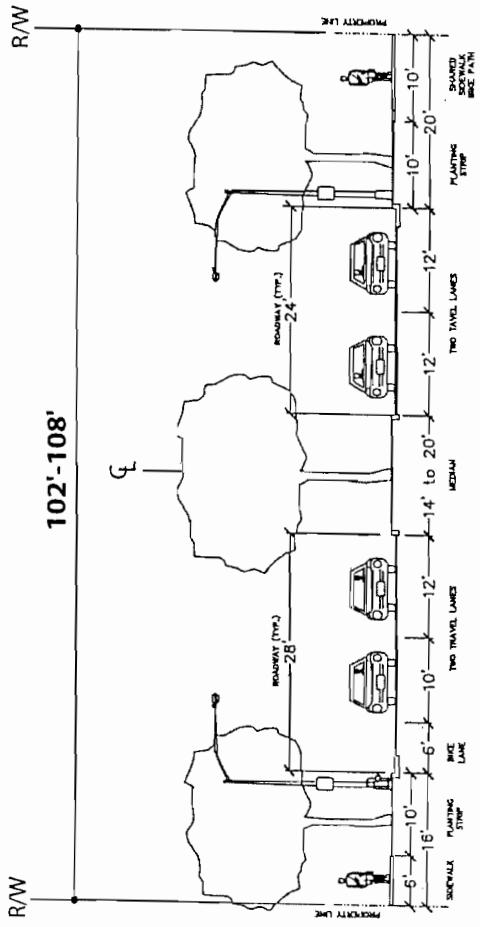

Kamaaha Avenue and Kealanani Avenue are the 4-lane roadways within the Villages of Kapolei. Figure 25 shows the City standards typical cross-section compared to the existing four-lane roadways typical cross-section within the Villages of Kapolei. As shown in Figure 25 the existing roadways are more generous in ROW allocation and roadway widths providing 10' more ROW and 8' more pavement width. The existing roadways provide 12' lanes with 6' bike lanes, 20' median and 17' outside shoulder. Outside the roadway typical cross-section, the shoulder is allocated as 6' sidewalk, 4' landscaping from edge of roadway to inside edge of sidewalk and 7' landscaping from outside edge of sidewalk to edge of ROW.

3. Two-Lane Roadway Cross-Sections

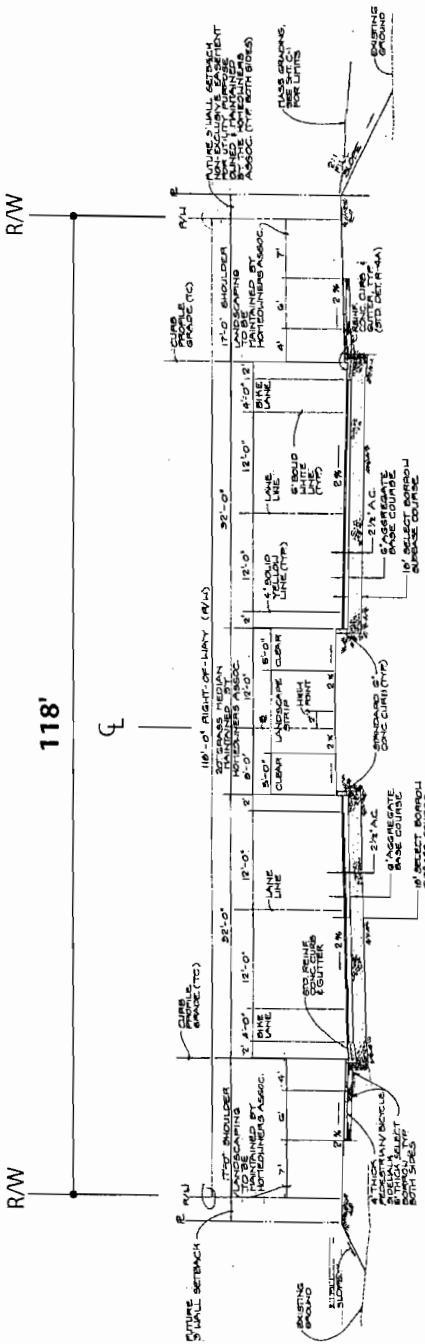

There are two typical cross-sections for 2-lane roadways within the Villages of Kapolei, a 70-foot and 50-foot ROW. Less ROW is used in the existing typical cross-section than the current City subdivision roadway standards but still provide the same pavement width, curb and gutter. Both typical cross-sections were constructed to, at that time, 1984 City standards. At that time, the standard sidewalk within a subdivision was 4-feet as is constructed. Figures 26 and 27 compare the roadway cross-sections for 2-lane roadways.

4. Cul-de-Sac Cross-Sections

Two different Cul-de-Sac ROW and roadway widths cross-sections were identified in the City standards. Figure 28-29 shows the typical 40' and 26' ROW Cul-de-Sac's and compare them with similar roadway cross-section located within the villages of Kapolei. As highlighted in the previous paragraph, overall ROW width is smaller as a result of the new guidelines published by the City. In both roadways, the roadway bed, flow line to flow line, remains the same providing the same travel way but have smaller planting strips between the roadway and sidewalk. The sidewalk widths comply with previous City standards and would be acceptable for dedication to the city.

B. Conclusion

As shown in this chapter, the roadways within the Villages of Kapolei development are more generous in roadway and landscaping width allocation. Future plans along Kapolei Parkway to have bicycle lanes can be accommodated with the existing configuration and require re-striping. More minor roadway within the Villages of Kapolei have less landscaping resulting in less ROW allocation but conform to the City standards during the time of construction of the roadways. Based on the comparison above, it is concluded that the roadways within the Villages of Kapolei adhere to the City standards and are suitable for dedication to the City and County of Honolulu in terms of roadway and pedestrian facilities.

-------	-------	-------	-------	------	------

LEVEL-OF-SERVICE F:	Demand volume exceeds capacity, resulting in extreme delays with queuing that may cause severe congestion and affect other movements at the intersection.
LEVEL-OF-SERVICE E:	Very long traffic delays.
LEVEL-OF-SERVICE D:	Long traffic delays.
LEVEL-OF-SERVICE C:	Average traffic delays.
LEVEL-OF-SERVICE B:	Short traffic delays.
LEVEL-OF-SERVICE A:	Little or no delay.

For unsignalized intersections, the Highway Capacity Manual evaluates gaps in the major street traffic flow and calculates available gaps for left-turns across oncoming traffic and for the left and right-turns onto the major roadway from the minor street.

The Highway Capacity Manual defines six Levels of Service (LOS), labeled A through F, from best to worst conditions. Levels of Service for signalized and unsignalized intersections are defined in terms of average user delays. Delay is a measure of driver discomfort, frustration, fuel consumption, and lost travel time.

Levels of Service Definitions
